►*1956 OLDSMOBILE ENGINE STALLING (In Warm Weather Immediately after Starting or is Hard To Start):* Adjust choke to one notch lean (from index). Adjust fast idle to 1500 RPM. Adjust throttle return check clearance to .020". Readjust throttle downshift screw so that screw is turned in 1½ to 2 turns after it just contacts tang of downshift lever. Make sure .020" clearance exists on the car between fast idle cam and top side of secondary throttle lockout tang to be sure choke valve is free to close. *CAUTION - Do not bend tang too far so that interference exists between bottom side of tang and fast idle cam.*

►*1956 PACKARD CARBURETOR HIGH ALTITUDE ADJUSTMENT NOTE* Leaner jets are not required for operation above 5000 ft. The choke should be set to three notches lean, and the secondary contour clearance should be set at .020" rather than .015".

►*PACKARD CARIBBEAN ENGINE ADJUSTMENT CAUTION:* Two carburetors used and special adjustment procedure required for balanced operation. *See Packard car model pages in 1955 Annual Data or later Manual edition.*

►*PONTIAC 285 HP ENGINE ADJUSTMENT CAUTION:* Two carburetors used and special adjustment procedure required for balanced operation. *See Pontiac car model data on Page 63.*

►*1956 PONTIAC COLD ENGINE STALLING CORRECTION & WARMING UP IMPROVEMENT (First Cars with No. 7008697 & 7007900 Carbs.):* Install new choke piston, No. 7009710 (can be identified by single bleed hole on side of piston—first type had two diametrically opposite holes) and set automatic choke 1 Notch Rich (supersedes Centered setting). *NOTE—Carburetors on which this change made in production are stamped "F" on identification tag*

►*1956 PONTIAC CARBURETOR LOADING-UP (DURING WARM UP) CORRECTION & CHOKE PISTON LINK PRODUCTION CHANGE:* On later production cars, the choke piston link contour has been changed to give an increased opening on cold idle. This change can be make on earlier carburetors by bending the choke link (using a pair of pliers) so that the choke piston protrudes 1/16" from the cylinder and the piston pin is one-half exposed when choke valve is fully closed Make sure no bind exists after bending link.

►*1956 PONTIAC (EXC. 285 H.P. ENGINE) HARD STARTING CORRECTION (With Partially Warmed-up Engine):* Change choke setting from one notch rich to center index. If hard starting is not eliminated completely with this change, set choke to one point lean.

►*1956 PONTIAC 285 H.P. ENGINE CARBURETOR CHANGE (To Improve Hot Starting Characteristics):* Install a new throttle body-to-bowl gasket, Part No. 7009256. The later gasket is identified by each venturi hole in gasket having an elongated section, and is being used in production beginning approximately March 1, 1956.

►*1956 PONTIAC 285 H.P. ENGINE STALLING (AFTER A FAST STOP) CORRECTION:* This condition can be corrected by removing the air horn assemblies from both carburetors and drilling out one internal vent on each side of each carburetor with a 1/8" drill as follows On automatic choke side of carburetor, drill out the internal vent hole located toward rear of air horn partition. On opposite side of carburetor, drill out the vent located on forward side of air horn partition.

►*1956 PONTIAC CARBURETOR FLOODING CORRECTION (Early Cars):* Install fuel filter, Part No. 854345 which is precipitation type filter having an impregnated fibre element

DESCRIPTION: Four barrel downdraft type with automatic choke. Carburetors are same general design used on 1955 car models except that Auxiliary Secondary Throttle Valves have been incorporated in all models except Buick. New settings and specifications are given below.

ADJUSTMENTS: *Make all adjustments in sequence given below (except for Idle Mixture and Idle Speed Tune-Up adjustments).*

►*PONTIAC IDLE ADJUSTING SCREW (THROTTLE STOP SCREW) NOTE:* The throttle stop screw (slow idle screw) as such, has been eliminated and replaced by a flat spring for positive closing. The screw which was formerly the fast idle screw is now both fast and slow idle screw The low step of the fast idle cam is used as the base for slow idle adjustment

Idle Setting: *Adjust only with engine at normal operating temperature with automatic choke not operating* (choke valve wide open, fast idle inoperative so that engine idles at hot or slow idle speed) With engine warm, set idle speed adjusting screw (throttle stopscrew) for correct idling speed as shown in table below (use tachometer), then adjust each idle mixture adjusting screw (one screw for each primary carburetor barrel —two screws only) until engine idles smoothly and RPM is at maximum (see Oldsmobile note following) Recheck idle speed

►*OLDSMOBILE NOTE* Manufacturer recommends that after setting idle as above (for highest vacuum reading and engine RPM), each screw should be turned out (rich) ¼ turn which will provide desired idling performance Check this setting by opening throttle to 1000 RPM point and then snapping throttle closed If engine rolls from richness, turn each screw in (lean) 1/8 turn

NOTE—Change in Idle Speed affects throttle linkage adjustment on all cars except Oldsmobile. Oldsmobile split throttle lever design insures throttle linkage remaining as set when idle speed readjusted.

Idle Speed Setting

Car Model	Synchr -mesh	Aut . Trans.
Buick ①	450 RPM	② 450 RPM
Chevrolet ①	450-500 RPM	③ 400-425 RPM
Oldsmobile ①	425 RPM	③ 400 RPM
Packard ①	450-500 RPM	④ 450 RPM
Pontiac (Exc. 285" Eng.) ⑤	450-470 RPM	②450-470 RPM
Pontiac (285" Eng.) ⑤	650 RPM	② 650 RPM

①—Air Conditioner turned "ON" if car so equipped
②—Transmission in "N" (Neutral)
③—Transmission in "D" (Drive Range)
④—Transmission in "High" range
⑤—On air conditioned cars, adjust idle speed to 510-530 RPM with air conditioner turned "OFF"

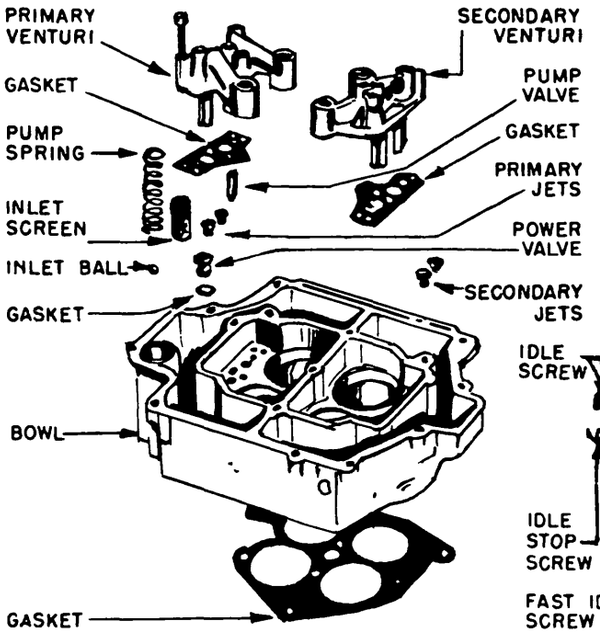
CONTINUED ON NEXT PAGE

ROCHESTER 4GC 4-BARREL CARBURETORS (Cont.)

►*OLDSMOBILE THROTTLE LINKAGE ADJUSTMENT NOTE.* Carburetors have "Split Throttle Lever" and linkage adjustment will not be disturned by Idle Speed Adjustment

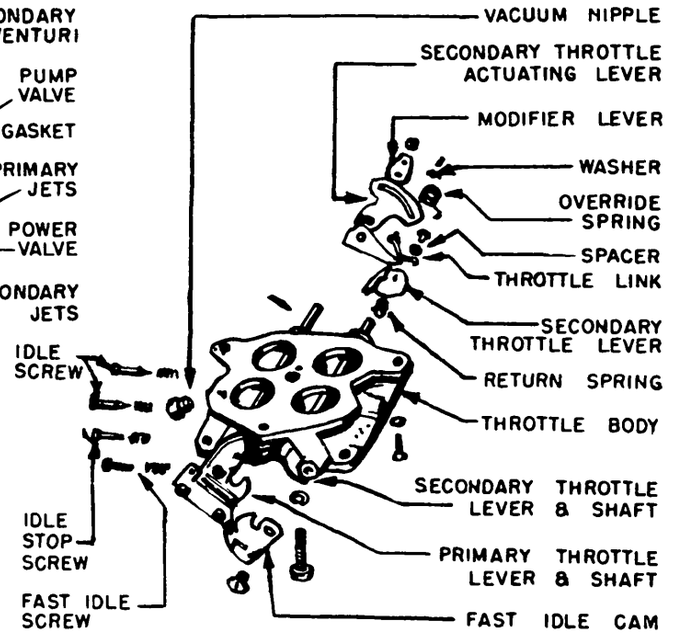
►*1956 PACKARD 5688 (310 H.P. ENGINE) THROTTLE LINKAGE ADJUSTMENT* See *CARBURETOR on Car Model pages*

►*1956 PONTIAC 285 H P. ENGINE THROTTLE LINKAGE ADJUSTMENT* See *CARBURETOR on Car Model pages*



Float S tting *CAUTION–Both Primary and Secondary Float Assemblies must be checked and adjusted separately and both FLOAT LEVEL & FLOAT DROP must be checked for each assembly* Remove bowl cover and float assembly from carburetor but DO NOT remove bowl cover gasket for following checks

Float L vel–*CAUTION–Do not remove bowl cover gask t.* Invert bowl cover install float gauge on cover and against curvature in air horn bore, or use scale to measure distance from gasket on cover to highest point on each float If floats do not just touch top portion of gauge between gauge legs, or if scale distance not correct, adjust by bending float arms at rear of float assembly (*CAUTION*–all floats must be set alike) Bend float arms horizontally until each float is centered between the gauge legs and check this setting by tilting bowl cover assembly 90° to each side to make certain that floats do not touch gauge legs under these conditions (*CAUTION*–this adjustment important to prevent floats touching sides of bowl and hanging up in service)



Float Level Setting
(Primary & Secondary Floats)

Car M d l	Float Height	Gauge No.
Buick	1 35/64"	BT 117
Chevrolet	1 5/8	BT 89
Oldsmobile (All)	1 5/8"	BT 89
Packard (All)	1 5/8"	BT 89
Pontiac (All)	1 19/32"	BT 101

Fl at Drop–*CAUTION–Do not remove bowl cover gasket.* Hold bowl cover assembly in upright position so that floats are free to hang down Use scale to measure distance from bottom face of gasket on bowl cover to bottom of floats If this distance or float travel (see table below) not correct adjust by bending tang at rear of float assembly toward needle seat to decrease drop or away from needle seat to increase drop All floats must be set alike

MAIN BODY ASSEMBLY

THROTTLE BODY ASSEMBLY

Float Drop Setting
(Primary & Secondary Floats)

Car Model	Flcat Drop
Buick	2¼"
Chevrolet	2 1/4"
Oldsmobile	2¼"
Packard	2¼"
Pontiac (All)	2¼"

Accelerating Pump Stroke· *CAUTION–This is a linkage adjustment and not a seasonal change recommendation.* Back off idle speed stopscrew and fast idle screw so that primary throttle valves are fully seated hold throttle lever in this position, use scale to measure height of pump plunger rod (from top surface of bowl cover to bottom edge of pump plunger rod) If height not correct (see table below), adjust by bending pump rod as required

Pump Rod Setting

Car Model	Pump Rod Height
Buick	1 1/32"
Chevrolet	1 1/16"
Oldsmobile	1 1/16"
Packard	1 1/16"
Pontiac (exc 285 HP Eng)	61/64"
Pontiac (285 H P Eng)	1'

Atmospheric Idle Vent Adjustment *NOTE–Idle Vent eliminated on Packard carburetors A "Vented" gasket is used between throttle body and float bowl to allow escape of hot vapors from above throttle valves)* Adjust other car models as follows

Oldsmobil –*(NOTE–Adjust Idle Vent after Fast idle Setting is made)* While holding throttle so fast idle screw is on highest step of fast idle cam check opening of idle vent valve which should be approximately 1/32" To adjust bend tang on pump arm with tool BT-67

►*OLDSMOBILE THROTTLE BODY GASKET NOTE·* A special "Vented" throttle body gasket is used to supplement the Idle Vent Valve and allow better escape of hot gases from above throttle valves

Pontiac (Exc. 285 HP Eng. Carb)–With vent valve closed and operating tang against face of valve there should be 054" (Tool KMO-480-A) clearance between lower edge of primary throttle valve and inner wall of bore opposite idle adjusting screws

Automatic Choke Setting· To adjust, loosen heat suction tube connection on cover, loosen three cover retainer screws (*CAUTION*–On Oldsmobile with one toothed retainer engaging serrations in cover, this retainer must be freed from cover serrations), rotate cover until index mark on cover is aligned with center graduation of scale on housing (Centered setting only-see table for recommended settings), tighten all cover retainer screws, tighten heat tube connection

Automatic Choke Setting

Buick	Centered (At Index)
Chevrolet	1 Notch Lean
Oldsmobile (Synchro-mesh)	2 Notches Lean
Oldsmobile (Hydra-Matic)	1 Notch Lean
Packard	Centered (At Index)
Pontiac (exc 285 HP Eng)	①1 Notch Rich
Pontiac (285 HP Eng)	Centered (At Index)

①—Supersedes Centered setting (see changes above)

CONTINUED ON NEXT PAGE

ROCHESTER 4GC 4-BARREL CARBURETORS (Cont.)

Choke Rod Adjustment: *Rod should be adjusted before adjusting Fast Idle, Unloader, and Secondary Throttle Linkage.* Rotate choke valve and fast idle cam until fast idle screw is in contact with SECOND step of fast idle cam, close choke valve until screw is against side of highest step on cam making certain that choke trip lever is in contact with choke counterweight lever. Measure choke valve opening or clearance between top edge of valve and dividing wall in air horn (see table below for gauge and clearance specification) Adjust by bending choke rod at lower angle using BT-18 bending tool.

Choke Rod Setting

Car Model	Gauge & Choke Opening
Buick	①② BT-115 (.140")
Chevrolet	③ BT-102 (.040")
Oldsmobile	③ BT-68 (.053")
Packard	③ BT-68 (.053")
Pontiac (All)	③ BT-68 (.053")

①—Large end of gauge. ②—Buick No. J-6152.
③—Small end of gauge.

Unloader Setting: *After choke rod adjusted (above),* move throttle lever to wide open position, make certain that choke trip lever is in contact with choke counterweight. Measure choke valve opening or clearance between upper edge of valve and dividing wall in air horn (see table below for gauge and clearance specification). Adjust by bending tang on fast idle cam using BT-69 bending tool

Unloader Setting

Car Model	Gauge & Choke Opening
Buick	①② BT-90 (.115")
Chevrolet	② BT-90 (.115")
Oldsmobile	② BT-90 (.115")
Packard	②③ BT-90 (.115")
Pontiac (All)	②⑪ BT-90 (.115")

①—Buick Gauge J-6152. ②—Use small end of gauge.
③—Packard Gauge J-6057. ⑪—Pontiac Gauge J-6178.

Secondary Throttle Lockout Setting: Close choke valve completely. Bend lockout lever to obtain .015" clearance between cam and widest surface of lockout lever.

Secondary Throttle Contour Setting. Hold choke valve completely closed. Bend lockout lever to obtain clearance (see table below) between cam and narrowest surface of lockout lever.

Secondary Throttle Contour Setting

Car & Model	Contour Setting
Buick	.030"
Chevrolet	.015"
Oldsmobile	.035"
Packard	.015"
Pontiac (All)	.015"

Car Starter Switch Setting (Buick): Back off throttle stop screw to close throttle valves completely. Make pencil mark on switch end of primary throttle shaft to line up with longest of three indicator marks on casting. With test light across switch terminals, slowly open throttle valves. Light should come on when pencil mark is between the two small marks on casting. Adjust by changing shims (Maximum .066"). Reset idle RPM to specifications.

Dampener Valve Setting (Buick): Remove fast idle cam and replace retaining screw. Adjust lever tang (Tool J-6058A) to give measurement of 51/64" (Tool J-6153 No. 1 end) from cam screw shoulder vertical to top of counterweight lever. Hold lever in this position, seat damper valves against outside of bore and tighten in place. Readjust tang to give 53/64" (Tool J-6153 No. 2 end) from cam screw shoulder vertically to top of lever. Proper adjustment prevents valve edge striking bore when in closed position.

►*AUXILIARY SECONDARY THROTTLE VALVE CAUTION (EXCEPT BUICK): Auxiliary secondary throttle valves are calibrated at the factory and field adjustments are not required.*

Fast Idle Setting: *NOTE—When fast idle setting is made "Off Engine", fast idle should be checked "On Engine" to insure proper warm-up performance. Adjust fast idle after Choke Rod adjusted (above).*

"Off Engine" Adjustment—With choke valve and throttle valves fully closed so that fast idle adjusting screw resting on high step of fast idle cam, adjust fast idle screw for correct primary throttle valve opening or clearance between edge of valve and wall on side opposite idle adjusting screws (see table below for gauge and clearance specification).

Fast Idle Setting "Off Engine"

Car Model	Gauge & Throttle Opening
Buick	J-1388 (.020")
Chevrolet	⑪
Oldsmobile	① BT-90 (.024")
Packard	①② BT-90 (.024")
Pontiac (exc. 285 HP Eng.)	③

①—Use small end of gauge. ②—Packard Gauge J-6057.
③—See "Pontiac Idle Adjusting Screw Note" above. Fast idle setting will be correct when "slow idle" speed properly set.

⑪ - No fast idle adjustment provided. Fast idle will be correct when low idle speed and choke rod adjustments properly made.

"On Engine" Adjustment—After Idle completed with carburetor on engine, and with engine and transmission at normal operating temperature, rotate fast idle cam so that fast idle screw rests on high step of cam, adjust fast idle screw for correct engine RPM as follows:

Fast Idle Setting "On Engine"

Car Model	Engine RPM
Buick	1700
Oldsmobile	① 1400-1500
Packard	① 1500

①—With transmission selector lever in "N" (Neutral).

Throttle Return Check Adjustment (Oldsmobile): *(NOTE—Make sure that normal idle speed and fast idle speed adjustments are correct).* With engine at normal operating temperature and running, rotate the fast idle cam so the fast idle screw is on highest step of fast idle cam. Measure clearance between contact screw of throttle return check and contact on throttle lever. Clearance should be .020". If adjustment necessary, loosen contact screw locknut and adjust. Use two wrenches when adjusting locknut to prevent turning the plunger.

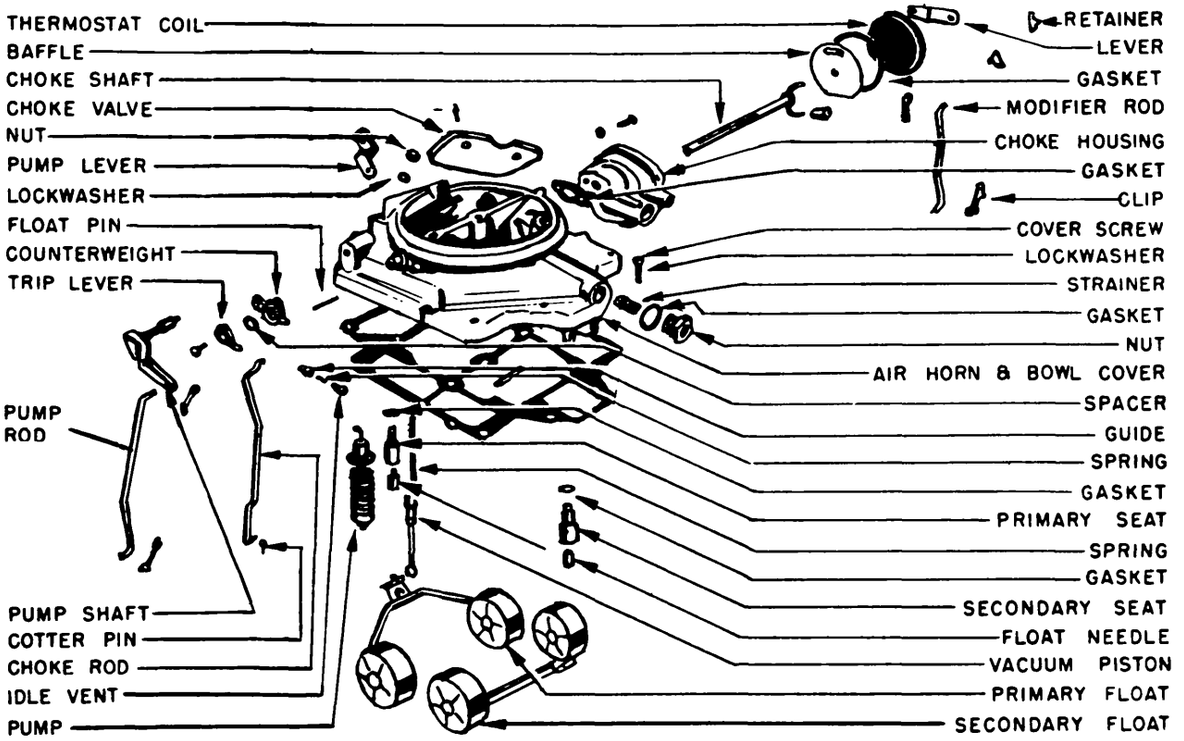
OVERHAUL: *CAUTION—When disassembling carburetor, be sure to keep PRIMARY and SECONDARY side parts separate so they will not be confused or interchanged when carburetor assembled.*

Disassembly: Carburetor consists of three main subassemblies (Air Horn & Bowl Cover, Carburetor Bowl, and Throttle Body) which can be overhauled separately as follows:

Air Horn & Bowl Cover—On Cadillac, disconnect and remove choke modifier rod. On all models, disconnect and remove pump connector rod. Remove trip lever retaining screw from end of choke shaft, remove trip lever and spacing washer from shaft. Take out fast idle cam pivot screw, remove choke rod with lever and cam as an assembly. Take out all air horn retaining screws (*CAUTION*—there are 13 screws—3 inner and 10 outer— with **one screw in center rib dividing wall just inside edge of air horn**). Lift air horn and bowl cover assembly straight up using extreme care not to damage float assemblies (*CAUTION*—break cover loose from bowl with finger pressure only, DO NOT pry on cover flange). Disassemble as follows: Invert the cover assembly, take out float hinge pins and remove floats and intake needles, remove needle seats and gaskets (*CAUTION*—Keep each float assembly, intake needle, and seat together, DO NOT mix primary and secondary side parts). Remove power piston by rotating retaining washer until flat side allows piston to pass, remove piston spring. Remove idle vent valve, spring, and retainer by pressing on retainer with a screwdriver and sliding assembly up out of well in bowl cover. Remove pump plunger and rubber seal as an assembly by disengaging plunger shaft from pump lever and pulling assembly out of cover (seal, retainer, washer, and spring can be removed from plunger for cleaning). Remove pump inner lever from countershaft by removing nut and washer, then slide countershaft out of cover boss. Remove fuel inlet fitting, gasket and strainer. If choke to be disassembled, proceed as follows: On Cadillac, remove retaining screw and lift off choke modifier lever. Remove cover attaching screws and retainers, lift off thermostat cover and coil assembly (*CAUTION*—On Cadillac, do not remove metal pointer or coil from shaft in cover), remove gasket and baffle plate. Remove choke valve (remove staking burrs from valve screws before taking screws out). Rotate choke shaft counter-clockwise until choke piston clears cylinder, slide shaft out and remove shaft and piston as an assembly (piston can be disconnected by using a wire to push piston pin out of piston and link). Remove choke housing by taking out two attaching screws, remove and discard choke housing gasket.

Carburetor Bowl—Take out three attaching screws and lockwashers in each venturi cluster, carefully remove clusters by lifting them straight up to avoid damaging

CONTINUED ON NEXT PAGE



ROCHESTER 4GC 4-BARREL CARBURETORS (C nt.)

idle tubes and main well tubes (*CAUTION*–Clusters are serviced as an assembly and should not be disassembled further). Keep primary and secondary side clusters separate (primary cluster has pump discharge nozzles). Remove all main metering jets (located in bowl adjacent to venturi cluster support). *CAUTION*–Primary and secondary side metering jets are different size and must not be interchanged. Remove power valve and gasket (located in bowl adjacent to primary metering jets). Remove pump return spring from pump cylinder, then invert bowl casting to remove aluminum pump inlet ball (from bottom of pump cylinder) and brass pump outlet check needle (from passage under primary venturi cluster mounting face). *CAUTION*–Do not lose these parts and NEVER substitute a steel ball for the aluminum inlet ball. Remove pump inlet screen from intake passage at side of cylinder.

Throttl Body–Remove large screw and washer from counterbore in center of throttle body (visible when bowl and throttle body inverted), remove three smaller screws and lockwashers from flange, carefully separate throttle body from bowl, remove and discard gasket. On all cars except Buick & Cadillac, remove the secondary auxiliary throttle valve assembly from carburetor body by lifting it out of the secondary throttle bores. Remove both idle adjusting screws and springs, idle stop screw and spring, and fast idle screw and spring. *(CAUTICN - Keep each screw and its proper spring together).* On Cadillac, remove choke modifier lever and retaining screw from primary throttle shaft. Free secondary throttle actuating link by taking out cotter pin in each end, unhook inner end of primary throttle shaft override spring from lever using long nose pliers, remove override spring retaining screw from primary throttle shaft, remove secondary throttle lever retaining screw and washer, then slide secondary throttle actuating lever and override spring off primary shaft, remove link. Slide secondary throttle lever and return spring from secondary throttle shaft. This completes throttle body disassembly.

► *CAUTION: Sec ndary Auxiliary Throttle Body and Main Throttl Body ar furnish d as an assembly with throttle valves and shafts and n attempt should be made to remov throttl valv s (disturbing valves will upset low spe d m t ring p rformance).*

Cl aning & Inspecti n: Wash all parts thoroughly in carburetor cleaning solvent **except** following parts which should be cleaned in clean gasoline: Choke cover and coil assembly, pump plunger, primary venturi cluster (with pump discharge nozzles). Blow out all passages in castings with air, remove all gum and carbon deposits (*CAUTION*–do not use drills to clean out jets and passages). Inspect strainer screens and replace if distorted or plugged. Check floats for dents, leaks, or wear at hinge pin holes. Inspect fast idle cam for wear on steps. Inspect throttle body carefully for wear at throttle valves and bore and shaft wear in bore

ROCHESTER 4GC 4-BARREL CARBURETOR AIR HORN & BOWL COVER ASSEMBLY

(replace as an assembly if worn excessively). Inspect all parts for wear or damage and replace as required.

Reassembly: Use new gaskets. Install all parts in reverse order of disassembly procedure (above) and pay particular attention to the following:

Auxiliary Secondary Throttle Valve Assembly - Install the auxiliary secondary throttle valve assembly into base of carburetor body from bottom side (make sure the calibrated spring, nylon bushing and operating pin are in position in throttle body assembly).

Secondary Throttle Lever & Spring Installation: Install return spring on secondary throttle shaft with bent end of spring in hole in throttle body, wind up spring one complete turn, then install secondary lever on shaft over straight end of spring (bent portion of lever should be above shaft), install spacer and retaining screw in end of shaft. Install secondary throttle actuating link (insert plain end through lever hole, install cotter pin on shaft side to clear return spring).

Primary Throttle Lever & Spring–Start secondary throttle actuating lever on primary throttle shaft with curved slot portion outward and toward the rear. With inner portion of lever on shaft, start override spring on shaft with long end inward, then slide lever and spring on shaft and engage washer end of secondary throttle actuating link in slot in lever. Install override spring retaining screw through loop end of spring and into primary throttle shaft from upper side. Hook inner end of override spring over top edge of secondary throttle actuating lever. Install washer and cotter pin on end of secondary throttle actuating link. On Cadillac, install choke modifier lever and retaining screw on end of primary throttle shaft (lever must point upward when throttle closed and marking "RP" must be outward).

Throttle Body-to-Bowl Assembly Caution–Install new gasket on bottom surface of bowl with largest projecting tab on primary side and surrounding vacuum passage to power valve piston (*CAUTION*–gasket is not reversible). Install all throttle body attaching screws loosely (including large screw in center of throttle body), then tighten all screws evenly.

Venturi Cluster Installation Caution–Make certain that brass pump discharge needle installed in pump passage in bowl before installing primary venturi cluster. Use new gaskets and install each venturi cluster in correct position making certain that clusters correctly aligned by the tangs on the cluster. *CAUTION*–Primary and Secondary clusters not interchangeable and can be identified by brass pump discharge nozzles used on primary cluster only.

Metering Jet Installation Caution–Primary and secondary side metering jets are DIFFERENT sizes (in general, secondary jets are larger size than primary jets) and must be installed in correct positions. *NOTE*–On later Cadillac carburetors, primary jets are brass finished, secondary jets are copper plated.

CONTINUED ON NEXT PAGE

ROCHESTER 4GC 4-BARREL CARBURETORS (C nt.)

Accelerating Pump Plunger Assembly–When installing rubber seal on plunger stem, slide seal on shaft with larger end toward the piston, see that upper end engaged in groove in plunger stem. Insert assembly through bowl cover from below and pull seal through cover so that cover edge engages groove in seal. When installing cover, guide pump plunger into cylinder. **Floats and Intake Valve Assembly**–Make certain that parts installed in correct position (primary and secondary parts not interchangeable). On Cadillac, make certain that float hinge pins installed in holes farthest from bowl cover. On Oldsmobile, see that tang on float arm is back of float balance spring (balance springs not used on later Cadillac carburetors and should be removed and discarded on earlier carburetors–see Changes & Corrections above). Adjust float level and float drop or travel (see Adjustment data above). **Air Horn & Bowl Cover Installation**–Use new gasket, carefully align all holes in gasket and cover. When installing cover, use care in guiding pump plunger into pump cylinder and power valve piston into its bore, and see that floats not bent by striking on edge of bowl. Install all bowl cover attaching screws, tighten inner screws first, then outer screws, evenly and securely. **Choke Valve Installation**–After choke shaft and piston assembly installed in air horn, slide choke valve through shaft with letters "RP" upward, use new screws and install screws loosely, then tighten screws as follows: **Cadillac**-Press firmly on choke housing end of shaft and hold valve tightly closed, tighten screws securely and stake ends of screws lightly taking care not to bend choke shaft. **Oldsmobile**–First install counterweight, spacing washer, and trip lever on end of choke shaft, press lightly on end of choke shaft to obtain minimum clearance of .020" between spacing washer and counterweight, tighten choke valve attaching screws with shaft in this position, stake screws lightly taking care not to bend choke shaft. Install choke baffle plate with curved slot over tang on choke lever.

Thermostatic Housing & Coil Installation–With retainer screws loose, rotate cover counter-clockwise until coil hook picks up choke lever tang, then position cover for correct choke setting (see Adjustment data) and tighten retaining screws. On Cadillac, install choke modifier lever loosely (lever should be forward and slightly down when metal pointer is at scribed line), tighten lever screw as part of Choke Modifier adjustment (see Adjustment data).

ROCHESTER "B" & "BC"

CHEVROLET PASS. CARS	Rochester Model No.
1956 6 Cyl. (Synchro-mesh)	BC 7009255
1956 6 Cyl. (Powerglide)	BC 7009254
CHEVROLET TRUCKS	
1956 235" Eng. (Std. Trans.)	B 7004468
1956 261" Eng.	BC 7005140
1956 Auto. Trans.	BC 7009255

►CHANGES, CAUTIONS, CORRECTIONS

►*1956 MODEL BC METERING PRODUCTION JET CHANGE (To Improve Part Throttle Performance):* One step rich Main Metering Jet No. 7002958 (No. 58) replaced No. 7002957 (No. 57) used in early carburetors. When new jet to be installed, use No. 7002958 (No. 58) for replacement.

DESCRIPTION: Single barrel downdraft carburetors with manual choke control (B) or automatic choke (BC). Carburetors are same design as used on previous models, with Two-Step Power System.

ADJUSTMENT: Set these carburetors to the following specifications:

IDLING ADJUSTMENT

Idle Screw Setting—Adjust only with engine warmed up to normal operating temperature so that choke valve is wide open and fast idle inoperative (carburetors with automatic choke). Turn idle screw in or out from initial setting (see table below) until engine fires smoothly. Recheck engine idling speed.

Idle Mixture Setting

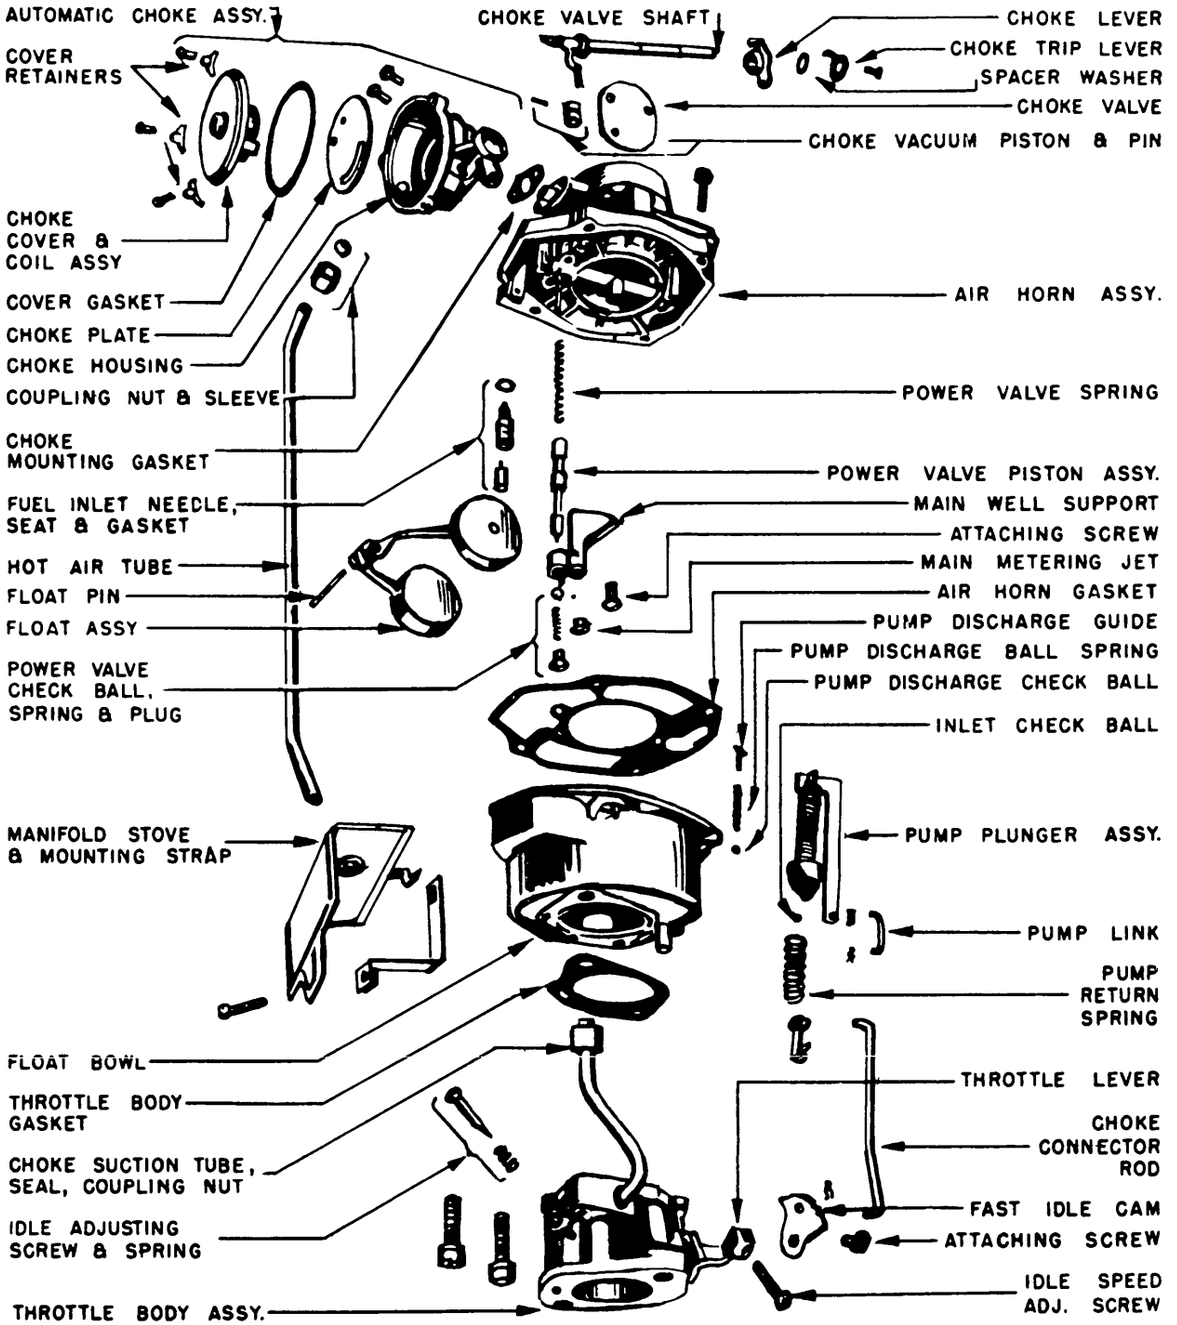
Model	No. Turns Open
Pass Cars (All)	2½ turns
Trucks (BC Carb.)	2½ turns
Trucks (B Carb.)	1½-2½ turns

Idle Speed Setting

Pass. Cars (Synchro-mesh)	475 RPM
Pass. Cars (Powerglide)	①425 RPM
Trucks (Std. Trans)	450-500 RPM
Trucks (Auto. Trans.)	②400-450 RPM

①—With transmission selector lever in "Dr".
②—With transmission selector lever in "N".

ACCELERATING PUMP



No seasonal adjustment provided.

FLOAT LEVEL

CAUTION—Two separate adjustments required:

1). Float Level Setting—***CAUTION—When removing air horn and bowl cover on "BC" automatic choke models, disconnect heat suction tube at upper coupling nut and use care not to disturb seal at lower end of tube.*** Invert bowl cover and float assembly but DO NOT remove cover gasket, install gauge (see table below) over floats (on Chevrolet, center tang on gauge enters main discharge nozzle), bend float arms vertically so that both floats are same height, then bend button on float arm which contacts intake needle until both floats just touch top of cut-out in gauge. On Chevrolet, bend float arms horizontally so that each float is centered in gauge cut-out, then tilt assembly 90° to each side to make certain that floats do not touch gauge.

2) Float Travel or Drop Setting—1¾" from face of cover gasekt to **bottom** of each float with floats in extreme lower position. To check, hold assembly in upright position so that floats drop to bottom of travel, measure from gasket to bottom of each float at center (use Float Drop Setting Gauge BT-93). Adjust by bending drop tang at rear of float assembly.

ROCHESTER MODEL BC CARBURETOR (WITH AUTOMATIC CHOKE)

Carburetor	Float Level Setting Float Level	Checking Gauge
All Models	1 9/32"	①3696192

①—Rochester Gauge No. M-250.

CONTINUED ON NEXT PAGE

ROCHESTER "B" & "BC" (C ntinued)

FAST IDLE
(Chevrolet Model BC Carburetors)

Adjustment—With choke cover properly set (see Automatic Choke Setting below), rotate fast idle cam until throttle stopscrew is on second step of cam and against shoulder of first step. Hold cam and throttle lever in this position, measure choke valve opening or clearance between lower edge of valve and air horn wall. See table below for clearance and checking gauge. If clearance not correct, adjust by bending connector rod at lower dog leg using bending tool BT-18 (Chevrolet No. J-4552).

Fast Idle Setting

Carburetor	Choke Opening	Checking Gauge
All "BC" Models	076"	①BT-99

①—Use SMALL end of gauge (Rochester No)

UNLOADER
(Chevrolet Model BC Carburetors)

Adjustment—To check setting, open throttle valve wide and check choke valve opening or clearance between lower edge of valve and air horn wall. See table below for clearance and checking gauge. If clearance not correct, adjust by bending tang on throttle lever using bending tool BT-18 (Chevrolet No. J-4552).

Unloader Setting

Carburetor	Choke Opening	Checking Gauge
All "BC" Models	230"	①BT-99

①—Use LARGE end of gauge (Rochester No)

AUTOMATIC CHOKE
(Chevrolet Model BC Carburetors)

Choke Setting—Adjust by loosening three retainer screws and rotating choke cover until scribed mark on cover is in line with longer center mark of scale on housing (Centered Setting) Choke valve should be lightly closed at 85°F

OVERHAUL: *See 1955 Annual Data or later Manual dition.*

② - Use 7009907 for replacement.

►CHANGES, CAUTIONS, CORRECTIONS

► *1956 CHEVROLET V8 TRUCK ENGINE CARBURETOR-TO-MANIFOLD GASKET PRODUCTION CHANGE (To Eliminate Hard Hot Starting):* New intake manifold-to-carburetor gasket, Part No. 3733281, with better insulation characteristics, is now being used in production and should be used on all 2-barrel carburetor V8 Truck installations when replacement required. Former gasket, Part No. 3704952, will continue to be used on passenger cars.

► *1956 OLDSMOBILE STALLING DURING WARM-UP CORRECTION:* Carburetors with letter "B", "C" or higher stamped in carburetor identification tag incorporate changes in piston and thermostat housing to provide proper "pull off" of choke valve, and permit choke valve to remain at proper "pull off" position until engine is warm On earlier carburetors, drill 3/64" hole in end of choke piston which will reduce the amount of vacuum behind choke piston and eliminate the stalling condition. *NOTE* - When removing choke valve from choke shaft it will be necessary to file the staked choke valve screws. Use a small amount of grease on file to collect any brass chips that might fall into carburetor

► *1956 OLDSMOBILE SLOW IDLE SCREW PRODUCTION CHANGE & INSTALLATION*· Slow idle screw spring has been replaced by locknut on later carburetors to obtain a more positive setting. TO INSTALL locknut on early carburetors, back off idle adjusting screw to remove spring (only), spin locknut No. 7010819 on screw, turn screw in 6 turns and tighten locknut. Hold choke wide open, idle screw off fast idle cam, throttle closed, then turn idle screw in until throttle valves just begin to open. Turn screw in an additional turn, tighten locknut against throttle lever. Readjust idle speed with engine warm.

► *FUEL FILTER PRODUCTION CHANGE (To Correct Carburetor Flooding Conditions).* New glass bowl, impregnated fiber element, precipitation type, fuel filter is now being used in production and is available for installation on earlier cars. Filter Package, Part No. 854345, can be installed using one 90° elbow, Part No. 504500 or 114920.

► *1956 PONTIAC UNLOADING CORRECTION (To Relieve Flooding):* Interference between accelerator pedal and floor mat at "Hump" above transmission, prohibits opening of choke, necessary to relieve flooding condition. To correct, move top of pedal to left to obtain clearance for full pedal travel.

► *1956 PONTIAC UNLOADER ADJUSTMENT CHANGE:* For complete "Unloader" adjustment, *see "Unloader Setting" below.*

DESCRIPTION· Dual downdraft type with Automatic Choke (2GC), or Manual Choke (2G) Standard Trans Truck These carburetors have Rochester Calibrated Cluster design "Venturi Cluster Assembly", vacuum controlled Power System, throttle operated accelerating pump with double-spring pump plunger All carburetors have an internal vent in the air horn and an external vent on the bowl cover (On Oldsmobile, this vent is controlled by a tang on the pump lever and is opened at low idle only). The new (Concentric Bowl) carburetor used on Oldsmobile is similar in design to the (Side Bowl) carburetor used on previous models, the principal difference being the concentric bowl design and the relocation of the metering jets toward the center of carburetor, and vacuum operated throttle return check.

ADJUSTMENTS· Make all adjustments exactly as follows

Idl Setting· If preliminary adjustment required to warm up engine, set both idle adjusting screws 1½ turns open from inner seated position (all models) With engine at operating temperature (choke valve wide open, fast idle inoperative), adjust throttle stopscrew for correct idle speed (see table below), then turn each idle adjusting screw in or out to secure smoothest possible idle performance (highest manifold vacuum and RPM) See Oldsmobile Note following Readjust idle speed and recheck idle setting

►*OLDSMOBILE NOTE*· After setting idle adjusting screws as above, turn each screw out (inch) ¼ turn which will provide desired idle performance (manifold vacuum and RPM will drop off slightly) Check performance by opening throttle to 1000 RPM point and then snapping throttle closed If engine rolls due to richness, turn each screw in (lean) not more than 1/8 turn

Idle Speed Setting

Car Model	Synchro-mesh Cars	Automatic Trans.
Chevrolet V8	475 RPM	425 RPM in "D"
Chevrolet Trucks	475 RPM	425 RPM in "N"
Oldsmobile	425 RPM	400 RPM in "Dr"
Pontiac	① 450-470 RPM	① 450-470 RPM

① - 510-530 RPM (With Air Conditioning turned on).

►*AUTOMATIC TRANSMISSION THROTTLE LINKAGE ADJUSTMENT* See Car Model pages for necessary adjustment following idle speed adjustment *OLDSMOBILE NOTE*—Carburetor has "Split-Throttle Lever" and linkage will not be disturbed by idle speed setting

Throttle Return Check Adjustment (Oldsmobil): *CAUTIONS* - **1)** The following adjustment must be repeated after any change in slow idle adjustment. **2)** Always hold the plunger with a wrench while adjusting the screw to avoid damage to the diaphragm.

Adjustment - With engine at operating temperature, and slow idle set at 400 RPM in "Drive", remove air cleaner, manually close choke valve to locate fast idle screw on correct point of high step of cam. Mark fast idle cam at contact point of fast idle screw, so that correct position can be rechecked with air cleaner in place. With cleaner in place, adjust fast idle speed to 1700 RPM in Neutral. With engine off and fast idle cam in the closed choke position, adjust plunger screw on throttle return check to obtain.050" clearance between the screw head and throttle lever.

CONTINUED ON NEXT PAGE

ROCHESTER 2G & 2GC (C nt.)

Atmospheric Idle Vent (Oldsmobile)· *Not used on Chevrolet & Pontiac.* Consists of a vent opening in the bowl cover with a vent cap actuated by a tang on the pump lever Vent is opened at low idle but must be closed at all other throttle positions

Idle Vent Checking & Adjustment - *NOTE* - Be sure fast idle adjustment is set so engine is operating between 1400 and 1500 RPM, then proceed as follows Hold throttle so fast idle screw is on top of highest step of fast idle cam then check opening of atmospheric idle vent in air horn. Valve should be opened approximately 1/32" To correct, use Tool BT-67 to bend tang on pump arm.

Accelerating Pump Rod Setting: *This is a linkage adjustment (Pump does not have Seasonal setting).* With throttle stopscrew backed off so that throttle valves completely closed, place combination Float & Pump Gauge (see table below) in inverted position on pump housing on bowl cover Leg on gauge should just contact top of pump rod Adjust by bending lower end of pump rod using bending tool BT-18

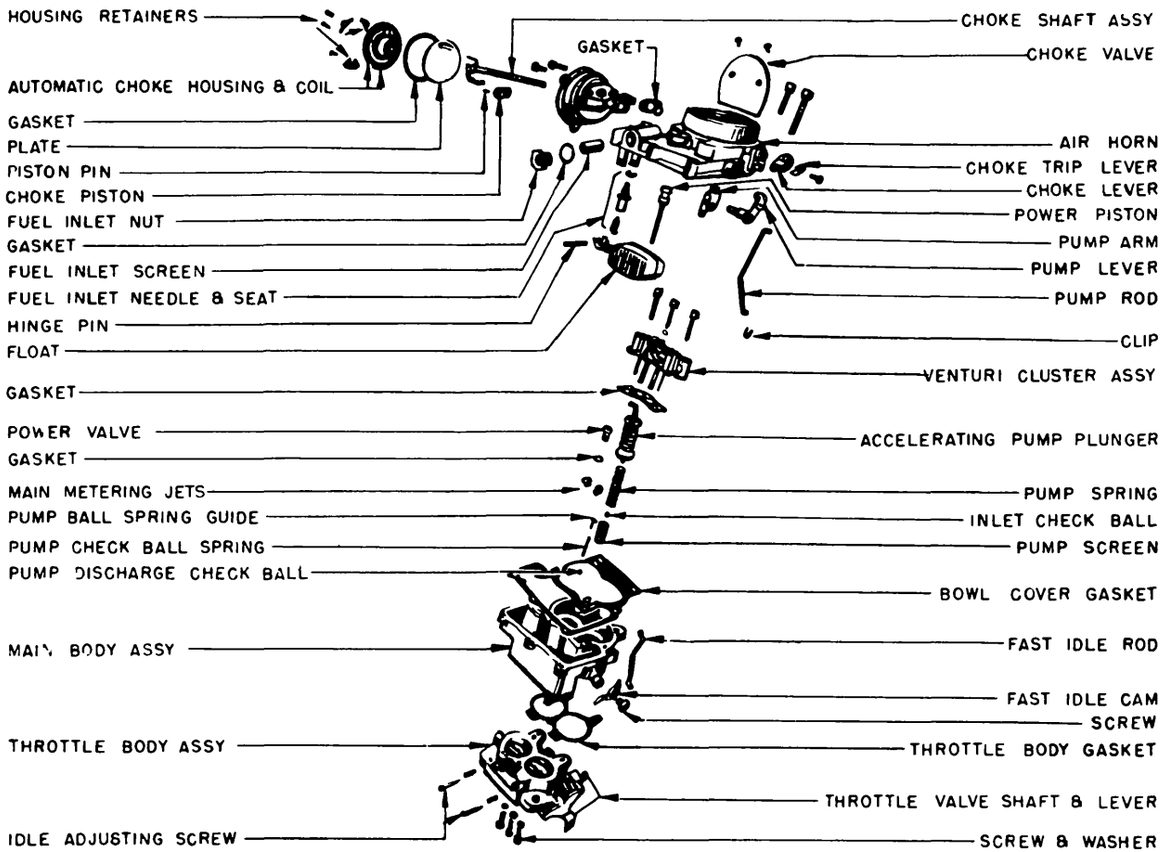
Pump Rod Setting

Car Model	Checking Gauge & Distance
Chevrolet V8 (Pass & Trk)	① BT-129 (57/64")
Oldsmobile	② BT-126 (3/16")
Pontiac	③ BT-130 (57/64")

① - Chevrolet No. J-6326. ② - Oldsmobile No. J-6336.
③ Pontiac No. J-5916.

Fl at Setting· *Both Float Level and Float Drop must be correct. Check and adjust as follows*

Float Level–Remove bowl cover and float assembly but DO NOT remove bowl cover gasket Invert assembly, place combination Float & Pump Gauge (see table below) over float and against pump side of power piston shaft so that outer gauge leg is in line with center of float Bottom of float should just contact bottom edge of gauge Adjust by bending float arm using bending tool BT-69



Float Level Setting

Car Model	Checking Gauge & Height
Chevrolet V8	① BT-129 (1 1/4")
Oldsmobile	② BT-126 (1 7/16")
Pontiac	③ BT-130 (1 15/64")

① - Chevrolet No. J-6326. ② - Oldsmobile No. J-6337.
③ - Pontiac No J 5916.

Fl at Drop–Hold bowl cover and float assembly upright so that float drops down to limit of travel Place combination Float & Pump Gauge against gasket on cover at free end of float (see Float Level Setting table above for gauge number) so that single leg of gauge extends downward Bottom of float at free end should be even with scribed line on gauge (1 29/32' on all carburetors except Oldsmobile, 2" Oldsmobile. Adjust by bending float arm tang (behind needle seat) toward needle seat to decrease drop or away from needle seat to increase drop.

Fast Idl Setting· *On Ch vrol t & Pontiac, Choke Rod S tting automatically provid s corr ct fast idle s tting (no s parat Fast Idl Scr w) On Oldsmobil (with separate Fast Idle Screw), an additional Fast Idle Adjustment is required*

ROCHESTER 2GC DUAL CARBURETOR (2G SIMILAR EXC. MANUAL CHOKE)

Choke Rod Checking & Adjustment (All Models)–Turn throttle stopscrew (Chevrolet & Pontiac), Fast Idle Screw (Oldsmobile) in until it just contacts second step of fast idle cam, close choke valve until screw rests against shoulder of high step on cam Check choke valve opening or clearance between upper edge of choke valve and air horn wall by inserting SMALL end of gauge (see table below) vertically Adjust by bending tang on choke lever counterweight using bending tool BT-69

Choke Rod (Fast Idle) Setting

Car Model	Checking Gauge & Choke Opening
Chevrolet V8	④ BT-108 (.089")
Oldsmobile	⑤ BT-127 (.073")
Pontiac	⑥ BT-128 (.061")

④ - Chevrolet No. J-5921. ⑤ - Oldsmobile No. J-6338.
⑥ - Pontiac 1/16" drill rod.

Fast Idl ·Scr w S tting (Oldsm bil nly)–*Manufacturer r comm nds that this adjustment be made ON THE ENGINE as outlined b low.*

Checking & Adjusting (Off th Engin) - Back off fast idle screw. Place LARGE end of gauge BT-90 (.024") between edge of throttle valve and bore on side opposite idle adjusting screw, close throttle against gauge and apply tension to throttle lever to hold gauge in place Close choke valve so that high step of fast idle cam is in line with fast idle screw turn fast idle screw in until gauge just drops out

Checking & Adjustment (On th Engin)–With engine and transmission at normal operating temperature and selector lever in Neutral, rotate fast idle cam so that high step in line with fast idle screw, turn fast idle screw in until engine speed is 1600-1700 RPM. This will provide correct warm-up speed and prevent stalling.

Unloader Setting· Place throttle lever in wide open position (see Oldsmobile Note below), check choke valve opening or clearance between upper edge of valve and air horn wall using LARGE end of correct gauge (see table below) inserted vertically Adjust by bending tang on throttle lever using bending tool BT 69

CONTINUED ON NEXT PAGE

ROCHESTER 2G & 2GC (C nt.)

►*1956 FONTIAC UNLOADER ADJUSTMENT:* Proceed as follows

1) Loosen top trunnion nut on intermediate throttle rod and push down on rod until it bottoms.

2) With rod in this position, tighten nut finger tight plus three full turns.

3) Remove carburetor air cleaner assembly. Depress accelerator pedal forcibly to floor. Check to see that accelerator pedal is not hitting "Hump" over transmission. If so, move upper end of pedal to left, by enlarging left hand hole in accelerator pedal bracket, and rotating bracket counterclockwise.

4) With accelerator pedal depressed as in step 3, bend unloader tang on carburetor to give correct opening between edge of choke valve and air horn.

►*OLDSMOBILE NOTE:* Before making above adjustment, the throttle stopscrew (slow idle speed screw) must first be turned IN one turn from point where throttle valves are completely closed.

Car Model	Unloader Setting Checking Gauge & Choke Opening
Chevrolet V8	..... ⓓ BT-108 (23/64")
Oldsmobile	..... ⓞ BT-127 (.155")
Pontiac	..... ⓟ BT-128 (.163")

ⓓ - Chevrolet No. J-5921. ⓞ - Oldsmobile No. J-6338.
ⓟ - Pontiac No. J-5920.

Automatic Choke Setting: Centered at index for all carburetors except Oldsmobile. One Point Rich for Oldsmobile. To adjust, loosen heat tube connection on cover, loosen three cover retaining screws. *CAUTION* - If one retainer has "toothed" type engagement notches in cover, screw must be backed off sufficiently so that retainer can be disengaged from cover notches. Rotate cover to align marks.

NOTE–With above setting, choke valve should be lightly closed at 75°F.

OVERHAUL: Adjustments may be made and various parts be serviced without completely disassembling the entire unit.

Disassembly: Major units of carburetor consist of Air Horn Assembly, Main Body, and Throttle Body.

Air Horn Assembly–Consists of Automatic Choke & Fuel Bowl Cover.

Automatic Choke–Remove three choke cover screws and retainers, choke cover and coil assembly, cover gasket and baffle plate. Remove choke trip lever, fast idle link and lever (rotate lever until slot in lever will pass over tang on link). Remove two choke valve screws and choke valve. Rotate choke shaft counterclockwise to free choke piston from housing, then pull piston and choke shaft from carburetor. Remove two choke housing attaching screws and remove choke housing and gasket from Air Horn.

Fuel Bowl Cover–Disconnect pump link from throttle lever by rotating it until it clears pump lever. Remove eight cover screws and remove cover. Invert cover on flat surface, remove float hinge pin, float assembly and float needle. Remove float needle seat and gasket and remove filter screw. Depress power piston shaft allowing spring to snap, which forces piston from casting. Remove retainer on pump plunger shaft and plunger assembly from pump arm. Remove pump lever and shaft by loosening setscrew on inner arm and removing outer lever and shaft. Remove cover gasket.

Main Body–Remove pump plunger return spring from pump well main metering jets, and power valve. Remove three screws from top of cluster and remove cluster and gasket. With long nose pliers, remove pump discharge spring retainer, then the spring and check ball. Invert Main Body and remove three large bowl to throttle body attaching screws, remove throttle body and gasket.

Throttle Body–Remove fast idle cam, idle adjusting needles and springs. Throttle body should be replaced as an assembly to insure proper relation of valves to vacuum advance and idle discharge orifices.

►*1956 OLDSMOBILE CLEANING CAUTION: Use only a Cold Immersion type cleaner.* Hot type cleaners may affect sealing properties of dichromatic coating. DO NOT soak air horn as an assembly in cleaner or solvent.

Cleaning & Inspection: Thoroughly clean carburetor castings and metal parts in clean solvent. *CAUTION*–Choke coil and housing and pump plunger should not be immersed in solvent. Clean pump plunger in clean gasoline only. *DO NOT SOAK AIR HORN ASSEMBLY IN CLEANER OR SOLVENT FOR MORE THAN ONE HALF HOUR IF CHOKE PISTON HOUSING HAS NOT BEEN REMOVED.* Blow out all passages in casting until dry. *CAUTION*–Do not pass drills or wires through calibrated jets or passages as they may enlarge orifice and seriously affect carburetor calibration. Inspect all parts for wear damage, burrs or ridges. Inspect gaskets for being hard or brittle, pump leather for damage. Replace all parts as inspection justifies or if parts loose or damaged in cluster.

Reassembly: Throttle Body to Main Body–Install idling adjusting screws and springs in throttle body until finger tight and then back off 1½ turns for temporary adjustment, add throttle body gasket and attach throttle body to bowl. Install fast idle cam, drop pump discharge ball into discharge hole and replace spring and retainer. Install cluster with new gasket, tighten screws evenly, (center screw takes red fibre gasket). Replace main metering jets and power valve with new gasket. Install pump return spring by pressing with finger to center in pump well.

Fuel Bowl Cover (Air Horn)–Replace pump lever assembly, install filter screen float needle seat and gasket. Replace power piston in vacuum cavity (check to see that piston travels freely). Lightly stake retainer in place. Attach plunger shaft with retainer shaft end pointing inward. Install cover gasket. Attach needle to float, position it carefully and insert float hinge pin. Adjust float (see table above for setting). Place cover in position making certain that accelerator pump plunger is positioned and will move freely. Raise cover and lower straight down to insure proper installation. Install eight screws, pump link and retainer.

Choke–Place new gasket in position, attach choke housing to cover and tighten screws securely. Place choke shaft in choke housing and rotate clockwise so that piston rides in bore in housing. Install choke valve on shaft with letters "RP" facing upward, center choke valve before tightening screws. Place baffle plate and choke housing gasket into position and install choke coil and cover. Rotate cover clockwise until index marks on cover and housing are aligned. Attach retaining screws and tighten securely. Replace link in fast idle cam and choke lever, place choke lever on cover with the tang facing outward and toward the pump lever. Install trip lever so that tang of trip lever is under tang of choke lever.

1956 Series 40	WW 7-105, 5A

►CHANGES, CAUTIONS, CORRECTIONS

►*LEAN MIXTURE ON MODERATE ACCELERATION CORRECTION:* To eliminate this condition, install repair kit, Buick Part No. 1392722, consisting of idle tubes, main metering jets and main discharge jets. After installation completed, scribe letter "A" changing carburetor Code (found on air horn directly above float chamber) from 7-105 to 7-105A. *Carburetors with Code 7-105A have these new changes made*

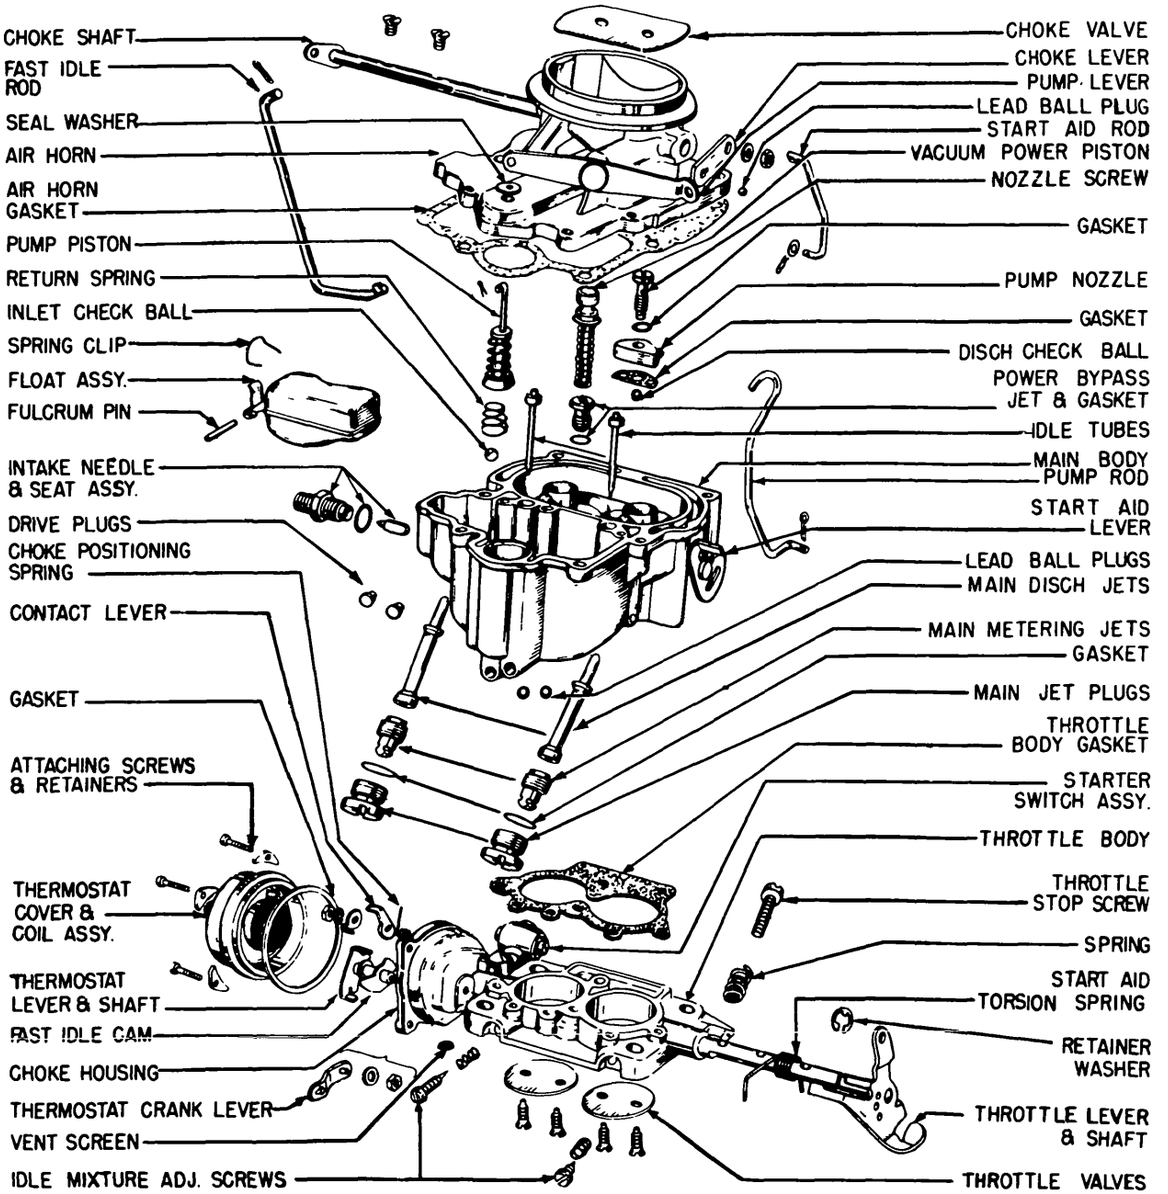
DESCRIPTION: These carburetors are dual barrel type with each barrel having its own idle system, main metering system and throttle valve. Automatic choke housing with fast idle cam is located on throttle body on opposite side from throttle lever. Two holes drilled in intake manifold into exhaust gas cross-over permit exhaust gas heat to enter passages around throttles to prevent ice formation around throttle area.

ADJUSTMENTS: *Make all adjustments exactly as follows:*

Idle Setting—1¾ turns open. Turn each adjusting screw in until it bottoms lightly then back off 1¾ turns.

Idle Speed—450 RPM Hot Engine idle, with brakes applied and selector lever in neutral.

Pump Seasonal Setting—One hole in pump lever, three holes in throttle lever. **(1955)** Set pump rod in long stroke hole for normal setting. **(1956)** Set Pump rod in middle hole (medium) for normal setting.



Pump Stroke Setting—**(1955)** 1" from top of plunger offset to bowl cover with pump rod in long stroke hole. **(1956)** 7/8" from top of plunger offset to bowl cover with pump rod in middle (medium) stroke hole.

Float Level—3/16" distance from center of float with lip held firmly against needle valve, to top of bowl casting (gasket removed). Use Tool T-25569 placed at center of float and resting on bowl casting (gasket removed). Use Tool T-24733 to bend lever next to float as necessary.

►*CAUTION: Make the following adjustments in the same sequence as given.*

Fast Idle Setting: Remove air cleaner, thermostat cover, throttle stop screw and spring; replace screw without spring. With throttle valves held closed, turn throttle stop screw in, just to point of contact with throttle lever, then turn screw in 5 additional turns. With choke valve closed, throttle lever against stop screw, distance between fast idle lever and high step of fast idle cam should be .0550" (No. 55 drill). To adjust, bend fast idle lever with Tool J-5197. *NOTE* - Fast idle lever must be parallel to carburetor mounting surface after bending.

Choke Positioning Period: Turn throttle stop screw in 6½ to 7 turns from fully closed throttle position. At this position, the spring pick-up lever should be at the point of contact with the choke positioning spring. If pick-up lever does not contact spring or if pick-up lever has moved spring away from choke housing, adjust by bending ear on pick-up lever with long nose pliers.

STROMBERG "WW" (BUICK) DOWNDRAFT CARBURETOR

Cam Position Setting: Remove throttle stop screw, open throttle just enough to clear fast idle cam, fully close choke valve by pushing up on thermostat spring lever. Close throttle until fast idle lever rests on high step of fast idle cam. Side of fast idle lever should just clear the upper index lug on fast idle cam. Use Gauge J-1388 (.020" feeler) to check clearance. To adjust use Tool J-5197 to bend choke rod as required.

Start Aid Setting: With No. 53 drill (.0595") between choke valve and wall of air horn, hold choke valve closed against rod, make certain that start aid rod is at top of slot in start aid lever, then rotate throttle valves toward open position. Start aid torsion spring should just clear the ear on the start aid lock lever as throttle is opened. To adjust, bend start aid rod as required.

CONTINUED ON NEXT PAGE

STROMBERG WW (BUICK) CARBURETORS (Cont.)

Wide Open Kick Setting: Open throttle valve while holding choke valve closed lightly. Choke valve should open just enough to insert No. 27 drill gauge (.1440") between the choke valve and wall of air horn. Adjust by bending ear on throttle lever. *NOTE*–Start aid rod must be at top of slot in start aid lever.

Choke Positi ning Spring: Close choke valve with light pressure upward on thermostat spring lever until positioning spring lever just contacts choke positioning spring. Distance between upper edge of choke valve and wall of air horn should be .159" (No. 21 drill). To adjust use needle nose pliers to bend choke positioning lever.

Starting Switch Setting (On Car): With transmission in neutral and parking brake applied, back off throttle stop screw, rotate fast idle cam to slow idle position, and fully close throttle valve. *NOTE* - On Dynaflow cars, make certain Dashpot will not prevent full closing of throttle valve. Remove left oil filler cap, hold straight edge against rear face of lower arm of throttle lever which contacts Dashpot, so that scale rests on rocker arm cover. With throttle valve fully closed, mark cover at front edge of scale. Turn ignition switch on, slowly open throttle while holding scale in position against throttle lever, mark point on rocker arm cover at which cranking motor is energized. Distance between pencil marks or rocker arm cover should be 3/4-1 1/8". To adjust switch timing, add or remove shims.

OVERHAUL: *NOTE* - Throttle valves and shaft should not be disassembled for normal cleaning and inspection. Remove choke rod, unloader link, unloader arm. Remove choke valves and shaft. *NOTE* - Choke valve has slight bend, DO NOT straighten. Remove pump rod, and pump plunger cotter pin.

Air Horn Disass mbly: Remove air horn, and gasket, pump plunger assembly and washer, power piston assembly, by pushing down and applying pliers to outer end of piston stem. Then with use of a 1" block, pry piston straight up to avoid damaging stem.

Main 3 dy Disassembly: Remove pump nozzle with screw, washer, and gasket, and idle jet tubes. Remove float needle seat elbow fitting, together with gasket and float needle. Remove float retainer, float, and hinge pin. Remove power valve and gasket, invert carburetor and catch large pump inlet check ball and small outlet check ball. Remove main metering well plugs and gaskets. Use wrench T-24924 to remove main metering jets. Remove main discharge nozzles by screwing Remover T-24967 (R.H. thread) into nozzle, then pulling nozzle from main body. *NOTE* - There are no lead gaskets under nozzles in this carburetor.

Throttle Body Disassembly: Remove throttle body screws, throttle body, and gasket from main body. Remove starter switch screw and clip, terminal cap, return spring, and guide block assembly. Tilt throttle body and catch plunger and ball. *NOTE* - Do not remove starter switch unless visibly damaged, or plugged. Remove choke cover, gasket, screws, and retainers. Use wrench T-25047 to remove choke housing shaft outside nut, then remove lockwasher, arm, choke housing shaft and lever assembly, spacer washer, and fast idle cam. Remove idle needles, idle stop screw, and springs.

Cleaning & Inspection: Use Bendix Metalclene or comparable cleaner to soak all parts for cleaning, and follow cleaning operation by rinsing in kerosene, distillate or white gasoline to remove all gummy deposits that have been loosened by cleaner. Remove lead plugs, if necessary, to clean passages in main body. Remove plugs with Remover T-25052 and replace with T-25054 to save damaging plug seats. Inspect all parts for excessive wear or damage which might affect their usage and replace all parts that are questionable. Check all passages for possible restriction from normal size using correct drill, blow through or suck on nozzles to check that they are clear, replace small parts too small to detect their imperfections. Maximum allowance for throttle stem bearing is .006", replace throttle valves if bent, or damaged. Clean and inspect parts of accelerator vacuum switch.

Throttle Body Reassembly: Install stop screw and spring, hold throttle valves fully closed, turn stop screw in just to point of contact with throttle lever, turn screw in one turn for initial speed setting. Install needles and springs, seating needles lightly then backing off each needle 1 3/4 turns from seat for initial mixture adjustment setting. Install fast idle cam, spacer washer, choke housing shaft and lever assembly arm, lockwasher and nut. Install starter switch ball, plunger, guide block assembly, return spring, terminal cap, clip and screw.

Main B dy R ass mbly: Install main discharge nozzles using Tool T-24967, and position so that flat surface is parallel with direction of flow. Install metering jets with wrench T-24924, metering well plugs with new copper gaskets, if available, with T-19099. Install power valve with new gasket, float and hinge pin, float retainer clip, needle seat and elbow fitting together with gasket and float needle. Hold float arm tang against needle, check float with gauge J-5475. Distance from top of float to top edge of float bowl should be 3/16". To adjust bend float arm tang. Float must not rub on walls of bowl. Install idle jet tubes, accelerator pump check balls (new balls if available), large ball in plunger well small ball in discharge well. Install pump discharge nozzle and screw with new washer and gasket.

Air Horn Reassembly: Install choke shaft in air horn, with lever end toward choke housing, choke valve with identification mark up. Install new choke valve screws loosely, then center valve by pressing up and endwise on choke shaft lever. Tighten screws and check for uniform clearance and freedom of operation. Choke valve should drop freely of its own weight. Stake screw heads. Install power piston assembly and carefully stake in two places, piston must operate freely in cylinder without lubricant. Install pump plunger assembly with washer on top side of air horn hole. Install air horn assembly with new gasket, making certain that pump plunger leather does not have a curled edge. Install air horn screws and washers, accelerating pump rod with lower end in medium stroke hole, cotter pins in pump plunger and rod. Back out throttle screw and completely close throttle valves. Bend pump rod to obtain 7/8" measurement from upperside of pump plunger offset to air horn casting. Open throttle, pump arm must clear air horn at least 1/32". Install choke unloader arm, lockwasher, and nut with arm in horizontal position pointing toward float bowl with choke closed. Install unloader link, washer, and clip. Install choke rod, adjust fast idle, low speed choke positioning, and choke unloader adjustments, install choke cover and gasket, rotate counterclockwise until index marks align and choke valve closes partially, tighten screws and retainers.

SERVICE PARTS: Gasket Sets - Buick No. 1172374. **Repair Kit** - Buick No. 1173056.

STROMBERG "WW" DODGE & PLYMOUTH

DODGE 1956	Stromberg Code No.
D62-1,2 S-M	WW3-124
D62-1,2 O.D.	WW3-125
D62-1,2 PowerFlite	WW3-126
D63-1 S-M	WW3-135
D63-1 O.D.	WW3-136
D63-1 PowerFlite	WW3-137
D63-2,3 S-M	WW3-138
D63-2,3 O.D.	WW3-139
D63-2,3 PowerFlite	WW3-140
PLYMOUTH (Power Pack)	
6 Cyl. S-M	WW3-124
6 Cyl. O.D.	WW3-125
6 Cyl. PowerFlite	WW3-126

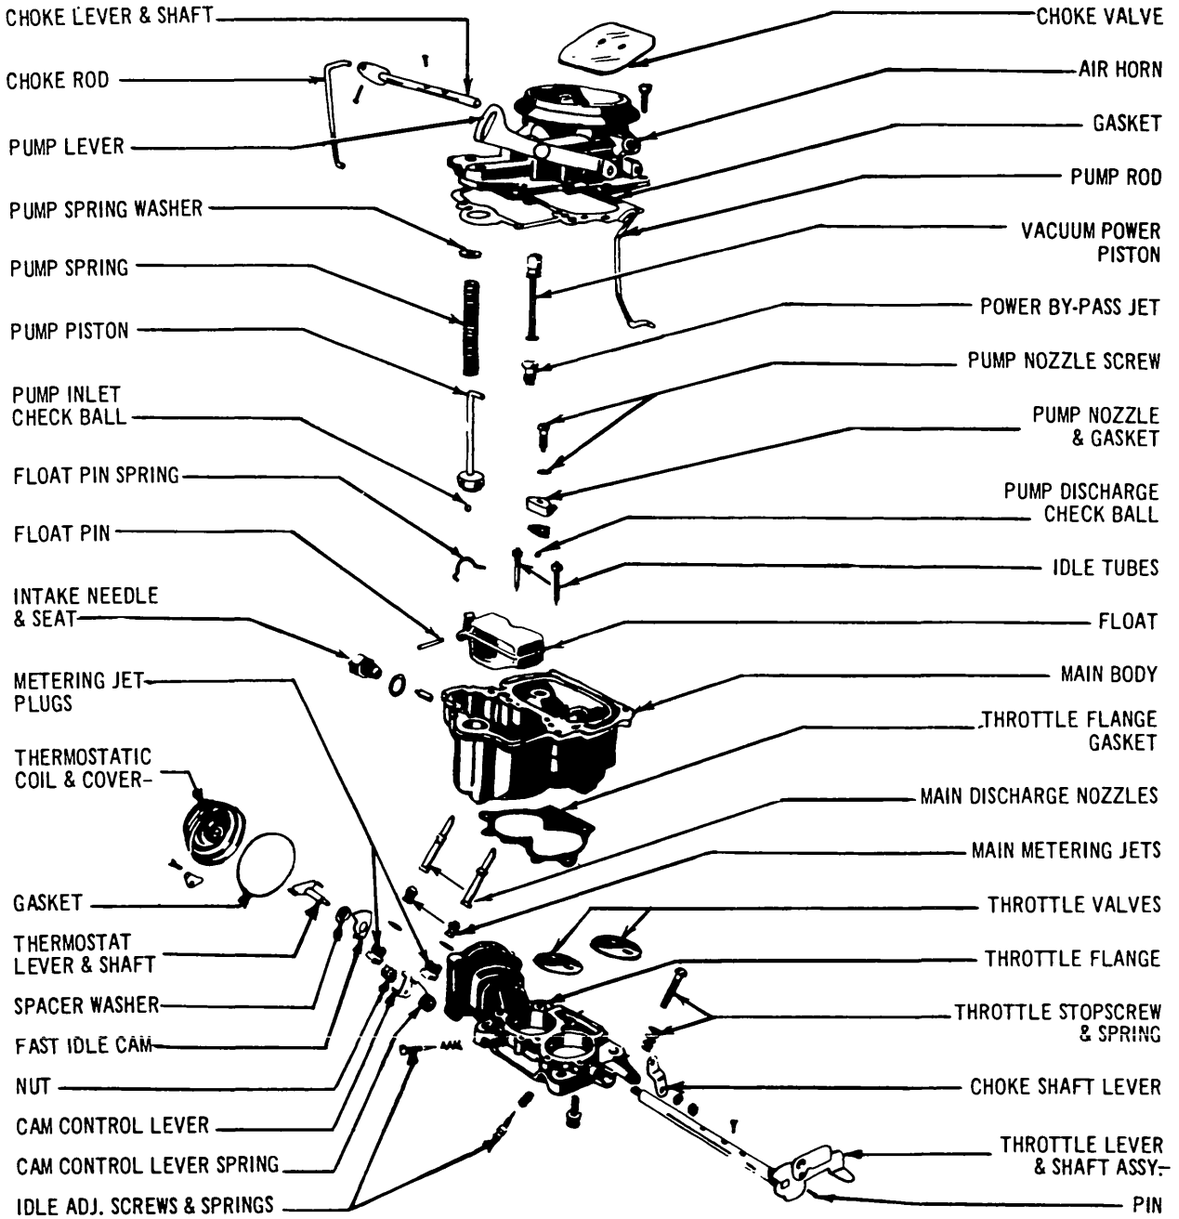
DESCRIPTION: These carburetors are dual barrel, downdraft type of new design with vertical air intake. Automatic choke housing with fast idle cam is located on throttle body on opposite side from throttle lever. Choke valve operated by connecting link. Fuel system is similar to other Stromberg carburetors with usual Float System (single float), Idle System, Main Metering System, Power System, (with vacuum piston operated power by-pass jet), and Accelerating System (pump operated by horizontal fulcrum lever with duration spring type pump piston). All models are alike except for added units for each type service as listed above.

ADJUSTMENTS: *CAUTION—Make all adjustments exactly as listed below. Kickdown switches used only on Overdrive equipped cars. Dashpot only on PowerFlite equipped cars. See table above.*

IDLE SETTING

Idle Setting—Turn both idle adjusting screws in until they bottom lightly then back off 1 turn. Start engine, turn each adjusting screw in equally until engine starts to reduce speed then back off screws to obtain smooth operation and highest vacuum.

Idle Speed—Turn throttle stop screw in or out to obtain 450-500 RPM Std. Trans., 475-500 RPM PowerFlite (selector lever in Neutral).



ACCELERATING PUMP

Pump Seasonal Setting—Setting can be changed as required. Centered hole for Normal operation, Inner hole for minimum stroke for less discharge, Outer hole for maximum stroke and greater discharge.

Pump Stroke Setting—Hold carburetor in vertical position to properly seat pump check ball. With pump rod in center hole of throttle lever, hold choke valve wide open, travel of accelerator pump, as throttle valves are moved from open to fully closed, should be 13/64-15/64" (6 cyl. carb.), 7/32-1/4" (V8 carb.).

ECONOMIZER SETTING

No adjustment required. Valve opens when manifold vacuum drops to 4-6" (65-70 MPH).

STROMBERG "WW" (DODGE, PLYMOUTH) DOWNDRAFT CARBURETOR

FLOAT LEVEL

3/16" distance from center of float with lip held firmly against needle valve, to top of bowl casting (gasket removed). Use Tool T-25569 placed at center of float and resting on bowl casting (gasket removed). Use Tool T-24733 to bend lever next to float as necessary.

FAST IDLE

►*CAUTION: All Fast Idle Adjustm nts including Unloader Adjustment must be made in the sequence given below.*

CONTINUED ON NEXT PAGE

STROMBERG "WW" DODGE & PLYMOUTH (Cont.)

1) Fast Idl Speed—With choke cover removed, place one cover screw through Spring Tool T-25906 and attach Tool to housing above choke lever. Hook other end of spring to choke lever. Remove spring from throttle stop screw and replace screw only. Close throttle valves, turn stop screw in until it contacts lever, then continue to turn screw in 4½ turns (V8 Carb.), 5 1/8 turns (6 Cyl. Carb.). Hold choke valve closed and bend cam contact ear so that No. 48 drill rod will just go between ear end of contact lever and first step of fast idle cam. *NOTE*—Ear must be parallel to throttle shaft after bending. Replace throttle stop screw spring

2) Fast Idle Cam Position—Open throttle valve to clear fast idle cam, close choke valve tightly. Force throttle closed against tension of cam positioning spring Ear on cam contact lever should just clear high step of fast idle cam. (Max. .020"). Bend fast idle rod as necessary.

3) Chok P sitioning Spring (Dodge & Plymouth 6 Cyl. Carbur t rs nly). With Spring Tool T-25906 in position, attach weight tool T-25864 on choke lever between rod and end of shaft. Hold carburetor vertical, close throttle making sure cam contact lever ear rests on high step of fast idle cam (If necessary rotate fast idle cam to get this position) Apply light closing pressure on throttle valve which should open choke valves against choke positioning spring tension (see Spring Color Caution below), just enough to insert correct size drill rod (see table below), between choke valve and wall of air horn Adjust by bending ear of choke lever as required.

►*CHOKE POSITIONING SPRING CAUTION Make sure correct colored spring is used and use correct drill rod specified for that carburetor.*

Ch k P sitioning Spring Setting

Carb. Cod N .	Drill R d	Spring C l r
WW3-120	#30	Copper
WW3-120 A,B	#24	Copper
WW3-121	#30	Copper
WW3-121A,B	#24	Copper
WW3-122	#28	Silver
WW3-122A,B,C	#24	Copper
WW3-124, 125	#31	Black
WW3-126	#37	Copper
WW3-131,A	#24	Copper
WW3-132,A	#24	Copper
WW3-133	#24	Silver
WW3-133 A, B	#24	Copper

UNLOADER SETTING

Apply light closing pressure to choke valve and open throttle valve to wide open position. Choke valve should open .180-.150" (Distance between choke valve and wall of air horn) Adjust by bending ear of cam lever as necessary.

AUTOMATIC CHOKE SETTING

Car & Carb.	Setting
Dodge 6 Cyl. & V8	Centered (At Index)
Plymouth	Centered (At Index)

DASHPOT SETTING

Push plunger in to end of its stroke. With throttle stop screw set at normal idle speed, there should be 1/16-3/32" clearance between end of dashpot plunger and ear on throttle lever. Adjust by loosening locknut and turning dashpot in bracket

OVERDRIVE KICKDOWN SWITCH

Clearance between ear of throttle lever and threaded end of switch housing should be 1/64-1/32" with throttle valves held in wide open position. Adjust by loosening locknuts and repositioning switch.

OVERHAUL: *NOTE*—Throttle valves in open position extend below the throttle flange, making it of vital importance to handle the throttle flange unit with extreme care to prevent damage to valves.

Disassembly: Consists of separating the three units Air Horn, Throttle Flange and Main Body and removing component parts of each unit separately. Release upper end of choke rod and lower end of pump rod and remove rods. Remove Overdrive Unit & Dashpot Control if so equipped Remove Air Horn attaching screws, Air Horn & gasket. Remove idle tubes, invert carburetor and catch pump inlet check ball. While inverted, remove four throttle body attaching screws, remove Throttle Flange & gasket from Main Body.

Air Horn—Remove accelerating pump piston, and remove washer and spring from pump piston. Remove vacuum power piston with small block of wood and open end wrench as a pry Remove choke valve screws, choke valve, and choke shaft.

Main Body—Remove pump discharge nozzle, screw and gasket, float needle valve seat, gasket and needle valve. Remove fulcrum pin spring clip, float and fulcrum pin, power by-pass jet and gasket. Invert body and remove accelerating pump and check ball, metering jet plugs and gaskets, (Tool T-19099), main metering jets (Tool T-24924) and main discharge jets (Tool T-24967). Remove lead ball and drive plugs.

Throttle Body—Remove thermostat cover attaching screws, lug washers, thermostat cover assembly, and gasket. Remove nut, lockwasher, and crank lever from end of thermostat lever and shaft. Remove thermostat lever and shaft, spacer washer, and fast idle cam. Remove nut, lockwasher, cam control lever, and spring from end of throttle shaft. *NOTE*—Nut and shaft have left hand thread, and nut is colored black for identification. Remove idle needle valves and springs. Scribe mark on throttle valves along throttle shaft as well as throttle body to assure assembly in same position in same barrel, **particularly on notched throttle valves.** Remove throttle valve screws, valves, throttle shaft and lever.

Cleaning & Inspection· Clean all metal parts in Bendix Metalclene, blow out all tubes and channels with compressed air DO NOT CLEAN NON METALIC PARTS IN BENDIX METALCLENE

Reassembly· Use Repair Kit for Code Number stamped on air horn cover Reverse disassembly after noting the items that follow

Throttle Valve Installation - 'Dash' stamped on valves must be toward idle port and visible from top of throttle body when valves are installed

STROMBERG "WW" STUDEBAKER

STUDEBAKER	Stromberg Code No.
1956 V8 Comm. (Early)	WW 6-115
1956 V8 Comm. (Later)	WW 6 117, A
1956 V8 Pres.	WW 6-117, A

►CHANGES, CAUTIONS, CORRECTIONS

►*1956 CARBURETOR INSTALLATION CAUTION.* Use only Manifold to Carburetor Gasket Part No 684059 for WW6-115 or No. 154006 for WW6-117 carburetors. DO NOT USE Gasket No. 684059 on WW6-117 Carburetors as choke vacuum passage will be shut off by gasket.

►*1956 CHOKE THERMOSTAT COVER (Code WW6-117) PRODUCTION CHANGE (To Improve Cover Seal):* Inner gasket was eliminated and air horn housing revised to offset use of only one gasket. Revised carburetors (Using only one gasket) are identified by Stromberg Model No. WW6-117A *See "Carburetor Installation Caution"* above for correct Manifold-to-Carburetor Gasket for proper choke operation

DESCRIPTION: Dual barrel, downdraft type as same design as "WW" carburetors used on previous Studebaker models (see Production Changes above)

CARBURETOR ADJUSTMENT: ***Make all adjustments exactly as follows:***

Idle Setting: Turn both idle mixture adjusting screws in until they are lightly seated, then back each screw out exactly 1¾ turns. Start engine and allow it to run until normal operating temperature is reached. With engine at normal operating temperature (choke valve wide open, fast idle inoperative) and with air cleaner in place, adjust idle speed and mixture as follows:

Idle Mixture—First check and adjust idle speed. Turn BOTH idle mixture adjusting screws in evenly and slowly until engine begins to run unevenly, then turn screws out evenly and slowly until engine again runs unevenly, finally set both screws approximately halfway between these two points where smoothest idling performance is secured. Recheck engine idle speed. *CAUTION*—BOTH adjusting screws must be turned equally and in the same direction when making above adjustment.

Idle Speed—With engine at normal operating temperature and fast idle cam in slow idle position so that idle adjusting button contacts lowest step of cam, adjust screw for correct idle speed:

CONTINUED ON NEXT PAGE

STROMBERG "WW" STUDEBAKER (Con..)

Idle Speed

All Transmissions ①550-600 RPM

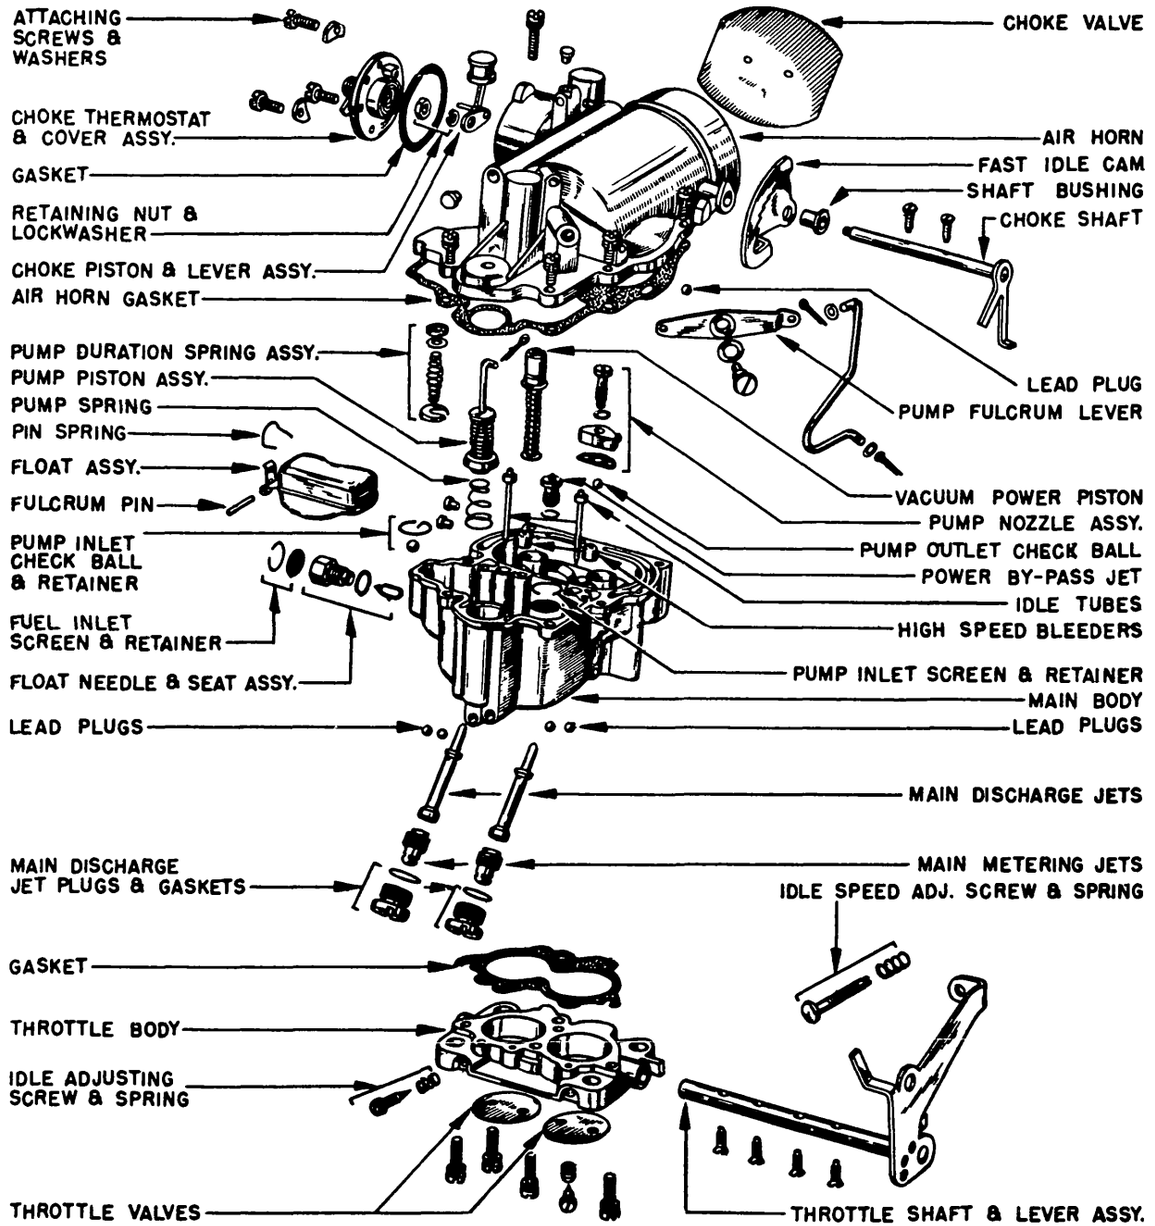
① - With selector lever in neutral.

Accelerating Pump: Three holes provided in throttle lever for pump connector rod engagement:
Center Hole—Normal operating conditions.
Inner Hole—Shorter stroke, less fuel discharge.
Outer Hole—Longer stroke, more fuel discharge.

Float Level: To check float setting, remove air horn and bowl cover and gasket, hold float lever lip firmly against intake needle valve to place float in closed-valve position. Measure float height by placing Float Level Gauge T-25569 (Studebaker No. J-5475) squarely on top edge of float bowl at center of float. If float not even with step on gauge, bend float lever lip next to float pin as required using bending tool T-24733 (Studebaker KMO-269-S5).

FLOAT SETTING

Studebaker WW ....3/16"①



①—Top of float below top edge of bowl.

Fast Idle Cam Setting: Check with fast idle cam in fast idle position with choke valve fully closed. In this position, one-half of diameter of button on throttle stopscrew should rest on highest step of fast idle cam (button should hang over so that half-diameter travel of fast idle cam will cause screw to drop down on to next-lowest step of cam). *NOTE*—Fast Idle setting can also be checked as follows: With slow idle adjusting screw button resting on high step of fast idle cam, apply light closing pressure to choke valve, check remaining opening by inserting a #31 drill rod between lower edge of choke valve and air horn wall (choke opening should be .105-.135"). Adjust by bending ear on choke lever which contacts fast idle cam up or down, as required, using bending tool KMO-478.

Unloader (Dechoke) Setting: To check setting, hold choke valve closed tightly, open throttle valves to point where stop on throttle lever rests against stop on carburetor throttle body and choke valve is opened slightly. Check choke valve opening by inserting #1 drill rod (.228") between lower edge of choke valve and air horn wall. If opening not correct (.203-.265"), adjust by bending ear on choke lever which contacts throttle lever using bending tool KMO-478.

Automatic Choke Setting: (WW6-115) Centered with arrow on cover aligned with boss on housing. (WW6-117, A) 1 Point Lean with arrow on cover one notch lean from boss on housing.

Throttle Return Check (Cars with Automatic Transmission): Consists of a dashpot unit mounted on the carburetor with the dashpot plunger contacting the throttle lever during the last 3/16" of throttle movement toward closed throttle position. Dashpot will prevent too-rapid closing of throttle and keep engine from stalling. *See Throttle Linkage Adjustment under CARBURETOR on car model page.*

STROMBERG "WW" (STUDEBAKER) DOWNDRAFT CARBURETOR

ZENITH DOWNDRAFT

METROPOLITAN — **Zenith Model**
1956 Nash & Hudson Model 30 VIG-10

DESCRIPTION: The Zenith Model 30 carburetor is a single barrel downdraft type with manual choke control and inter-connected fast idle device. Same design as used on 1955 Metropolitan.

ADJUSTMENTS: Adjust carburetor as follows:

Idle Adjustment: Adjust only with engine at operating temperature with choke valve wide open and fast idle inoperative. If preliminary adjustment required to warm up engine, turn idle mixture adjusting screw until lightly seated, then back off screw ½ turn. With engine warmed up, turn screw in or out for smooth idling performance. *CAUTION– Screw controls idle air bleed and should be turned IN for richer mixture.*

Idle Mixture Setting—0 to 1 turn open.

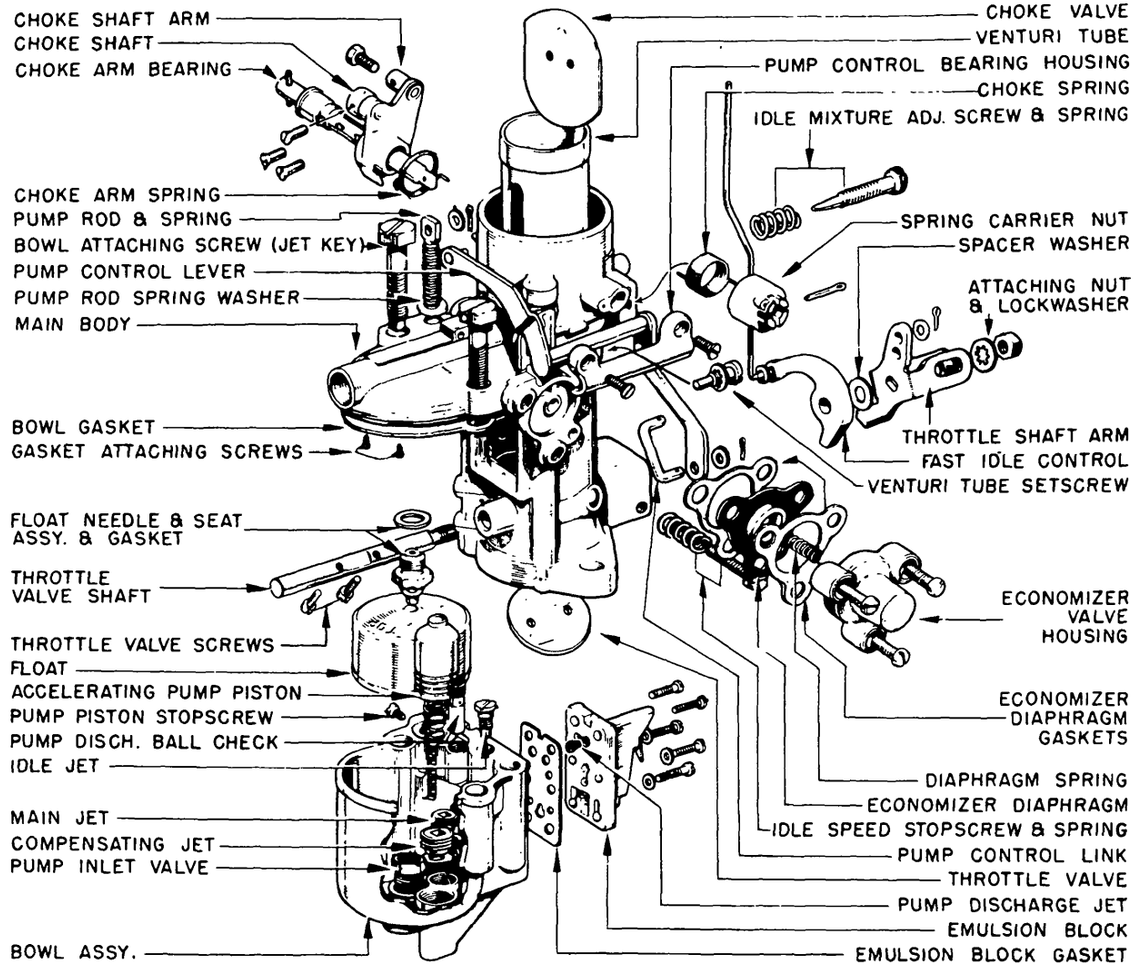
Idle Speed Setting—500 RPM. at normal operating temperatures.

Accelerating Pump Setting: Two holes provided in throttle lever for pump link. Connect link as follows: **Upper Hole**—Maximum stroke (Winter or cold weather operation), **Lower Hole**—Minimum stroke (Summer or warm weather operation).

Float Level: Non-Adjustable. Float is free type (guided by sides of bowl) and acts directly on fuel intake needle valve in bowl cover.

Fast Idle: Consists of an inter-connected linkage between choke valve lever and throttle valve lever which opens the throttle valve 1/32" when choke closed for cold starting. To adjust fast idle, remove cotter pin from grooved nut controlling the choke spring, turn nut clockwise until spring tension is just relieved, then **with choke valve closed,** turn nut ½ turn counter-clockwise and secure setting with cotter pin. This will provide correct throttle valve opening.

Choke Valve Linkage: Adjust so that choke valve is fully closed when button on instrument panel is pulled out.



OVERHAUL: With carburetor off engine, separate bowl assembly from main body by removing two bowl attaching screws, and sliding bowl downward carefully to avoid damage to emulsion block and main nozzle. Then disassemble as follows:

Bowl Disassembly–Lift float out. Use one of bowl attaching screws ("Jet Key" screw with square end) to remove main jet and compensating jet from bottom of bowl. Remove idle jet from top of bowl casting (jet is slotted for screwdriver blade). Remove emulsion block from side of bowl. (*CAUTION*–Loosen lower center screw first, remove the other four screws, finally remove this lower center screw, which acts as a puller for the block). Remove pump inlet check valve from bottom of bowl and discharge ball check valve from top of bowl casting. Remove pump piston locating stopscrew, remove pump piston and spring. Remove air inlet orifice plug from top of capacity well. *NOTE*– It is not necessary to remove pump discharge jet from emulsion block (can be cleaned from rear of block).

Main Body Disassembly–Remove three screws retaining economizer diaphragm housing on main body, carefully remove housing, diaphragm, diaphragm spring, and gaskets. Remove fuel intake needle and seat assembly from bowl cover. Remove idle adjusting screw and spring. Remove bowl gasket from cover by using pliers to remove the gasket retaining drive screws.

Cleaning & Inspection–Clean all parts thoroughly, clean and blow out all passages in carburetor castings. Inspect all parts for wear or damage.

Reassembly–Install all parts and assemble carburetor by reversing disassembly procedure above. Use all new gaskets and install gaskets without any sealing compounds.

ZENITH DOWNDRAFT CARBURETOR

►*BOWL COVER GASKET NOTE:* If care is used to locate gasket properly when installing bowl on main body casting, it will not be necessary to use the locating drive screws which are installed in production to hold the gasket in place.

SERVICE PARTS: Repair Kit - Metropolitan No. 8112215 (add 8112037 for major repair).

ZENITH JET SPECIFICATIONS

Part — Model 30 VIG-10	Size
Main Jet	#72
Compensating Jet	#97
Idle Speed Jet	#55
Pump Discharge Jet	#60
Full Throttle Bleed	1.4 mm
Part Throttle Bleed	2.0 mm
Progression Jet	1.6 mm

DELCO-REMY "WINDOW" DISTRIBUTORS

CADILLAC	Delco-Remy Distr. No.
1956 Series (Std Engine)	1110858
1956 Series (Eldorado Engine)	1110859
OLDSMOBILE	
1956 All Series	1110857

DESCRIPTION: The Delco-Remy "External Adjustment" (Window) Distributor is a completely new unit with the distributor cap forming the housing enclosing all of the mechanism Adjustments on the car are made through a slot in the side of the cap after the window has been raised and it is not necessary to remove the cap in service The Contact Point Assembly has been designed to make this type of adjustment possible through use of a horizontal spring-loaded adjusting screw accessible through the window slot (turning screw clockwise decreases breaker gap, counter-clockwise increases gap) The entire automatic (centrifugal) advance mechanism is located above the breaker cam and is enclosed within the large circular rotor *See illustration for design details*

ADJUSTMENTS: *Cam Angle can be adjusted on the car without removing distributor cap Inspection or replacement of contacts points and setting of breaker gap r quires removal of cap or distributor removal from engine*

Cam Angl Setting (On Car): Operate engine at idle speed Lift adjustment window on side of adjustment cap Use Allen wrench (or special tool—see Note below) to turn contact point adjusting screw Turn screw in or clockwise to increase cam angle, out or counter-clockwise to decrease cam angle Use dwell meter and set cam angle to 29° (limits 26-33°) *NOTE*—If dwell meter not used, approximate setting can be secured by turning adjusting screw in until engine begins to misfire and then turning screw out or counter-clockwise ½ turn (180°)

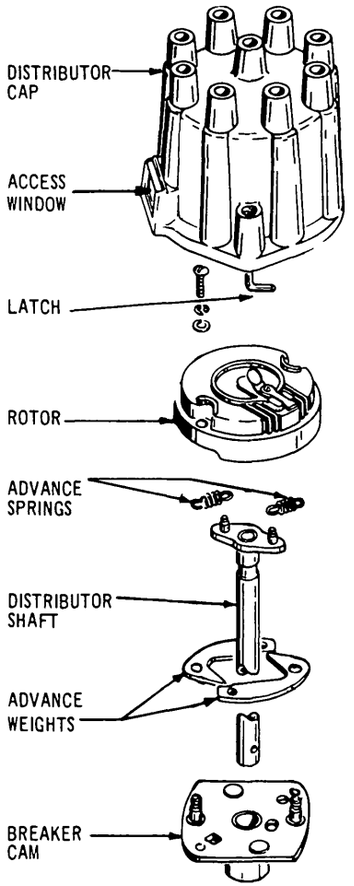
Adjusting T I N t—Special extension wrench, Oldsmobile Tool No J-6296, will simplify cam angle adjustment on the car

Breaker Gap & Cam Angle Setting (On Bench): Distributor cap can be removed for access to contact point assembly by releasing two latches as follows: Engage screwdriver in slotted head of latch, press down, turn screwdriver ¼ turn in either direction

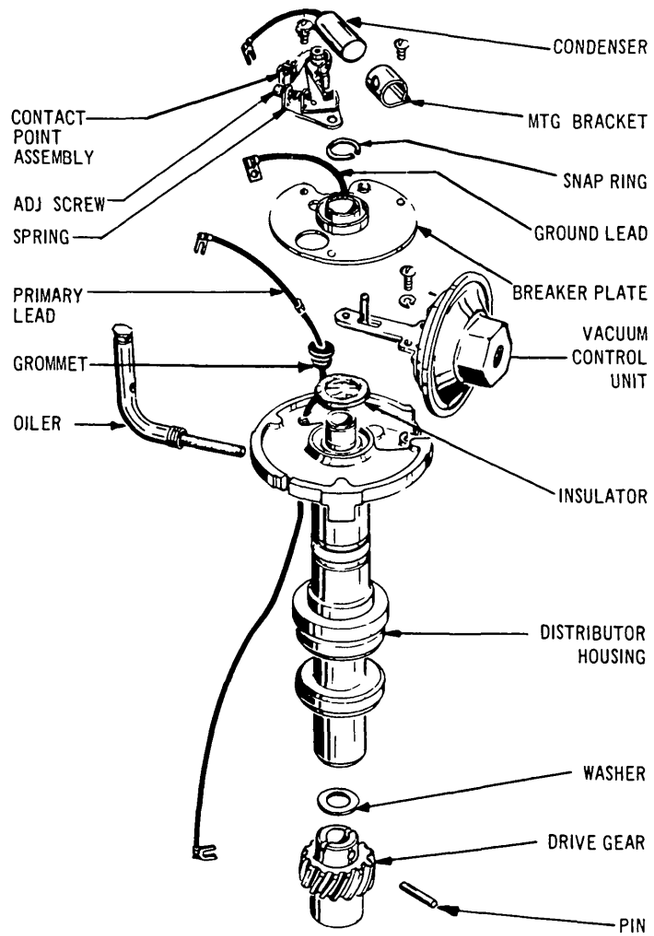
Breaker Gap Setting—Use Allen wrench to turn adjusting screw in or out for gap of 016" *NOTE*-Adjusting screws is spring-loaded and nolocking screws are used to position the stationary contact mounting plate

Cam Angl S tting—Operate the distributor on a Testing Machine, use dwell meter to set cam angle at 29° (limits 26-33°) in same manner as in setting cam angle on the car (above) *NOTE*—If testing machine and dwell meter not used, approximate setting can be secured by mounting distributor in vise and connecting a test lamp and battery across the contact points Turn adjusting screw in or clockwise until the test lamp lights (points opening), then turn adjusting screw out or counter-clockwise ½ turn (180°)

DISTRIBUTOR PARTS REPLACEMENT: Remove distributor cap by releasing latches as follows: Engage screwdriver in slotted head of latch, press down, turn screwdriver ¼ turn in either direction



Rotor Removal & Installation: Rotor can be removed by taking out two screws attaching rotor to cam plate



►*ROTOR INSTALLATION CAUTION·* Rotor can be installed in only one position (located by one square nib and one round nib on underside which must fit into corresponding holes in base plate). **Any attempt to install rotor in any other position will result in breaking rotor when attaching screws tightened.**

Contact Point Replacement: Loosen terminal screw on contact plate post and remove condenser and primary leads Take out two screws in contact set base and lift old contact set out Install new contact set When connecting leads, primary lead should be inside condenser lead and then looped over condenser lead and fastened in outer position on terminal screw (spade type lead terminals should be placed back-to-back on screw) Make certain that leads do not interfere with cap, advance weight base, or breaker advance plate Apply trace of Delco-Remy Cam & Ball Bearing Lubricant to face of breaker cam Adjust breaker gap *NOTE*—On Replacement Contact Sets, breaker arm spring tension and contact alignment are pre-set at factory and do not require adjustment

Condenser Replacement: Remove condenser from breaker plate by disconnecting lead from contact set terminal post and taking out mounting screw in condenser bracket When installing condenser, make certain that bracket is properly located over protrusions on breaker plate and that terminal lead does not interfere with cap, advance weight base, or breaker advance plate

DISTRIBUTOR SPECIFICATIONS: Breaker Gap—.016"
Cam Angle or Dwell—29° (26-33°)
Breaker Arm Spring Tension—19-23 ozs
Automatic & Vacuum Advance—*See individual car model data pages*

DELCO-REMY "WINDOW" DISTRIBUTOR ASSEMBLY

FORD, LINCOLN, MERCURY DISTRIBUTORS

Car Model	Distributor No.

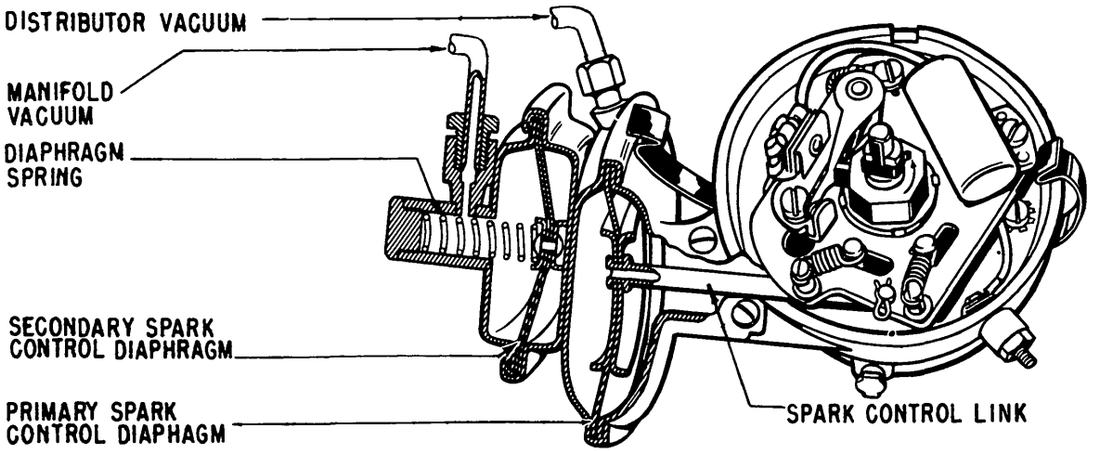
1956 Thunderbird	B6S-12127-B
LINCOLN	
1956 Lincoln	FDU-12127-B
1956 Continental	FEC-12127-A
MERCURY	
1956 All Models	B6A-12127-D

►CHANGES & CORRECTIONS



►*SUDDEN ENGINE STOPPING (Ignition Interruption):* May be caused by defective weld at either terminal of distributor primary lead. Examine lead for good weld at terminal lug.

►*DISTRIBUTOR PRIMARY LEAD GROUND:* May be caused by end of distributor identification plate fastening screw extending through case and penetrating primary lead insulation. Correct by replacing damaged lead and filing off sharp point of screw.

►*DISTRIBUTOR DIAPHRAGM UNIT PRODUCTION CHANGE & REPLACEMENT NOTE:* New Distributor Diaphragm Unit, No. B6A-12370-B, used on later cars and can be installed on all cars as replacement. This unit has stronger diaphragm and can be identified by diecast end cover (previous type No. B6A-12370-A had stamped cover).

►*ENGINE DETONATION CORRECTION: If caused by rupture or leakage of secondary diaphragm (allowing primary diaphragm to advance spark excessively), see Distributor Diaphragm Unit Change above.*

DESCRIPTION: This "Loadomatic" type distributor is a full automatic advance type in which the spark advance is regulated entirely by vacuum differential at the carburetor. Spark advance characteristics are controlled by two breaker plate springs, working against the distributor spark control diaphragms. A secondary diaphragm is provided (farthest from distributor body) to give a rapid spark retard at the acceleration "tip-in" point. The primary diaphragm (closest to distributor body) operates in same manner as the single diaphragm type.

FORD, LINCOLN, MERCURY DISTRIBUTOR ASSEMBLY

OPERATION: (Distributor Double Diaphragm) - The secondary spark control diaphragm forces a quick, momentary spark retard while distributor vacuun line, carburetor vacuum passages, and primary spark control diaphragm are normalizing to new pressure conditions which develop when spark control valve closes the manifold vacuum passage in the carburetor. The secondary spark control diaphragm is not connected either to the breaker plate or the primary spark control diaphragm. There is merely an air chamber between the two diaphragms. The secondary spark control diaphragm is held in an outward position by straight intake manifold vacuum working against a calibrated spring (this spring is located under the hex head plug in center of secondary diaphragm housing). Vacuum is taken from base of carburetor throttle body above the throttle valves. When throttle is opened suddenly for rapid acceleration, manifold vacuum drops quickly, and the spring loaded secondary spark control diaphragm moves toward primary spark control diaphragm. The resulting air pressure between the two diaphragms pushes the primary diaphragm inward providing a quick spark retard.

ADJUSTMENT: *See "Ignition" on Car Mod I pages.*

TESTING: (Distributor Double Diaphragm) - Disconnect distributor and manifold fittings at diaphragm and attach a screw-in adaptor, for use with distributor tester vacuum pump, to primary diaphragm fitting (large fitting). Adjust vacuum pump to a steady reading of 20 inches of vacuum. Connect hose to primary fitting. If reading is less than 20 inches, one or both diaphragms are leaking and should be replaced. Disconnect vacuum hose and reset vacuum pump to 3 to 5 inches of vacuum. Connect hose to diaphragm fitting and check for a steady reading of 3 to 5 inches. Replace unit if reading not steady. *NOTE - New diaphragm assemblies should be checked at both vacuum settings before installation.*

DISTRIBUTOR OVERHAUL: *See "Ford, Lincoln, Mercury Distributors" in 1954 Annual Data or later Manual editions and note the following:*

Distributor Shaft Endplay: .022-.030" (supersedes previous specification of .020-.024").

AUTO-LITE 12-VOLT REGULATORS

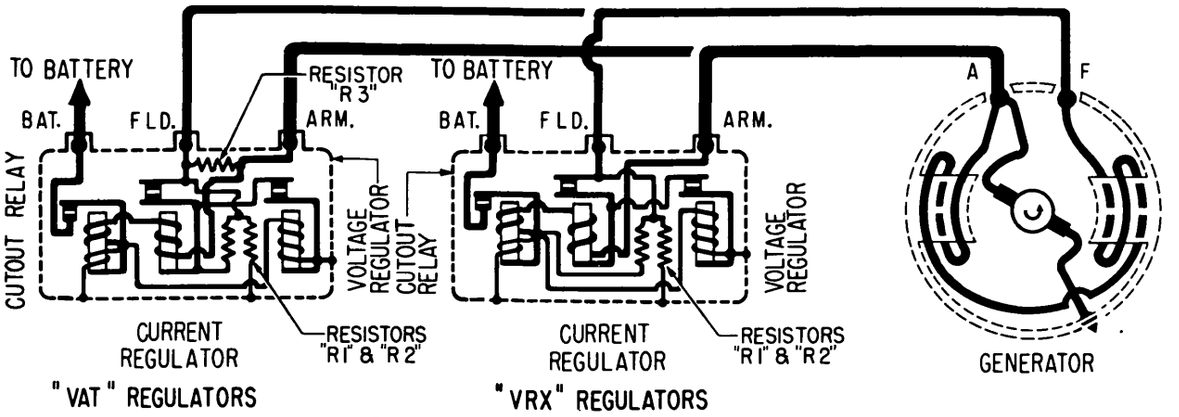
DESCRIPTION: Auto-Lite "VAT" and "VRX" Regulators are 12-volt types of similar design to previous Auto-Lite 6-volt regulators except for use of a third "R3" resistor on some "VAT" regulators. *See wiring diagram.*

►*CHECKING & ADJUSTMENT CAUTION:* Removal of cover (for regulator adjustments) requires breaking of seal. Regulator can be checked to determine if it is operating satisfactorily without breaking the seal or removing the cover as directed below.

CHECKING REGULATOR (Without breaking seal): Connect ammeter in charging line at regulator "BAT" terminal (in series with battery), connect voltmeter between regulator "BAT" terminal and ground. Then check as follows:

V ltage Regulat r—Operate generator at speed corresponding to 30 MPH. Adjust charging rate to 10 amperes (.25 ohm resistor can be used connected in charging line). Continue operation for 15 minutes to "normalize" or bring the regulator up to operating temperature (temperature can be checked by placing accurate thermometer 2" from the regulator cover). Note voltmeter reading. If this does not agree with with Voltage Regulator Setting given below, regulator is defective or requires adjustment.

Current Regulat r—Operate generator at speed corresponding to 30 MPH. Add load in excess of rated capacity shown on regulator cover (turn on car lights and accessories, add additional load such as carbon pile or lamp bank at point between ammeter and battery, or use variable resistance across battery) to insure current regulator operating. Continue operation for 15 minutes to "normalize" or bring the regulator up to operating temperature (temperature can be checked by placing accurate thermometer 2" from the regulator cover). Note ammeter reading. If this does not agree with "Test A" figure in Current Regulator Setting below, regulator is defective or requires adjustment.



CHECKING & ADJUSTMENT (Requiring Cover Removal): Connect ammeter in charging line at regulator "BAT" terminal (in series with battery), connect voltmeter between regulator "BAT" terminal and ground (except for Cutout Relay cut-in voltage test when voltmeter should be connected between regulator "ARM" terminal and ground). Make tests as follows:

VOLTAGE REGULATOR

►*NORMALIZING THE REGULATOR:* Before checking voltage setting, bring regulator to operating temperature as follows: Operate generator at speed of 1500 RPM., adjust charging rate to 10 amperes (connect .25 ohm resistor in charging line or use variable resistance connected across battery). Continue operation for 15 minutes to "normalize" the regulator or bring it up to operating temperature (temperature can be checked by placing accurate thermometer 2" from regulator cover).

Air Gap: .048-.052". Check with wire gauge placed between armature and core at contact side of stop pin. Contacts should be closed with .052" gauge and should just open when armature pressed down against .048" gauge. Adjust by loosening stationary contact support screw and raising or lowering the contact support.

Voltage Setting: After regulator normalized (see above), and with generator charging at 10 ampere rate, note voltmeter reading and regulator temperature. If voltage setting not within range shown in Voltage Regulator Setting specifications below, adjust regulator as follows:

VAT, VRX Voltage Regulator Setting

Table No. 1 Temp.	① Volts	Table No. 2 Temp.	② Volts
50° F.	14.7	50° F.	14.3
80° F.	14.5	80° F.	14.2
110° F.	14.3	110° F.	14.0
140° F.	14.1	140° F.	13.9

① - Plus or minus .3 volt.
② - Plus or minus .2 volt.

Adjustment—Decrease generator speed to slow idle, remove regulator cover, adjust voltage regulator by bending armature spring lower hanger down (increase spring tension) to increase voltage setting, or up (decrease spring tension) to lower voltage setting. After each adjustment, check setting by first cycling regulator (decrease speed until cutout relay contacts open, then increase generator speed to 1500 RPM) and then rechecking voltmeter reading and temperature with 10 ampere charging rate.

CURRENT REGULATOR

►*NORMALIZING THE REGULATOR:* Before checking current setting, bring the regulator up to operating temperature by following steps (1) and (2) below.

(1)—Follow same procedure given above for Normalizing the Regulator for Voltage Setting checking. *If Current Regulator being checked immediately after checking and adjusting the Voltage Regulator, this step can be omitted. NOTE*—At end of this 15 minute operation, current setting should agree with "Test A" specifications in Current Regulator Setting given below.

(2)—Operate generator at speed of 2000 RPM., add load sufficient to cause current regulator to operate (turn on car lights and accessories, add additional load such as lamp bank or carbon pile, or use variable resistance across battery) with voltage of 13.7-13.9 volts (VAT Regulators), 13.6-13.8 volts (VRX Regulators). Continue operation for 15 minutes to "normalize" the regulator by bringing it up to operating temperature (temperature can be checked by placing an accurate thermometer 2" from the regulator cover). *NOTE*—At end of this total 30 minute operation (steps 1 & 2), current setting should agree with "Test B" specifications in Current Regulator Setting given below.

Air Gap: .048-.052". Check and adjust in same manner as Voltage Regulator (above).

Current Setting: After regulator normalized (see above), and with generator charging at full capacity, note ammeter reading. If charging rate not within range shown in "Test B" column of Current Regulator Setting below, adjust as follows:

CONTINUED ON NEXT PAGE

AUTO-LITE REGULATORS (C nt.)

Curr nt R gulat r Setting

VAT-6201A

Temp. (°F)	Test "A" Amperes	Test "B"
50°	48 max.	40-44
70°	46 max.	38-42
90°	44 max.	36-40
110°	42 max.	34-38
130°	40 max.	32-36

VRX-4008A, 4009A, 6201A

Temp. (°F)	Test "A" Amperes	Test "B"
50°	38 max	30-34
70°	36 max	28-32
90°	34 max.	26-30
110°	32 max.	24-28
130°	30 max.	22-26

CUTOUT RELAY

►*NORMALIZING THE REGULATOR* If regulator is cold, first bring it up to operating temperature as directed under Voltage Regulator above *If Cutout Relay checked immediately after checking Voltage & Current Regulator, no further normalizing will be required.*

Air Gap. .031-.034" with contacts open. Check with feeler gauge between lower face of armature and core as close to armature hinge as possible. The .031" gauge should be "GO" 034" gauge "NO GO". Adjust by bending armature upper stop up or down as required

Contact Gap: .015" minimum. Check with feeler gauge. Adjust by expanding or contracting the stationary contact support to lower or raise the contact.

Cut-in (Closing) Voltage: Connect ammeter in charging line at regulator "BAT" terminal (in series with battery), connect voltmeter between regulator "ARM" terminal and ground. Connect a variable resistance in the line between the regulator "FLD" and generator "F" terminal. With the regulator normalized (see above), operate the generator at the engine slow idle speed, set resistor so that full resistance is in the field circuit. Slowly turn resistance out of field circuit and note voltmeter reading at instant relay contacts close (needle will jump slightly). If cut-in voltage does not agree with settings shown below, adjustment is required. Adjust by bending armature spring lower hanger down (increase spring tension) to increase cut-in voltage, or up (decrease spring tension) to decrease cut-in voltage. Then check cut-out voltage.

Cut-out (Opening) Voltage: After checking cut-in voltage (above), turn resistance completely out of field circuit and note ammeter reading. If ammeter does not indicate charging current of 10 amperes, increase generator speed until 10 ampere reading secured Turn resistance in the field circuit slowly and note voltmeter reading at point where ammeter indicates maximum DISCHARGE current (ammeter pointer will drop to zero, then go beyond the zero point, and finally return to zero). This voltmeter reading is the cut-out voltage and should agree with settings shown below Adjust by varying the contact gap.

Cutout Relay Settings

Regulator	Cut-in – Voltag	– Cut-out
VAT-6201A	13.0-13.75	8.2-9.3
VRX-6008A, 6009A	13.0-13.7	①8.2-9.3
VRX-6201A	13.0-13.7	①8.2-9.3

①—With approximately 3-5 amperes discharge current.

LINCOLN & MERCURY AUTOMATIC HEADLIGHT DIMMER

Lincoln & Mercury (1956)

DESCRIPTION: Similar in design and operation to previous model.

SERVICE PARTS: *NOTE* - Both six and twelve volt dimmers use a standard six volt radio vibrator.

Part	Part No.
Control Tube Assembly	FDK-13691-A
Ballast Tube Assembly	FDK-13692 B
Cover Assembly, Switch	FDK-13694-B
Gasket, Switch Cover	FDK-13695-A
Vibrator Assembly	FDK-18885-A
Switch Assembly	FDU-13532-A

ADJUSTMENTS: Three adjustments are possible on the 1956 Headlight Dimmer Switch Assembly. Adjustments are as follows

Fine Sensitivity: Accessible by removing rubber plug in the cover. It varies "Dim" and "Hold" distances simultaneously through a limited range. To increase, turn adjustment screw clockwise.

Course Sensitivity: Located close to edge of chassis under cover. It varies "Dim" and "Hold" distances simultaneously over a broad range and must be used when fine sensitivity control will not provide desired results. Turn adjustment screw clockwise to increase range

Hold Control: Located in center of chassis under cover. It varies the "Hold" distance independent of the "Dim" distance. To increase the "Hold", turn adjustment screw clockwise.

LEVELING CONTROL HEAD: To level 1956 control head, release locking screw with 1/8" Allen wrench and adjust phototube unit by hand until bubble is centered in spirit level

►*OTHER DATA See "Lincoln & Mercury Automatic Headlight Dimmer" in 1955 Annual Data or later Manual edition*

AUTRONIC EYE

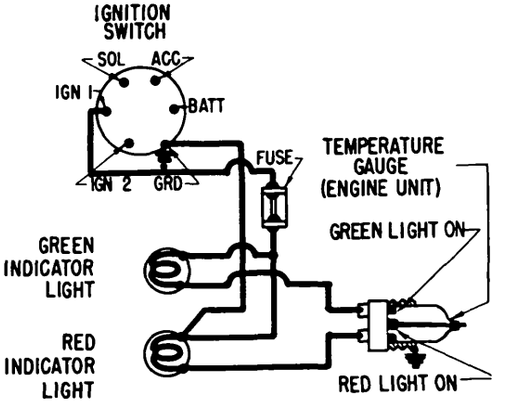
DESCRIPTION: Similar in design and operation to previous models.

ADJUSTMENTS: *See "Autronic Eye" in 1955 Annual Data or later Manual edition. Follow procedures outlined for LATER UNITS (1955).*

►*OTHER DATA. See "Autronic Eye" (Later Units) in 1955 Annual Data or later Manual edition.*

OLDSMOBILE TEMPERATURE INDICATOR

Oldsmobile (1956)



DESCRIPTION: The unit consists of one green and one red indicator light in instrument cluster and a thermal unit at rear of left hand cylinder head. The thermal unit contains a bi-metal strip which is actuated between two terminals within the unit The thermal unit has three basic positions - cold, normal, and hot.

OPERATION: When the ignition switch key is turned to the start position, a test circuit is closed to determine if red light is functioning properly. When a cold engine is started, the bi-metal strip closes the circuit to the green light, causing the green light to burn indicating that the engine is not up to operating temperature and remains on until the engine reaches operating temperature If the engine reaches an abnormally high temperature, the bi-metal strip closes the circuit to the red light, causing the red light to burn indicating that the engine temperature is abnormally high.

SPECIFICATIONS: Green light burns until engine temperature, at rear of cylinder block, reaches 111-115° F, at which time the light turns off automatically. Red light comes on when engine temperature reaches 218-222°F.

SERVICE PARTS: **Thermal Unit (Engine)** - Oldsmobile No 1998140

Indicator Lamps - Oldsmobile No. 1583988 (Red), No. 1583989 (Green)

OLDSMOBILE TEMPERATURE INDICATOR

DELCO-REMY 12-VOLT REGULATORS

►*"1118825" & "1118900" SERIES REGULATOR NOTE:* Regulators of these series **with Letter "B" following Model Number** are similar to "1119000" Series and all data below applies to these models also.

DESCRIPTION: These regulators differ from preceding "1118825" and "1118900" series **without Letter "B" following the model number** in that the direction of current flow through the Current Regulator contacts has been reversed (see Wiring Diagram and Contact Mounting illustrations).

►*ADJUSTMENT CAUTION* When checking Current Regulator on these 1119000 series regulators, DO NOT use the "Quick Check Method" outlined for previous 1118825 series regulators. Using a screwdriver inserted in hole in regulator base to short out Voltage Regulator will short out BOTH the Voltage and Current Regulators and allow generator to operate without control.

CHECKING & ADJUSTMENT: Make all checks and adjustments in following sequence Voltage Regulation, Cutout Relay Operation, and Current Regulation AFTER regulator has been brought up to normal operating temperature as directed below. Generator must be repolarized each time leads are reconnected and before operating.

►*GENERATOR REPOLARIZING* After generator and regulator leads reconnected, connect jumper lead between regulator "GEN" and "BAT" terminals momentarily to allow a quick current surge through generator winding. This will prevent damage to equipment caused by reversed polarity (vibration, arcing, and burning of relay contact points).

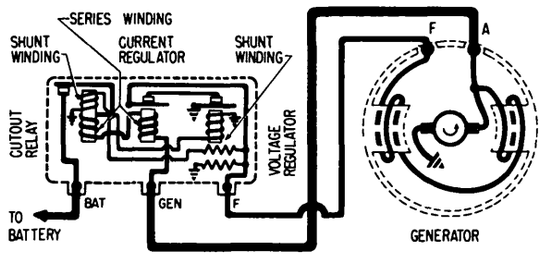
VOLTAGE REGULATOR

►*NORMALIZING THE REGULATOR* Before checking voltage setting, bring regulator to operating temperature as follows. Connect 1/4 ohm resistance in series with battery, see that regulator cover in place, operate regulator for 15 minutes continuously with no other load than ignition (*NOTE*–If variable resistor used in place of fixed 1/4 ohm resistor, set resistor for 1-10 ampere charging rate).

Air Gap: .075" (except 1119004), .063" (1119004) with contacts just touching. Check by pressing down on armature until contacts are just touching. Adjust by loosening upper contact mounting screws and raising or lowering contact bracket. Align contacts and tighten bracket mounting screws.

Voltage Setting: Setting can be checked using either Fixed Resistance or Variable Resistance Method:

Fixed 1/4 Ohm Resistance Method



1)–Connect 1/4 ohm fixed resistor (not less than 25 watts) in charging circuit at regulator "BAT" terminal (in series with battery), connect voltmeter between between regulator "BAT" terminal and ground.

2)–Cycle the generator using either of the following methods. **(A)** Move voltmeter lead from regulator "BAT" terminal to "GEN" terminal. Reduce generator speed until voltmeter reading is 2 volts (6 volt types), 4 volts (12 volt types), then move voltmeter lead back to "BAT" terminal. **(B)** Connect variable resistance in field circuit (in line between generator and regulator "F" terminals), turn out all resistance, operate generator at 3500 RPM and turn in resistance until generator voltage reduced to 6 volts (6 volt types), 12 volts (12 volt types), then turn out all resistance and remove variable resistor.

3)–Operate generator at 3500 RPM (cars & trucks), note voltmeter reading with regulator cover in place. This is the voltage setting (see data below). Adjust by turning adjusting screw at voltage regulator armature spring lower bracket clockwise to increase setting, or counter-clockwise to decrease setting.

Variable Resistance Method

1)–Connect variable resistance (not less than 25 watts) and ammeter in charging circuit at regulator "BAT" terminal (in series with battery), connect voltmeter between regulator "BAT" terminal & ground.

DELCO-REMY 12-VOLT REGULATORS WIRING DIAGRAM

2)–Cycle the generator (use either method outlined in step 2 of Fixed 1/4 Ohm Resistance Method above).

3)–Check and adjust voltage setting as outlined in step 3 of Fixed 1/4 Ohm Resistance Method above.

Voltage Setting Specifications

Setting–13.8-14.8 volts with regulator ambient temperature of 125° F. Regulator settings can be "tailored" to keep the battery in a satisfactory state under the operating conditions of the particular car as directed below.

►*AMBIENT TEMPERATURE NOTE.* "Ambient Temperature" is the temperature of the air surrounding the regulator approximately 1/4" from the regulator cover when the regulator is at operating temperature ("Normalizing" procedure as given above should result in an ambient temperature of 125° F.) and can be measured by placing a thermometer 1/4" from the regulator cover. For ambient temperatures other than 125° F., regulator settings are as follows.

Ambient Temp.	Voltage Setting Range (For "Normal" settings of 13.8-14.8 volts)					
165°	13.2	13.4	13.6	13.8	14.0	14.2
145°	13.5	13.7	13.9	14.1	14.3	14.5
125°	13.8	14.0	14.2	14.4	14.6	14.8
105°	14.1	14.3	14.5	14.7	14.9	15.1
85°	14.4	14.6	14.8	15.0	15.2	15.4
65°	14.7	14.9	15.1	15.3	15.5	15.7
45°	15.0	15.2	15.4	15.6	15.8	16.0

"Tailoring" Voltage Regulator Setting

If battery is consistently undercharged or overcharged (using too much water), adjust the voltage regulator setting (within range of 13.8-14.8 volts at ambient temperature of 125° F.) as directed below. *CAUTION* Regulator setting above 14.8 volts (at 125° F.) may cause damage to lights and other voltage-sensitive equipment and should be avoided.

1)–**Battery uses too much water.** If voltage regulator setting **above** normal range listed above, reduce setting to within upper portion of normal range and check battery condition over a period of time. If voltage regulator setting **within** normal range listed above, reduce voltage setting 0.1 or 0.2 volts and check battery condition over period of time. This should be continued until battery remains charged with minimum use of water.

2)–**Battery is consistently undercharged**–If voltage regulator setting is **below** normal range listed above, increase setting to within lower portion of normal range and check battery condition over a period of time. If voltage regulator setting is **within** normal range listed above, increase voltage setting 0.1 volt and check battery condition over period of time. This should be continued until battery remains charged with minimum use of water.

CUTOUT RELAY

►*ADJUSTMENT CAUTION. Disconnect battery lead before making Air Gap and Contact Gap adjustments.*

Air Gap: .020" with contacts just touching. To check, press down on armature until points just close (use finger pressure on armature directly above contacts), measure gap between armature and center of core. To adjust, loosen two screws at armature hinge on back of relay, raise or lower armature as necessary. *CAUTION*–Make certain that both sets of contact points close simultaneously.

Contact Gap: .020" with armature up against upper stop (*CAUTION*–Gap must be same for both sets of contacts to insure simultaneous closing). Use feeler gauge to check gap. To adjust, bend upper armature stop up or down as necessary.

Cut-in (Closing) Voltage: 11.8-13.5 volts (exc. 1119004), 11.5-13.0 volts (1119004). To check with regulator properly connected to generator and battery, connect voltmeter between regulator "GEN" terminal and ground. Use either of the following methods to check cut-in voltage:

1)–Slowly increase generator speed and note voltmeter reading at instant contacts close, then decrease generator speed and make certain that relay contacts open. See item (3) for adjustment.

2)–Connect a variable resistor in the field circuit between regulator "F" terminal and generator "F" terminal (use 15 ohm-25 watt resistor for 6 volt systems, 25 ohm-25 watt resistor for 12 volt systems). Operate generator at medium speed with all resistance turned in, slowly turn out resistance and note voltmeter reading at instant relay contacts close. Slowly turn in resistance and make certain that relay contacts open. Adjust as follows:

CONTINUED ON NEXT PAGE

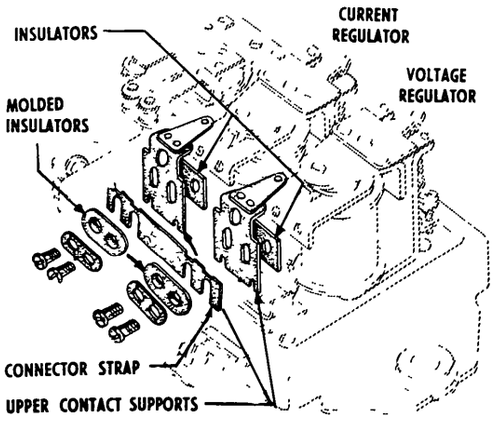
DELCO-REMY 12-VOLT REGULATORS (Cont.)

3)–Turn adjusting screw under armature spring (adjacent to contacts) in or clockwise to increase cut-in voltage, out or counter-clockwise to decrease cut-in voltage.

CURRENT REGULATOR

►*CHECKING & ADJUSTMENT CAUTION:* Temperature Compensated Current Regulators should be checked by the "Load Method" which provides for bringing the regulator up to operating temperature. Regulators which are not temperature compensated can be checked by the "Jumper Lead" Method.

Air Gap: .075" with contacts just touching. Check and adjust air gap in same manner as Voltage Regulator (above).



Current Setting: Use correct method for each type as listed below. *CAUTION–Do not attempt to short out voltage regulator by inserting screwdriver through hole in base (will short out both voltage and current regulators and cause generator to operate without control).*

Load Method
(For Temperature Compensated Regulators)

1)–Connect ammeter in charging circuit at regulator "BAT" terminal (in series with battery).

2)–Turn on all accessory load (lights, radio, etc.) and connect additional load (carbon pile rheostat or bank of lights) to reduce voltage to approximately 1.0 volt below voltage regulator setting.

3)–Operate generator at 3500 RPM (cars & trucks) for 15 minutes with regulator cover in place. This will bring regulator up to operating temperature.

DELCO-REMY 12-VOLT REGULATORS CONTACT ASSEMBLY

4)–Cycle the generator by using either of the following methods: **(A)** Connect voltmeter between regulator "GEN" terminal and ground, reduce generator speed until voltmeter reading is 2 volts (6 volt systems), 4 volts (12 volt systems), then increase generator speed to 3500 RPM. **(B)** Connect variable resistance in field circuit (in line between regulator and generator "F" terminals), operate generator at 3500 RPM with all resistance turned out, turn in resistance until generator voltage reduced to 6 volts (6 volt systems), 12 volts (12 volt systems), then turn out all resistance.

5)–Operate generator at 3500 RPM and note ammeter reading which is the current setting. Adjust by turning the adjusting screw at the current regulator armature spring lower bracket clockwise to increase setting, or counter-clockwise to decrease setting.

Jumper Lead Method
(For Non-Temperature Compensated Regulators)

1)–Connect ammeter in charging circuit at regulator "BAT" terminal (in series with battery).

2)–Connect short jumper lead across voltage regulator points (from upper contact bracket to armature).

3)–Turn on all lights and accessories or connect additional load (see step 3 under Load Method above) to cause current regulator to operate.

4)–Operate generator at 3500 RPM (cars & trucks) and note ammeter reading which is the current setting. Adjust as directed in step (5) under Load Method above.

Current Regulator Setting

Regulator No.	Setting (Amps)
1119000,	23-27
1119002	32-37
1119001, 3	27-33
1119004	37-42
1119122	23-27
1119123	27-33
1119145	33-37
1119148	9-11
1119150, 51	32-37
1119152, 53	15.5-18.5
1119155	23-27
1119156	48-52
1119162	32-37

FORD, LINCOLN, MERCURY 12-VOLT REGULATORS

DESCRIPTION: These 12-volt regulators are similar in design to previously used 6-volt units and are intended for use with the 1956 12-volt electrical systems.

CHECKING & ADJUSTMENT: *CAUTION*—Regulators are temperature-compensated and must be brought up to normal operating temperature before checks are made. This normal temperature is that existing adjacent to the regulator cover after 1/2 hour of operation in the car or after the regulator has been heated until the temperature is stabilized (standard normal temperature is 70-80° F.

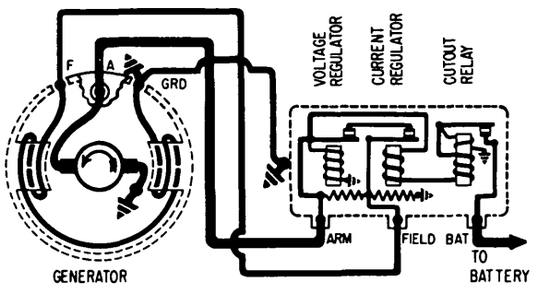
►*NORMALIZING THE REGULATOR:* **On the Car**—Clip special thermometer T56L-10505-A on regulator cover (see Note below). Operate engine with generator charging at 10 ampere rate for 30 minutes or until regulator temperature is stabilized.

On the Bench—Procedure is same as on the car except that a small fan should be mounted 12-15" from the regulator so as to circulate air over the regulator cover while it is being warmed up.

Thermometer T56L-10505-A Note—This thermometer is calibrated in 10° F. increments and has additional Voltage scales indicating the correct voltage regulator setting for each temperature reading (both 6 volt and 12 volt scales provided).

►*TEST METER CONNECTIONS:* If special Test Sets used, make all connections in accordance with manufacturer's instructions. If individual meters used, make connections as follows: Connect test ammeter and 1-1/2 ohm fixed resistor in series in charging line at regulator "BAT" terminal (in series with battery). Connect voltmeter between regulator "ARM" terminal and ground (regulator base or battery grounded terminal). Connect a 50 ohm variable field rheostat (2 amp. rating) in generator field circuit (disconnect field lead at regulator "FIELD" terminal, connect rheostat between this lead and regulator "FIELD" terminal).

CUTOUT RELAY



Cut-in (Closing) Voltag : After regulator normalized and with test meters connected (see above), check cut-in voltage by either of the following methods: **(1)**—With resistance turned out of field circuit, slowly increase generator speed and note voltmeter reading at instant relay contacts close (pointer will drop back slightly). Repeat this check several times by decreasing generator speed until contacts open and then increasing speed until contacts close. If closing voltage not correct as shown in setting table below, adjustment is required. **(2)**—With field resistance completely turned in the field circuit, operate generator at 1500 RPM., slowly turn resistance out of field circuit and note voltmeter reading when relay contacts close (pointer will drop back slightly). Repeat this check several times by turning resistance in and out of field circuit.

Adjustment—Bend adjusting arm under armature spring (to left of relay contacts) upward to increase cut-in voltage, or downward to decrease cut-in voltage. Replace regulator cover and recheck the setting.

Cut-in (Closing) Voltage Setting

All Models—12.0-12.8 volts.

Cut-out (Opening) Discharge Current: This can be checked after checking cut-in voltage by increasing generator speed (or turning out field resistance) until charging current is approximately 10 amperes, then slowly decrease generator speed (or turn in field resistance) until maximum **discharge** current indicated on ammeter (ammeter will return to zero as contacts open). Discharge current should be approximately 2-6 amperes.

FORD, LINCOLN, MERCURY 12-VOLT REGULATOR WIRING DIAGRAM

VOLTAGE REGULATOR

Voltage Setting: After Cutout Relay checked (above), cycle regulator by decreasing generator speed until cutout relay contacts open and then increase speed to 1500 RPM. Clip special thermometer on regulator cover to establish regulator ambient temperature and corresponding voltage setting (see Voltage Regulator Settings for various ambient temperatures below). Turn resistance completely out of field circuit (charging rate should be approximately 10 amperes). Note voltmeter reading. This is the voltage setting and should agree with setting listed below.

Adjustment—Bend adjusting arm under armature spring (to left of regulator contacts) upward to increase voltage setting, or downward to decrease voltage setting. Replace regulator cover and recheck the setting after each adjustment.

Voltage Setting

All Models—14.6-15.4 volts with ambient air temperature of 70-80° F. *See table below.*

Ford Voltage Regulator Settings
(Ambient Temperature Correction)

Ambient Temp. (° F)	Std. 30 Amp. Reg. (Volts)	H.D. 40 Amp. Reg. (Volts)
45°	14.9-15.7	14.3-15.1
55°	14.8-15.6	14.3-15.0
65°	14.7-15.5	14.3-14.9
75°	14.6-15.4	14.2-14.9
85°	14.5-15.3	14.1-14.8
95°	14.3-15.1	14.1-14.7
105°	14.2-15.0	14.0-14.7
115°	14.1-14.9	14.0-14.6
125°	13.9-14.7	13.9-14.5
135°	13.8-14.6	13.8-14.4

CURRENT REGULATOR

Current Setting: This check requires that a load be added, or that the generator voltage be dropped to approximately 13 volts, to cause current regulator to operate. It is recommended that a heavy duty variable resistance (carbon pile) be connected across the 1-1/2 ohm fixed resistor in the charging line (connect resistance from ammeter lead terminal of fixed resistor to ground—see Test Meter Connections above). After Voltage Regulator checked (above), and with all resistance turned out of the field circuit, operate generator at 1500 RPM (Ford), 2000 RPM (Continental, Lincoln, Mercury), decrease the resistance of the carbon pile resistance until voltage drops to approximately 13 volts and ammeter reading is at maximum. This ammeter reading is the current setting. If not correct (see table below), adjust as follows:

Adjustment—Bend adjusting arm under armature spring (to left of regulator contacts) upward to increase current setting, or downward to decrease current setting. Replace regulator cover and recheck setting.

Current Setting

Std. 30 Amp. Regulator—28-32 amperes (all models).
H.D. 40 Amp. Regulator—38-42 amperes (all models).

►CHANGES, CAUTIONS, CORRECTIONS

► *1956 CADILLAC BRAKE PEDAL LINKAGE BIND CAUSING BRAKE DRAG:* Binding can exist at brake rod-to-relay connection, pedal rod at toe-board hole, and pedal rod to felt air seal retainer. *NOTE* - Check level of pedal for correct horizontal position in car as viewed from seat before making repairs to eliminate binding. Correct by shimming between attaching bracket and steering column.

DESCRIPTION: Self-contained hydraulic vacuum power braking device utilizing engine intake manifold vacuum and atmospheric pressure for its power. It consists of three separate units as follows:

Power Unit: Three elements are combined to make up this single unit, namely:

(1) Vacuum Power Cylinder comprising a cylinder power piston, and piston return spring.

(2) Hydraulic Master Cylinder containing an hydraulic plunger, compensating valve, residual check valve, and fluid reservoir.

(3) Control Valve, mechanically actuated, which controls degree of brake application or release in accordance with foot pressure applied to pedal.

Vacuum Reserve Tank provides vacuum assist for a limited time when engine stalls.

Manifold Check Valve, in vacuum source line, maintains vacuum in unit should engine stall.

OPERATION: With engine running, brakes unapplied, both sides of power piston are open to atomspheric pressure. Application of the brake pedal causes vacuum port to open, thus connecting the forward side of vacuum power piston and rear side of reaction diaphragm to engine vacuum. This pressure differential causes power piston to move forward, thereby exerting a thrust on the hydraulic plunger. This increases line pressure to the four wheels. Release of the brake pedal restores the pressure balance in the power cylinder.

CHECKING & ADJUSTMENT: Check all parts of the power brake system before disassembling the Power Brake Unit whenever brake trouble experienced.

Adjustments: None required. If unit becomes faulty, manufacturer recommends that unit be overhauled using Power Brake Repair Kit. *NOTE*–Use all parts in kit. *DISCARD ALL OLD RUBBER PARTS.*

Bleeding Brakes: Bleed in same manner as standard brake system. Do not use vacuum assist while bleeding. Engine should not be running and vacuum reserve should be reduced to zero by applying the brake several times before starting bleeding.

Air Cleaner: Clean twice a year. To clean, remove air cleaner and thoroughly wash in cleaning solvent. Allow cleaner to dry before reinstalling.

CONTINUED ON NEXT PAGE

BENDIX POWER UNIT (C ntinued)

R filling Fluid R s rv ir: Maintain fluid level at ¾" from top (Cadillac), ¼" from filler plug opening (Lincoln & Mercury), at "L" mark on dipstick (Oldsmobile), ½" from filler opening (Others).

Vacuum & Hydraulic Lin Inspection: Every 5000 miles, check hose, tubing and connections. Replace deteriorated hose or damaged tubing.

TESTING: Road test brakes by making a brake application at about 20 MPH to determine if vehicle stops evenly and quickly. If pedal has a spongy feel when applying brakes, air may be present in hydraulic system. Bleed system as described above. When engine is stopped and transmission is in neutral, apply brakes several times to remove all vacuum in system. Depress brake pedal, hold light foot pressure on pedal and start engine. If vacuum system is operating, pedal will tend to fall away under foot pressure, and less pressure will be required to hold pedal in applied position. If no action is felt, vacuum system is not functioning. Stop engine and again remove all vacuum in system. Depress brake pedal and hold foot pressure on pedal. If pedal gradually falls away under foot pressure, hydraulic system is leaking. If brake pedal travels to within 1" of toeboard, brake shoes require adjustment or relining.

LUBRICATION: Piston packing seal is lubricated at time of assembly and requires no further lubrication *CAUTION–NEVER lubricate vacuum valve.*

TROUBLE SHOOTING: The following conditions apply to Power Brake operation. Be sure brake shoes, drums, linkage, and adjustments correct before repair of Power Brake System.

Hard P dal: Vacuum failure due to faulty vacuum check valve, collapsed vacuum hose, plugged vacuum hose or fittings, leaking vacuum reservoir or vacuum hose and pipe connections; bound up pedal mechanism; glazed linings; grease, brake fluid, or water on linings; vacuum leak in unit between piston plates, past leather piston packing, between vacuum cylinder and master cylinder, or around hydraulic plunger seal; restricted air cleaner; jammed pushrod and valve plunger; broken counter-reaction spring; leak past atmospheric poppet; vacuum hose on piston loose or restricted.

"Grabby" r S v r Brak s: Grease or brake fluid on linings; scored drums; anchor pins loose; vacuum leak in the reaction diaphragm; sticking pushrod and valve plunger; faulty pivot arm and vacuum poppet action; restricted diaphragm passage.

P dal Goes T Fl r (Or Alm st T Flo r): Brakes require adjustment; air in hydraulic system; hydraulic leak in lines or at wheel cylinders; fluid reservoir needs replenishing; cracked drums or broken linings; hydraulic leakage at compensating valve, hydraulic plunger seal, compensating seal or outlet fitting seals.

Brak s Fail T R l as (Or Sl w R l as): Anchor pins loose; bound up brake pedal linkage; brakes improperly adjusted; faulty residual check valve; excessive hydraulic plunger seal friction; faulty compensating valve; excessive piston packing friction; restricted air passage in piston plate; restricted air cleaner; sticky pushrod and valve plunger; broken piston return spring.

REMOVAL (CADILLAC): Disconnect relay to unit rod at clevis. Disconnect relay rod from pushrod. Disconnect both vacuum hoses from power unit. Disconnect hydraulic line at outlet fitting. Remove four screws, lockwashers and nuts from cylinder mounting bracket and remove power brake assembly from car.

REMOVAL (CHEVROLET): From engine side of dash panel remove vacuum lines from vacuum inlet tube on intake manifold (top of engine on V8, left side center on 6 Cyl.). Remove vacuum line to vacuum reservoir. Remove stop light wire connection. Remove hydraulic line from hydraulic cylinder. From inside body remove lever to pushrod retaining bolt washer, lockwasher and nut and disengage pushrod from pushrod lever. Remove bolts and lockwashers retaining power brake unit to dash unit and remove unit from vehicle.

REMOVAL (LINCOLN & MERCURY): Disconnect pushrod from brake pedal. Remove master cylinder outlet fitting bolt (NOTE–It is not necessary to remove stop light switch wire or hose assembly from outlet fitting). Do not disturb outlet fitting in master cylinder. Loosen manifold hose clamp at check valve, remove hose from valve. Loosen vacuum reserve tank hose clamp at check valve and remove hose from valve. Remove bolts securing power brake assembly to bracket on dash panel, remove assembly.

REMOVAL (OLDSMOBILE): Disconnect hydraulic line at power brake master cylinder. Use care to prevent dirt entering hydraulic line and secure hose so that open end is above level of junction assembly to prevent loss of fluid. Plug master cylinder outlet with rubber stopper. Disconnect leads from stoplight switch and fold back floor mat. Remove three brake pedal bracket attaching bolts. Remove bracket and pedal assembly. Remove mast jacket grommet retainer clip and slide grommet up mast jacket. Remove mast jacket cover plate attaching screws. Loosen speedometer cable hold down clip and slip cable from under clip, then remove speedometer cable and grommet from mast jacket cover plate. Remove two cover plate to power cylinder bolts, and remove cover plate while positioning power brake unit so it rests on edge of opening in toe pan. Disconnect vacuum hoses and remove power brake unit through toe pan opening.

►*INSTALLATION NOTE:* When reinstalling hoses, position clamps so screw heads may be reached from below car. Place 5/16" bead of 3M Sealer around entire toe pan groove.

REMOVAL (PACKARD): Disconnect vacuum, atmospheric, and hydraulic lines and stoplight wires from power unit (raise hydraulic line above level of junction assembly to prevent fluid leakage). Disconnect and remove brake and accelerator pedals. Remove steering column grommet retainers, slide grommet up out of way. Remove carpet retainers and fold back carpet. Remove cover plate screws, then remove power brake and cover as an assembly, take out mounting screws and remove power brake from cover.

REMOVAL (PONTIAC): Disconnect vacuum hose from vacuum pipe leading to vacuum tee connector. Raise car and remove engine side apron from left side. Remove electrical cables from behind cable guide on reservoir cover of brake unit. Remove coiled hydraulic pipe from outlet fitting on hydraulic cylinder and from tee connector. Disconnect pushrod from pedal and wires from stoplight switch. Remove nuts from U-bolt retaining pedal pivot bracket to steering column; remove pedal and pivot bracket (with stoplight switch assembly attached). Remove accelerator pedal. Push rubber grommet up on steering column and move floor mat out of way. On Synchro-mesh cars, remove clutch pedal seal retainer and steering column seal retainer and remove seals. On Hydra-Matic equipped cars, remove screws retaining mounting plate to floor pan and remove mounting plate with power brake unit attached. On Synchro-mesh cars, remove screws retaining power brake unit to mounting plate (brake will rest on frame). Remove screws retaining mounting plate to floor pan and remove mounting plate, "jockeying" as necessary to clear clutch pedal. Remove power brake unit. *(CAUTION–Do not support or carry brake unit by pushrod since pushrod may be pulled out of plunger).* Remove mounting plate from brake unit, if not previously removed, and remove vacuum hose from vacuum cylinder inlet tube.

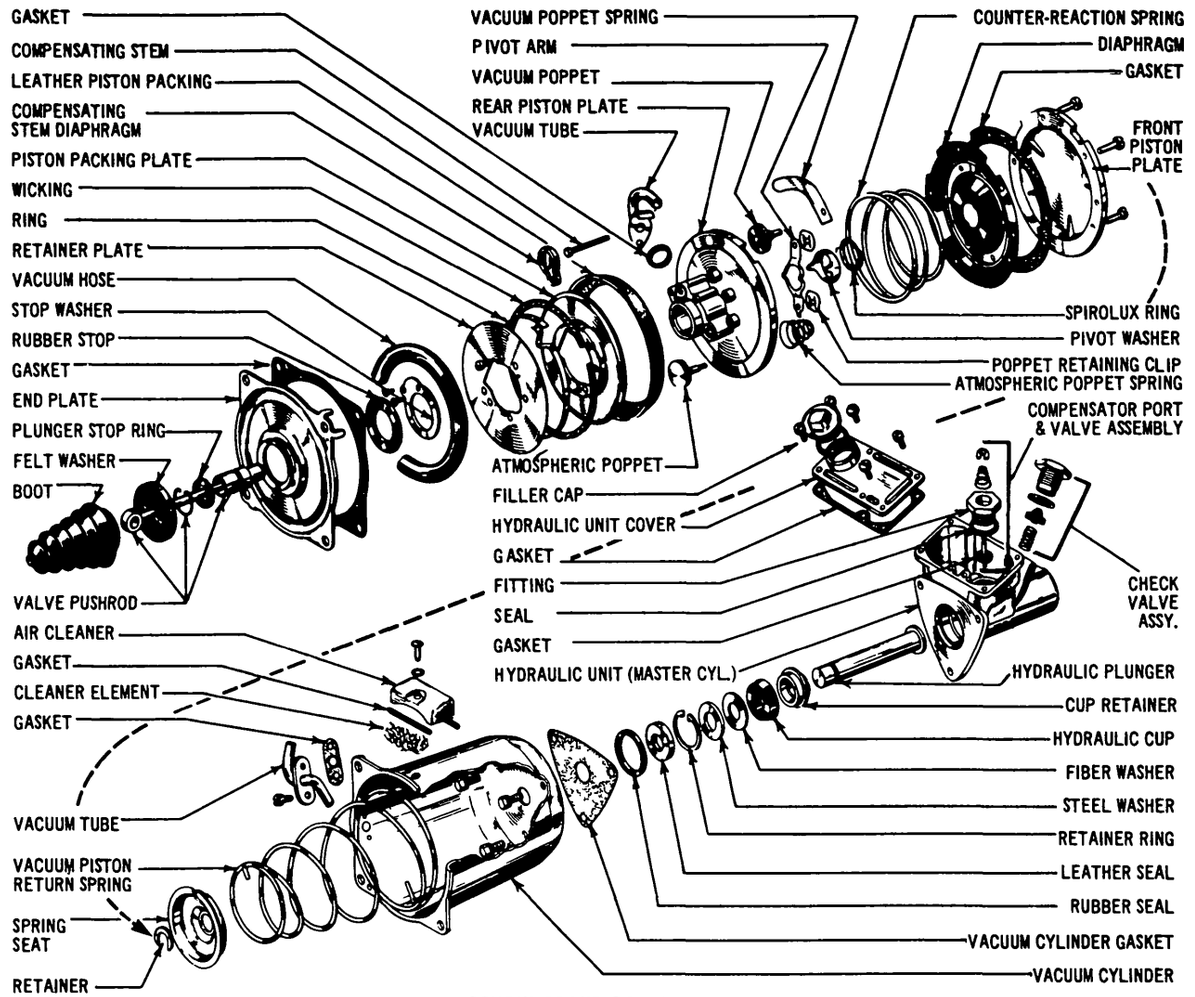
DISASSEMBLY: *CAUTION–Use extreme care to prevent hydraulic system parts coming in contact with mineral oil or grease.* Clean all dirt from outside of unit, using care not to allow dirt or solvent to enter unit. Remove fluid filler cap or dipstick and gasket then empty fluid out of reservoir. On Lincoln, remove screw that secures heat shield to booster body, remove shield by sliding it off hydraulic cylinder.

►*CAUTION: Before further disassembly, scratch alignment marks at the following points: (1) Vacuum cylinder shell and vacuum cylinder end plate. (2) Vacuum cylinder shell and hydraulic cylinder casting. (3) Reservoir cover and hydraulic cylinder casting. (4) Tube fitting and hydraulic cylinder casting.*

Hydraulic Unit: Place hydraulic unit in vise (lead jaws) at its normal mounting angle and remove the six cover screws, cover and gasket. Using a 1 1/8" (thin-wall) socket wrench, unscrew and remove compensator port and valve assembly. Remove rubber seal ring from port fitting. Unscrew hydraulic output fitting and remove fitting and take off rubber seal ring. Remove check valve assembly and valve spring. Separate check valve rubber cup and cup retainer. Remove unit from vise and empty remaining fluid. *NOTE*–Master cylinder piston assembly will be removed after vacuum cylinder is removed from hydraulic cylinder casting.

CONTINUED ON NEXT PAGE

BENDIX POWER UNIT (C ntinu d)



Vacuum Unit: 1) Replace unit in vise. Release lip of valve rod boot from cylinder end plate and slip boot and felt off over end of rod. Bend up two tabs on end plate and separate end plate and end plate gasket from cylinder. Slide vacuum hose off vacuum tube attached to vacuum cylinder. Remove air cleaner screw and separate screw gasket, shell, hair and rubber seals from vacuum cylinder. Remove two vacuum tube attaching screws, vacuum tube and gasket. *(CAUTION–* Inspect inner surface of vacuum cylinder under holes for burring from attaching screws. Remove burrs to prevent damage to power piston assembly). Pull out piston assembly from vacuum cylinder.

2) Compress piston return spring about ½" and remove the return spring seat retainer, spring seat and return spring. Remove the three vacuum cylinder mounting bolts and lockwashers. Remove vacuum cylinder, gasket rubber seal ring and metal encased leather seal from hydraulic cylinder casting. Using special pliers, next remove master cylinder piston cup washer retainer ring and lift the master cylinder piston and seal parts as a unit from the hydraulic cylinder. *(CAUTION–* Protect polished surfaces of master cylinder piston). Remove the steel backup washer, phenolic guide washer, cylinder piston seal and seal retainer from the master cylinder piston.

Vacuum Piston Stop, Compensating Stem & Vacuum H se: Remove vacuum hose from piston tube. Remove tube screw and separate tube and rubber seal from piston assembly. Visually inspect condition of rubber stop. If there is no evidence of wear or damage, remove screws and remove steel stop washer with rubber stop attached. If rubber stop warrants replacing, separate stop from steel washer before removing steel washer Remove compensating stem diaphragm and compensating stem.

Vacuum Piston, Valve Pushrod & Plunger: Hold rear piston plate assembly in vise using care not to damage surface at vacuum tube port Loosen five piston plate screws and separate front piston plate, gasket, diaphragm assembly and counter-reaction spring from rear piston plate assembly Remove vacuum poppet spring screw, spring from rear piston plate. Using pliers, remove atmosphere poppet retaining clip. Break clip, if necessary, to remove from poppet stem Separate atmosphere poppet spring and atmosphere poppet from piston plate. Remove pushrod and plunger, and vacuum poppet assembly from piston plate From groove in bore of piston plate, remove plunger stop ring. Using sharp tool under end of Spirolox ring, remove ring from groove at end of plunger Separate pivot washer and pivot arm from plunger. Remove clip and separate vacuum poppet from pivot arm From recess around plunger remove flat rubber seal.

Rear Pist n Plat Packing & Plates–Place rear piston plate on bench, with packing and plates facing upward. Remove six retainer plate attaching screws, retainer plate, ring wicking, piston packing plate and leather piston packing.

BENDIX BRAKE POWER UNIT

CLEANING & INSPECTION: Thoroughly wash all parts in diacetone alcohol. Use air hose to blow dirt and cleaning fluid out of recesses and internal passages. Remove rust or corrosion from bore of vacuum cylinder shell with fine emery cloth. Place all cleaned parts on clean paper or cloth to prevent possibility of dirt being assembled into power brake. Inspect all parts for wear or damage and replace as necessary. Particular attention should be given to following items:

Vacuum Cylinder Shell: Inspect shell for scores, pits, dents or nicks, or damaged threads in nuts or in mounting flanges

Hydraulic Cylind r Casting: Examine bore down one inch from open end. For the hydraulic cup to seal properly, this portion of bore must be free from scores, deep scratches or corrosion. The sealing surfaces at the reservoir cover, compensating port, and hydraulic outlet port must be free of scoring, pitting, dents and nicked edges. Also check casting for cracks and damaged threads

Hydraulic Port Fitting: The surface at the small end of the fitting must be free from scoring or corrosion which might prevent sealing with rubber cup of residual check valve.

Compensating Port Fitting: Inspect surface around port opening, inside threaded end of fitting, for scoring or corrosion which might prevent proper seating of compensating valve.

Valve Supply Tub : Make sure tube braze is secure and that tube plate is not distorted.

CONTINUED ON NEXT PAGE

BENDIX POWER UNIT (C ntinu d)

Pist n Plates· Examine plates for cracks and damaged threads Inspect plunger bore in rear piston plate and poppet seats for scratches and nicks **Do not** attempt to refinish bore Replace with new plate, if necessary

Hydraulic Plunger & Washer Assembly Inspect polished surface for scores, pits, or dents **Do not** attempt to refinish plunger surface Replace with new assembly, if necessary

Pushrod & Plung r Assembly Rod must pivot freely in plunger without any noticeable end play Inspect plunger for scores, pits, or dents on outside diameter of polished surfaces **Do not** attempt to refinish plunger surface Replace with new assembly, if necessary

Vacuum Cylinder End Plate Examine for distortion

REASSEMBLY· Before reassembly, make sure working area, parts, and tools are free of dirt, grease and oil

Comp nsating Valv Insert stem of valve poppet assembly through hole in threaded end of fitting Assemble large coil of poppet spring to fitting over end of poppet Hold poppet on seat, compress spring, and insert "C" washer retainer in groove at end of stem Crimp ends of "C" washer together to retain in place Coat rubber seal with brake fluid and assemble over threads of fitting

Mast r Cylinder 1) Coat residual check valve rubber seal with brake fluid and place over threads of hydraulic outlet fitting in inverted position, and insert cone end of cup and retainer assembly in end of fitting Center check valve spring in recess of rubber cup Hold master cylinder casting upside down and thread outlet fitting into hydraulic cylinder Tighten to 50 ft lbs

2) Insert washer end of plunger into cylinder Place cup retainer on plunger so that smaller inside diameter of retainer is toward plunger washer Coat hydraulic cup with brake fluid and place over plunger, lip on cup must be toward cup retainer Place Spauldite guide washer against cup Place steel washer against guide washer Slide all parts into bore of cylinder *CAUTION*–Use care so as not to cut cup when placing on plunger and when inserting cup into bore of cylinder It will be necessary to use a small screwdriver or similar tool having a smooth edge to start lip into bore

3) Press parts into cylinder bore and insert snap ring using snap ring pliers Be sure snap ring is engaged in recess Push in on hydraulic plunger and then install compensating valve assembly into master cylinder Pull back on plunger **to be sure** plunger washer tilts compensator valve Tighten fitting to 15 ft lbs Place cover gasket on reservoir of cylinder Align cover scribe marks and replace cover screws, with exception of rearmost screw on right hand side Re-place filler cap or dipstick gasket, screw filler cap into cover or replace dipstick

Rear Pist n Plate Packing & Plates· Place piston assembly flat on work bench inside of piston assembly ring Place leather packing against piston with lip up Place packing plate inside leather packing, with beveled edge of plate down against packing, so that "cutouts" and holes in plate are aligned with piston Coil wicking inside lip of leather packing. Cut wicking to required size Remove wicking and dip in vacuum cylinder oil, let excess drip off and reinstall wicking Coil expander ring inside wicking with barbs pointing upward into wicking Engage notch at loop end of ring with hook at opposite end Replace and align wicking retainer plate Replace screws and tighten evenly

Vacuum Piston, Valve Pushrod & Plunger· 1) Place stem of vacuum poppet in hole at rounded end of pivot arm and install two retaining clips making sure that clips are pushed down against pivot arm A piece of bar stock with 1/8′ hole in end, or piece of brake pipe with flared end, facilitates installation Place rubber seal in recess of pushrod plunger with lip of seal toward pushrod Coat plunger with Lubriplate, place into bore of rear piston plate and engage snap ring in recess in bore of piston plate Place pivot arm vacuum poppet sub-assembly over end of plunger, insert pivot washer and engage Spirolux ring into groove at end of plunger (Engage end of ring in groove and then screw into place) Place vacuum poppet spring into recess of piston plate and with end of spring over end of vacuum poppet stem, insert screw Place atmospheric poppet spring between pivot arm and piston plate with large coil of spring towards atmospheric port From opposite side of piston plate, place atmospheric poppet so that stem passes through plate, spring, and hole in pivot arm Install retainer clips on stem of poppet in same manner as before A length of round rod with a flat end can be used to back up atmosphere poppet when installing clips

2) Clamp rear piston plate assembly in vise and screw guide pins into place Place large end of counter-reaction spring in piston plate Place diaphragm over guide pins so that by-pass holes and notches in diaphragm and plate are aligned *NOTE*–When by-pass holes and notches are aligned, correct side of diaphragm will be toward piston plate

3) Move diaphragm downward until it seats on spring When properly seated, flange of metal ring will be within counter-reaction spring Place gasket and front piston plate over guide pins, making sure by-pass holes and notches are properly aligned

4) Apply force on front piston plate to compress counter-reaction spring until front piston plate rests on rear piston plate Loosely install two screws Remove guide pins, one at a time, and install remaining three screws, Tighten all screws evenly

Vacuum Piston Stop, Compensating Stem & Vacuum Hose Place vacuum poppet compensating stem into hole in recess in hub of piston plate Place compensating stem diaphragm in recess with "by-pass" slot of diaphragm outward and tab to left (when slot is toward you) Place steel stop washer over pushrod, align washer with hub of piston, replace two screws and tighten securely Soften coating of rubber stop (if stop was removed) with gasoline and cement to steel washer Position rubber seal in recess of piston, hook plate of tube to piston plate and replace screw, tighten screw securely. Attach vacuum hose to tube and coil hose around hub of piston

Vacuum Cylinder· 1) Pull out hydraulic plunger, place Plunger Seal Installer (J-5405) over end of plunger, and assemble leather seal over seal tool with lip of seal toward master cylinder. Press seal into recess of master cylinder and then remove tool from plunger Place rubber seal into master cylinder recess around leather seal. Align vacuum cylinder to master cylinder, and with gasket in place, insert three capscrews (and lockwashers), tighten to 6 ft. lbs

2) Place larger end of vacuum piston return spring in vacuum cylinder making certain hook on spring is between a screw head and a raised projection on end of cylinder Assemble retainer plate over end of spring, aligning notch with hook on spring Compress spring, and with retainer plate over end of plunger, insert "C" washer into groove of plunger.

3) Apply thin film of vacuum cylinder oil to bore of vacuum cylinder and to lip of leather packing, insert piston into cylinder so that free end of vacuum hose is in line with center of hole. Push piston into cylinder, adjusting position slightly until hook seats between two web sections of front piston plate. Move piston 20-25° in both directions in cylinder and stroke piston against spring several times by hand, to allow piston to find its normal operating position. Check location of end of hose with respect to center of hole in cylinder. Install tube and gasket and replace two screws. Slide end of hose onto vacuum tube approximately 5/8". Operate piston by hand through its full stroke several times to make certain that hose does not rub against cylinder or piston. Should interference occur, remove and rotate piston to a new web position where interference does not occur.

Air Cleaner & End Plate· Place two rubber seals on bottom edges of air cleaner shell. Place hair in shell. Replace screw and gasket and attach air cleaner shell to vacuum cylinder. Be sure hair is under shell, a small steel scale or similar tool can be used to push hair under ends of shell. Align end plate gasket and end plate and place against vacuum cylinder. Bend over two tabs of end plate to secure plate to cylinder. Install rod guard felt in large end of boot. Dip small end of boot in brake fluid and place boot and felt over pushrod. Attach lip of boot to scallops at center of end plate.

INSTALLATION: To install power brake assembly reverse removal procedure and note the following

Hudson & Nash: To prevent any contact during operation, a minimum of ¾" clearance must be maintained between centerline of pushrod-to-bell crank clevis pin and outer surface of front adjusting link locknut.

Pontiac: There should be approximately 1/8" clearance between pushrod and bore of plunger at top or 12 o'clock position with brake pedal released If improper clearance noted, loosen brake pedal pivot bracket and shift slightly to obtain clearance. *NOTE*–If clearance cannot be obtained, check for bent pushrod or bent mounting plate.

HYDROVAC POWER UNIT

Buick (1956 Opt.)
Chevrolet Trucks (1956)
Ford Trucks (1956)
Studebaker (1956)

►CHANGES, CAUTIONS, CORRECTIONS

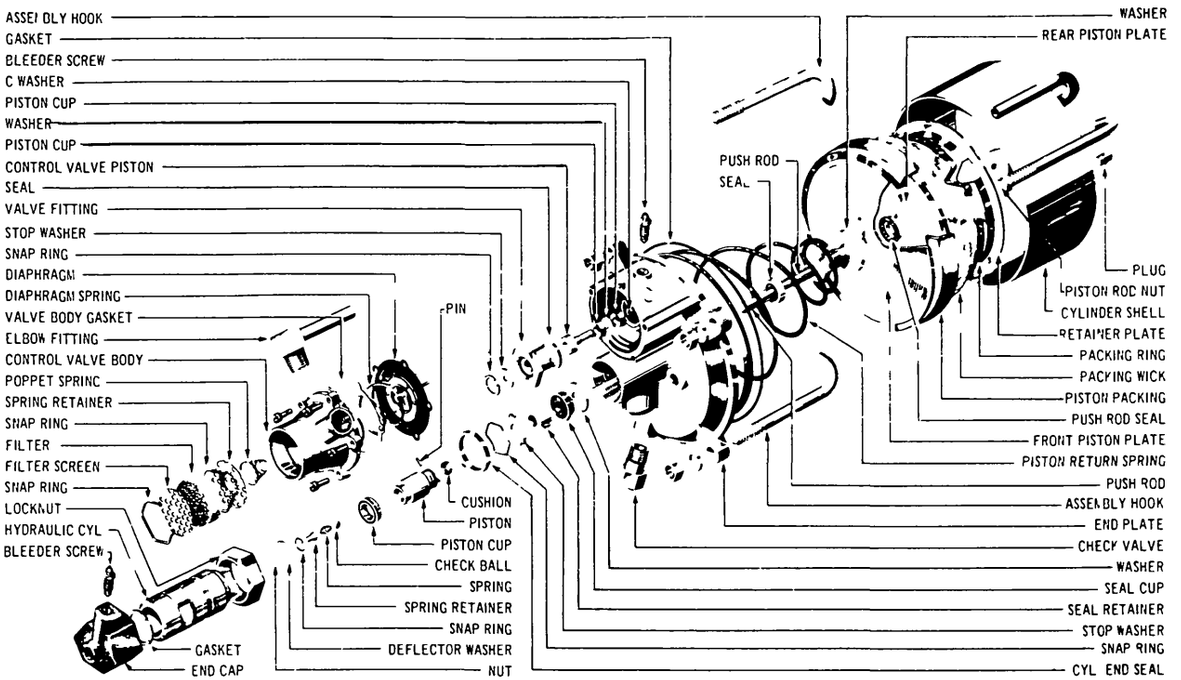
►*1956 CHEVROLET TRUCK HYDROVAC POPPET VALVE PRODUCTION CHANGE:* Repair Kit No. 2214318 consisting of large poppet valve, small poppet valve, lead gasket and screw, when installed, eliminates the need to replace Hydrovac control cover and poppet valve as an assembly, when poppet valve failure is encountered.

Removal & Installation – 1) Remove poppet valve by inserting an offset open end wrench or small pry bar behind the large poppet valve to pry out rivet retaining smaller valve, or support valve body on two wood blocks and drive out poppet shaft with punch.

2) Assemble above parts, being sure lead gasket is behind small poppet, before starting screw into large poppet.

3) Hold shaft with pair of thin offset pliers and tighten screw securely.

DESCRIPTION: Bendix HYDROVAC Power Unit is connected in hydraulic brake line between master cylinder and wheel cylinders (no mechanical connection).



OPERATION: As brake pedal is depressed, hydraulic pressure developed in master cylinder is transmitted to power brake hydraulic cylinder and to hydraulic piston in vacuum control valve. As hydraulic piston in power brake hydraulic cylinder is against stop washer when pedal is first depressed, check ball in piston is held off its seat by piston yoke. This allows fluid from master cylinder to pass through piston directly to wheel cylinders. This feature permits normal operation of brakes when engine is not running. Fluid under pressure is also directed to hydraulic piston in vacuum control valve. As fluid pressure moves this piston, it actuates vacuum diaphragm control shaft and forces diaphragm against vacuum poppet valve sealing off atmospheric side of diaphragm from manifold vacuum. Continued movement of piston and diaphragm forces atmospheric poppet valve off its seat and admits air under atmospheric pressure to vacuum piston.

BLEEDING BRAKES *(CAUTION – This operation must be done with engine stopped and no vacuum in the power brake system).* Attach bleeder hose to bleeder valve on control body, keep end of drain hose below surface of fluid in drain jar. Loosen bleeder valve ½-¾ turn. Depress brake pedal slowly by hand to expel air. When pedal has reached toe board, close bleeder valve before returning pedal to released position. Repeat this procedure until air bubbles cease to appear at the end of the bleeder drain hose in the jar and the stream is a solid fluid mass, then tighten bleeder valve and remove drain hose. *(NOTE* - **During the operation the brake master cylinder must be filled with fluid).** Following above procedure, bleed at bleeder valve on end cap of hydraulic cylinder, then proceed to bleed wheel cylinders in the usual manner.

LUBRICATION: Remove screw plug on front end of vacuum cylinder and fill cylinder to level of hole (Studebaker 1 oz.) with Delco Shock Absorber Fluid or Bendix Hydraulic Cylinder Fluid as follows:

Chevrolet– Every 10,000 miles, or each 6 month period, especially just ahead of cold weather.

Ford & Studebaker– Once yearly or every 20,000 miles.

HYDROVAC BRAKE POWER UNIT

TROUBLE SHOOTING· Before trying to determine cause of trouble, make certain that master cylinder reservoir is full, that brake system is free of air, that there are no binds in the brake linkage, that there are no air or fluid leaks to the master and wheel cylinders Then proceed as follows

Hissing Sound (Engine Running), Brakes Either On or Off: Caused by external leak on vacuum side of control diaphragm. Check and correct leak at control valve body, diaphragm, and gasket to end plate. Check and correct leak between vacuum cylinder and end plate

Hissing Sound (Engine Running), Greater When Brakes Off: Caused by external leak on atmospheric side of control valve diaphragm. Check and correct leak at atmospheric poppet, external pipe and rubber tubing, and valve body screws

Hissing Sound (Engine Running), Brakes On: Caused by internal vacuum leak, air entering through breather. Overhaul unit and check for leak at vacuum poppet, control diaphragm, or vacuum power piston.

Little or No Boost From Power Brake (May be Accompanied by a Hissing Sound or Loss of Brake Fluid):

1) Internal vacuum leak between atmospheric and vacuum side of power piston Overhaul unit, and check for leak at vacuum poppet, control diaphragm, or vacuum power piston

2) Internal hydraulic leak Check for low brake fluid level. Overhaul unit and check for presence of brake fluid in inner side of vacuum cylinder, or inner side of control diaphragm Check and correct leaks at control valve cup, control valve fitting "O" ring seal, vacuum piston push rod seals, or hydraulic power piston cup or ball check

3) External hydraulic leak Check and correct leak at point of origin

4) Internal friction Check and correct shock absorber fluid level in vacuum cylinder. If necessary, overhaul unit and check for rusty, dirty, or distorted vacuum cylinder wall, dry or worn vacuum piston leather packing swollen rubber cups due to heat or wrong brake fluid, worn or damaged rubber cups, or dirt, rust, sludge, or foreign matter in power piston or control valve regions.

Booster Loses Effectiveness Whil Stopping (Pedal dr ps und r f t. May sh w up as slow op ration f p w r brak): Caused by internal hydraulic leak or internal or external vacuum leak. Overhaul unit and check for leaks at control valve, valve fitting, power piston, vacuum poppet, control diaphragm, or vacuum power piston Check for sticking power piston, or restricted air cleaner (if so equipped)

Tendency To Over-Brake (Pedal dr ps und r f t. May sh w up as slow op ration f p w r brak): Restriction in atmospheric passage or sticky control valve. Clean air filter for restriction in atmospheric passage. If necessary, overhaul unit and check for misalignment of control valve assembly Check for dirty or sticky

CONTINUED ON NEXT PAGE

HYDROVAC POWER UNIT (C ntinued)

vacuum or atmospheric poppet, as well as sticky control valve. NOTE—Above condition may also be caused by internal hydraulic leakage or internal friction. To correct, overhaul unit and check for leak at hydraulic power piston cup or ball check. Check for binding in power piston assembly. Check level of lubricant in vacuum cylinder.

Brak s Sl w t R l as (r fail to release completely): May be caused by sluggish control valve action or internal friction. Overhaul unit and check for weak vacuum power piston return spring or atmospheric poppet return spring. Check for dirty or sticky control valve. Check for power cylinder lubricant level. If necessary overhaul unit and check for binding in power piston assembly.

N P w r Assist (n first application after engine shut ff): Caused by an external vacuum leak or an internal vacuum leak in the check valve. Check and correct external leaks at valve body, external pipe, vacuum cylinder, and atmospheric poppet. For the internal leakage, overhaul or replace check valve assembly.

Brak s Apply Wh n Engin Started: Caused by broken or improperly assembled atmospheric valve return spring or control valve diaphragm return spring, sticking control valve piston.

Air in Hydraulic System: Caused by an improperly assembled, defective or missing control valve piston secondary cup.

Grabbing Brakes: Caused by sticking control valve piston or sticking power piston.

L ss f Fluid fr m Brak System: Caused by defective hydraulic cylinder cup or seal, defective or damaged control valve piston cup (crack or split in lip at center of cup), dirt chips or other foreign matter under lip of piston cups, improperly tightened or defective gaskets or rubber seals.

Power Unit Fails t Op rate: Low or no vacuum due to clogged or restricted lines, defective check valve, clogged air filter (if so equipped).

REMOVAL OF POWER BRAKE UNIT: Disconnect brake lines at cylinder end plate. Loosen vacuum line hose clamp at check valve and slide hose off. Remove three nuts and lockwashers from cylinder mounting bracket and remove unit from car. *NOTE*—Ford and Studebaker have stop light wires that must be disconnected before unit is removed.

DISASSEMBLY OF POWER BRAKE UNIT: When disassembling Power Brake use care in handling parts to prevent their coming in contact with mineral oil or greases. Do not handle hydraulic cups and seals with greasy hands.

Hydraulic Cyl. Assembly 1) Loosen hydraulic cylinder nut and unscrew hydraulic cylinder assembly from end plate. Hold end cap in a vise and remove hydraulic cylinder from cap using an open end wrench on the flat part of cylinder. Remove gasket and bleeder fitting from end cap.

2) **On Ch vrol t Trucks and Stud bak r,** remove bolt holding hydraulic line end connection to end cap and remove fitting and copper gaskets. Scribe line on cylinder shell and end plate so these parts can be reassembled in their original positions. Loosen hook bolts and remove cylinder shell, sliding tube out of rubber hose.

3) **On Chevrolet Trucks and Ford,** remove residual check valve snap ring. Remove spring seat, spring and residual check valve. Loosen hook bolts and remove cylinder shell, sliding connector out of rubber hose.

4) **On all cars,** compress piston spring by pressing down on end plate. Hold piston in position with Vacuum Piston Retaining Strap, Tool J-5650 (two wire hooks and a plate can readily be made to hold piston in position). Remove hydraulic piston assembly from pushrod by holding retaining spring back and removing small pin. Remove hydraulic piston cup from piston, remove snap ring, retainer, spring, and ball. Remove hydraulic cylinder and seal. Remove snap ring, then remove pushrod seal cup parts. Drive out pushrod leather retainer with a flat end rod or drift.

Vacuum Control Valve Assembly: 1) Scribe control valve body and end plate to insure proper location on reassembly. Remove control valve body screws and remove control valve assembly with diaphragm and gasket. Remove diaphragm from control valve body.

2) **On Studebaker,** remove air intake filter snap ring, screen and filter, and take out lower snap ring and screen.

3) **On Chevrolet and Ford,** remove snap ring which retains cover on control valve and poppet assembly and remove cover, valve spring and gasket,

4) **On all cars,** remove hydraulic control valve fitting from end plate. Push piston out of fitting and remove cups from piston (washer between cups on Chevrolet and Studebaker). Remove seal, retainer ring, and stop washer from fitting.

Vacuum Piston: Remove nut from threaded end of push rod, retainer plate, packing, and expander ring. Remove small diameter piston plate with rubber seal ring. Remove leather packing, larger diameter piston plate, and washer from push rod.

Vacuum Piston Pushrod Assembly (Ford): Remove pushrod lock ring from groove in piston guide. Remove spring washer, then lift out pushrod, spring, bottom spring washer, and bottom lock ring.

Vacuum Piston Pushrod Guide (Ford): Clamp hexagonal section of guide sleeve in a vise. Remove guide sleeve to body gasket, washer, and nut. Loosen outer locknut, then remove assembly from vise. Remove locknut, gasket, and guide sleeve. Remove piston guide by drawing it into cylinder shell.

Check Valve (Studebaker): Remove assembly, from elbow in end plate. Remove plug from bushing and bushing from check valve assembly. Remove snap ring, spring retainer, and spring with check ball. Remove spring from check ball.

REASSEMBLY OF POWER BRAKE UNIT: Before reassembling unit, clean all parts thoroughly, and after cleaning, wash all parts for hydraulic system in alcohol. Be careful not to get grease or oil on hydraulic parts. Use new rubber seals and cups when reassembling.

Vacuum Piston: (*NOTE*—An assembly ring can be made by cutting a 1" section from end of a power cylinder). Place front (larger) piston plate in assembly ring with lip down. Place new leather packing on plate with lip up, place new rubber seal in center of plate. Install rear (smaller) piston plate with lip down. Coil new wick inside lip of packing and cut it to proper size. Soak wick in cylinder oil (not ordinary oil) and allow it to drain thoroughly. Install wick. Place packing ring inside wick with gripper points up, and engage notch at loop end of ring with hook at opposite end. Install wick retainer plate with cutout portion over loop of expander ring. Place flat washer over threaded end of pushrod (guide rod on Ford), insert pushrod (guide rod) through assembled piston parts, being careful not to damage inner seal ring. Large piston plate should rest against flat washer. Clamp hex on pushrod (guide rod) in a vise, being careful not to damage polished surfaces. Install nut and tighten securely, being careful not to allow either piston plate to rotate while nut is being tightened. Remove assembly ring. Stake nut with center punch.

Pushrod Assembly (Ford)—Clamp hexagonal section of guide rod firmly in a vise. Assemble pushrod attaching parts over beveled end of pushrod in following order: Lock ring, one spring retainer, spring (large end first), second spring retainer, snap ring (smaller). Use care in assembling smaller diameter snap ring in groove at lower end of pushrod, to avoid distorting ring. Insert end of pushrod in recess at end of guide rod. To attach pushrod to guide rod, compress spring and assemble to lock ring in groove of guide rod. Be sure lock ring is firmly seated in groove of guide rod.

Vacuum Control Valve Assembly: 1) Install stop washer and retainer ring in hydraulic control valve fitting.

2) **On Chevrolet and Studebaker,** dip piston cups in brake fluid and install on piston with washer between cups. Install C-washer. Lips of both cups must point away from end of piston with hole in it.

3) **On Ford,** install new rubber cups on piston with lip of cups toward small end of piston.

4) **On All Cars,** install piston in fitting with hole in end of piston next to stop washer. Install a new rubber seal gasket in groove in fitting. Install fitting in end plate and tighten securely.

5) **On Studebaker,** install poppet return spring with small end down, retainer and snap ring in control body. Install new filter, screen and outer snap ring.

6) **On Chevrolet and Ford,** install poppet return spring with small end down, gasket, end cover with air inlet tube, and secure in place with snap ring.

7) **On all cars,** place guide pins in control valve body screw holes in end plate (Guide pins can be made by cutting heads off three 8-32 x 2½" machine screws). Install gasket diaphragm, diaphragm spring (if so equipped), and control body on guide pins allowing cylinder tube to slide into connecting hose. (*CAUTION*—When assembling diaphragm, spring, and control valve body, extreme care should be taken not to distort the diaphragm when compressing the spring). Remove guide pins one at a time and install screws and lockwashers. Install hose clamps.

CONTINUED ON NEXT PAGE

HYDROVAC POWER UNIT (Con.inued)

Hydraulic Cylinder Assembly: 1) Install new pushrod leather seal into end plate with lip of seal toward hydraulic cylinder side of end plate. Place end plate on bench and install stop washer with chamfered side down. Install seal cup, with lip up and seal retainer with counterbored side next to cup (Studebaker); flat side next to cup (Chevrolet & Ford). **On Ford and Chevrolet,** next install spring with small end toward bore end of plate. (No spring on Studebaker). **On All Cars,** next install stop washer and install snap ring in groove.

2) Place vacuum piston return spring over pushrod with small end of spring next to piston, carefully guide pushrod through seat in end plate. Compress spring. Use vacuum piston retaining strap or hook clamps to hold end plate and the cylinder together. Install ball, spring, retainer and snap ring in piston. **On Studebaker,** install deflector washer and nut.

3) Dip hydraulic piston cup in brake fluid and install in groove with lip of cup toward check valve end of piston. Dip hydraulic piston in brake fluid and assemble piston on pushrod. Install retaining pin in hole in piston and rod. When pin is in position, retaining spring will hold it in position. Place end cap in vise and install bleeder screw, end cap gasket, hydraulic line connector with copper gaskets and retaining bolt.

4) **On Chevrolet Trucks and Ford,** install residual check valve spring, spring seat, and snap ring.

5) Thread hydraulic cylinder into end cap with milled flats next to end cap, and securely tighten cylinder. Thread check nut on cylinder to limit of threads. Install hydraulic cylinder end seal against shoulder in end plate. Guide lip of piston cup into cylinder carefully, and threaded cylinder into end plate until cylinder bottoms firmly against end seal. Tighten cylinder until bleed screw on end cap is aligned with bleed screw in end plate and tighten check nut securely.

6) Remove piston retaining strap or clamps. Place rubber gasket in groove on end plate. Saturate cotton wicking by dipping vacuum piston in Shock Absorber Fluid, and allow excess oil to drain off. In addition, coat inside of cylinder shell lightly with shock absorber fluid. Insert piston into shell by tipping piston and gradually working it down into shell. Align scribe marks on shell and end plate (if made) and attach hook bolts. Tighten each bolt evenly until all bolts are uniformly tight.

Check Valve (Studebaker): Install end of spring over check valve ball. Install spring retainer plate with depression in plate in end of spring, install snap ring. Install plug in check valve body. Install fitting in bushing and install valve assembly in elbow on end plate.

INSTALLATION OF POWER BRAKE UNIT: Position power brake unit on mounting bracket and install lockwashers and nuts. Connect vacuum hose to check valve on power brake and tighten hose clamp. Connect brake line fittings to end plate. **On F rd and Stud baker,** connect stop light wires. **On all cars,** bleed system (see above).

MORAINE POWER UNIT

Buick (1956) ①
Cadillac (1956) ②
Oldsmobile (1956) ②
Pontiac (1956) ②

① - Hydrovac Power Unit also used.
② - Bendix Power Unit also used.

►CHANGES, CAUTIONS, CORRECTIONS

►*1955-56 BUICK SLOW PEDAL RETURN OR FAILS TO RETURN TO NORMAL POSITION:* This is caused by vacuum leaks in power brake cylinder, that are the result of any one of three conditions that follow.

1) Broken Air Valve. To check for broken air valve, push in on pushrod to separate valve and piston assembly from power piston, and gently move end of air valve (covered with rubber boot), sideways. Excessive movement indicates broken valve. *CAUTION* - Excessive pressure sideways will break a good valve.

2) Punctured Vacuum Hose. Replace with new hose.

3) Weak Inner Piston Return Spring. Valve & Piston assembly (small piston) not returning to unapplied position completely, causing vacuum leaks between valve reaction plate to piston seal and power piston (large piston). To correct install new inner piston return spring Buick No. 5455800. *NOTE* - New spring has greater length with larger coil diameter than first type spring. To install, remove power brake cylinder from car, mount it in vise (do not crack cylinder by overtightening vise), with hydraulic cylinder down. Remove pushrod boot and retainer from cover, air cleaner assembly, two housing cover screws, cover and gasket. Hold power piston down, disconnect vacuum hose from tee, remove tee and gasket from housing. Slowly release power piston. *NOTE* - Make sure lip of leather piston does not catch in holes in housing. Remove center return spring (valve and piston return spring) and replace it with new spring No. 5455800. Center new piston return spring in cylinder housing, then large return spring around it with its smaller end down. Locate bent end of spring wire between one of bolt heads and adjacent dimple in housing. Place power piston with attaching parts on large return spring so bent end of spring wire rests between two round bosses on piston guide. Locate piston so side of boss opposite vacuum hose clears vacuum tee hole in housing by ¾". Push power piston down in cylinder entering hydraulic piston in hydraulic cylinder and hold piston down while installing vacuum tee with gasket and two screws. Push vacuum hose on tee 5/8". Push power piston down to check for free operation and proper location of springs, then install gasket and cover on cylinder housing with two screws. Install filter assembly and rubber boot, and install power unit on car.

►*1956 CADILLAC BRAKE PEDAL LINKAGE BIND CAUSING BRAKE DRAG:* Binding can exist at brake rod to relay connection, pedal rod at toe-board hole, and pedal rod-to-felt air seal retainer. *NOTE* - Check level of pedal for correct horizontal position in car as viewed from seat, before making repairs to eliminate rod binding. Correct by shimming between attaching bracket and steering column support.

Pedal R d t To -board Hol - Secure 1/8" clearance on rod with pedal in applied position, by moving pedal attaching bracket at support mount, laterally or by enlarging hole in toe-board.

Pedal Rod at Felt Air Seal - Centralize seal around rod by removing one screw from retainer and rotating entire seal and retainer around other screw, and relocating first screw.

Brake Rod to Relay Connection - With brakes fully released, clevis pin should fit easily into clevis pin hole. Remove stock on upper edge of lower relay arm until clevis pin will enter freely.

DESCRIPTION· Self contained vacuum and hydraulic unit of same design as used on previous models beginning with 1955

CHECKING & ADJUSTMENT: Check all parts of power brake system before disassembling Power Brake Unit whenever brake trouble experienced.

Adjustments: No special adjustments required. Anytime brake pedal goes to within 1". from floor (floor mat to underside of pedal pad), brakes should be adjusted. At time brakes adjusted, make following inspections:

1) Check vacuum lines and connections between intake manifold, check valve, vacuum reserve tank, and vacuum power cylinder for possible vacuum leaks.

2) Check fluid level in master cylinder reservoir. See Lubrication below.

3) Check condition of air cleaner element and insert clean element, if necessary.

4) Check steering column pedal plate for loose screws. Check for free operation of brake pedal. If binding exists, check for misalignment between pedal and vacuum cylinder pushrod.

5) Check stop light switch for proper operation.

Bleeding Brakes: Bleed in same manner as for standard brakes. Do not use vacuum assist while bleeding. Engine should not be running and vacuum reserve should be reduced to zero by applying brake several times before starting bleeding procedure. *NOTE* - On Cadillac bleed master cylinder first by attaching bleeder hose to bleeder fitting on end of master cylinder and backing off fitting ¾ turn, and bleeding until brake fluid runs clear and free of bubbles Then proceed to each wheel cylinder.

LUBRICATION· Check fluid level in brake reservoir every 1,000 miles Refill to ½-1" from top of filler plug opening (Buick), within ¾" of top only (Cadillac), high enough to register on dipstick (Oldsmobile), ½" from top of filler plug opening (Pontiac).

PERIODIC SERVICE: Intake manifold tee connector should be removed and cleaned Spring and Fall or every 10,000 miles.

TROUBLE SHOOTING: Before checking Power Brake Unit for source of trouble check remainder of brake system.

Hard Pedal: 1) Vacuum failure due to faulty vacuum check valve, collapsed vacuum hose, plugged vacuum fittings, hose or pipes, leak between vacuum power cylinder and hydraulic master cylinder.

2) Bound up pedal mechanism.

3) Power Brake unit trouble—internal vacuum hose loose or restricted, jammed sliding valve, vacuum

CONTINUED ON NEXT PAGE

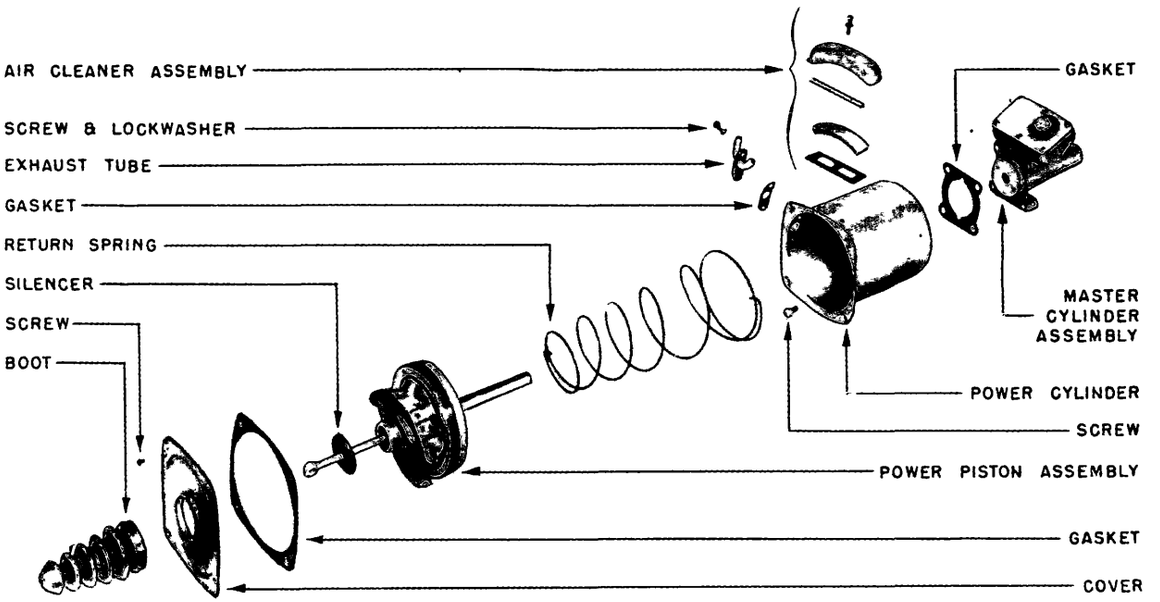
MORAINE POWER UNIT (C nt.)

leaks in unit caused by loose piston plate screws, loose piston packing, faulty master cylinder piston, vacuum seal, or leak between hydraulic master cylinder and vacuum power cylinder; defective diaphragm; restricted air cleaner.

Grabbing Brak s (Apparent Off-and-On Condition): Power Brake unit valve trouble—reaction diaphragm leakage, faulty rubber bumper pad in reaction diaphragm; sticking sliding valve reaction; restricted diaphragm passage; master cylinder piston binding in power piston guide.

P dal Goes t Fl or (Or Almost to Floor): Brake adjustment; fluid reservoir needs replenishing, power brake hydraulic leakage—defective primary or secondary cup, defective vacuum seal, defective head nut or head nut gasket, cracked master cylinder casting, leaks at wheel cylinders or in pipes, or in connections, defective "O" rings on cylinder plug.

Brak s Fail t R l as (Or Slow Release): 1) Bound up brake pedal linkage.



2) Weak brake shoe return springs, or rusty bosses on backing plate.

3) Faulty residual check valve, excessive hydraulic plunger seal friction, excessive piston packing friction, restricted air passage in vacuum piston, restricted air cleaner, sticky air valve, broken piston return spring, broken air valve return spring.

REMOVAL & INSTALLATION: Buick - Disconnect brake pipe from master cylinder, vacuum hoses from power cylinder, stop light wires from stop light switch. Place drip pan under reservoir and remove reservoir. Disconnect pushrod from brake pedal and remove pedal. Remove dash insulator retainer from pedal plate, remove retainer and push steering column seal up steering column jacket. Pull floor mat away, remove pedal plate to toe-pan screws, remove pedal plate and power brake unit from car together. To install reverse removal procedure, adjust brake pedal and bleed system.

Cadillac: Disconnect relay to unit rod at clevis. Disconnect relay rod from pushrod. Disconnect both vacuum hoses from power unit. Disconnect hydraulic line at outlet fitting. Remove four screws, lockwashers and nuts from cylinder mounting bracket and remove power brake assembly from car. To install, position power brake assembly on mounting bracket, install screws, lockwashers and nuts. Connect hydraulic line at outlet fitting, both vacuum hoses to check valve and tighten hose clamp. Connect relay rod to power piston pushrod and clevis and bleed lines.

Oldsm bil : Disconnect positive battery cable at junction block on right fender filler plate, solenoid lead wire (purple) from wiring harness, then pull cable through sleeve on power brake. Disconnect flex line at power brake master cylinder, disconnect leads from stoplight switch and fold back floor mat. Remove three brake pedal bracket attaching bolts, and remove bracket and pedal assembly. Remove mast jacket grommet retainer clip and slide grommet up mast jacket. Remove mast jacket cover plate attaching screws, loosen speedometer cable hold-down clip and slip cable from under clip, then remove speedometer cable and grommet from mast jacket cover plate. Remove two cover plate to power cylinder bolts, and remove cover plate, while positioning power unit so it rests on edge of opening in toe-pan. Disconnect vacuum hose and remove power brake unit through toe-pan opening. *NOTE* - When reinstalling hose, position the clamp so screw head may be reached from below car. To replace, scrape off old sealing compound, then place 5/16" bead of medium bodied sealer around entire toe-pan groove and reverse sequence of operations. Fill master cylinder and bleed brakes.

MORAINE POWER BRAKE ASSEMBLY

Pontiac: Removal - Disconnect vacuum hose from vacuum pipe leading to vacuum tee connector. Raise car and remove engine side apron from left side. Remove coiled hydraulic pipe from outlet fitting on hydraulic cylinder and from tee connection. Disconnect pushrod from pedal, disconnect wires from stoplight switch. Remove nuts from U-bolt which retains pedal pivot bracket to steering column, remove pedal and pivot bracket (with stoplight switch attached). Remove accelerator pedal, and push rubber grommet up on steering column and move floor mat out of way. Then proceed as follows:

Synchro-mesh Cars - Remove clutch pedal seal retainer and remove seals. Remove screws which retain Power Brake Unit to mounting plate, (Brake will rest on frame). Remove screws which retain power unit to mounting plate to floor pan and remove mounting plate, "jockeying" as necessary to clear clutch pedal. Remove power brake unit.

Hydra-Matic Cars - Remove screws which retain mounting plate to floor pan and remove mounting plate with power unit attached. *CAUTION* - Do not support or carry brake unit by pushrod, since pushrod may be pulled out of plunger.

Synchro-mesh Installati n - With aid of an assistant to support and align brake unit from underside of car or under hood, position brake unit in car, place mounting plate over clutch pedal, position it against floor pan and install mounting screws. Align brake unit with mounting plate and install mounting screws. Replace clutch pedal and steering column seals and seal retainers. Complete installation as given under **Hydra-Matic** below.

Hydra-Matic Installation - Install mounting plate. Place mounting plate with bracket attached in position and install screws which retain mounting plate to floor pan. Replace steering column seal and retainer, brake pedal pivot bracket (with pedal and stoplight switch attached). *NOTE* - Brake pedal pivot bracket has tang which must fit in a hole in steering column. Install pushrod in pedal, fastening pin with hair-pin retainer. Attach anti-rattle spring around pushrod and connect to hole in brake pedal. Pull rubber boot back from vacuum cylinder so that pushrod can be observed when it enters vacuum cylinder. There should be 1/8" clearance between pushrod and bore of plunger at top 12 O'clock position. To correct clearance, loosen brake pedal pivot bracket and shift slightly. *NOTE* - If clearance cannot be obtained, check for bent pushrod. Connect stoplight switch wires and check for proper operation. Connect hydraulic pump and vacuum hoses. Fill hydraulic cylinder and bleed brakes.

OVERHAUL: *See "Moraine Power Unit" in 1955 Annual Data or later Manual edition and note the following.*

Bleeding Brakes: Cadillac has bleeder fitting at end of hydraulic cylinder. Bleed master cylinder first by opening bleeder valve ¾ turn and bleed until fluid runs clear and free of bubbles, then proceed to wheel cylinders.

Disass mbly, Cl aning & Insp cti n (Cadillac): Same as Buick.

R ass mbly (Cadillac): Same as Buick.

MIDLAND POWER UNIT

F rd Pass. Cars & Trucks (1956)
Thunderbird (1956)
NOTE - Hydrovac Power Unit also used on Trucks.

DESCRIPTION: Consists of a vacuum power chamber, hydraulically actuated vacuum control valve, and an hydraulic slave cylinder, all in a single sealed unit. Unit is mounted on left side of engine compartment and connected in hydraulic brake line between master cylinder and wheel cylinders. There is no mechanical connection and no adjustments are required

OPERATION: With engine running, brakes released, power diaphragm is vacuum suspended. Depressing pedal causes fluid to pass from master to slave cylinder, moving control valve piston, which admits atmospheric pressure to front of diaphragm. As pushrod moves, check valve seals fluid in slave cylinder and hydraulic line pressure builds up to operate brakes

REMOVAL & INSTALLATION: Depress pedal a few times to relieve vacuum. Remove lines and attaching bolts. To install, reverse removal procedure.

TROUBLE SHOOTING: Brake Pedal Kicks Back–Engine Running–Slave piston cups leaking, hydraulic check valve leak, intermittent vacuum leak in unit.

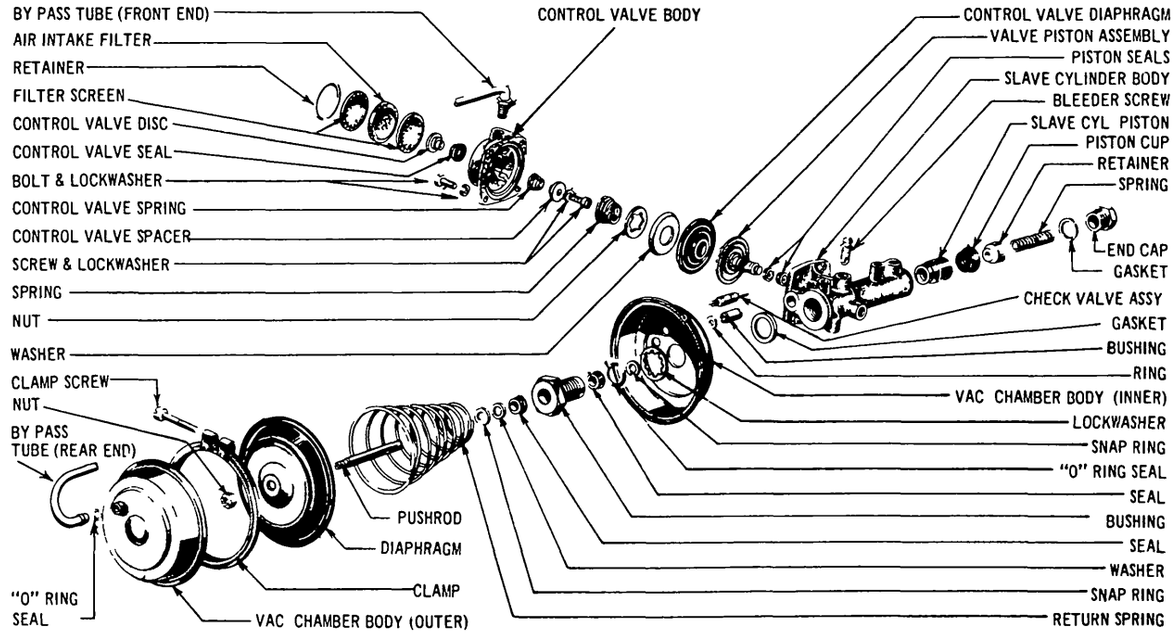
Loss of Fluid: Loose connections, master or wheel cylinders leaking, broken hydraulic lines

Brakes Do Not Release–Engine Running: Control valve piston sticking, hydraulic (slave piston) sticking, broken or weak control valve spring, dented or leaky diaphragm body.

Vacuum Leak With Brakes Released–Engine Idles Normally: Defective "O" ring seal or body-to-slave cylinder gasket, dirt or worn atmospheric valve seal, defective or dirty vacuum check valve.

Vacuum Leak With Brakes Released–Rough Engine Idle: Leaking diaphragm in vacuum chamber, leaking control valve piston or diaphragm, leaking control valve vacuum valve seal.

Hard Pedal–Indicating Inoperative or Weak Booster: Clogged air cleaner element, sticking hydraulic (slave) cylinder piston, air leak at atmospheric valve seal, control valve diaphragm, control valve piston, or power chamber diaphragm.



OVERHAUL: *TRUCK NOTE*–Do not remove breather in cab or controls mounted in engine compartment unless operating conditions indicate repairs are necessary.

Disassembly: 1) Remove control valve bypass tube from control valve and the body. Remove stop light switch. Mark both halves of body with a scriber, then mark flanges of control valve and slave cylinder so parts can be assembled in their original positions.

2) Remove clamp then remove outer body and the diaphragm and pressure plate assembly with return spring. Remove vacuum check valve from inner body.

3) Remove retainer and air intake hose fitting (or snap ring, screens, and filter) from control valve body. Remove control valve to slave cylinder attaching bolts and lockwashers. Lift the control valve body, diaphragm spring, and the control valve piston and diaphragm assembly from slave cylinder body.

4) Remove pushrod bushing, lockwasher, inner body, and gasket from slave cylinder body. Remove transfer bushing and "O" ring seal from cylinder body.

MIDLAND BRAKE POWER UNIT

5) Remove end plug or cap, gasket, return spring and retainer, from end of slave cylinder. Remove slave cylinder piston cup and piston from cylinder. Remove inner and outer pushrod bushing seals.

6) Remove inner and outer seals from control valve piston. Remove control valve diaphragm plate and retaining nut by prying inner tangs of nut away from piston shaft. Separate the control valve disc and spacer by removing attaching screw and lockwasher. Then remove disc, seal, spring, and spacer from control valve body Remove check valve retainer, check valve and return spring as an assembly from slave cylinder piston. Remove pushrod from diaphragm and disassemble check valve.

Inspection: Wash all metal parts in brake fluid and dry thoroughly Use air to dry all internal passages. Replace all worn or damaged parts and if slave cylinder bores or control valve plunger show wear or evidence of corrosion, the slave cylinder body should be replaced. Replace pushrod if rough or damaged. If control valve seat is worn or damaged, replace control valve body.

Reassembly: 1) Assemble diaphragm on pushrod. After nut is tightened, coat threads with shellac to prevent leakage. Assemble control valve disc, seal, spring, and spacer in the control valve body with screw and lockwasher. Position control valve diaphragm and plate on control valve, and secure diaphragm and plate solidly in place with nut. Install control valve piston seals on piston.

2) Insert check valve spring and valve and retainer in slave cylinder piston. Be sure check valve floats freely and does not bind in bore. Install the inner and outer pushrod bushing seals, and secure them in place with the retainers.

3) Coat the piston bores in slave cylinder body with hydraulic fluid. Dip slave cylinder piston, seal, retainer, and spring in fluid. Install piston in bore with recessed end toward pushrod bushing end of body. Carefully position seal and retainer on top of piston. Insert spring in retainer, and secure it in place with end plug or cap, using new gasket.

4) Place new gasket and inner body of vacuum power chamber on slave cylinder body. Make certain transfer bushing and "O" ring are in place before inner body is installed on cylinder body. Install pushrod bushing lockwasher over end of bushing. Thread bushing in place, be sure inner body seats squarely on cylinder body, then tighten bushing securely.

5) Dip control valve piston in hydraulic fluid, then install control valve. Position control valve spring on control valve diaphragm with small end of spring on diaphragm plate. Position control valve body over spring, align the scribe marks, then install control valve body-to-slave cylinder body attaching bolts and lockwashers. Tighten bolts solidly. Install air intake hose fitting (or screens, filter, and snap ring) on control valve body.

6) Place small end of diaphragm return spring on top of pushrod bushing. Carefully insert end of pushrod into bushing. Align diaphragm plate on large end of spring. Place outer body of vacuum power chamber on top of diaphragm with marks in alignment. Install clamp, making certain diaphragm head is properly positioned between two halves of chamber, then tighten clamp screw firmly.

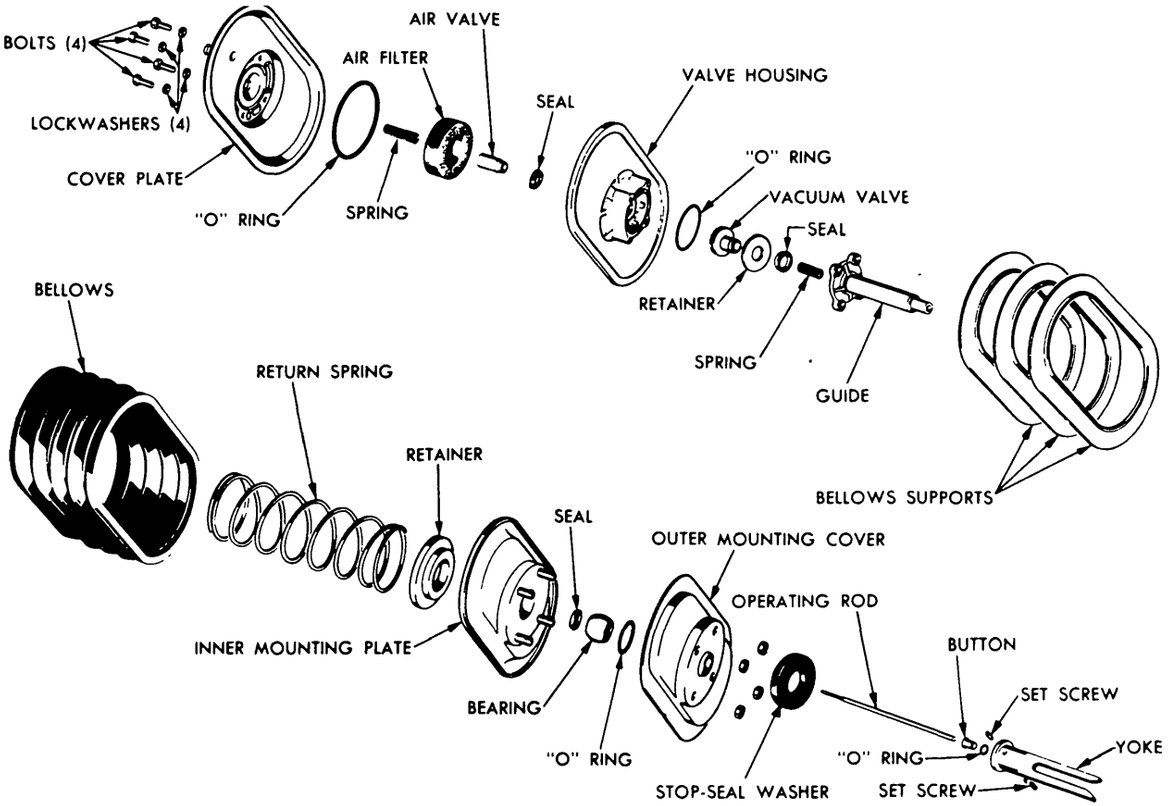
7) Assemble check valve, then install it in inner body of chamber. Install a new seal on slip end of bypass tube, then install tube in outer body of chamber and control valve. Tighten nut on control valve body firmly.

CHRYSLER, DE SOTO, DODGE PLYMOUTH "BELLOWS TYPE" POWER BRAKE

Chrysler & Imperial, All Models (1956)
D Soto, Dodge, Plymouth, All Models (1956)

►CHANGES, CAUTIONS, CORRECTIONS

► *1956 BRAKE PEDAL RETURN SPRING & CONTROL VALVE SPRING PRODUCTION CHANGE (To Improve Low Temperature Operation):* New "Kelsey-Hayes" Power Brake Unit No. 1731216 replaces Unit No. 1637814. New Unit identified by daub of green paint on front outer bellows cover plate. It includes a New Control Valve Spring No. 1676486 and requires the use of New Pedal Return Spring No. 1730077. Both springs are painted green and must be used together. Use Pedal Return Spring painted black with power units not daubed with green paint.



DESCRIPTION: This "Assist Type" power brake unit consists of an oval shaped air-vacuum bellows, control valve, and push rod. A control valve operating rod extends through the push rod and actuates the brake unit control valve. The unit is mounted on the engine side of the dash panel and is connected mechanically to the brake pedal linkage. A trigger arm on brake lever operates the control valve through the valve operating rod. In the event of power failure, normal manual brake action is assured as the brake pedal lever pin is free to slide in slot of power piston rod yoke when brake pedal is depressed.

OPERATION: Vacuum from the intake manifold is applied to unit, and air is evacuated from the air-vacuum bellows through the vacuum valve during brake application. When brakes are released, air (atmosphere) enters the unit through the built in air cleaner and is regulated by the air valve. The valve operating rod, which is controlled by the pedal, overcomes the spring pressure of the air valve and keeps atmospheric pressure inside the air-vacuum bellows. The return spring extends the bellows completely whenever brakes are not applied.

ADJUSTMENT & TROUBLE SHOOTING: *See "Power Brake Pedal Linkage Adjustment (following).*

REMOVAL: *(CAUTION – Before removing brake unit, place a wood wedge between brake power lever and the forward edge of triangular opening in brake pedal lever bracket to prevent trigger arm from extending through hole in dash panel which would cause damage to trigger arm).* Remove the nuts and lockwashers mounting unit to dash panel. Pull unit and mounting plate straight out and away from panel, using care not to lose the nylon bushings on pedal linkage pin which engage power unit yoke.

DISASSEMBLY: 1) Remove nuts attaching mounting plate to power unit and remove plate. Remove and discard "O" ring on mounting plate. With an Allan wrench loosen the two setscrews and remove yoke from power unit shaft. Discard the valve operating rod bottom seal.
2) Remove nuts attaching outer mounting plate. Using a screwdriver, gently pry up plate to loosen, and remove plate. Discard "O" ring seal. Compress bellows by hand sufficiently to remove the guide bearing. Remove and discard seal from inside bearing. Peel back outer lip of bearing completely around inner mounting plate (keep one hand on inner plate to keep it from snapping up). Remove plate and lift out return spring and retainer.
3) Place unit on its side and remove bolts and lockwashers attaching valve cover to valve. Lift off valve cover (if necessary, use a flat blade to separate cover plate from bellows flange). *(CAUTION – Use extreme care to avoid marking or scratching inner face of plate where it contacts bellows flange).* Remove "O" ring from valve cover and discard it. Remove air valve spring from center of valve, then remove the air filter. Slide air valve out of valve housing *(NOTE* – It may be necessary to make a small hook from a paper clip to remove valve).
4) Place valve housing end down on bench, then remove bellows from valve, by peeling back the outer lip of bellows. If a new bellows is to be installed, remove the three bellows supports. Remove bolts and lockwashers attaching guide to valve body. Lift out guide to expose vacuum valve, valve spring and seals. Discard seals. Remove vacuum valve and retainer and discard housing to guide seal. Invert valve housing and remove valve seal from its groove in valve body. *(CAUTION – If using a sharp instrument or point d pliers, be very careful not to mark or scratch inside diameter bore of valve housing).*

"BELLOWS TYPE" POWER BRAKE ASSEMBLY

REASSEMBLY: Clean all parts except bearing, bellows, and filter and blow dry with air. Bellows may be cleaned with mild soap and water if necessary. Inspect all parts for damage and replace all defective parts. During reassembly, use new "O" and seal rings.
1) Insert a new air valve seal into bore of valve housing (lips of seal facing out when installed). Carefully position a new vacuum valve in retainer. Invert valve housing and install valve and retainer. Press down firmly on retainer to snap in place. Position a new valve housing to guide seal in groove provided. Install a new vacuum valve seal in bore of guide, with lips of seal toward bottom of bore.
2) Install the vacuum valve spring in center of valve (smallest). Position guide over vacuum valve, lining up bolt holes in guide with bolt holes in valve body. Carefully lower guide down against valve body, making sure that tapered portion of vacuum valve enters seal evenly. Press down on guide to seat, then install bolts and lockwashers. Tighten evenly and securely. *(CAUTION – Be sur that count rsunk holes at end of guide line up with th long centerline of valve housing).*

CONTINUED ON NEXT PAGE

CHRYSLER, DE SOTO, DODGE, PLYMOUTH "BELLOWS TYPE" POWER BRAKE (C nt.)

3) If a new bellows is being installed, position the supports in bellows (bellows supports must be centered in the three center accordian folds and aligned with bellows and each other). Using holding fixture (made from a piece of four inch pipe) to support the guide and valve assembly, install the bellows. *(CAUTION – Be sure the arrows on edge of bellows and housing are aligned).*

4) With the bellows in the holding fixture, lightly coat the outside surface of the air valve with silicone grease (do not use any other kind), then insert the **small end first** into bore of valve housing. Use finger pressure to test for free movement of valve against vacuum valve spring. Install air valve spring in recess in air valve and filter. Install a new valve housing cover "O" ring on shoulder of valve body hub. Position valve cover over housing, with notch in edge of cover matching arrow on bellows. Be sure that air valve spring nestles on dimple in center of cover. Press cover down evenly over valve housing to seat cover "O" ring. Install bolts and tighten securely.

5) Remove assembly from holding fixture and invert unit. Coat guide lightly with silicone grease, then install return spring. Position the spring evenly around hub of valve housing and guide. Place spring retainer and inner mounting plate over spring, being sure that arrow stamped on plate is in line with arrow on edge of bellows. Compress return spring, then fold edge of bellows over edge of plate so it fits evenly around plate.

6) Install a new guide bearing seal in groove inside bearing bore (seal must seat snugly in bearing). Using silicone grease, lubricate inside of bearing, then slide over guide while compressing bellows, (bearing must be installed with lip of seal facing out). Push bearing down over guide and into pocket of plate. Release bellows (bearing will ride up guide with plate into position. Install the bearing to mounting plate "O" ring, then lower outer mounting plate down onto assembly (the notch in edge of plate must be in line with arrows on bellows). Install nuts and draw down finger tight.

7) Slide a new valve operating rod seal ring over nylon bumper on end of rod and into groove, then install rod in center of guide. Press on end of guide to test for free operation of air and vacuum valves (a "two-step" movement should be felt when rod depressed and released fully). Place a new stop seal washer in position and install yoke on end of guide. Compress bellows slightly, then alternately tighten set screws (hub of yoke must be down snug against shoulder of guide, with the setscrews aligned with tapered holes in guide). Tighten mounting plate nuts securely. Place mounting bracket in position, with long center line of bracket at right angles to long centerline of power unit. The off set of the bracket must be so that when installed in car, the axis of the unit will be inclined down toward front of car. Install lockwashers, nuts and tighten securely.

INSTALLATION: Be sure that unit is so placed that its axis inclines down toward **fr nt** of car and that vacuum inlet connection is toward engine. As the yoke passes through dash panel, be sure that it engages pedal linkage correctly by sliding over nylon bushings on power brake lever cross pin. Install mounting plate nuts and tighten securely.

CHRYSLER, DE SOTO "PISTON TYPE" POWER BRAKE

Chrysler & Imperial, All Models (1956)
DeSoto, All Models (1956)

►CHANGES, CAUTIONS, CORRECTIONS

► *1956 VALVE ROD & PEDAL RETURN SPRINGS PRODUCTION CHANGE (To provide more positive action):* New "Bendix" Power Brake Unit No. 1731217 replaces former Unit No. 1671546 and contains a new Valve Rod Spring No. 1676487, and requires the use of new Pedal Return Spring No. 1730077. Both new springs are painted green and must be used together. *NOTE - This new Unit No. is stamped on Air Cleaner Cover but is not the Air Cleaner Cover No.*

► *1956 INTERMITTANT BOOSTER ACTION CORRECTION:* Inspect booster valve rod at point where it contacts trigger arm. Wipe off all lubriplate, check to see that rubber dust shield is properly placed with 1/8" clearance between shield and nylon button. If sticking condition not corrected, replace Valve Rod Spring with Spring No. 1676487 (painted green) and Pedal Return Spring with Spring No. 1730077 (painted green). Both springs must be used together.

DESCRIPTION: The "Assist Type" power unit consists of a vacuum cylinder, piston operated push rod, and control valve assembly which is integral with piston assembly. The unit is mounted on the engine side of the dash panel and connected mechanically to brake pedal linkage through the power brake unit push rod. A valve operating rod within the piston rod is operated by a trigger arm on upper end of brake pedal lever. In the event of power failure, normal manual brake action is assured as the brake pedal lever pin is free to slide in slot of power piston yoke when brake pedal depressed.

OPERATION: With brake pedal released, both sides of vacuum cylinder piston are open to the atmosphere. Application of brake pedal causes vacuum port to open, forcing piston toward rear and exerting a thrust on power lever of brake pedal lever assembly which causes master cylinder to be applied. The amount of pressure exerted on master cylinder push rod is in proportion to distance brake pedal is depressed.

ADJUSTMENT & TROUBLE SHOOTING: *See "Power Brake Pedal Linkage Adjustment (following).*

REMOVAL: *(CAUTION – Before removing brake unit, place a wood wedge between power brake lever and the forward edge of triangular opening in brake pedal lever bracket to prevent trigger arm from extending through hole in dash panel which would cause damage to trigger arm).* Disconnect vacuum hose at power unit and remove complete power unit and bracket after removing the four nuts and lockwashers attaching it to dash panel.

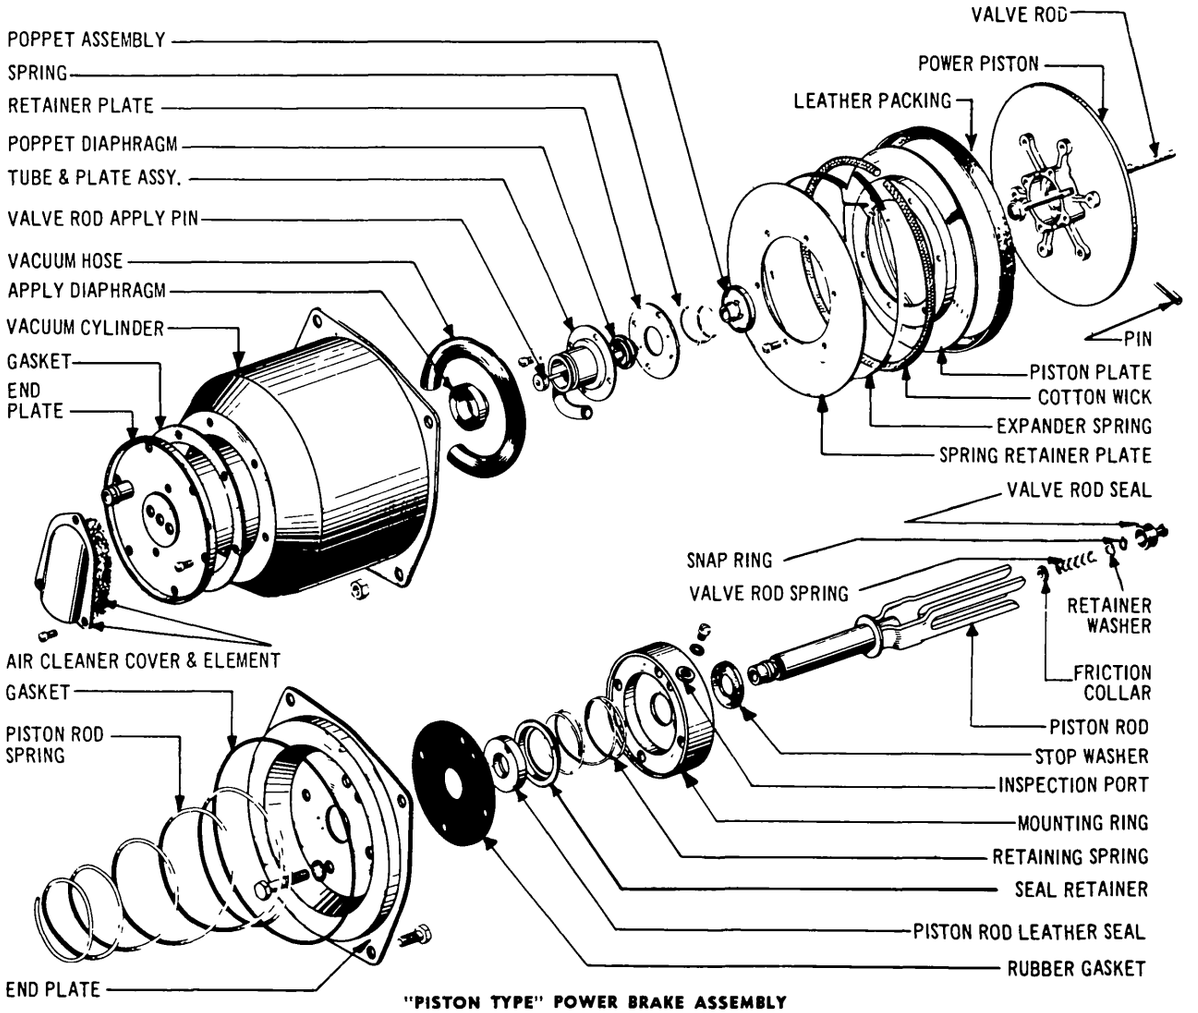
INSTALLATION: Position power unit on dash panel so that its axis inclines down toward front of car. As yoke passes through dash panel, be sure that it engages the pedal linkage correctly by sliding over the nylon bushings on power brake lever cross pin. Replace the attaching bolts and nuts and tighten securely. Remove wedge from pedal bracket.

DISASSEMBLY: *(CAUTION – Do not clamp piston rod or yoke in vise during service perations).* During disassembly of the power unit, scribe lines on all component parts before removing to insure correct reassembly.

1) Remove air cleaner cover screws, cover, and filter material. Remove tube plate screws and separate tube plate and gasket from cylinder. Slide end of hose from vacuum tube. Remove the four bolts and nuts from end plate and remove cylinder shell and rubber ring gasket. Remove hose from vacuum plate and rubber diaphragm from end of tube fitting. Using thin nose pliers, pull out diaphragm balancing pin. Remove tube and plate attaching screws, separate tube and valve poppet parts from piston plate. Separate plate, poppet spring, and diaphragm from poppet. From opposite end of assembly remove valve rod rubber seal. Remove snap ring, retainer washer, spring and friction collar. Remove valve rod from piston rod.

2) Drive out piston retaining pin from piston (part way) and note if piston is free on piston rod. If piston is free on rod, hold spring compressed while removing retainer pin from piston. If piston is tight on rod after retaining pin removed, use a 5/8" diameter brass rod with squared end to drive piston rod out of piston .

CONTINUED ON NEXT PAGE



CHRYSLER, DE SOTO "PISTON TYPE" POWER BRAKE (C nt.)

3) Separate piston rod, end plate and spring from piston, and remove rubber stop washer from piston rod. Remove bolts and lockwashers and separate mounting ring, seal retaining spring, washer, piston rod leather seal, plate, expander spring, wick, packing plate, and leather packing from piston plate.

REASSEMBLY: Wash all metal parts in Bendix Metaclene and all rubber parts in alcohol. Use air to blow out all passages. Inspect piston rod, valve seat at end of valve rod, or valve seat at center of piston plate and replace if scratched or nicked. Replace piston rod leather seal or piston leather packing if these parts worn excessively.

1) Assemble piston plate with threaded hole side up. Assemble leather packing on piston with lip side up. Place packing retainer plate on packing, with raised side up, and align holes in piston. Coil cotton wick inside of packing lip and cut wick to required length. Remove and dip wick in Bendix Vacuum Cylinder Oil. Let excess oil drip off, and again coil wicking inside lip of packing. Install expander ring inside of wicking, with gripper points next to wicking. Engage notch at loop end of spring with hook at opposite end of spring. Align holes in expander spring retainer plate with threaded holes in piston plate. Install screws and tighten securely.

2) Install inspection port screw and gasket, if screw was removed. Insert bolts and lockwashers through holes in end plate and assemble mounting ring rubber gasket over bolts. *NOTE*–Align gasket inspection hole with holes in mounting ring and end plate.

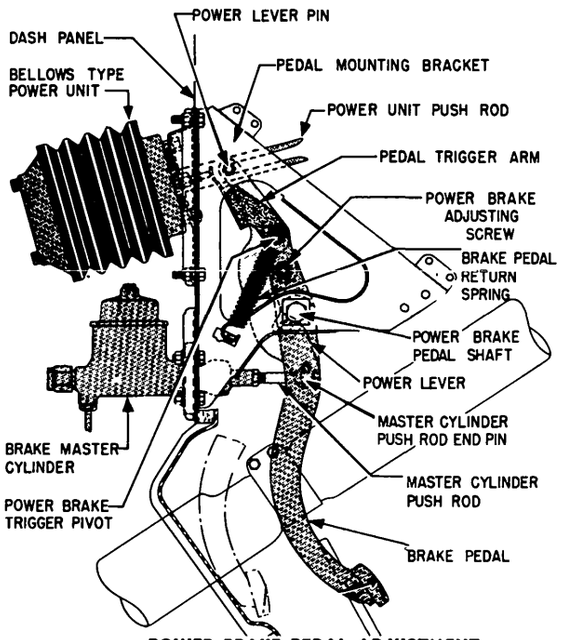
"PISTON TYPE" POWER BRAKE ASSEMBLY

3) Assemble new piston rod leather seal on gasket, with lip away from gasket, and center seal over hole in gasket. Place seal retainer over seal and install retaining spring. Coat bearing surface of mounting ring with silicone grease and assemble mounting ring on end plate, making certain inspection port hole in mounting ring lines up with hole in gasket. Thread bolts into mounting ring and tighten bolts. When bolts tight, outer rim of mounting ring should be in contact with end plate.

4) Slide rubber stop washer over piston rod up against steel washer on piston rod and insert rod through seal in end plate. Assemble piston return spring on end plate with large diameter end next to plate. Align slot in piston rod and vacuum test port in end plate. Align piston so that two of four threaded bolt holes in valve side of piston are in line with slot in piston rod. Press piston on piston rod up against shoulder of rod and install retaining pin.

5) Insert valve rod in piston until end of rod protrudes at opposite end of plate. Assemble friction collar, valve rod spring, and spring retainer washer over valve rod. Compress spring and install snap ring in groove in valve rod. *NOTE*–To aid in seal installation, turn seal partially inside out. Assemble small diameter end of seal over valve rod and assemble large diameter over end of piston rod.

6) Assemble small diameter of poppet diaphragm in recess of poppet assembly. Assemble poppet spring over diaphragm with small diameter end next to poppet plate. Assemble retainer plate over large diameter of diameter of diaphragm and center poppet on piston plate. Align holes in retainer plate with holes in piston plate. Place vacuum tube and plate on retainer plate and align. *CAUTION–Vacuum tube must be in lower left quadrant. Insert when the slot in pushrod is horizontal and vacuum test port is upward and approximately 22½° to right of end plate centerline, regardless of the scribe marks on tube plate and piston.*



7) Make certain that bead at outer diameter of diameter of diaphragm is in annular groove of tube and plate assembly. Replace tube and plate attaching screws and tighten securely and uniformly. Assemble valve rod applying diaphragm over end of tube and plate assembly. Slide vacuum hose on tube approximately 5/8", and coil hose so it is parallel to piston plate. Place new rubber gasket on end plate. Align vacuum cylinder and end plate to scribe marks. Install bolts and nuts (insert bolts through end plate and into cylinder flange) and tighten securely.

8) Place new gasket on end of vacuum cylinder. Align tube plate and vacuum cylinder scribe marks, and slide vacuum hose on vacuum tube approximately 5/8". Assemble four plate attaching screws. Align cleaner cover with tube plate and install screws. Tighten uniformly. Insert air cleaner material into opening at bottom of air cleaner cover.

CHRYSLER, DE SOTO, DODGE, PLYMOUTH POWER BRAKE PEDAL ADJUSTMENT

ADJUSTMENT: Pedal Trigger –(*NOTE* – This adjustment is made with the brake pedal assembly removed from car). Install Gauge C-3508 (plastic material with scribed lines) over power lever pin, positioning center lines of gauge on center line of power brake lever. Position power brake adjusting screw so arrow on head of screw is pointing toward trigger pivot pin. Using a screwdriver, wedge the power brake pedal pivot to rear side of hole in power lever until the adjusting screw collar is compressed and metal to metal contact is made. With gauge installed and adjusting screw collar compressed, the outer curved surface of trigger arm must contact the inner circle scribed on gauge (distance between center line of power brake lever cross pin and outer curved surface of power brake pedal trigger arm must be .640" ± .005". If position of trigger arm not correct, adjust by turning power brake adjusting screw until trigger arm outer surface is aligned with inner circle of gauge. Tighten adjusting screw securely after correct adjustment made.

Arc of Trigger Arm - Install gauge, Tool C-3508 on power lever cross pin. With wedge removed and trigger arm-to-power brake lever cross dimension adjusted correctly, outer surface of trigger arm must contact outer circle of gauge within the angle scribed on gauge. NOTE - With pedal assembly clamped in vise, it will be necessary to move power lever (by hand) to locate trigger arm on outer circle of gauge. Carefully bend trigger arm to specifications or replace arm assembly. New trigger arm must be checked for correct arc.

POWER BRAKE PEDAL ADJUSTMENT

Pedal Free Play: Check adjustment as follows: Remove vacuum hose from power brake unit and press brake pedal several times to eliminate all vacuum in unit. Insert a screwdriver blade between rubber collar of power brake trigger pivot and rear side of elongated hole in power brake lever, forcing them apart *(NOTE – If brake pedal lever and power brake lever are not held apart, a false free play setting will be obtained).* Check the free play with linkage in this position by pushing lightly at pad end of brake pedal. Pedal free play should be between 1/16" & 1/8" (Dodge & Plymouth), 1/32" & 1/8" (Chrysler & DeSoto). Adjust as necessary by shortening or lengthening the master cylinder pushrod.

TROUBLE SHOOTING: If operation not satisfactory, correct by turning adjusting screw not more than 90° either way from original setting as follows:

Slow Pedal Release: Rotate adjusting screw counterclockwise.

Time Delay During Fast Application: Rotate adjusting clockwise.

Pedal Vibrates (Unit Chatter): Rotate adjusting screw counterclockwise.

CAUTION - Adjusting screw should not be turned more than 90° from vertical (arrow up).

DODGE & PLYMOUTH "SAFEGUARD"

Dodge, 6 Cyl. D-62-1, 2 (1956)
Dodge, V8 D-63-1, 2, 3 (1956)
Plymouth, All 6 Cyl. & V8 (1956)

►CHANGES & CORRECTIONS

► *1956 PLYMOUTH MASTER CYLINDER COVER BOLT CAUTION:* New replacement covers use ¼" shorter bolt with less body length. New bolt Part No. 1671571. DO NOT use original type cover bolt with new replacement covers (Bolt will bottom before cover tight).

DESCRIPTION: Two-cylinder (front wheels), single double-acting cylinder (rear wheels), hydraulic type of same design as used on previous models.

ADJUSTING & SERVICING: *See "Chrysler-Lockheed Safeguard" in Manual.*

Brake Pedal Adjustment: Adjust master cylinder pushrod to obtain 3/32" to 3/16" free play with master cylinder piston against stop. On Plymouth, distance between brake pedal and pedal stop should be .015-.030", which will result in approximately 1/8" free play at pedal pad. *See Power Brake Note below.*

► *POWER BRAKE NOTE (Integral Power Unit):* Power Brake Unit has built-in pedal return spring and a pedal return stop, and **requires no free play adjustment.**

Minor Wear Adjustment: Turn adjusting cams(pull down on wrench handle) until shoe is locked against drum (Dodge), light drag (Plymouth). Back off cam just enough to remove all drag. Repeat adjustment for each shoe in all four wheels.

Major Brake Adjustment: Use adjusting gauge MT-19-K or feeler gauges and cutaway drum and adjust eccentric and anchor pin for each shoe to obtain .006" clearance at both toe and heel for all models.

► *CAUTION:* After adjusting brakes on one wheel, do not use same gauge setting for brakes on another wheel. Gauge must be set according to diameter of brake drum on **each** wheel.

Hand Brake Adjustment: Hand Brake is independent type mounted on drive shaft at rear of transmission. *See Car Model Pages and individual model Spec. Data Pages.*

BLEEDING BRAKES (With Integral P w r Unit): With outlet line to wheel cylinders connected loosely, attach pressure bleeder to reservoir, open bleeder screw on top of master cylinder, bleed unit until free of air, close bleeder screw, continue bleeding until no bubbles appear at outlet connection, tighten connection. If pedal not firm, bleed all wheel cylinders as on standard manual brakes.

BLEEDING BRAKES (Manual Brakes & with "B llows" or "Piston" Power Units): *See "Hydraulic Brake Servicing" in Manual.*

OVERHAULING BRAKE UNITS: *See "Hydraulic Brake Servicing" in Manual.*

TROUBLE SHOOTING: *See "Hydraulic Brake Trouble Shooting" in Manual.*

CHRYSLER, DE SOTO, DODGE "CENTER PLANE" BRAKES

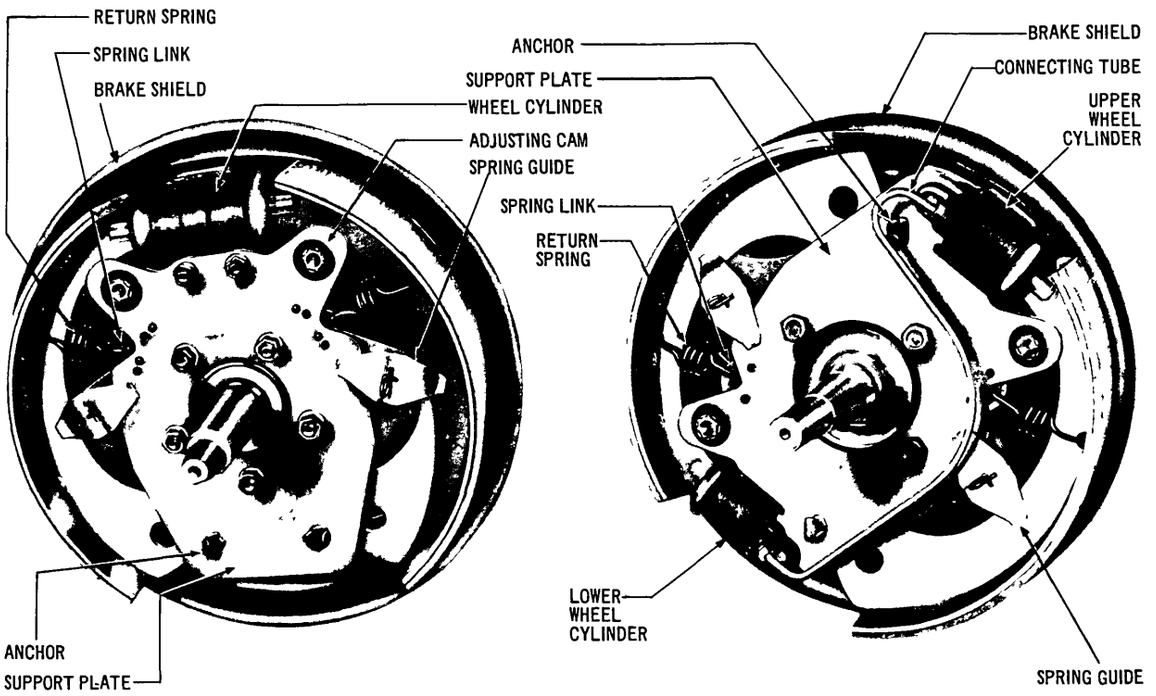
Chrysler & Imperial, All Models (1956)
DeSoto, All Mod ls (1956)
Dodge "500" (1956)

►CHANGES, CAUTIONS, CORRECTIONS

►*1956 BRAKE "SQUEAK" CORRECTION:* To correct brake squeaks or other brake noises proceed as follows:
1) Torque axle housing to rear spring U-bolt nuts to a specified torque of 65-80 ft. lbs.
2) Inspect for out of round drums, distorted support plates, or loose anchor pins. To correct loose anchor pins, remove support plates, check alignment, place support plate with the pin resting in vise, repeen end of pin until it is tight.
3) Torque the five rear wheel brake support to axle bolt nuts to 35 ft. lbs. The four front wheel brake support bolt nuts must be torqued to 55 ft. lbs.
4) Brake shoe guide spring, Part No. 1484680, which is held in place by the retainer, Part No. 1486945, must be very tight against brake shoe and support. Loose guide springs should be bent to restore their tension. The retainer must not exceed specifications of 15/32", measured between inside ends.

►*REAR WHEEL REMOVAL CAUTION:* **Do not apply s rvice brakes to hold shoes against drum while using whe l puller.** To hold hub and drum from turning while using wheel puller back off brake shoes from drum with adjusting cams. Apply hand brake and allow one rear wheel to remain on floor, or block wheel in suitable manner.

DESCRIPTION: "Center Plane" brakes have two floating shoes mounted between two plates located on the center plane of the lining. On front wheel brakes, two single piston cylinders (single action) are attached to the support plate assembly, the upper cylinder actuating the front shoe, and the lower cylinder actuating the rear shoe. On rear wheel brakes, one double piston cylinder (double action) is attached to the top of the support plate assembly and actuates both brake shoes. An anchor pin in support plate assembly holds spring link in a fixed position at one end. The other end of link is positioned by brake shoe adjusting cam, providing a constant-loaded spring length. Side rattle and twisting of shoe is controlled by spring guide, which maintains a constant pressure against side of web of shoe holding shoe against support plate.



ADJUSTMENTS: Place car on stands, so that all four wheels are free. Check master cylinder and see that fluid level is not over ½" below top of cylinder. Place parking brake lever in fully released position.
Brake Pedal Adjustment: Release locknut on brake pedal to master cylinder pushrod and rotate rod to obtain 1/32-1/8" free travel, tighten locknut.

Front Wheel Adjustment: Turn each adjusting cam on both front shoes in the direction of FORWARD wheel rotation until lining is solid against drum and wheel is locked. Turn adjusting cams slowly in opposite direction (each cam a little at a time) until no drag is felt.
Rear Wheel Adjustment: Turn front shoe adjusting cam in direction of **forward** wheel rotation and rear shoe adjusting cam in direction of **reverse** wheel rotation until lining is solid against drum and wheel is locked. Turn adjusting cams slowly in opposite direction until no drag is felt.
►*RELINED OR NEW SHOE ADJUSTMENT NOTE* – Apply brake pedal prior to adjusting brakes to properly center shoes in brake drum and to assist in adjustment.
Hand Brake Adjustment: Hand Brake is independent type mounted on drive shaft at rear of transmission. *See Car Model Pages and individual model Special Data Pages.*

BLEEDING BRAKE SYSTEM: Use compressed air refiller, Tool C-3496 attached to master cylinder to keep master cylinder filled. Back off adjusting cams all the way, then starting with right rear wheel cylinder, attach bleeder hose, Tool C-650 to valve, with other end in jar partially filled with brake fluid. Bleed intermittently, opening and closing valve (at wheel cylinder) until fluid runs out of bleeder hose in a solid stream without bubbles. Repeat this operation on left rear wheel, right front wheel and finally left front wheel. At front wheels (with two cylinders), bleed lower cylinder first to force air out of connecting line to upper cylinder, then bleed upper cylinder. Repeat bleeding operation if brake action indicates air still in lines. Readjust cams after completing bleeding operation.

BRAKE SHOE REPLACEMENT: Removal – 1) Remove wheel, hub and drum assembly using puller C-845 to remove drum assembly.
2) Insert wrench C-3462, in the inner support plate hole, with tool cam slot engaging the spring hook. Turn tool handle to disengage spring from spring link, and turn handle in opposite direction to release the spring. Remove both springs in this manner. *CAUTION* - Do not use brake spring pliers or damage to lining will result.
3) Turn brake shoe guide spring retainer 1/4 turn and remove (the lip on end of spring is for correct positioning on outer support assembly). Slide shoes from support assembly.
Installation: 1) Position brake shoe in support plate, (make sure that wheel cylinder pushrods properly engage toe end of shoes and that shoes are in alignment).
2) Check tension of springs which should be 70 lbs. plus or minus 5 lbs., installed length. This can be checked by hooking a scale at toe end of shoe and pulling shoe away from wheel cylinder. Scale should read 35-45 lbs., before contact is broken between web of shoe and wheel cylinder.

TROUBLE SHOOTING: *See "Hydraulic Brake Trouble Shooting" in Manual.*

Packard & Clipper, All Models (1956)
P ntiac, All Models (1956)

►CHANGES, CAUTIONS, CORRECTIONS

►*1956 BUICK BRAKE SQUEAK CORRECTION:* A new brake anti-squeak spring Part No. 1178586 replaces early spring Part No. 1345469. It is more effective in eliminating brake squeak due to increased tension. To install, remove wheel and tire assembly, hook spring ends together, place spring over upper edge of drum and hold in place while prying spring over balance of drum. Center punch drum at five equal distance points so that point of spring retainer clip will rest in depression. *NOTE* - Sand linings and true up drums as necessary.

►*1956 BUICK BRAKE PEDAL TWISTING CORRECTION (DYNAFLOW MODELS WITH MANUAL BRAKES):* On early 1956 Dynaflow models a bending or twisting of the brake pedal plate can be corrected by removing the brake pedal pivot locknut, bolt and pedal as well as the dash insulator retainer. Drill a 9/32" hole through the cowl using the unused hole in brake pedal bracket as a guide. Install a ¼" x 20 x ¾" bolt, washer and locknut and tighten to cowl panel.

►*1956 BUICK BRAKE DRUM REBORE CAUTION:* If brake drum does not clean up when rebored to diameter of 12.083" it must be replaced. Excess reboring will affect dissipation of heat and may cause distortion of drum.

►*1956 CADILLAC BRAKE (SQUEAL) PRODUCTION CHANGE:* Effective at Eng. No. 021493, paint eliminated from brake drum silence springs and from brake drum in vicinity of springs to reduce possibility of brake squeal.

►*1956 HUDSON WASP & HORNET 6 REAR WHEEL BRAKE CYLINDER PRODUCTION CHANGE:* Beginning with Serial No. W-9403 (Wasp), No. X-9204 (Hornet), the diameter of the rear wheel brake cylinder was decreased to 7/8" from 15/16" to improve brake distribution.

DESCRIPTION: Single anchor, "No-Eccentric", hydraulic type of same design used on corresponding previous models.

ADJUSTMENTS: Before attempting any adjustment, car should be placed on stands with all wheels free. Brake pedal should operate freely and there should be no bind in hand brake lever or cables.

Brake P dal Adjustment: This adjustment should conform with recommendations before any other adjustment is made. See car model below.

Buick - No pedal adjustment necessary. Pedal must return freely to fully released position (piston guide contacting bumper washer).

Cadillac - With power brake pushrod in fully released position, distance between front edge of groove in pedal-to-relay rod and toe-board should be 7/8"±1/16". Screw relay rod into or out of trunnion relay to obtain this distance.

Hudson & Nash–Pedal free travel should be ¼-½" with master cylinder piston against stop. Adjust at master cylinder pushrod.

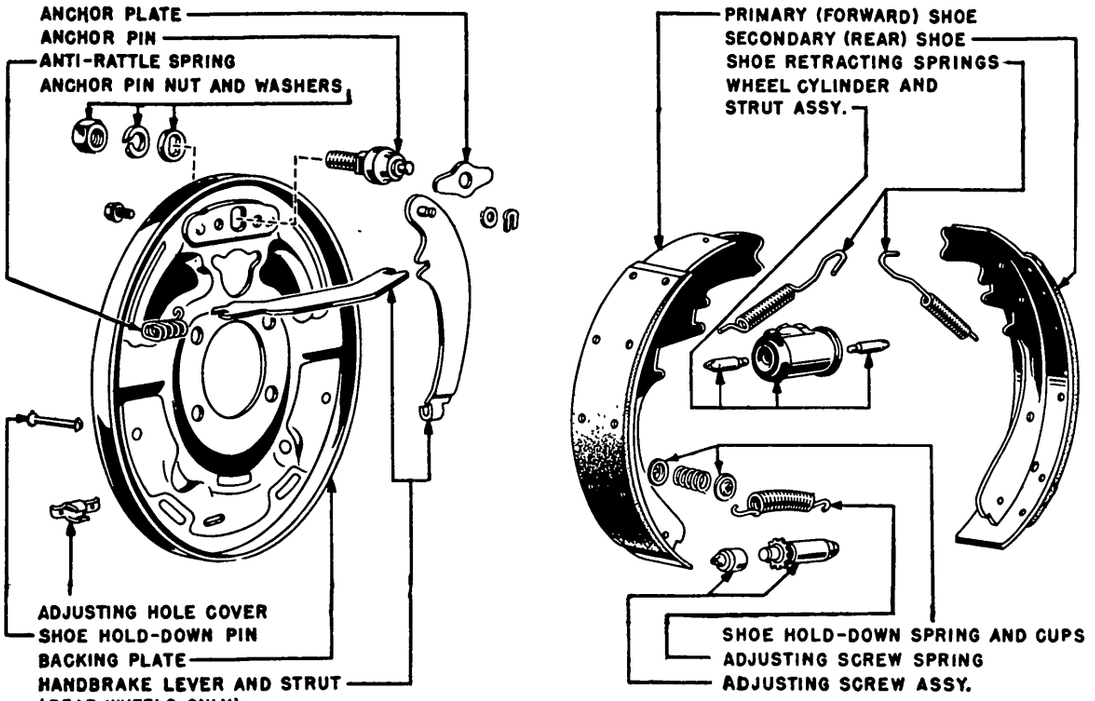
Oldsmobile–Adjust the master cylinder pushrod to obtain a minimum of 3/16" free travel. Pedal rubber bumper should be slightly compressed.

Packard–Brake pedal should have ¼" free play with master cylinder piston against stop. Adjust at master cylinder pushrod.

Pontiac–Brake pedal should have 4 3/8-4 5/8" clearance (distance from lower side of pedal pad to floor mat) with master cylinder piston against stop. Adjust at master cylinder pushrod.

Minor Wear Adjustment: Check and adjust brake pedal clearance (see Brake Pedal Adjustment), release hand brake lever, and see that cables are free and are not holding brake shoes against drum. At each wheel, expand brake shoes by turning adjusting screw up until wheel can just be turned by hand, adjust hand brake (cars where hand brake adjusted with shoes "expanded"-see Hand Brake Adjustment), then back off adjusting screw the number of notches or "clicks" as shown in table below. Check wheel for freedom of drag. If drag noted, tap backing plate to assist centralization of shoes, then recheck. If drag still exis ts, anchor pin adjustment may be in order. See Major adjustment.

Adjusting Scr w S tting



Buick	① 15 Notches
Cadillac	14 Notches
Hudson	14 Notches
Nash	14 Notches
Oldsmobile	16 Notches
Packard	②
Pontiac	14 Notches

①–17 Notches maximum.

②–Turn brake adjusting screw up until wheel can just be turned by hand, then back off screw until wheel turns free.

Hudson Mechanical Follow-up Cabl Adjustment: Disconnect cable from brake pedal and master cylinder piston pushrod from brake pedal. Place a 3½" spacer block between brake pedal rod pad and floor mat. Depress pedal rod until pad contacts spacer block; retain in that position and adjust the mechanical follow-up cable length at the clevis end so that the clevis pin can be installed freely with no slack in cable.

CONTINUED N NEXT PA E

BENDIX HYDRAULIC SINGLE ANCHOR BRAKE ASSEMBLY

BENDIX HYDRAULIC (Cont.)

Maj r Adjustm nt (For N w Shoes, Relined Brakes or when Minor adjustm nt not satisfactory): Jack up all four wheels, loosen or disconnect parking brake cables at equalizer or intermediate lever, remove adjusting hole covers on backing plate and inspection hole cover on drums (remove wheels for access). Check Pedal Clearance (see Brake Pedal Adjustment) Adjust each wheel brake as specified by car manufacturer, given below.

CAUTION–If hand brake cables not disconnected or loosened, shoes may be held "ON" by cables.

Buick–Turn adjusting screw up to expand shoes until wheel can just be turned with both hands (if wheel off, drum should just turn with long bar). Back off 15 notches. (Max. 17 notches). Wheels should be free at approximately 6 notches. If not it indicates need for anchor pin adjustment or tight parking brake cables

Anch r Pin Adjustment–Loosen the anchor pin nut just enough to permit anchor pin to slide in the slotted hole, *(CAUTION*–Loosening anchor pin nut too much will allow brake shoe spring to tilt pin), rap backing plate with hammer adjacent to anchor pin to insure anchor pin assuming central position between shoes, tighten anchor pin nut securely, then recheck drag. (If this has changed recheck anchor pin adjustment). Check and adjust hand brake (see Hand Brake Adjustment). Wheels should be free of any drag.

Cadillac–Loosen anchor pin lock nut ½ turn and tap anchor pin up with a hammer, then all the way down to bottom of its slot. Turn adjusting star wheel to expand brakes until wheel can just be turned with two hands Tap backing plate near anchor pin to raise it to a central position between shoes. Check brake drag If centering of anchor pin has released brakes, increase expansion of shoes and reset anchor pin again. Repeat until there is no change in drag with change in anchor pin setting, then tighten anchor pin to 80-120 ft lb. torque. Loosen star wheel 14 notches, place .015" feeler through drum slot at bottom and rotate wheel until feeler is wedged between secondary shoe and drum. Primary shoe will be tight against drum for measuring secondary clearance Reverse wheel rotation until 015" feeler is again at bottom and adjust star wheel to obtain .015" clearance. The clearance at top of shoe should now be .010". If upper clearance is greater or less than .010". loosen anchor pin locknut and reset anchor pin, tapping it up to increase clearance and down to decrease clearance. Reset clearance at lower end with star wheel and recheck upper clearance.

Oldsm bil - Expand shoes until heavy drag is felt on brake. Release all adjusting screws approximately 16 notches (until brake drums are free of drag) and replace adjusting screw hole covers. Move adjusting screw end at primary shoe against drum by inserting screw driver into slot provided in drum, then turn drum backward to force end of primary shoe against drum. Check clearance at anchor and adjusting ends of secondary shoes with .015" feeler inserted in brake drum slot. Clearance should be equal to within .002". If not adjust anchor and adjusting screw as required. *NOTE* - Clearance at anchor end should not be more than at adjusting screw end.

Pontiac - Insert a .015" feeler between lining and drum 1½" from adjusting screw end of secondary (rear) lining and expand shoes with adjusting screws until feeler gauge cannot be withdrawn. Back off adjusting screw until only a slight drag is felt on feeler gauge. *NOTE* - this ensures that shoes are against anchor pin and primary shoe is against drum. Withdraw feeler gauge and insert it between lining and drum about 1½" from anchor pin end of secondary lining. This should give slightly heavier drag than near adjusting screw. Adjust anchor pin to get this adjustment. Tighten anchor pin to 75 ft. lbs. Complete adjustment as shown in minor adjustment above, and hand brake adjustment below.

Eccentric Anchor Pin–Pin has square end and can be turned with a wrench after nut has been loosened. Turn pin in direction of forward wheel rotation to decrease clearance. End of anchor pin is beveled and high point indicates high side of eccentric cam. Hold pin with wrench while tightening nut.

Packard–Insert a .015" feeler gauge through inspection hole in drum at point 1½" above lower end of secondary shoe. Expand the adjusting screw (star wheel) until a slight drag is felt on the feeler. Remove feeler and insert a .010" feeler through inspection hole in drum at a point 1½" from upper end of secondary shoe. If clearance not within limits, loosen anchor pin locknut and adjust anchor pin. Turn anchor in direction of forward wheel rotation to decrease clearance. At the same time readjust the adjusting screw to maintain 015" clearance at lower end of shoe. Hold anchor in set position and tighten locknut Turn clearance adjusting screw (star wheel) until drum can just be turned with both hands, then back off screw until drum turns free

Hand (Parking) Brake Adjustment: *CAUTION–Brake shoes must be expanded on some cars when adjusting hand brake cables.* Adjust each car as follows

Buick - *CAUTION* - Do not attempt to adjust parking brakes by simply tightening adjusting nut at brake cable sheave. Pull on both ends of rear brake cable to make sure cables operate rear brake shoes freely and do not bind in conduits. Cable must be free in sheave and spring must return lever to fully released position. Adjust brakes at anchor and adjustment screw as described in minor or major brake adjustment. *NOTE* - When brake lever is in fully released position, signal switch plunger must be depressed 3/16". Adjust by loosening mounting screws and relocating switch.

Cadillac–Adjust the locknut on the equalizer link to obtain 1/8" clearance between the rear edge of the rear relay lever and end of slot in the frame X-member. **D n t expand r ar brak sh s.** Adjust the equalizer lock nut until the rear brake cables are taut. Attach spring scale to hand brake lever and apply a pull of 50 lbs. Measure the distance the hand brake lever has moved from its fully released position. This should be 2 1/8-2 3/8" or 7 notches. Readjust cable tension, if necessary to obtain this amount of movement with 50 lb. pull. Recheck front cable for equalizer 1/8" clearance described above.

Hudson & Nash–Withdraw hand brake lever to rear to provide a 3½' clearance between hand brake lever handle and bracket face With lever in this position, tighten hand brake cable at equalizer to a point where rear brakes are fully applied. This will prevent possible brake drag To release parking brake, apply brake pedal pressure, turn the parking brake handle counterclockwise 70°, and push it into released position.

Oldsmobile - Release parking brake, and make minor brake adjustment if there is excessive brake pedal travel. Adjust front cable so that the intermediate lever is held from seating itself on end of the seat in left hand "X" member by ½". Adjust rear brake cables to remove all possible slack without moving brake shoes from released position. Distribute the adjustment between cables so that equalizer link is 90° to the propellor shaft when clevis pin installed. Lock clevis jam nuts and install cotter pins. Install clevis pins with head at top.

Packard–Tighten adjusting screws until wheel can just be turned by hand. Pull hand lever to first notch on ratchet Adjust clevis on hand brake cable so that the clevis pin can be easily installed without any slack in the cable. Release hand brake lever. Back off adjusting screw at each wheel until wheel turns freely. Apply hand brake and check equalization by turning each wheel by hand. If not equal loosen adjusting screw on the tighter brake. Replace hole covers and road test.

Pontiac–Apply hand brake to first notch and check equalization. Loosen adjusting screw of tightest brake if not equal. If more than a few notches are required, loosen clamp screws on spreader and pull downward on the tight side of cable. This should equalize cable. Tighten spreader clamp screws while hand brake lever is still in the applied position. Brake cables are sufficiently tight if rear wheels can barely be turned by hand with lever in the first notch. When lever fully released, wheels should turn freely with cable pulled down approximately 1½" by gripping cable midway between conduit and clearance hole through frame X-member. When adjusting rear end of front cable for close adjustment for tension, be sure to turn clevis on or off cable end but do not twist cable. Coarse adjustment is secured by selecting the correct hole in the spreader.

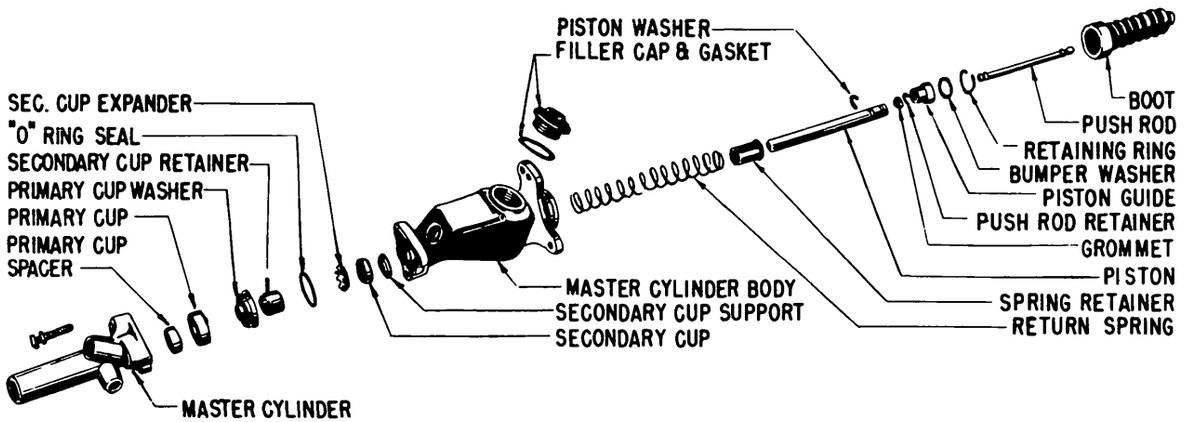
BLEEDING BRAKE SYSTEM & OVERHAULING BRAKE UNITS: *See "Hydraulic Brake Servicing" in Brake Section of Manual.*

► *BLEEDING POWER BRAKE NOTE* Bleed power brake master cylinder first by attaching bleeder drain hose to fitting on end of master cylinder, backing off fitting ¾ of a turn and bleed fluid into a partially full bottle of clean brake fluid until bubbles cease. Then proceed as for standard master cylinder.

TROUBLE SHOOTING: *See "Hydraulic Brake Trouble Shooting" in Brake Section of Manual.*

BUICK HYDRAULIC BRAKE MASTER CYLINDER

Buick, All Models (1956)



DESCRIPTION: This new master cylinder is a displacement type and is connected directly to the brake pedal by a pushrod. Pedal linkage adjustment is not required. The hydraulic check valve has been removed from the master cylinder to the junction block which is located inside of the front center cross member just behind the pitman shaft. The stop light switch is located on the left side of the master cylinder.

OPERATION: The operation of the displacement type master cylinder is similar to conventional master cylinders except that the piston travel is longer (4"), and the hydraulic brake fluid check valve is located in the brake line junction block. Fluid replenishment is provided in the usual manner from the master cylinder reservoir, which is integral with the master cylinder.

REMOVAL: Disconnect brake pipe from master cylinder and tape end of pipe to prevent entrance of dirt. Disconnect stop light wires from stop light switch and disconnect pushrod from brake pedal. Remove brake pedal. Remove screws holding steering column jacket rubber seal retainer to firewall and push it up on steering column jacket Pull floor mat away from toe pan and remove the toe pan Remove master cylinder attaching bolts and remove master cylinder

DISASSEMBLY: Remove toe pan from master cylinder (if car is equipped with synchro-mesh transmission, remove heat shield). Clean outside of master cylinder, remove filler cap and drain hydraulic fluid from reservoir. Place master cylinder in vise in vertical position with pushrod up. Remove boot from pushrod and using Truarc Ring Pliers, J-4245, remove retaining ring and guide bumper washer. Remove pushrod and piston from body. Remove return spring, retainer and piston washer. To disassemble pushrod from piston, insert piston into a 9/16" I.D. washer and support washer on jaws of vise. *(CAUTION–Protect piston with a cloth. Do not clamp piston in vise).* Hold piston and strike the pushrod with a soft mallet to drive piston out of guide. Remove grommet and pushrod retainer from end of pushrod. Turn cylinder with opposite end up and remove the bolts holding cylinder to body. Remove primary cup insert, cup, and spacer from cylinder. Remove primary cup washer, "O" ring, bearing, secondary cup retainer, expander, cup and cup support from assembly body. Discard primary cup, washer, "O" ring, bearing, secondary cup, expander, piston guide, grommet, retaining ring, boot, and filler cap gasket.

INSPECTION: Wash all parts in "Declene" or a good grade of clean alcohol *(CAUTION–Do not use gasoline, kerosene or mineral base oil).* Inspect all parts and replace any that are defective. Inspect pushrod bore and counterbore for pits, scoring, rust or dirt. Make sure that bore from reservoir to cylinder bore is clean and open. *NOTE–Bores of master cylinder body and nose piece may be cleaned and reconditioned with fine crocus cloth if not too deeply scratched. The piston is chrome plated and sand paper or emery cloth should never be used on its surface.*

BUICK HYDRAULIC BRAKE MASTER CYLINDER

REASSEMBLY: Place piston guide on pushrod and move to a position so that pushrod retainer and grommet can be installed on end of pushrod. Install piston guide on piston so that land of piston guide engages groove of piston. Install piston washer, spring retainer, and return spring on piston. Place pushrod and piston assembly in body and insert guide bumper washer and retaining ring. Replace boot on pushrod and turn cylinder so opposite end is up. Place secondary cup support, cup, expander, retainer, bearing, "O" ring, primary cup washer and insert in body assembly. Install primary cup spacer and primary cup in hydraulic cylinder. Bolt hydraulic cylinder to body and check filler cap vent holes to make sure they are clean, then install cap nut and gasket.

INSTALLATION: Reverse removal procedure, and bleed brake system.

BENDIX (LOCKHEED) SELF-CENTERING

Rambler (1956)
Willys, All Models (1956)

DESCRIPTION: "Self-centering" hydraulic type with non-adjustable anchor ramps for each shoe.

ADJUSTMENT: Before making adjustments, jack up all four wheels, check brake pedal clearance or free travel (see below), fully release hand brake and make certain that rear wheels are free, then adjust each wheel as follows

Brake Shoe Adjustment (For Wear or New Linings):
► *CAUTION Brake shoes must be "centralized" by several hard brake applications before adjusting.*

Eccentric Adjustment - Adjust eccentric for each brake shoe by turning eccentric out until brake shoe firmly applied and wheel is locked, then back eccentric off until wheel just rotates freely without drag. Shoe clearance will then be approximately .010".

Anchor Lip Adjustment - Pressure required to pull shoe outward from support plate should be 15 lbs. Measure with spring scale hooked in end of shoe. Adjust by bending anchor lip slightly toward brake support plate to obtain this 15 lb. coil spring pressure to hold shoes on support plate ledges.

Hand Brake Adjustment: Remove all slack from rear wheel brake cables as follows

Rambler - Withdraw hand brake lever to rear to provide a 3½" clearance between hand brake lever handle and bracket face. With lever in this position, tighten the hand brake cable at equalizer to a point where rear brakes are fully applied. This will prevent possible brake drag.

Willys (Except Jeep) - Pull hand lever "on" three notches, loosen front nut on connecting link between intermediate lever on frame cross-member and rear cable equalizer, tighten rear nut on link until slight drag noted at each rear wheel, then tighten front nut to lock adjustment. Release hand lever and check rear wheels for freedom from drag.

CJ5, 6 & 3B Jeep - Hand brake is independent type.

Brake Pedal Adjustment: Adjust master cylinder pushrod by loosening locknut and turning rod for following pedal free travel with master cylinder piston and pushrod back against stop

Brake Pedal Free Travel	
Rambler	¼-½"
Willys	½" min.

BLEEDING BRAKE SYSTEM & OVERHAULING BRAKE UNITS: *See "Hydraulic Brake Servicing" in Brake Section of Manual for complete data.*

TROUBLE SHOOTING: *See "Hydraulic Brake Trouble Shooting" in Brake Section of Manual.*

WAGNER-LOCKHEED SELF-CENTERING

Stud baker, All Models (1956)

►CHANGES & CORRECTIONS

►*FRONT WHEEL SECONDARY LINING NOTE:* Front wheel secondary lining is ¼" thick (3/16" on all other shoes), and is pre-ground off-center at the factory to eliminate brake squeal. This lining is applied to the full length of the shoe, and is marked "Secondary" and "Top" and should be installed as marked.

DESCRIPTION: Wagner Lockheed Hydraulic self-centering and self-energizing type (with Bendix type brake shoe assemblies). Brakes are not self adjusting, and new adjustment procedure is required. New self-centering device used.

Self-centering Device—The upper anchor pin end of each brake shoe rests against a wedge-shaped anchor block which is mounted on fixed brake anchor pin (shoes do not contact anchor pin directly) so that the shoes are free to move radially. The wide edge of the anchor block is toward the top. When the brakes are applied, the lining surface pressure tends to force the shoe to adjust its position on the block and center itself in the drum. This centering action takes place on light, or heavy brake application and is continuous with drum expansion. The anchor plate aids in keeping the shoes properly aligned at the self-centering block.

Adjusting Device—Consists of a "star wheel" adjusting screw and stud assembly mounted between the lower ends of the two brake shoes (similar to Bendix Duo-servo brake shoe assemblies). Adjusting screw spring serves a dual purpose, holding the shoes against notches of adjusting screw, and binding against ratchet on screw to serve as a screw lock.

ADJUSTMENTS: Place car on stands so that all four wheels are free. Check master cylinder and see that fluid level is ½" below top of cylinder. Place parking brake handle in fully released position. Adjust as follows:

Brake Pedal Free Travel Adjustment: Loosen locknut on brake pedal-to-master cylinder rod, turn master cylinder rod until free travel is ¼-3/8" (Manual brakes), or 1/8-¼" (Power brakes).

Brake Shoe Adjustment: Remove adjusting hole cover from backing plate, insert screwdriver or special adjusting tool through adjusting hole and turn adjusting screw to expand shoes until drum is just locked (pivot tool on edge of slot, move handle upward to expand shoes). Then back off the adjusting screw 8 notches or "clicks" (more if necessary) until drum is free of any drag. Replace adjusting hole cover, adjust parking brake.

Parking Brake Adjustment: Set control handle four notches from the fully released position. Adjust rear wheel cables at equalizer on frame side rail by backing off front nut and tightening rear nut until all slack is removed from cables and a heavy drag noted when rotating rear wheels by hand, tighten front adjusting nut. Release control handle fully and see that wheels are free of any drag.

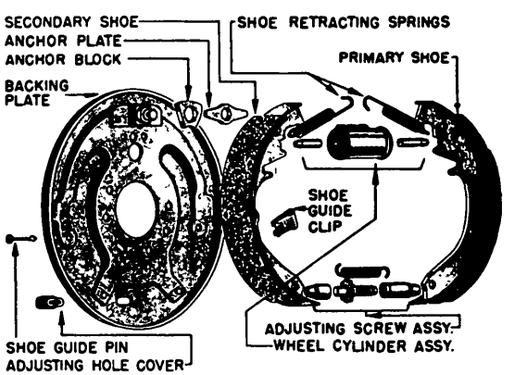
BRAKE SHOE REMOVAL & INSTALLATION:

Front Brake Shoe Removal: Place wheel cylinder clamp across cylinder boots. Remove adjusting screw spring and assembly. Hold guide pin against backing plate and remove clip. (Clip on the shoe whose return spring is on top at the anchor pin). Pull shoe out at end away from cylinder to release shoe from cylinder push rod. Move shoe away from backing plate off anchor block to relieve spring tension. Remove spring and shoe. Repeat this operation for other shoe. If Tool J-1681 Remover and Replacer available, remove springs first, then clips, and spread shoes out of wheel cylinder push rods. Slip adjusting screw off shoes and remove adjusting screw spring.

Front Brake Shoe Installation: Lubriplate wear surfaces by backing plate. Check anchor block installation. The curved side must contact primary shoe and arrow must point toward primary shoe. Hook return spring on shoe table, with outer other end of spring on anchor block pin and shoe against anchor block. Move shoe down to pivot on anchor block and pin, start web into cylinder push rod, push shoe toward backing plate, stretching spring. Align guide pin holes and install pin and clips, with pin seated in clip. Hook other spring on other shoe and anchor pin, placing shoe web above cylinder push rod. Pull lower end of shoe away from spindle and slide shoe down on anchor block behind anchor block guide, inserting web in cylinder push rod at the same time. Install guide pin and clip. Spread shoes and install adjusting screw assembly and install spring. If Tool J-1681 Remover and Replacer available, hook adjusting screw spring and adjusting screw in position. Place shoes on backing plate, engage webs in cylinder push rods, install guide pins and clips. Install anchor block and guide and use tool to install springs. Remove Cylinder clamps. Rotate adjusting screw to fully released position, center shoes to aid in brake drum installation. Install drum and adjust wheel bearings. Adjust clearance as shown in ADJUSTMENTS above.

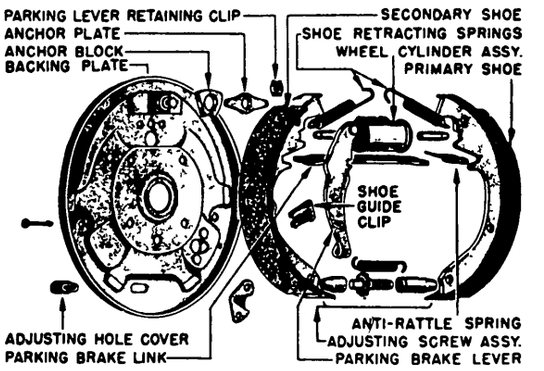
Rear Brake Shoe Removal: Install cylinder clamps, pull parking brake lever toward axle shaft and unhook cable. Spread shoes, disengage parking brake link, remove link and anti-rattle spring. Then follow procedure listed above for front brake removal. To remove parking brake lever from hole, remove spring clip and slip lever pin out of web. *NOTE*—The lever is mounted on outer side of web (Champion & Flighthawk) and inner side all other models.

Rear Brake Shoe Installation: Install parking brake lever with clip securely in place. Then install shoes as described for front shoes, above. Place anti-rattle spring in actuating link. *NOTE* - On Champion and Flighthawk, spring installed on end of link with largest offset. Insert link between shoes engaging front shoe with end having anti-rattle spring. Connect cable, remove clamps, install drums and adjust clearance as shown in ADJUSTMENTS above.



BLEEDING POWER BRAKE: *CAUTION* - This operation must be done with engine stopped and no vacuum in power brake system.

1) Fill master cylinder, open bleed screw at control body on power unit, depress pedal to expel air. Close screw before pedal reaches toe-board on final cycle. Repeat this procedure until solid fluid, free of bubbles comes from bleed screw. Keep master cylinder supplied during operation.



2) Using same method bleed at bleed screw located on hydraulic end cap of power unit, then proceed to wheel cylinders.

BLEEDING BRAKE SYSTEM & OVERHAULING OF MASTER CYLINDER & WHEEL CYLINDERS: *See "Hydraulic Brake Servicing" in Brake Section of Manual.*

TROUBLE SHOOTING: *See "Hydraulic Brake Trouble Shooting" in Brake Section of Manual.*

REAR BRAKE ASSEMBLY

FRONT BRAKE ASSEMBLY

WAGNER-LOCKHEED SELF-CENTERING BRAKES

CHEVROLET-BENDIX HYDRAULIC

Chevrolet Pass. Cars, All Models (1956)
Chevrolet Corvette (1956)
Chevrolet Trucks, All Models except 1½ & 2 Ton
Rear Brakes (1956)

►CHANGES, CAUTIONS, CORRECTIONS

►*PASS. CARS & HALF TON BRAKE SHOE GRINDING CAUTION*· If bench type grinder used, grind shoes to 057- 087" smaller diameter than drum size If spindle type grinder used, grind shoe to drum diameter

►*POWER BRAKE NOTE* Bendix Power Unit optional on passenger cars. Hydrovac Power Unit optional on trucks. *See "Bendix Power Unit" or "Hydrovac Power Unit" under Power Brakes.*

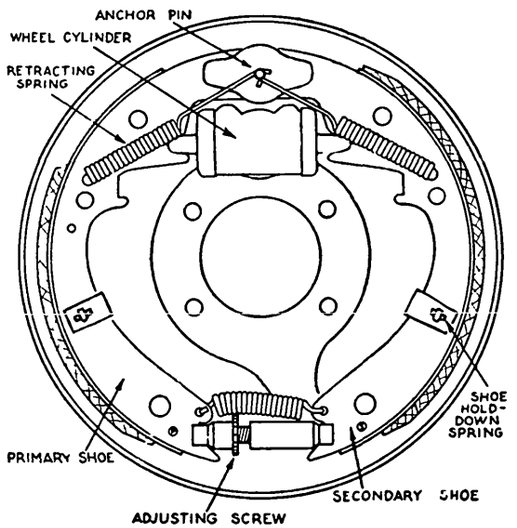
DESCRIPTION: Duo-Servo, single anchor, hydraulic type without eccentric adjustment

ADJUSTMENT: Adjustments are made differently for wear (Minor Adjustment) and for new lining or shoe assemblies (Major Adjustment). Major adjustment should also be made whenever a minor adjustment is not satisfactory.

Brake Pedal Adjustment: Before adjustments made, make sure pedal returns to fully released position freely, with no binding, and that pedal retracting spring has not lost its tension

Passenger Cars–1/16' pedal movement before contact of pushrod and main cylinder piston. To adjust, loosen check nut on clevis. Turn pushrod in proper direction to secure adjustment. Tighten check nut on clevis

Trucks (Forward Control)–¾' clearance between top of pedal arm and toe board. To adjust, loosen check nut at rear of clevis on main cylinder pushrod. Turn main cylinder pushrod by knurled portion ahead of boot, in proper direction to secure desired clearance. Tighten check nut.



Trucks (Others)– 1¾' (Low Cab Forward), 11/16" (Others except Fwd. Control), clearance between upper corner of lower pedal arm and seal around upper pedal arm in toe board. To adjust, remove cotter pin and loosen castle nut on adjusting bolt, then rotate adjusting bolt in required direction to obtain desired clearance, tighten adjusting bolt nut, recheck clearance, reinstall cotter pin in adjusting bolt nut.

Minor Adjustment (For Wear): Jack all wheels clear of floor. On passenger cars, loosen check nut at brake cable equalizer to remove tension from brake cable. On trucks, disassemble clevis of parking brake pull rod. On all cars and trucks, remove adjusting hole covers from flange plates. Expand brake shoes by turning adjusting screw with Tool J-4707 until a light uniform drag is felt on brake drum (move outer end of tool toward center of wheel to expand shoes). On passenger cars and ½ Ton truck, turn adjusting screw in opposite direction 7 notches to relieve brake drag. On all other truck models, back off adjusting screw just enough to eliminate drum drag (not to exceed 7 notches). *(NOTE*– If more than 7 notches required to eliminate drag, a Major Adjustment is required). Replace adjusting hole covers. Reconnect and adjust parking brake (see Hand (Parking) Brake below). Check brake pedal clearance (see above).

Major Adjustment (New or Relined Shoes)· Pass. Cars & ½ Ton Trucks and Trucks (other than ½ Ton) adjusted differently *See "Pass Cars & ½ Ton Brake Shoe Grinding Caution" above*

Pass. Cars & ½ Ton Trucks - Same as Minor Adjustment above *See "Pass Cars & ½ Ton Truck Caution" above*

¾ & 1 Ton (All Brakes), 1¼ & 2 Ton (Front Brakes): Loosen anchor pin nut just enough so that pin can be rotated (*CAUTION*–if nut loosened too much, brake springs will tilt anchor pin). With tool J-4707, turn brake adjusting screw to expand brake shoes until a heavy drag is felt on the drum. Tap brake flange plate and turn eccentric pin in direction tending to reduce drag by allowing shoes to center in drum. If drag on drum is reduced, expand shoes by tightening adjusting screw several more notches and again turn eccentric anchor pin while tapping brake flange plate Repeat this operation until drag remains constant. Then tighten anchor pin nut to 60-85 ft. lbs. torque (¾ Ton Front & Rear Brakes, 1 Ton Front Brakes), 125-150 ft. lbs. torque (1 Ton Rear Brakes, 1½ & 2 Ton Front Brakes). Back off adjusting screw just enough to eliminate drag but **not more than 7 notches.** If more than 7 notches required to eliminate drag, repeat adjustment procedure. Adjust parking brake (below). *NOTE*–If heavy intermittent drag noted, brake drums should be rebored and new linings installed.

FRONT BRAKE ASSEMBLY

HAND (PARKING) BRAKE· Passenger Cars and ½ & ¾ Ton Trucks adjusted differently 1, 1½, 2 and some ¾ Ton Trucks have propeller shaft mounted parking brakes *CAUTION*–Service brakes must be properly adjusted before making parking brake adjustment.

Adjustment (Pass. Cars): Jack up both rear wheels. Check clearance between idler lever and mounting bracket at equalizer (approximately ¼"). To correct, disconnect equalizer, tighten check nuts on forward cable. Pull hand brake out 7 "clicks" (not same as notches) Loosen forward check nuts on equalizer and tighten rear one until there is a slight drag on both rear wheels when rotating drums. Tighten check nuts securely Set parking lever back to 2 clicks from full release position, at which point no brake shoe drag should be felt

Adjustment (½ & ¾ Ton Trucks using cable connected to rear wheel service brakes) Jack up both rear wheels. If clevis of parking brake disassembled, place parking brake lever in fully released position, then install clevis to brake pull rod to obtain a dimension of 1 7/16' from end of pull rod to centerline of clevis. With parking brake lever in fully released position and pull back spring in place, adjust parking brake cable at idler lever to obtain a clearance of ¼" between idler lever and rear end of slot in guide. Pull hand brake lever back four notches from fully released position. Pull cables out of conduits by hand as far as possible and assemble cables into idler lever links Tighten nuts and locknuts. Pull back hand lever until heavy drag is felt at one wheel. Check other wheel for drag, and if any difference is noted, loosen tight wheel until equal drag is obtained. With hand lever pulled out nine notches both rear wheels should be locked so that they cannot be turned by hand. *NOTE*–If more than nine notches are required to lock brakes, check service brake adjustment

Adjustment (¾ & 1 Ton Trucks using propeller shaft mounted parking brakes) Place the hand brake lever in fully released notch of ratchet sector Loosen locknut on brake pull rod Remove cotter pin from clevis pin holding brake rod to brake cam (leave loose) Set brake cam rest flat on upper brake band bracket Back off adjusting nuts (at lower end of spring) and adjusting nut at top of adjusting bolt (bolt joins lower part of band to bracket) *(CAUTION*–Do not remove nuts, loosen only) Remove lock wire from anchor screw Adjust anchor screw until there is 010- 015"clearance between lining and drum at anchor screw Tighten adjusting bolt (bolt without spring) until there is 020" clearance between drum and lower end of brake band Tighten locknut Tighten adjusting nut at lower end of spring until there is 020" clearance between drum and upper end of brake band Tighten locknut Adjust brake pull rod so clevis pin can be installed while brake cam rests flat on upper brake band bracket Install cotter pin in clevis pin of brake pull rod and tighten locknut on brake pull rod Install lock wire on anchor screw Recheck all points of facing for correct clearances

Adjustment (1½ & 2 Ton Trucks): Use independent type *See "Chevrolet Twinplex" for data.*

BLEEDING BRAKE SYSTEM: *See "Hydraulic Brake Servicing" in Manual*

TROUBLE SHOOTING· *See "Hydraulic Brake Trouble Shooting" in Manual.*

BRAKE SHOE REPLACEMENT: *See "Chevrolet-Bendix Hydraulic" in 1954 Annual Data or later Manual edition.*

CHEVROLET TRUCK TWINPLEX

Ch vr l t Trucks, 1½ & 2 Ton (1956)- Rear Wheels Only.

►*BRAKE BOOSTER NOTE:* Hydrovac Power Unit Standard on 2 Ton and 1½ Ton Special Models, Optional on others.

DESCRIPTION: Two cylinder, four anchor type (each shoe anchored at each end and linked to wheel cylinder at each end). Brakes are radially self-centering.

ADJUSTMENT: Each shoe has one adjustment (adjusting screw at adjustable anchor end). Adjustment is same for both wear and for new or relined shoe clearance.

Brak P dal Adjustm nt: *See "Chevrolet-Bendix Hydraulic" for data.*

Brak Sho Adjustm nt: Jack up both rear wheels, remove adjusting hole covers from backing plates (two holes at each wheel—one for each shoe). Use tool J-4707 or screwdriver inserted through rear (lower shoe) adjusting hole and turn adjusting screw up (move outer end of tool toward center of wheel) until light brake drag is felt on wheel, then back off adjusting screw 3 notches for correct running clearance. Adjust upper shoe similarly by inserting tool through front adjusting hole.

Parking (Hand Brak) Adjustment: Parking brake is independent type mounted on propeller shaft at rear of transmission.

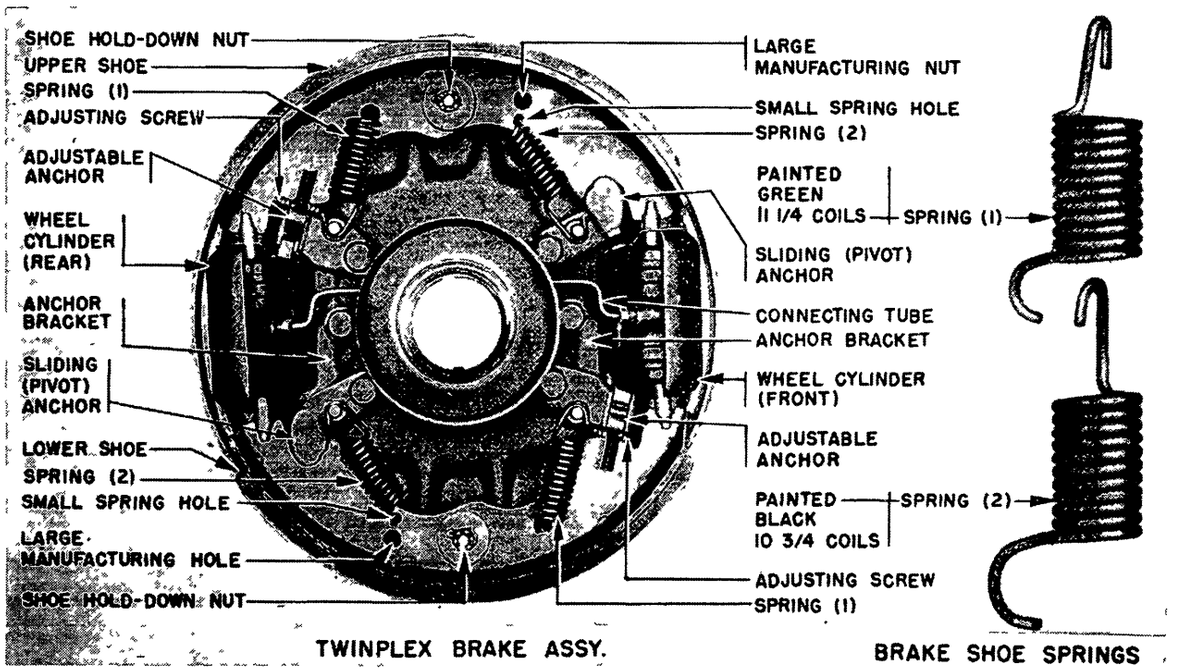
1½ & 2 Ton—Fully release brake lever. Loosen locknut on outer shoe adjusting screw then tighten to secure a clearance of .010" to .015" measured at point directly above screw. Tighten locknut. Loosen locknut on link between hand brake lever and shoe actuating lever. Tighten adjusting nut on link to secure a clearance of .010" to .015" between inner shoe and drum. Tighten locknut.

BLEEDING BRAKE SYSTEM: Pressure or manual methods can be used.

Pr ssure Bl ding: 1) Back off adjusting screw all the way on upper shoes of both rear wheels. Fill master cylinder reservoir to top of filler plug opening. Connect pressure bleeder to master cylinder and open valve in bleeder tank line. (*NOTE*—Bleeder tank should be charged with 25-35 lbs. air pressure and kept at approximately this pressure during bleeding operation. End of bleeder tube must be in a bleeder jar or bottle and covered with fluid while performing all bleeding operations).

2) Connect bleeder tube to bleeder valves in following sequence, open bleeder valve and bleed until all air bubbles disappear, then close bleeder valve. Sequence as follows:

a) Hydrovac slave cylinder (No. 2 bleeder valve on end cap). *NOTE*—Will take approximately ½ pt. of fluid.
b) Hydrovac valve (No. 1 bleeder valve on top of control valve).
c) Front, rear wheel cylinder on left side.
d) Front, rear wheel cylinder on right side.
e) Left front wheel cylinder (one only).
f) Right front wheel cylinder (one only).

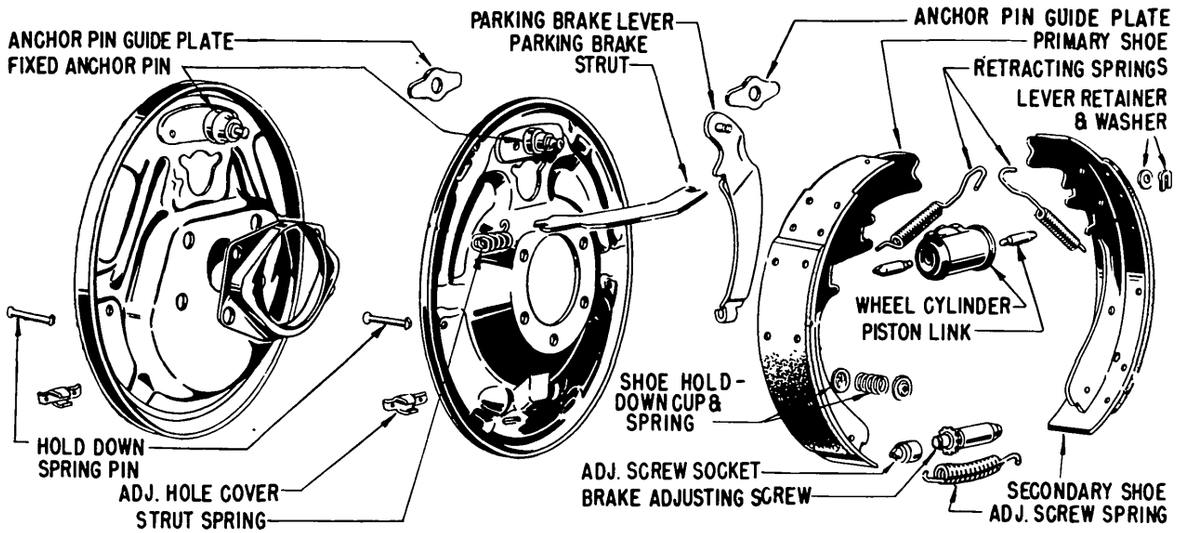


3) Adjust upper shoe on each rear wheel with pressure tank still connected. Push down hard on brake pedal several times to centralize shoes. Disconnect pressure tank and readjust all brake shoes..

4) Apply approximately 75 lbs. pressure on brake pedal and check pedal clearance from toe board to forward edge of pedal pad. Clearance should be a minimum of 5" with floor mat removed. If reserve less than 5", rebleed Hydrovac and rear brakes in sequence outlined above.

Manual Bleeding: 1) Install adapter and automatic filler J-713. Connect bleeder tube to Hydrovac bleeder valve No. 2 (on end cap). Place end of tube in container having sufficient fluid to cover end of tube.

2) Open bleeder valve approximately ¾ of a turn, depress brake pedal a full stroke and allow it to return slowly, making sure end of tube is under surface of liquid in container. Continue operating pedal, refilling jar at master cylinder when necessary, until liquid emerging from bleeder tube is air bubble free. Close bleeder valve. Proceed to bleed system as outlined in steps **2) b)** through **f), 3) and 4)** under "Pressure Bleeding" above, using automatic filler in place of pressure tank.



TROUBLE SHOOTING: *See "Hydraulic Brake Trouble Shooting" in Manual.*

FORD, LINCOLN, MERCURY (BENDIX) BRAKE ASSEMBLY

►CHANGES, CAUTIONS, CORRECTIONS

► *1956 LINCOLN & CONTINENTAL BRAKE SQUEAL CORRECTION:* An anti-squeal spring, Part No. 51A-1140, is available for installation on outside of brake drum. Spring should be installed on a clean drum only.

► *BINDING BRAKE PEDAL CORRECTION:* Brake pedal spacer, Part No. LD-22483-A, is manufactured with large chamfers on the ends. If brake pedal shaft nut is over-tightened, ends of spacer tend to score side walls of the support, reducing side wall spacing and causing interference with brake pedal hub. Paint in this area can also be a contributing factor to interference. Replace worn or damaged parts. Reduce length of hub to provide fit but do not remove more than .020" or a rattle may develop.

► *1949-56 MERCURY BRAKE SHOE RETRACTING SPRING PRODUCTION CHANGE:* New oil-tempered spring (painted brown) Part No. B5A-2035-A released to improve spring action.

► *1955 FORD & THUNDERBIRD BRAKE LINING CHANGE & REPLACEMENT CAUTION:* Later cars have "shorter" Primary Shoe Brake Lining and modified brake shoes to reduce any tendency toward pulling or diving when brakes applied. This new primary lining should be installed only as sets and must not be mixed with previous longer lining. If new lining installed on old shoes, shorter end of lining must be toward anchor end of shoe and it will be necessary to drill two additional holes for rivets at anchor end of lining (use new lining as template in drilling holes). *NOTE* - Previous type lining can also be used on new shoes but also requires drilling of two holes. *Install first type (longer) or later type (shorter) Primary Linings only in sets and DO NOT mix linings.*

DESCRIPTION: Duo-Servo, single anchor, hydraulic type without eccentric (Front Wheel eccentrics used on 1955 cars have been discontinued). Anchor Pins on all models except Ford Trucks are FIXED and no Major Adjustment is required on these models.

ADJUSTMENTS: Before making any adjustments, jack up all four wheels, check brake pedal clearance (see below), fully release hand brake lever and make certain that all wheels turn free. Then adjust as directed below.

Brake Pedal Adjustment: Pedal must have more than 5/16" but less than 7/16" free travel (Ford Pass. Cars, Lincoln, Mercury); or more than 3/16" but less than 3/8" free travel (Ford Trucks), before master cylinder piston begins to move.

All Pass. Cars and Trucks - Loosen locknut on eccentric bolt attaching brake pedal to master cylinder push-rod and turn bolt for desired free play.

Minor (Wear) Adjustment: Remove adjustment hole cover, rotate adjusting screw until shoe begins to drag (Ford Pass. Cars & Trucks), or tight against drum (Lincoln & Mercury). Then back off adjusting screw until drum runs free (Ford Trucks), 10 to 12 notches (Ford Pass. Cars), 12 to 14 clicks (Lincoln & Mercury).

Major Adjustment (Ford Trucks with Adjustable Anchor Pin): Rotate drum until feeler slot is at lower end of Secondary (rear) shoe, then insert .010" feeler between brake shoe and drum, and rotate drum, moving feeler gauge up along secondary shoe until shoe assembly is wedged forward as much as possible. Turn adjusting screw until primary shoe contacts drum securely and secondary shoe is snug against feeler. Back off, adjusting screw to obtain .010" clearance 1½" from each end of secondary shoe. If .010" clearance cannot be obtained at both ends of secondary shoe, an anchor pin adjustment is needed.

Anchor Pin Adjustment - Loosen anchor pin nut just enough to permit moving pin up or down by tapping nut with soft hammer. *NOTE - DO NOT BACK NUT OFF TOO FAR AS SHOES WILL MOVE OUT OF POSITION WHEN NUT IS TIGHTENED.* Move anchor pin up or away from center of drum to reduce clearance at anchor end of secondary shoe, and down to increase clearance. Tighten anchor pin nut securely and recheck secondary shoe clearance.

Hand Brake Adjustment: All Pass. Cars & F-100 Truck - Adjust service brakes. With service brakes fully released, place parking brake lever in fully applied position. Equalizer should not touch frame crossmember. Adjust cable from control handle to equalizer lever as necessary. There should be no slack in parking brake cables with control lever in fully released position. To adjust, loosen locknut on equalizer rod, tighten adjusting nut to remove slack. Pull cables alternately to equalize tension on each through yoke, tighten locknut. *CAUTION* - Overtightening cables will pull rear brake shoes off their anchors.

Ford F-250, F-350, P-350 Trucks - These models have independent parking brake on propeller shaft at rear of transmission. *See "Ford Truck Self-Centering" Brake for adjustment data.*

BLEEDING BRAKE SYSTEM & OVERHAUL OF BRAKE UNITS: *See "Hydraulic Brake Servicing" in Brake Section of Manual.*

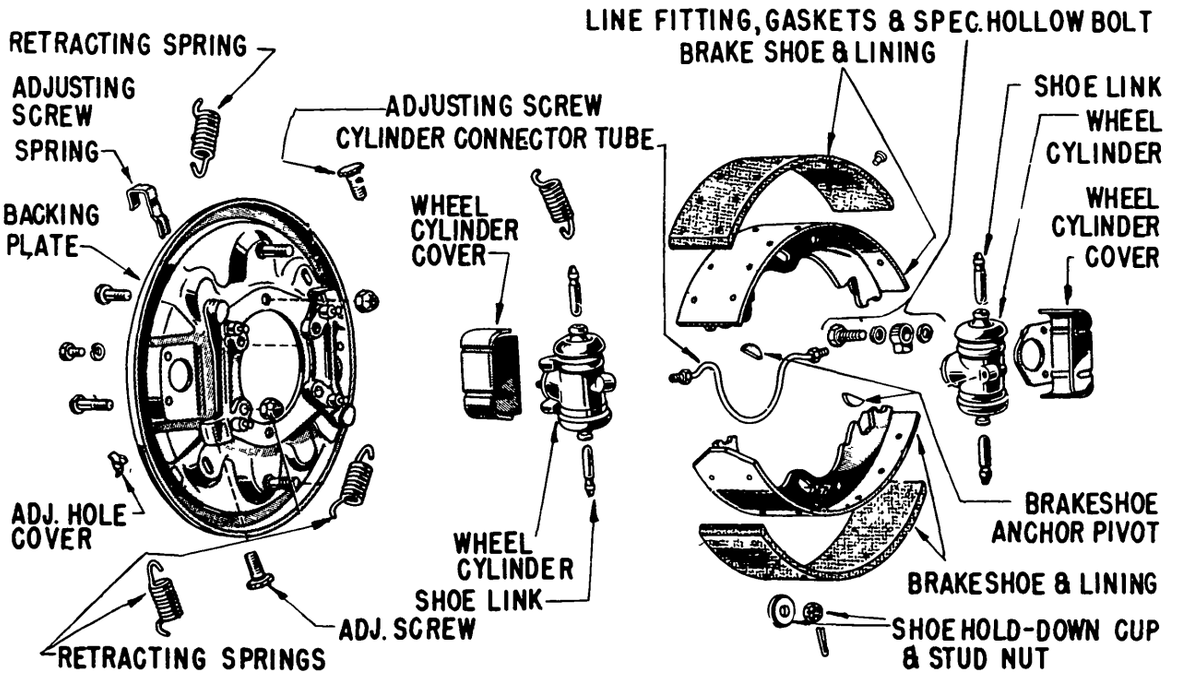
TROUBLE SHOOTING: *See "Hydraulic Brake Trouble Shooting" in Brake Section of Manual.*

FORD TRUCK SELF-CENTERING

Ford Trucks - B,C,F,P-500; B,C,F-600 (1956) Rear Brakes Only.

►CHANGES, CAUTIONS, CORRECTIONS

►*FRONT WHEEL BRAKE CAUTION: Ford-Bendix "Uni-Servo" type brakes used on front wheels of these models.*



►*POWER BRAKE NOTE: "Hydrovac" or "Midland Hi-Power" Standard or Optional on these trucks. See "Hydrovac" or "Midland Hi-Power" under Power Brakes.*

DESCRIPTION: Two-cylinder, two-shoe, four-anchor type hydraulic brakes. Each shoe is anchored at each end and linked to wheel cylinder at each end so that all shoes are self energizing for both forward and reverse motion. All shoes are radially self-centering.

ADJUSTMENT: Make adjustments with brake drums at normal temperature and with wheels either jacked up or contacting road (if wheels on road so they cannot be turned to check for drag, make this check by striking drum with a hammer - sound will be deadened if shoes contacting drum). Remove two adjusting hole covers on backing plate (adjacent to right hand anchor bolt at each wheel cylinder), insert tool through slot and turn notched adjusting screw "star wheel" until linings drag on drum, then back off adjusting screw until wheel is free of drag. Depress pedal to centralize shoes and recheck wheels. Adjust each shoe in each wheel in this manner. *NOTE* - When brake linings are replaced, an additional adjustment is required. Adjust shoe hold-down bolt until a clearance of .025" is obtained (measure from brake shoe to gauge surface on brake plate). Gauge surface is machined boss on brake plate which is in line with hold-down bolt.

Brak P dal Adjustment: Pedal must have at least 3/16" but not more than 3/8", free travel measured at pedal pad before master cylinder piston begins to move. To adjust, loosen locknut on brake pedal to master cylinder pushrod, rotate rod until free travel within limits, tighten locknut.

Parking Brake Adjustm nt: On cable controlled parking brakes, move parking brake lever to fully released position. On transmission mounted parking brake levers set lever to first notch. Observe position of cam to make sure flat portion is resting on brake band bracket. If cam not flat with bracket, remove clevis pin from upper part of cam, then adjust clevis rod to allow flat portion of cam to rest on brake band bracket. Install clevis pin and cotter pin. Remove lock wire from anchor adjusting screw, turn adjusting screw clockwise until clearance of .010" is established between brake lining and brake drum at anchor bracket. Loosen lock nut on adjusting screw for lower half of brake band, adjust screw to establish .010" between brake lining and drum at lower half of brake band. Tighten locknut. Turn upper band adjusting nut until .010" clearance established between upper half of band and drum. Be sure to install lock wire in anchor adjusting screw.

FORD TRUCK SELF-CENTERING BRAKE ASSEMBLY

DISASSEMBLY: *NOTE* - Brakes can be serviced without removing hubs or disturbing wheel bearings. Remove wheels, then screws holding drum to hub (mark drum and hub to insure correct assembly). *(CAUTION - If wheel cylinder connecting tubes and bleeder screws removed, mark ports to which tubes attached to assure correct reassembly).* Disassemble brakes as follows: Remove retracting springs with Tool 2035-N. Remove brake shoe hold-down screw, then brake shoes.

REASSEMBLY: *(NOTE* - For best results, new shoe and lining assemblies should have the lining of correct thickness ground to proper radius concentric with brake drum. If linings are not ground, it may be necessary to readjust the linings after the linings have been "worn in". Make sure no nicks or burrs are on shoe edge at point of contact with brake plate). Place light film of Lubriplate on primary (sliding pivot) anchor and shoe bearing surfaces on brake plate. Position brake shoes in anchors and in slotted ends of wheel cylinder. Apply light film of Lubriplate to hold-down screw, then install hold-down screw, washer and nut. Tighten hold-down nut until there is a clearance of .025" between center (of three) machined bosses on plate and edge of shoe. This clearance necessary to hold shoe parallel to drum or prevent shoe from binding against outer machined bosses. Install retracting springs (Tool 2035-N), wheel cylinder brake pipe, drum assembly, wheel. Adjust brakes.

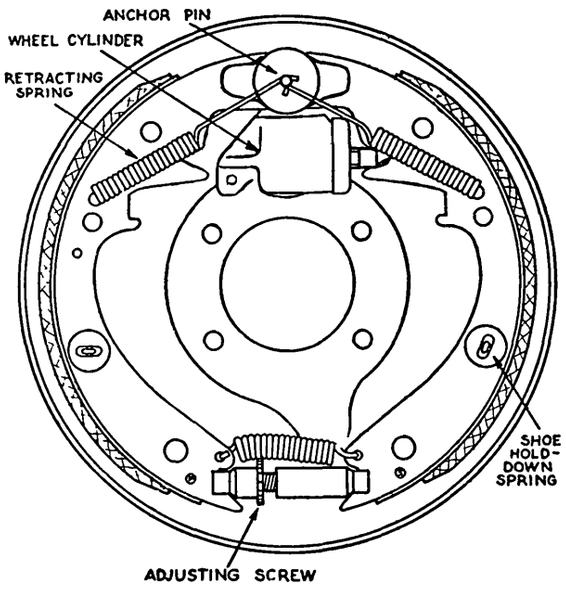
BLEEDING BRAKE SYSTEM: Bleed **top** wheel cylinder **first,** then lower. If power unit used, unit must be bled before wheel cylinders, with engine off and no vacuum in power unit system. *See "Hydraulic Brake Servicing" in Brake Section of Manual.*

TROUBLE SHOOTING: *See "Hydraulic Brake Trouble Shooting" in Brake Section of Manual.*

FORD TRUCK BENDIX UNI-SERVO

Ford Trucks—F-250; F, P-350; B, C, F, P-500; B, C, F-600 (1956) Front Brakes Only.

►*REAR BRAKE CAUTION: Different type brakes used on rear wheels as follows:*
F-250; F, P-350—"Ford-Bendix" Hydraulic, Duo-Servo type. *See "Ford, Lincoln, Mercury Bendix".*
B, C, F, P-500; B, C, F-600—Ford "Self-Centering" type. *See "Ford Truck Self-Centering".*



►*POWER BRAKE NOTE: "Hydrovac" or "Midland Hi-Power" Standard or Optional on these trucks. See "Hydrovac" or "Midland Hi-Power" under Power Brakes.*

DESCRIPTION: Bendix "Uni-Servo" single anchor, hydraulic type with single-acting wheel cylinder mounted on the backing plate and actuating the primary shoe through a strut (no direct connection to secondary shoe). Brake shoes are conventional Bendix type (joined by adjusting screw at lower end, single anchor between shoes at upper end with retracting springs hooked to each shoe and anchor pin). Wheel cylinder has single piston and cup with a return spring seated in the end of the cylinder.

ADJUSTMENTS: Make adjustments with brake drums at normal temperature and with wheels either jacked up or contacting road (if wheels on road so they cannot be checked for drag, make this check by striking drum with a hammer—sound will be deadened if shoes contacting drum).

Minor Adjustment: Remove adjustment hole cover from brake carrier plate. Rotate adjusting screw, with a suitable tool, until shoe begins to drag, then back off shoe until drum can be turned without drag.

Major Adjustment: Wedge primary shoe against the drum by inserting a .010" feeler gauge through slot in drum at center of secondary shoe and expand shoes by turning adjusting screw. Then adjust adjusting screw and anchor pin (slotted type) for .010" clearance at each end of secondary shoe (measure 1½" from each end of shoe).

UNI-SERVO BRAKE ASSEMBLY

Brake Pedal Adjustment: Brake pedal free travel should not be less than 3/16" nor more than 3/8" before push-rod touches master cylinder piston. Adjustable at master cylinder pushrod.

Parking Brake Adjustment: Set lever to first notch. Observe position of cam to make sure flat portion is resting on brake band bracket. If cam not flat with bracket, remove clevis pin from upper part of cam, then adjust clevis rod to allow flat portion of cam to rest on brake band bracket. Install clevis pin and cotter pin. Remove lock wire from anchor adjusting screw, turn adjusting screw clockwise until clearance of .010" is established between brake lining and brake drum at anchor bracket. Loosen locknut on adjusting screw for lower half of brake band, adjust screw to establish .010" between brake lining and drum at lower half of brake band. Tighten locknut. Turn upper band adjusting nut until .010" clearance established between upper half of band and drum. Be sure to install lock wire in anchor adjusting screw.

BLEEDING BRAKE SYSTEM & OVERHAUL OF BRAKE UNITS: *See "Hydraulic Brak S rvicing" in Brak Section of Manual.*

TROUBLE SHOOTING: *Se "Hydraulic Brake Tr ubl Shooting" in Brake Section of Manual.*

ℂ - Studebaker No.

S-M - Cars with synchro-mesh transmission.

DESCRIPTION: Single plate, dry disc type. Release levers formed with weight on outer ends which increases pressure on driven member as engine speed increases. Levers pivoted on pressure plate on needle bearings with fulcrum located in yoke support on cover plate. Hardened-steel screw contact provided on lever tips.

REMOVAL OF CLUTCH: *See "Clutch" on car model page.*

DISASSEMBLY, REASSEMBLY & ADJUSTMENT: *See complete "Long 9CF, 9½CF, 10CF, 11CF" Clutch in Manual and note following specifications*

Pressure Plate: Pressure plate refacing by grinding or turning down on lathe will throw release levers out of adjustment. If pressure plate being refinished remove .020" from face and install spacer washer .015" thick on release lever yoke under cover. *NOTE*–If washers are found on release lever yokes under cover when clutch disassembled, replace these washers (if old pressure plate used) or discard washers (if new pressure plate installed).

Release Lever Height (Front): Height should be within .031" of each other. Replace cover and pressure plate if not.

Clutch Springs: Pressure springs should check with table below. Replace springs if weak or burned or if clutch has been subjected to excessive heat.

① - Set release levers flush with bottom of gauge with offset of gauge 1/32" above hub (361362, 85, 91), 1/16" below hub (361361), flush with hub (950).
② - Set release levers flush with bottom of gauge using 3/16" step (361865), 1/8" step (361371), 1/16" step (361386).
③ - Set release levers flush with bottom of gauge using step marked 10" (361404), 10½" or 11" (361402, 3)
⑨ Set release levers flush with bottom of gauge
Setting - *See "Release Lever Adjustment (Without Fixture)" under "Borg & Beck Type A" Clutches in Manual.*

DRIVEN MEMBER: *See Car Model pages for Part Nos.*

BUICK (OWN)

►CHANGES, CAUTIONS, CORRECTIONS

1939-55 REPLACEMENT CLUTCH ASSEMBLY (Series 40 & 50): New "finger type" Clutch Assembly, No. 1392653, similar to 1956 Series 40 Clutch is furnished for service to replace previous "Crown Spring" Clutch No. 1393485 (used on 1939-55 Series 40 and 1940-52 Series 50). Individual parts are still furnished for Crown Spring Clutches. New Release Bearing should be used with this replacement clutch as follows

Replacement Clutch Release Bearing – When "finger type" clutch installed, it is recommended that new type Clutch Release Bearing, Buick Part No. 1310983, be used with this clutch. This bearing has flat face for release lever contact (previous type release bearing has rounded face).

►*CLUTCH EQUALIZER INTERFERENCE CORRECTION (Early Cars)* To correct, grind approximately 1/8" off end of equalizer and remove 1/4" off each end of reinforcement ridge. Correction has been made in later production cars.

►*CLUTCH RELEASE LEVER PRODUCTION CHANGE (Elimination of Release Lever Adjustment After 1st 5000 Cars)* First 5000 cars had release lever adjustment and can be identified by buttons threaded into inner ends of release levers. All later release levers have buttons welded into release levers and are not adjustable

DESCRIPTION: Single plate, dry disc type.

RELEASE LEVER ADJUSTMENT (1st 5000 Cars): Mount dial indicator on Support J-1013, set support on flat surface, press indicator stem down against surface until indicator hand has made one revolution, then tighten indicator to support and set indicator at zero. Place adjusting gauge, J 1036 on spare flywheel, then place clutch assembly on gauge so release levers are directly above machined bosses of gauge. Install cover bolts and tighten each one several turns at a time until all are uniformly tight Place support and indicator on machined hub of gauge so that indicator bears on adjustable button Indicator should read plus or minus .031" and release levers should read within .031" of each other. Adjust buttons to bring levers within limits. Stake buttons to release levers and recheck settings.

RELEASE LEVER CHECK (After 1st 5000 Cars - Non-Adjustable Levers): Proceed as in "Release Lever Adjustment" above. If variation between levers exceeds .031" or any part of clutch assembly is defective, clutch pressure plate and cover assembly must be replaced as a unit.

REMOVAL: *See "Clutch" on Car Model pages.*

OVERHAUL: Clutch cover and pressure plate serviced by replacement.

INSPECTION: Wash all metal parts of clutch, except release bearing and driven plate, in suitable cleaning solution.

Flywheel & Pressure Plate - Examine friction surface for scoring or roughness. Smooth with fine emery cloth, but if deeply scored or grooved, replace part.

Clutch Cover - Inspect cover for cracks or distortion. Check clearance between pressure plate driving lugs and edges of slots in cover with feeler gauges. Clearance should be .005- 008" (excessive clearance may cause rattle when engine intermittently accelerated with clutch disengaged)

Driven Plate - Inspect condition of facings, for loose rivets, broken or very loose torsional springs, and flattened cushion springs. Replace as required.

Driven Plate Run-Out Check - Slide driven plate, **front side first,** over transmission main drive gear until it is tight on spline, then set up dial indicator to bear against plate facing. While holding firmly against front end of main drive gear to take up play in main drive gear bearing, slowly rotate driven plate and observe amount of run-out. If run-out exceeds .025", replace driven plate. **Bearings** - Inspect for scoring or excessive wear on front contact face. Test for roughness of balls and races by pressing and turning front race slowly. Inspect main drive gear pilot bearing in crankshaft. Replace if rough or worn, using Puller J-164 for removal.

DRIVEN MEMBER: Long No CD873. Buick No. 1391632

CHEVROLET (OWN)

CHEVROLET MODEL	Clutch Assy. No.
Pass. Car, 6 Cyl	3836715
Pass Car V8	3836723
Pass. Car, All (Heavy Duty)	3836719
Commercial (6 Cyl. Exc. Fwd. Control)	3836715
Commercial (6 Cyl. Heavy Duty)	3836719

DESCRIPTION: Single plate "Diaphragm Spring" type of same design used on previous models.

Clutch Plate

Car Model	Part No.
Pass. Car 6 & V8, Comm. 6	3704776
Pass. Car 6 & V8, Comm. 6 Hvy. Duty	3702402

REMOVAL: *See "Clutch" on car and truck model pages.*

OVERHAUL: *See "Chevrolet (Own)" Clutch in Manual.*

INLAND

Pontiac V8 (1956)

DESCRIPTION: Single plate, dry disc type. Clutch cover and spring assembly is made up of the cover, pressure plate, drive release straps, and clutch spring (diaphragm disc type). Same design as previous models.

Clutch Cover & Spring Assembly: Pontiac No. 758513.

Clutch Driven Member: Pontiac No 518130. Long No. 284585

OVERHAUL: Clutch cover and spring assembly is of riveted construction. Manufacturer recommends replacement of clutch driven plate assembly and cover and spring assembly when servicing required.

ROCKFORD

Model 8½ RM

Model	Rockford No.
Willys, 4 Cyl. (1956) ①	165317

① - Auburn Clutch also used.

DESCRIPTION: Single plate, three-lever type with six springs positioned in pairs adjacent to levers

REMOVAL: *See "Clutch" on car model pages.*

DISASSEMBLY: *NOTE*–Clutch cover and pressure plate assembly need not be disassembled when replacing driven member unless springs are to be replaced or other work performed. To disassemble, place cover assembly in arbor press, compress cover sufficiently to relieve clutch spring pressure, remove release lever pivot pins, unhook lever springs, remove levers Release pressure slowly, lift off cover

REASSEMBLY: Reverse disassembly procedure, make certain that pressure plate springs seated in pressure plate and cover and that lever springs correctly installed Check lever heights after assembly completed.

Clutch Springs: Check springs and replace if weak or burned. **Spring Pressure** - 170-180 lbs. at 1 3/32".

Spring Part No.–Rockford 105348.

Release Lever Setting: Manufacturer recommends use of Borg-Warner UF-300 or UF-400 Universal Fixture for lever adjustment. **Setting**–(165317) 2 5/16".

DRIVEN MEMBER: Borg & Beck "Borglite" type with spring dampener hub Borg & Beck No. 382298.

AUBURN

Car Model	Auburn No.
Dodge, 6 Cyl. (1956) ①	100052-2
Plymouth, 6 Cyl. (1956) ①	100052-2
Willys, 4 Cyl. (1956) ②	8501-39

①–Borg & Beck Clutch also used.
②–Rockford Clutch also used.

DESCRIPTION: Single plate, dry disc type of same design used on corresponding previous models

REMOVAL OF CLUTCH: *See "Clutch" on car model page.*

DISASSEMBLY & REASSEMBLY: *See complete "Auburn (Atwood)" Clutch in Manual and note following specifications:*

Willys Return Clip Spring Installation–Engage slot on flat end of spring under head of release lever adjusting screw, engage loop on curved end of spring over ridge on outer end of release lever

Clutch Spring Specifications

Car Model	Spring Pressure & Length
Dodge 6 Cyl.	254-280 lbs. at 1 1/16"
Plymouth 6 Cyl.	254-280 lbs. at 1 1/16"
Willys (8501-39)	220-230 lbs. at 1 9/16"

1956 REAR AXLES

CHRYSLER, DE SOTO, DODGE, PLYMOUTH HYPOID

"BARREL" TYPE REAR AXLE

Chrysler C-71 (Exc. T & C Wgn. & Power Pkg. Cars) ① ③
Chrysler C-71 Town & Country & Power Pkg. Cars ② ③
Chrysler C-72 & C-73 All Models ② ③
Chrysler C-70 All Models & 300B ② ③ ④
DeSoto S-23 with Powerflite (Exc. Sta. Wgn.) ①
DeSoto S-23 Station Wagon ②
DeSoto S-24 All Models ②
Dodge V8 with Powerflite ①

① - Pinion bearings adjusted by shims located between bearing spacer and front bearing cone. No shoulder on pinion shaft.
② - Pinion bearing adjusted by a spacer washer located between shoulder on pinion shaft and front bearing cone.
③ - "Bolted" Barrel type.
④ - "Screwed" Barrel type.

► *BARREL TYPE DIFFERENTIAL CASE NOTE: "Bolted" type and "Screwed" type require different disassembly & reassembly procedures.*

DESCRIPTION: Hypoid gear, semi-floating type with either "Screwed" or "Bolted" type differential case. Pinion bearing pre-load is controlled with either shims or spacer washers as noted above.

REMOVAL OF REAR AXLE: *See "Rear Axle" on Car Model pages.*

OVERHAUL: *See "Chrysler, DeSoto, Dodge & Plymouth (Barrel Type)" in 1953 Annual Data or later Manual editions.*

"CAGE" TYPE REAR AXLE

DeSoto S-23 (Synchro-mesh Trans.) Exc. Sta. Wgn.
Dodge 6 Cyl. All Models
Dodge V8 (Synchro-mesh Trans.).
Plymouth, All Models

► *REAR WHEEL BEARING GREASE PLUG DISCONTINUED:* Bearings are packed at factory and additional lubrication is not required. If bearings are removed for any reason, they should be cleaned and repacked for reassembly.

DESCRIPTION: Hypoid gear, semi-floating type with Hotchkiss drive.

REMOVAL OF AXLE: *See "Rear Axle" on Car Model pages.*

OVERHAUL: *See "Chrysler, DeSoto, Dodge, Plymouth (Cage Type)" in 1953 Annual Data or later Manual editions.*

PONTIAC HYPOID

All Models (1956)

► *PINION BEARING PRE-LOAD COMPRESSIBLE SPACER NOTE:* In production, a one-piece spacer is used for adjusting pinion bearing pre-load. A two-piece type spacer is furnished for service replacement, which replaces either a one-piece type or a two-piece type spacer.

DESCRIPTION: Hypoid gear, semi-floating type with Hotchkiss drive, of the same design as used on previous models.

REMOVAL OF REAR AXLE ASSEMBLY: *See "Rear Axle" on Car Model pages.*

OVERHAUL: *See "Pontiac Hypoid" in 1950-51 Annual Data or later Manual editions.*

METROPOLITAN HYPOID

1500 Series (1956)

► *PINION BEARING PRE-LOAD ADJUSTMENT NOTE:* A compressible spacer is used in place of shims for adjusting pinion bearing pre-load. *CAUTION* - Whenever the rear universal joint companion flange nut is loosened for any reason, the pinion bearing pre-load must be readjusted. See "Overhaul" below.

DESCRIPTION: Three quarter floating, hypoid gear, with Hotchkiss drive. Rear axle assembly is the same design as used on previous models.

REMOVAL: *See "Rear Axle" on Car Model page.*

OVERHAUL: Service procedures are the same as for previous models. *See "Metropolitan (Hudson & Nash) Hypoid" in 1954 Annual Data or later Manual edition and note the following:*

Pinion Bearing Pre-Load Adjustment: A pinion shaft crushable spacer, Part No. 8112309 is used in place of the former shims located behind front bearing. With differential assembly removed from carrier, install pinion gear and shaft assembly (pinion gear, bearings, spacer, seal, dust cover, companion flange, washer and nut) and tighten companion flange nut until a torque of 12-17 inch-pounds is required to rotate pinion shaft assembly.

(CAUTION - After the new spacer has been used once, it cannot be used again to adjust pinion bearing pre-load).

SPICER HYPOID

Hudson Hornet Special V8 (1956)
Nash Ambassador Sp cial V8 (1956)
Packard, All M d ls (1956)
Studebak r, All Models (1956)
Willys Utility Mod ls (1956) ① ②
① - Timken Spiral Bevel, Semi-floating rear axle is used alternately on L6-226 4WD Jeep Truck.
② - Willys 4WD Front Axle overhaul procedures are the same as for rear axles (Spicer).

DESCRIPTION: Hypoid gear, semi-floating type. A torque tube drive is used on Nash & Hudson. Other models have Hotchkiss drive.

REAR AXLE ASSEMBLY REMOVAL: *See "Rear Axle" on Car Model pages.*

AXLE SHAFT REPLACEMENT: *(NOTE* - Wheel bearing adjustment can be made without removing axle shafts, see below). Remove wheel, take off axle shaft nut and washer and use a puller to remove hub and brake drum assembly. Disconnect brake line at wheel cylinder and brake cable at backing plate. Take out bolts mounting oil seal assembly and backing plate on axle housing flange and remove backing plate *(CAUTION* - Be careful not to lose axle shaft endplay shims located between backing plate and axle housing flange). Remove axle shaft and wheel bearing assembly.

AXLE SHAFT ENDPLAY (WHEEL BEARING) ADJUSTMENT: Total endplay for both shafts should be as noted below. Endplay is controlled by shims located between backing plate and axle housing flange (right side only). *(NOTE* - A permanent shim pack may be found on left side of housing on some cars (.060"). On cars without shim pack on left side, the axle housing has been machined .060" longer for inside centering of axle shaft in spacer block). Adjust endplay to correct specification (see table below) by adding or removing shims from right side of axle only. Shims are available in .003", .005", .010", .030" thicknesses.

Axle Shaft Endplay

Mod l	Endplay
Hudson & Nash	.001-.004"
Packard	.001-.006"
Studebaker	.001-.006"
Willys	.001-.006"

► *HUDSON & NASH SERVICE REPLACEMENT TORQUE TUBE TRUNNION INSTALLATION: See "Hudson, Nash & Rambler" Rear Axle.*

TORQUE TUBE & PROPELLER SHAFT (HUDSON & NASH): Removal - Raise and support rear end of body. Disconnect hand brake cable at equalizer and remove hand brake bellcrank assembly from torque tube. Disconnect rear stabilizer bar at rear axle tube. Remove truss rods at axle tubes and at center bracket on torque tube. Disconnect torque tube from transmission adapter and move axle assembly and tube to rear to disengage propeller shaft from transmission. Disconnect rear of torque tube from rear axle housing and move tube forward sufficiently to expose coupling. On Hydra-Matic Drive cars, disconnect coupling flange and remove torque tube and propeller shaft. On synchro-mesh transmission cars, the coupling is a slip fit on pinion shaft and a press fit on propeller shaft. On Hydra-Matic Drive cars, remove pinion flange with Puller J-2984.

Installation: Reverse removal procedure, and note the following: Support pinion from rear while pressing companion flange on pinion shaft (Hydra-Matic Drive cars). On synchro-mesh transmission cars, install propeller shaft oil seal and retainer on propeller shaft. Butt propeller shaft at front end against a wood block and drive coupling on shaft with a lead hammer. *(CAUTION* - Do not install the seal and retainer on coupling prior to its installation on propeller shaft). Coupling must be driven on shaft to shoulder on splined area inside coupling. Install spacer, lubricate ground surface on coupling and the torque tube rear oil seal with rear axle lubricant. The propeller shaft with coupling can now be installed on pinion shaft (do not crimp lip of oil seal). Make sure that torque tube seal contacts coupling on the ground surface of coupling.

DISASSEMBLY: Rear Axle Housing - Drain lubricant from housing and remove axle shafts (see above). Check ring gear runout with a dial indicator placed against rear face of ring gear. If runout exceeds .003", check for cause of runout. Excessive runout may be due to warped ring gear, sprung differential case, carrier bores not parallel, or loose differential bearings. If differential case is sprung, it must be replaced. Remove differential caps, noting that each is marked and that a corresponding mark is located on rear cover gasket surface of housing. Pry differential case out of housing (do not pry on ring gear). Remove pinion shaft companion flange with a suitable puller and drive pinion shaft out of forward bearing using a brass drift. Remove pinion assembly from housing. Drive front bearing and oil seal out of front of housing, then drive rear bearing cup out of rear of housing. When removing rear bearing cup, retain the pinion gear depth shims located between cup and bore in housing, as the thickness of this shim pack must be known for correct setting of pinion at reassembly.

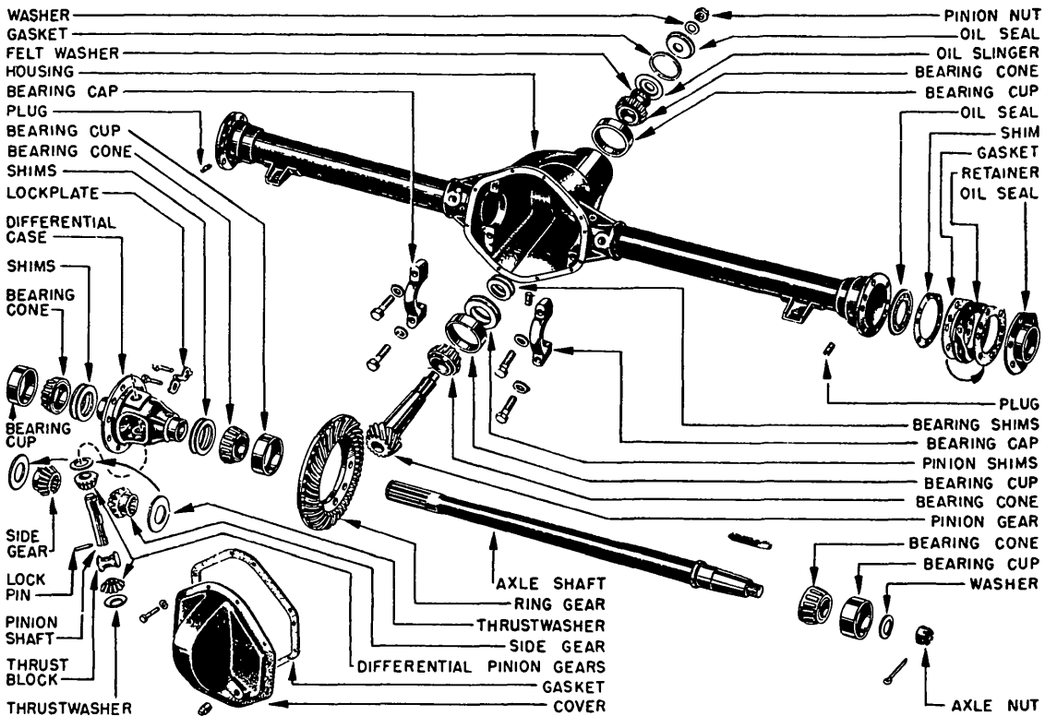
Differential Case: Remove differential side bearings with a suitable puller (J-2497, Hudson & Nash, J-986-A, Studebaker. W-104, Willys). *(NOTE* - Recesses are cast in differential case to allow puller to bear on bearing cone). Remove screws attaching ring gear to differential case and tap ring gear from differential case with a brass drift. Do not nick ring gear face of case or drop the assembly. Use a suitable punch to drive out lock pin which holds pinion shaft in place. Drive out pinion shaft and remove thrust block through differential side gear opening. Roll differential pinions around on side gears until they can be lifted out through holes in case. Remove side gears and thrust washers.

REASSEMBLY: Differential Case - Install thrust washers on side gears and install gears in bores of differential case. Install thrust washers behind the differential pinion gears and mesh gears with side gears so that holes are opposite and in line with each other. Roll gears around until gear holes are aligned with differential pinion shaft hole in case. Install pinion gear shaft with the lock pin hole in line with lock pin hole in differential case. Install thrust block through a side gear, aligning hole in block with differential pinion shaft. Press differential pinion shaft in place and measure the clearance between differential side gear and case. This clearance should not exceed .008" (the side gears should not fit tight enough to require more than eight ft. lbs. torque to turn differential gears. This may be checked by installing an axle shaft and using a torque wrench to turn shaft). Drive lock pin into place and upset end of pin to retain it in place. Place ring gear on differential case and bolt it in place with cap screws using two cap screws installed at opposite sides to pull gear into position. Tighten capscrews to 50-55 ft. lbs. (Hudson & Nash); 45-55 ft. lbs. (Studebaker); 40-50 ft. lbs. (Willys). Be sure that ring gear is pulled down evenly on differential case. Press differential side bearings on differential case (without shims behind bearings). Install case assembly in housing and install bearing caps, making sure that bearing cap identification marks correspond to marks on gasket surface of housing. Tighten bearing cap bolts finger tight. Mount a dial indicator with contact button against back face of ring gear. Insert two screw drivers between bearing cup and housing. Force differential assembly to one side as far as possible. Set dial indicator to zero and shift differential as far as possible to opposite side; note and record reading (this reading denotes shim requirements to be installed later between differential assembly and bearing cones). Remove side bearing caps and remove differential assembly.

PINION DEPTH SETTING: (Hudson & Nash) - The amount of shims used is determined by the amount of shims removed at disassembly and by the plus or minus figure etched on pinion. For example, if original pinion was marked + 2 and had a shim pack of .035" behind rear bearing cup and the new pinion to be installed is marked −1, the shim pack must be increased by .003" to bring the new pinion to its correct position. Install the pinion front bearing cup with Replacer J-2534 or J-5367. Insert pinion in position and install front bearing cone and cup. Check pinion setting as follows: Mount discs J-2499-2 on Arbor Gauge J-6482-1 or discs J-5223-5 on Arbor Gauge J-5223. Install gauge seated squarely in housing bores. Place bearing caps in position and tighten bolts finger tight. Install Gauge Block J-5223-16 in position against end of pinion gear and clamp in place with Clamp Bar and Screw J-5223-6 and J-5223-14. Loosen thumb screw in end of gauge block and move plunger out until head contacts gauge arbor. Lock plunger in

CONTINUED ON NEXT PAGE

SPICER HYPOID (Cont.)



place with thumb screw, being careful not to disturb position of plunger. Loosen screw in clamp holding gauge block against pinion and remove gauge block. Measure distance from end of anvil to top of plunger head with a two to three inch micrometer. This measurement represents the distance from rear face of drive pinion to centerline of rear axle, and should be 2 625". This measurement applies only to correctly adjusted pinions marked "0". On a pinion marked +2, the reading should be .002" less than this figure and with a pinion marked −3, the reading should be .003" greater. If micrometer reading shows pinion setting is incorrect by more than .002" plus or minus from the given figure, shims equal to that amount must either be added or removed from shim pack between rear bearing cup and housing.

Studebaker & Packard: Fasten the bar of Gauge J-589-D to axle housing, using two rear cover screws, so that hold down bolt in bar holds Step Plate J-589-10-2 tightly against ground surface of pinion gear (make sure Step Plate is flat on pinion). Place the two large discs on ends of gauge bar which has the micrometer, and place this fixture in differential side bearing bores of housing. Adjust micrometer until it contacts step plate, and record reading. The etched number on ground surface at end of pinion indicates the correct setting for that pinion (in the proper axle housing). These marks are referred to a "zero setting" which is standard for all housings of the same type. See "Studebaker-Packard Zero Settings" below For example, if the pinion setting is being checked in a Champion axle having a 4 56-1 ratio, and if the pinion is marked "0", the correct micrometer reading, using Gauge J-589-D would be .719". If pinion was marked +2, the correct setting would give a micrometer reading of .717", and if the pinion was marked −4, the correct setting would give a micrometer reading of .723". If the micrometer reading is not the one indicated in "Zero Setting" table (below), plus or minus the mark on pinion, add or remove shims between the rear bearing cup and housing as required to obtain as close a setting as possible.

Studebaker-Packard Pinion Zero Setting

Model & Ratio	Pinion Setting
Champion (3 54-1)	.625"
Champion (Other Ratios)	.719"
Comm. & Pres. (All Ratios)	.344"
Packard (All Ratios)	.344"

Willys: Use Pinion Setting Gauge W-99 which consists of a dial indicator and mounting fixture to be mounted on rear face of pinion (held in place with "C" clamp which is part of gauge). Before using this gauge, dial indicator must be set to "0" through use of a master gauge block, supplied with the equipment. Set dial indicator at "0" with gauge pin resting on correct lobe of master gauge (see "Pinion Gauge Setting" table below), and with one-half turn tension on the gauge pin. With pinion installed in axle housing (spacer W-126-6 can be installed on shaft in place of universal joint yoke), and with

SPICER SEMI-FLOATING HYPOID AXLE

pinion setting gauge in place, dial reading should be "0" for pinions marked "0", or **minus** for pinions marked "−", and should read **plus** for pinions marked "+", by an amount equal to the amount equal to the figure following the "+" or "−" sign on the pinion. Adjust by adding or removing shims from behind rear bearing cup in housing. Repeat test until correct dial reading is obtained.

Pinion Gauge Zero Setting

Model	Master Gauge Block
475 4WD Truck	"F"
6-226 4WD Truck	"F"
CJ-3B	"E"
CJ-5	"E"
CJ-6	"E"
DJ-3A	"D"
6-226 2X4 SW	"E"
475 2WD	"D"
4X475 SW	"E"
6-226 4X4 SW	"E"

PINION BEARING PRE-LOAD ADJUSTMENT: After pinion depth setting has been completed, remove pinion shaft and bearing assembly from housing and install shims (removed at disassembly) between front bearing and shoulder on shaft. Reinstall pinion shaft assembly in housing. Proceed as follows

Hudson & Nash: Install oil slinger, companion flange and nut (do not install oil seal). Check pre-load by attaching a spring scale to a "T" handle and socket, and rotate the pinion shaft on a horizontal plane. Add or remove shims from between front bearing and shoulder on shaft to obtain a pre-load of 25-35 inch-pounds required to rotate pinion shaft.

Studebaker, Packard & Willys: Adjust pinion by adding or removing shims between front bearing and shoulder on shaft so there is no endplay and there is a slight drag or resistance to turning.

DIFFERENTIAL SIDE BEARING & GEAR BACKLASH ADJUSTMENT: (Hudson & Nash) - Install differential case assembly in housing. Replace bearing caps in their proper position and tighten the cap screws finger tight. Insert two screw drivers between bearing cup and housing on the side opposite the ring and move differential assembly and ring gear away from pinion until opposite bearing cup is seated firmly against housing. Move screw drivers to ring gear side and move assembly over until ring gear teeth contact teeth of pinion Refer to recording of shim thickness required (taken at time differential case disassembled), and install the shims between

CONTINUED ON NEXT PAGE

SPICER HYPOID (C nt.)

bearing cups and housing. Divide total amount of shims between sides in such a manner that all ring gear and pinion backlash is eliminated. Remove bearing caps and take out differential case assembly. Keep each shim pack separate. Remove side bearings from differential and install shim packs on their respective hubs. Install an additional .015" thickness of shims behind the differential bearing on the tooth side of ring gear to provide proper backlash between gear and pinion and proper pre-load. Install bearings. Place axle housing spreader J-5231 in position and spread housing .020" maximum to permit installation of differential assembly. Install bearing caps and use sealing compound on bolt threads. Remove housing spreader and tighten bearing caps to 70-90 ft. lbs. Install dial indicator on housing with contact button resting against edge of ring gear tooth and check backlash between ring gear and pinion which should be .002-.006", and should not vary more than .002" between positions checked; check at four positions on ring gear.

Stud bak r & Packard: Place differential case in housing (without shims behind side bearings). Install a dial indicator on housing with contact tip against ring gear back face. Insert two large screw drivers between housing and cup on opposite side from ring gear and move ring gear away from pinion until bearing cone on ring gear side is seated firmly in its cup and against the housing. Set indicator at zero. Move assembly back toward pinion until ring gear meshes lightly with pinion (no backlash or clearance). This reading, less .003" is the thickness of shims required between differential case and side bearing on ring gear side of differential. To find thickness of shims required under other side bearing, subtract the thickness of shims just used from the total side movement obtained earlier (at reassembly of differential). To the figure thus obtained, add .008" shim thickness for pre-load. To facilitate installation of differential assembly in housing, cock the bearing cups and tap them lightly with a lead hammer. When reinstalling bearing caps, be sure numerals on caps and housing correspond. Tighten bearing cap bolts to 70-80 ft. lbs. Mount a dial indicator on axle housing with contact button against one ring gear tooth. Move ring gear by hand to check backlash which should be .003-.006". If backlash is not in the specified range, move shims from one side of carrier to the other to obtain desired setting.

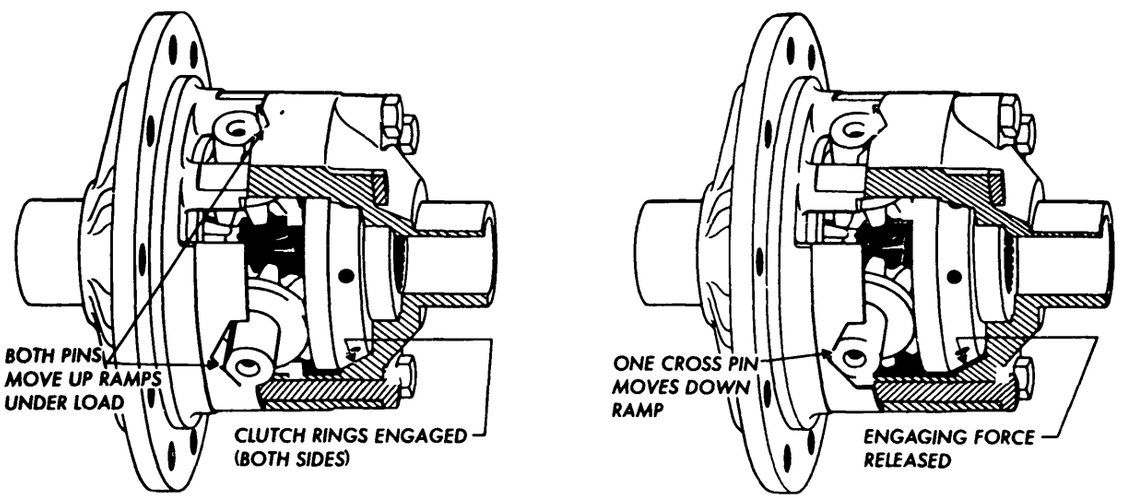
Willys: Refer to shim pack required for differential assembly (at reassembly of differential carrier). Add .008" to the total shim pack, then divide the total shim pack in equal amounts and install between each side bearing and carrier. Use Tool W-128 to spread the rear axle housing and install differential case. Install bearing caps in their proper position and tighten bearing cap bolts to 38-42 ft. lbs. Check backlash by mounting dial indicator on rear axle housing in line with gear and with contact point on the corner of a gear tooth. Move gear by hand and check amount of backlash which should be .004-.007". If backlash is not correct, change shims from one side of carrier to the other to obtain desired setting.

PACKARD TWIN-TRACTION DIFFERENTIAL

Packard, Caribbean (1956). Standard.
Packard, Other Models (1956). Optional.

DESCRIPTION: Partial locking type differential. The unit consists of a two-piece case, with each piece having two V-shaped ramps or cam surfaces diametrically opposite. When assembled, the V-shaped ramps of one piece are at a 90° angle to the ramps of the other piece, with the V's facing away from each other. The conventional mounting of pinions is replaced by two individual cross pins with a slidable joint at the center, permitting each one to move independently, although continuously engaged. Ends of the pins are machined in the form of a "V" and ride on the V-shaped ramps. Two internally splined clutch rings are fitted over each of the side gears and mate with tapered surfaces in the case halves. Two internally splined differential gears, as well as the clutch rings, are splined to the axle shaft at each end. Four pinions, carried by the cross pins, mesh with the differential gears. Pinions incorporate shoulders which contact the clutch rings. The unit is interchangeable with the standard Spicer differential.

OPERATION: *NOTE* - The unit is operationally designed to avoid sudden transfer of full engine torque to one axle under unequal rear wheel traction conditions. As a torque divider, sufficient traction torque is supplied to the non-spinning wheel and always a certain percentage of torque is transferred to the wheel with poor traction. Percentage of transfer is dependent upon operating conditions.



Straight-Ahead Driving: With full traction on both rear wheels, both cross pins move up on the ramp of the cam (a very slight amount), applying a load to and locking the clutch rings and restricting turning of the differential through the friction clutches. This provides a torque ratio between the axle shafts, based on the amount of friction in the differential and the amount of load that is being applied to the differential.

Turning: When turning a corner, the process outlined in "Straight-Ahead Driving" above is, in effect, partially reversed. The differential gears become a planetary gear set, with the gear on the inside of the curve becoming the fixed gear of the planetary. The outer gear of the planetary overruns as the outside wheel has a greater distance to travel. With the outer gear overrunning and the inner gear fixed, the pinions are caused to rotate. Since they are restricted by the fixed gear, they cause the cross pins to move down the ramps, thus relieving the thrust loads on the cone clutches. This permits the outer wheel to turn faster as in the conventional differential.

Unequal Traction Conditions Under Rear Wheels: When traction conditions under the rear wheels are unequal due to snow, slippery pavement, or rough roads, planetary action, similar to that in turning, takes place. In each case, there is a movement of a cross pin along the ramp to relieve pressure on the cone clutch on the side where less torque is needed. The wheel with traction gets the greater percentage of wheel torque while the wheel with poorer traction receives torque commensurate with that which it can use.

OVERHAUL: Serviced in same manner as conventional Spicer differential. Since replacement parts are not available, the differential must be replaced as an assembly. Ring and pinion gear sets are available for replacement.

LUBRICATION: Differential replacement units are furnished with two quarts of break-in lubricant. Do not attempt to break in a new unit with any fluid other than the recommended lubricant. Break-in period is 10,000 miles. If it is necessary to add or change the lubricant after the break-in period, use a standard brand of Multi-Purpose lubricant.

PACKARD TWIN TRACTION DIFFERENTIAL

BUICK HYPOID

All Series (1956)

►*REAR WHEEL BEARING OIL LEAKAGE CORRECTION & PRODUCTION CHANGE:* An "O" ring seal, Part No. 1466050 is being used in later production cars and can be used on early cars to correct oil leakage. The new seal is installed in groove on outer diameter of the rear wheel bearing.

►*1956 SERIES 70 DIFFERENTIAL OIL PUMP ELIMINATED:* The oil pump is no longer used in production and whenever the rear axle assembly is disassembled, the oil pump should be removed.

►*1956 REAR AXLE "CLUNK" CORRECTION & PRODUCTION CHANGE:* Differential cases are made of a harder material and the axle shafts have been machined with a bearing surface adjacent to splines for use with new bearing supports. The supports are equipped with aluminum bronze bushings and will pilot the axle shaft and carry the load at inner end instead of differential side gears. The new parts are available for service replacement on early cars in complete packages, Part No. 1392883 (Series 40 & 60); Part No. 1392919 (Series 50 & 70) which include differential case, thrust washers, oil baffles, felt washers, differential supports, axle shafts and wheel bearing retaining rings. The differential side gears are not included in the package, as the old ones may be used if in good condition. *NOTE* - All parts are interchangeable with early models except that the oil pump used on Series 70 models must be discarded when installing the new type shaft.

►*1956 DIFFERENTIAL SIDE GEAR CHANGE:* The length of the differential side gear hub has been increased from .460" to .520". Bearing Puller J-6199 must be changed as indicated below, for use with the later side gears. Either the early or later type side gears are satisfactory for use.

►*SUPPORT BEARING PULLER, TOOL J-6199 CHANGE FOR USE WITH LATER TYPE SIDE GEARS:* Grind off 1/8" from shoulder end of tool for necessary clearance with the later type gears. *CAUTION - When grinding the tool, do not overheat.*

►*1953-55 REPLACEMENT "FLOATING TYPE" PROPELLER SHAFT (To reduce rear axle noise):* A new "floating type" propeller shaft, Part No. 1173801 (1953 Series 52 & 72, 1954-55 Series 50 & 70); No. 1173841 (1953-54 other models) is available for service replacement. Install as follows: Check new propeller shaft for straightness (see "Overhaul" below). *(NOTE* - A new gear set and bearing should be used with new propeller shaft). Pack cavity at end of pinion spline with wheel bearing lubricant and slide propeller shaft over pinion spline, but do not install coupling pin. Complete reassembly of rear axle *(See "Buick Hypoid" in Rear Axle Section of 1955 Annual Data or later Manual edition.*

DESCRIPTION: Hypoid gear, semi-floating type with torque tube drive. The pinion gear and shaft are supported in carrier by two tapered roller bearings.

REMOVAL OF AXLE: *See "Rear Axle" on Car Model pages.*

AXLE SHAFT REPLACEMENT: Place car on stands under rear axle housing with wheels clear of floor. Remove rear wheel and brake drum. Remove nuts holding wheel bearing retainer plate to brake backing plate, leaving bolts in place to support backing plate. Pull axle assembly using Puller J-6176 with a slide hammer. Be careful not to disturb backing plate. Replace two opposite nuts finger tight to hold backing plate in position. To install axle (if wheel bearing or seal are the only new parts used), reverse removal procedure and install the old wheel bearing retainer gaskets with same number and thickness of new gaskets. If new rear axle housing or new brake backing plate are used, install axle shaft and bearing assembly without retainer gaskets. Using slide hammer and Puller J-6176, drive axle shaft and bearing into place until bearing is fully seated. To hold retainer plate snug against face of the bearing, install four nuts finger tight. With backing plate pushed tight against housing flange, measure clearance between retainer and backing plate with feelers (use two feelers at same time at opposite sides of retainer and average the two readings so obtained and select the number of new gaskets as required to give .005-.020" **less** thickness than average of the two measurements). Replace nuts holding wheel bearing retainer plate to brake backing plate and tighten to 65-75 ft. lbs. Then check with a .001" feeler gauge under retainer plate between two lower bolts. If gap exists, remove plate and apply non-hardening Permatex on both sides of gasket to prevent leakage. Replace brake drum and wheel. *NOTE* - The above method will provide the necessary crush on the gasket to prevent oil leakage at this point.

Wheel Bearing & Seal Replacement: After removal of axle shaft, nick the wheel bearing retainer ring (the ring need not be completely split, but nicked deep enough in 3 or 4 places to spread it). Retaining ring will then slip off with light pressure. Press wheel bearing off using Plate J-6191 in a press. If seal only is defective, pry old seal out of bearing and install new seal using Guide J-6213. Push seal in carefully with fingers until lip is over bearing inner race; then remove installing guide and drive seal in flush with a flat wood block. Press bearing and seal assembly against shoulder on shaft using Installer J-6257 in a press *(CAUTION - Bearing retainer must be on shaft before bearing is installed).* Press retainer ring against bearing with chamfer toward bearing.

OVERHAUL

DISASSEMBLY: 1) Remove rear axle assembly from car and place on suitable stands. Disconnect torque tube brake line from tee fitting located on axle housing. Disconnect strut rods from torque tube bracket. Fasten the two struts to each other loosely, keeping all parts in their original positions. Remove torque tube to carrier bolts and slide torque tube and propeller shaft from carrier. *(CAUTION - Strut rods are easily bent when disconnected from torque tube).*

2) Remove brake line from housing and remove both axle shaft assemblies (see "Axle Shaft Replacement" above). Remove carrier to axle housing nuts and lift carrier from housing, using Sling J-6247 and a chain hoist.

3) Place carrier assembly in a suitable mounting fixture. Check existing gear lash with a dial indicator positioned against tooth of ring gear (this will indicate gear or bearing wear and will also enable used gears to be installed at original lash setting to avoid changing gear tooth contact). On Series 70 with an oil pump, remove oil lines and pump. Remove differential bearing pedestal clamp bolts and open pedestal by tapping a wedge in each pedestal slot *(CAUTION - Do not use excessive force on wedges or distortion will result).*

4) Pull differential bearing supports using Puller J-6199 and a slide hammer (see "J-6199 Tool Modification" below). Install Spreader J-6185 and tighten spreader bolt just enough to free case assembly *(CAUTION - Do not spread pedestals more than is necessary to free case).* Lift case straight out until side bearings are half-way clear of pedestals. Then take hold of bearings with both hands to keep them from falling and lift case assembly out *(CAUTION - Keep right and left bearings, shims and supports in a set so they may be reinstalled in the same order).* Remove spreader tool. Mark ring gear and case so they may be reinstalled in same position. Remove ring gear from case.

5) Drive pinion shaft pin from pinion shaft and then drive shaft from case. Remove pinion shaft shield from case. Mark side gears, pinions and washers so they may be reinstalled on same side. Remove side gears, pinions and washers.

6) If differential bearing is to be replaced, pull bearing outer race from case using Differential Bearing Remover J-6552. Check pinion bearing pre-load (see "Pinion Bearing Pre-load Adjustment" below). It is also advisable to check pinion depth setting (see "Pinion Depth Setting" below). This will indicate any error in existing setting and will also enable used parts to be reinstalled at original setting to avoid changing gear tooth contact.

7) Cut out and drive up staked section of pinion bearing locknut with a cape chisel, being careful not to damage threads on pinion. Hold pinion nut to carrier with Holder J-6245 and turn pinion clockwise through nut using socket J-6192 and Handle J-6246. As pinion nut is removed, hold hand under pinion to catch it, as it may fall through. If necessary, tap pinion with a soft hammer, being careful to guide pinion with hand to avoid damage to bearing outer races.

8) If pinion bearing is to be replaced or pinion depth setting is to be changed, remove rear bearing from pinion shaft using Remover J-6184 and Holder J-6274 in a press. Pry pinion oil seal from carrier, being careful not to damage front pinion bearing. If front pinion bearing is to be replaced, drive outer race from carrier, using Remover J-6198 and Handle J-872-5 *(NOTE* - The remover must be inserted in carrier before drive handle is screwed into it).

REASSEMBLY: *(NOTE* - Before installation of pinion and bearings, make certain that interior of carrier housing is clean and dry. Also make certain that parts to be assembled are clean and that pinion bearing shims are not burred. Bearings and oil seals should be lightly lubricated with rear axle lubricant just before assembly).

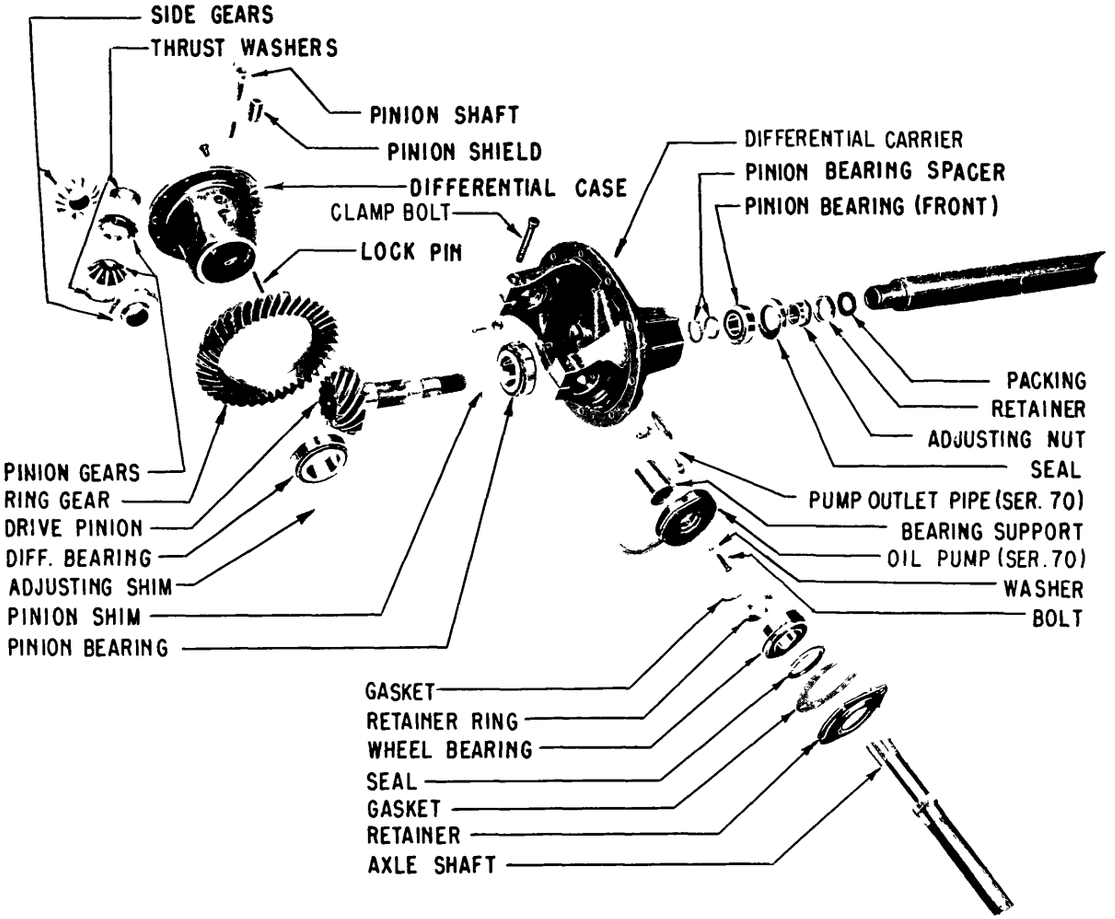
►*PROPELLER SHAFT NOTE: Propeller shaft should be checked for straightness (and straightened or replaced) before installation in rear axle assembly. See "Propeller Shaft Checking & Straightening" below.*

BUICK HYPOID (C nt.)

1) Drive front pinion bearing outer race against shoulder in carrier using Replacer J-7197 with driver handle. Drive rear pinion bearing against shoulder in carrier using Replacer J-6255 with driver handle.

2) Whenever a new carrier, a new pinion, or a new pinion bearing is used, a trial assembly must be made in order to determine correct pinion depth setting and pinion bearing pre-load *(see "Pinion Bearing Pre-load Adjustment" and "Pinion Depth Setting" below).*

► *CAUTION – Whenever a new pinion is to be installed, its depth setting must be gauged. Even though the new pinion has the same depth marking, it may require a different thickness shim because the dimension from the gauging surface to bearing shoulder varies in different pinions.*



3) After pinion setting and pinion bearing pre-load have been correctly adjusted (if necessary) and front and rear bearings have been installed on pinion, lubricate new pinion seal with rear axle lubricant and install with lip toward bearing, using Installer J-6200. Reinstall pinions and bearings carefully into carrier with new thickness pre-load spacers. Install pinion nut and tighten to 80 ft. lbs. Recheck pinion setting with gauge. Recheck pinion bearing pre-load, which must not exceed 40 inch pounds including drag of lubricated new seal. Stake pinion nut securely.

4) Drive differential outer races into case, using Replacer J-6263. Install side gears, pinions and spherical washers in case *(CAUTION* - There are no flat washers behind side gears). If same parts are used, replace in original sides. Install pinion shield and pinion shaft. Drive spring pin through hole in pinion shaft until flush with case. Bolt ring gear to case, making sure mating surfaces are clean and free of burrs and that matching numbers on ring gear and pinion are the same. *(NOTE* - Use three Studs, J-6251 to align parts. If same ring gear and case are used, line up marks so that parts are assembled in same relative position **(do not use lockwashers or any substitute bolts).** Tighten bolts alternately on opposite sides of case to 25-30 ft.lbs., then tighten in same manner to 65-75 ft. lbs.

5) Before installation of ring gear and case assembly make sure that differential bearings and bearing support surfaces in carrier pedestal are clean and free of burrs. Remove any burrs which might prevent proper seating. Place case assembly and differential bearings in position in carrier. If original bearings are used, replace in original positions. Insert Support Tools, J-6194 through pedestal bores into bearing inner races. Press tools toward each other to seat them, using hand pressure. If support tools are loose, install pedestal clamp bolts and nuts and tighten lightly until support tools can just be moved by twisting them. If support tools are too tight, loosen them by wedging pedestals open with chisels.

6) Rotate differential assembly three or four times to seat bearing rollers, then manually adjust the whole assembly sideways to get a .008" gear backlash. The assembly tools may be tapped lightly with a hammer to seat them. Check backlash as follows: Mount dial indicator so contact button bears against heel end of tooth on ring gear, and as nearly as possible in line with gear rotation and perpendicular to tooth surface. Check backlash at three or four points around ring gear. Lash must not vary more than .003" around ring gear. If lash varies more than .003", check for burrs, uneven bolting conditions or distorted case flange, and make necessary corrections. *(CAUTION* - Gear backlash check must be made with pinion locked to carrier to be sure it cannot turn). Adjust gear backlash at the point of minimum lash to .008" for all new gears. If original gear set is being installed, the original backlash should be maintained.

7) Measure with a shim between each bearing and its pedestal. Do not remove support tools for measuring. Select shim that measures .002" thicker than largest shim that can be inserted for each side, (this should pre-load each differential bearing .002"). The shims are furnished to be used singly in thicknesses ranging from .040" to .082" by two thousandths. Service shims are marked with their thickness in thousandths.

BUICK HYPOID REAR AXLE

8) Remove support tool farthest from ring gear, insert shim for that side, and replace support tool. Place other shim in position for insertion. While keeping a heavy hand pressure on shim, spread carrier pedestals just enough to start shim, using Spreader J-6185 *(CAUTION - Do not spread pedestals any further apart than is absolutely necessary to push shim into position).* Leave support tool in position until after shim is started to keep case assembly from dropping out of line.

9) Remove left assembly tool and push shim into final position. Center it first with fingers through pedestal bore, then with a support tool. Remove spreader tool and pedestal wedges. Drive each differential bearing support into its pedestal until seated solidly in bearing, using Support Tool J-6194. Then seat one support solidly and tighten the clamp bolt and nut on that side to 50-60 ft. lbs. before proceeding to other side. This is to prevent shock caused when second support is

CONTINUED ON NEXT PAGE

BUICK HYPOID (C nt.)

seated from dislodging the first support. Secure nuts with cotter pins. Recheck backlash which must be .007-.009" at point of minimum lash, with not more than .003" variation around gear.

►*1956 SERIES 70 NOTE:* Rear axle oil pump has been discontinued in production and it is recommended that it not be reinstalled after rear axle has been disassembled for any purpose.

10) Before installing carrier assembly, make sure housing mounting surfaces are free of old gasket material, nicks, and burrs. Rotate axle housing so carrier mounting surface is upward and install a new carrier gasket. Install carrier in housing using Sling J-6247. Install nuts and tighten them evenly and alternately to 50-60 ft. lbs. Install brake line on housing and install both axle assemblies.

11) Check propeller shaft and pinion splines for excessive wear and remove any nicks or burrs. Replace propeller shaft seal sleeve if scored or grooved. Inspect propeller shaft rear packing and retainer and replace if worn or damaged. Pack rear propeller shaft coupling with heavy wheel bearing lubricant, bringing level to inner end of splines. Slide propeller shaft on splines of pinion.

12) Before installing torque tube, flanges on both ends must be free of burrs or nicks. Also, check torque tube mounting surface on carrier. Slide torque tube over propeller shaft being careful to keep torque tube centered on propeller shaft to avoid side thrust *(CAUTION - Propeller shaft will bend easily if side pressure is put on it).*

13) Position torque tube with strut rod bracket downward, being careful not to damage brake line. Install torque tube to carrier bolts and tighten alternately to 50-60 ft. lbs. *(NOTE -* There is no gasket used between torque tube and carrier). Connect brake line at tee on rear axle housing. Connect strut rods and tighten bolt to 85-100 ft. lbs. Install rear axle assembly in car.

INSTALLATION: Reverse removal procedure. *See "Rear Axle" on Car Model pages.*

PINION BEARING PRE-LOAD ADJUSTMENT

►*NOTE: Whenever a new carrier, a new pinion, or a new pinion bearing is to be used, a trial assembly must be made in order to determine correct pinion depth setting and correct pinion bearing pre-load. Spacers used for pinion bearing pre-load and shims used for pinion setting will have to be changed for final adjustment in relation to the marking on the pinion being used, and the pinion setting gauge reading.*

1) For a starting pinion depth setting, use a pinion setting shim with a nominal thickness of .048". Place this shim against head of pinion and install rear pinion bearing using Replacer J-6377 in a press.

2) For a starting pinion bearing pre-load adjustment use a pair of spacers with a nominal thickness of .435". Place spacers in position on pinion and hold pinion in position in carrier. Install front pinion bearing and pinion nut. Hold nut to carrier with Holder J-6246 (Do not install seal at this time). Torque pinion nut to 80 ft. lbs. Rotate pinion three or four times to seat bearings. Turn pinion slowly with an inch-pound torque wrench. It should require 10 to 30 inch-pounds to rotate pinion, which will be the pinion bearing pre-load. If pre-load is under 10 inch-pounds a thinner spacer must be installed under front pinion bearing. If pre-load is over 30 inch-pounds a thicker spacer must be installed under front pinion bearing *(NOTE - Pinion Bearing pre-load spacers are furnished to be used in pairs so that possible thicknesses range from .400" to .470" by thousandths. See table below).*

Pinion Bearing Pre-Load Spacers

Part No.	Ⓒ Thickness	Part No.	Ⓒ Thickness
1169194	.200"	1169386	.208"
1169105	.201"	1169387	.209"
1169106	.202"	1169388	.210"
1169107	.203"	1169389	.220"
1169108	.204"	1170158	.230"
1169109	.205"	1170159	.240"
1169110	.206"	1170160	.250"
1169385	.207"	1170161	.260"

Ⓒ — Spacer thickness is marked on spacers.

3) *After pinion setting adjustment is completed (see below)* change preload spacers by same amount that pinion setting shims were changed from the nominal setting. If thickness of pinion setting shims was **decreased** .002", use pre-load spacers with .002" **less** thickness. If thickness of shim was **increased,** use pre-load spacers measuring .002" **thicker.**

4) Lubricate new pinion seal with rear axle lubricant and install with lip toward bearing, using Installer J-6200. Reinstall pinion and bearings carefully in carrier with "adjusted" thickness pre-load spacers, Install pinion nut and tighten to 80 ft. lbs. Recheck pinion setting with gauge. Setting for new pinion must be within .001" of setting marked on pinion. Setting for used pinion should be within .001" of original setting (as checked before disassembly). Recheck pinion bearing pre-load with an inch-pound torque wrench. Pre-load must not exceed 40 inch-pounds including drag of lubricated new seal. When pinion setting and pre-load are correct, stake pinion nut securely.

PINION DEPTH SETTING

►*NEW PINION INSTALLATION CAUTION: Whenever a new pinion is to be installed, its depth setting must be gauged with Pinion Setting Gauge J-5647. Even though the new pinion has the same depth marking, it may require a different thickness shim because the dimension from the gauging face to the bearing shoulder varies in in different pinions.*

CHECKING PINION DEPTH SETTING: After pinion bearing pre-load has been established (10-30 inch-pounds, without pinion seal installed) see above. Proceed as follows:

1) Use Pinion Setting Gauge J-5647 consisting of a "master gauge" and "indicator gauge" upon which a dial indicator is mounted. Make certain that gauge parts are clean, particularly the center and discs of indicator gauge, the centering holes, indicator pads, disc pads on the master gauge, and the adapter holes and outer surfaces.

2) Install discs on indicator gauge and install the small contact button on stem of dial indicator. Mount dial indicator on indicator gauge. Place indicator gauge on on master gauge so that spring loaded center is engaged in centering hole corresponding to the indicator pad "B", which is used for any of the following gear ratios stamped on pinion: 43-11; 43-12; 47-14; 42-13 (Pad "A" is used for certain prior model gear ratios).

3) Center indicator contact button on specified indicator pad and lock indicator by tightening the thumb screw. Hold yoke firmly with both discs contacting the horizontal and vertical pads on master gauge, and set dial indicator at zero (make sure that differential bearing support bores are free of burrs and that center of pinion is clean).

4) Rotate pinion until blank tooth between the matching number and the pinion setting mark is slightly counterclockwise of the center (at about 11 o'clock). This tooth is called the gauging tooth because it is used for located and gauging during production and should be used for gauging in service.

5) Drive a wedge into each pedestal split and spread them just enough so that an Adapter J-5647-17 will slip in. Then place the indicator gauge in carrier as follows: Remove discs from indicator gauge and hold it in position in carrier with pins centered in pedestal bores. Slide long adapter through pedestal bore farthest from pinion and over gauge pin. Then slide short adapter in place on other side. Be sure that gauge center is engaged in pinion center and that adapters are against shoulders of gauge. Then remove pedestal wedges. Turn pinion if necessary so that indicator contact button has a good contact with gauging tooth of pinion.

6) *(NOTE -* There are two methods of taking a reading on the pinion setting gauge as follows:) When using the first method, the indicator gauge is zeroed in the master gauge by pressing down firmly on the indicator gauge yoke with the thumbs. It is important when using this method, that equal pressure is applied when taking the actual reading in the carrier. When using the second method, the indicator is zeroed in by pressing the discs into the angle formed by the master gauge. No pressure is applied to the indicator gauge yoke. Since the gauge is zeroed in with no pressure on the yoke, the actual reading is also taken with no pressure on the yoke. However, the adapters must be tight in the pedestal bores; if they are not held solidly in place after the wedges are removed, the pedestal bolts must be installed and tightened to specified torque, (50-60 ft. lbs.).

7) Take dial reading, noting whether it is plus (+) or minus (—) as indicated by arrows on surface of yoke. *(CAUTION - This reading does not indicate thickness of the shim to be used, but only indicates the variation from the nominal setting of the gauging face of pinion).* Recheck indicator "zero setting" on master gauge with discs to make sure it was not changed in handling.

8) If the old ring gear and pinion set is to be reinstalled and it has been in use long enough to establish a wear

CONTINUED ON NEXT PAGE

BUICK HYPOID (C nt.)

pattern on teeth, the original pinion setting found before removal should be maintained to avoid changing tooth contact. If ring and pinion set is new, or has not been used long enough to establish a wear pattern on teeth, the dial indicator reading should be within .001" of the pinion setting marked on pinion. If pinion is not as specified, adjust as follows:

PINION SETTING ADJUSTMENT: The pinion setting is adjusted by changing thickness of shim which is located between rear pinion bearing inner race and head of pinion. Shims are furnished as indicated in table below.

Pini n Setting Shims

Part No.	① Thickness	Part No.	① Thickness
1171083	.040"	1171093	.050"
1171084	.041"	1171094	.051"
1171085	.042"	1171095	.052"
1171086	.043"	1171096	.053"
1171087	.044"	1171097	.054"
1171088	.045"	1171098	.055"
1171089	.046"	1171099	.056"
1171090	.047"	1173482	.058"
1171091	.048"	1173483	.060"
1171092	.049"		

① – Thickness is marked on shim.

1) Remove pinion assembly and press off rear pinion bearing using Remover J-6184 and Holder J-6274. Remove shim from pinion and wipe dry. Check thickness of shim to make sure it is correctly marked. Increase or decrease thickness of shim as required to proper pinion proper setting. If pinion is marked "+8" but gauge reads "+6", **decrease** thickness of shim by .002". If gauge reads "+10", **increas** thickness of shim by .002". If pinion is marked "–8" but gauge reads "–6", **increase** thickness of shim by .002". If gauge reads "–10", **decrease** thickness of shim by .002".

2) Change pinion bearing pre-load spacers by same amount the pinion setting shims were changed, and finally install pinion assembly in carrier. *See "Pinion Bearing Pre-load Adjustment" above.*

CHECKING & STRAIGHTENING PROPELLER SHAFT (Using V-bl cks): Support shaft assembly on V-blocks at each end (forward block just to rear of splines at forward end of shaft, rear block under splined coupling). Use a dial indicator to measure run-out at points 3" from each end of shaft tube (*CAUTION* - Do not allow unevenness of tube surface to cause indicator to bounce indicating wrong reading). If run-out not within .006" at these two points, straighten tube by pressing on center of tube (support tube at same point at front end and under splined coupling at rear as used for checking straightness). Then check run-out at center of shaft tube. If run-out exceeds .010" at this point, straighten tube while supporting it on blocks at tube weld point at each end. Then check run-out at pinion coupling. If run-out exceeds .001", support shaft at forward end and at splined coupling at rear end, and exert pressure at weld points on rear end of tube. Recheck all run-out points, then check runout at extreme forward end of shaft (must be less than .002").

CHEVROLET HYPOID (HOTCHKISS DRIVE)

Pass. Cars & Sed. D l. (1956)
1/2-Ton Trucks (1956)

►CHANGES & CORRECTIONS

►*1956 REAR WHEEL BEARING NOTE:* Bearing and axle shaft seal are serviced as an assembly. The bearing is permanently lubricated and no further lubrication is required. Install with spring loaded lip toward axle shaft retainer.

►*1956 PINION MARKING & PINION SETTING TOOL CHANGE:* The number marked on pinion will indicate, in thousandths, the pinion mounting distance. A new Rear Axle Pinion Gauge, J-6266 is used with the new pinion markings to obtain a more accurate adjustment. The new gauge is not used on earlier models.

DESCRIPTION: Semi-floating hypoid gear type with Hotchkiss drive. Design is similar to 1955 models, and the new wider ring gear and pinion sets may be used on 1955 models for service replacement.

REMOVAL: *See "Rear Axle" on Car Model pages.*

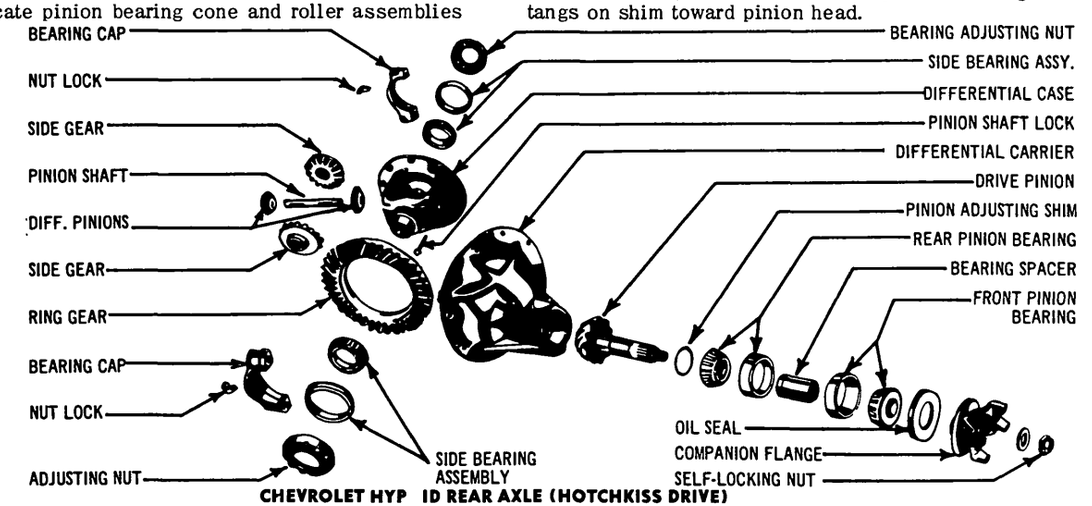
OVERHAUL: Service procedures are the same as for 1955 rear axles. *See "Chevrolet Hypoid (Hotchkiss Drive)" in 1955 Annual Data or later Manual edition, and note the following:*

Rear Wheel Bearing: Permanently lubricated type integral with seal. Install bearing and seal assembly with spring loaded seal toward axle shaft retainer.

►*PINION SHAFT REMOVAL NOTE:* Interference may be encountered on some models while pinion shaft is being removed. If pinion shaft will not clear ring gear, ring gear must be removed to avoid damaging teeth while pinion shaft is being removed.

Ring Gear & Pinion Backlash Adjustment: .006" to .008" backlash is preferred on all 1956 models.

Pinion Depth Setting Adjustment: If original ring gear and pinion, pinion rear bearing assembly and differential carrier will all be reinstalled, the original shim or one of the same thickness may be used. If the ring gear and pinion, pinion rear bearing assembly or differential carrier are to be replaced, the correct thickness of the pinion depth shim may be determined as follows:



1) Lubricate pinion bearing cone and roller assemblies with rear axle lubricant. Position rear bearing in its cup in carrier. Rotate bearing several times to make sure it is seated. Position gauge plate (part of Tool J-6266) on bearing so that the chamfered corner is toward pinion side and top of differential as installed in car.

2) While holding front cone and roller assembly in its cup with the clamp plate, insert the clamp screw (part of Tool J-6266) through the gauge plate, both bearings and clamp plate. Tighten only a sufficient amount to center bearings in cup. Check to see that neither gauge block nor clamp plate touch the housing. Oscillate gauge plate and bearings several times to be sure bearings are seated and then draw up hex nut until 20 inch-pounds of torque are required to oscillate plate and bearings. (*NOTE* - A torque of 60 ft. lbs. may be required to tighten nut on clamp bolt in order to obtain simulated preload of bearings after assembly. After tightening clamp bolt nut, measure turning torque with an "inch-pound" torque wrench).

3) Install Tool J-6266 body assembly across differential bores. Plunger on body must point inward toward center of pinion rear bearing. Mount a dial indicator, KMO-30 on tool body post with indicator button on top of tool plunger. Swing body so that plunger **does not** touch gauge plate, and set dial indicator at zero.

4) Slowly swing inner end of tool plunger across gauge plate until highest indicator reading is obtained. Record this measurement and recheck to see that it is correct. Record factory marking on pinion. **Subtract** the measurement obtained with the tool from marking on pinion. The **difference** between these two figures determines thickness of pinion depth shim to be installed with the particular pinion and ring gear, and rear bearing and carrier being checked. Shims are available in six different thicknesses: .021", .024", .027", .030", .033" and .036". Use the shim which is closest to the difference in measurement.

5) Remove indicator, tool, and pinion rear bearing cone assembly from carrier. Position the shim selected, between pinion gear head and rear pinion bearing with tangs on shim toward pinion head.

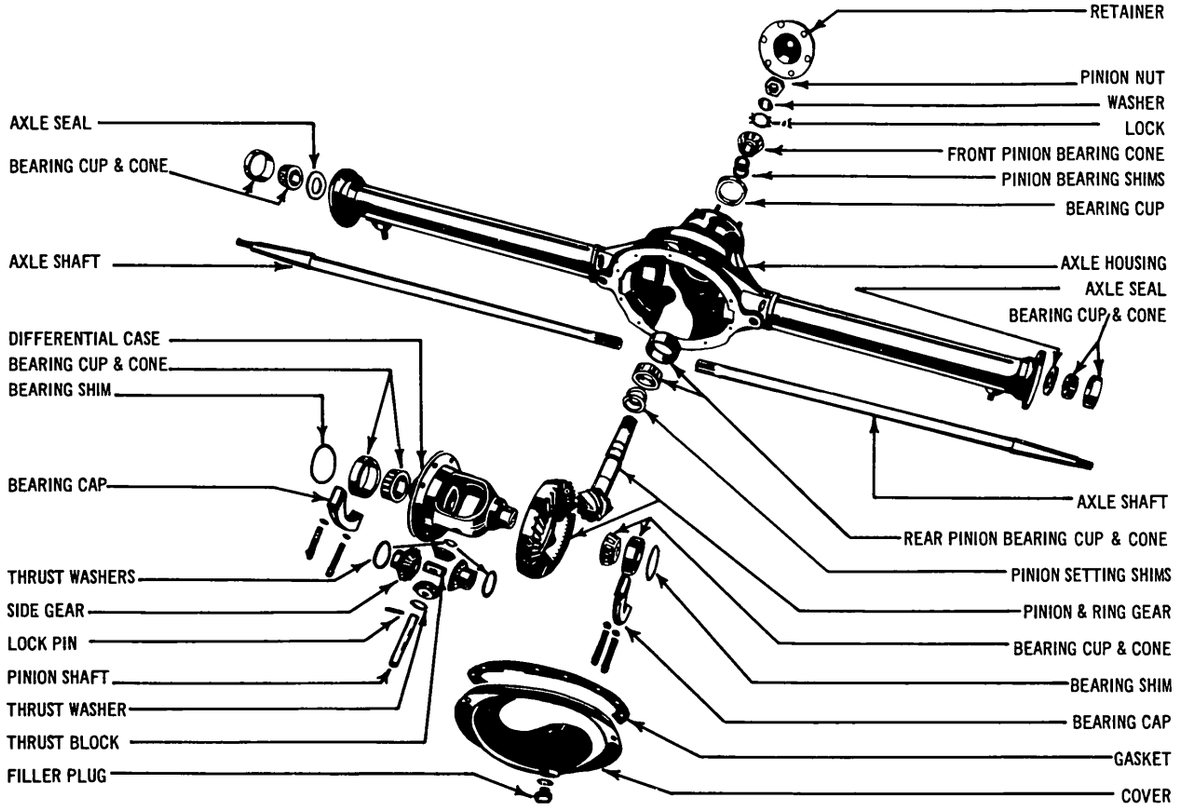
CHEVROLET HYP ID REAR AXLE (HOTCHKISS DRIVE)

HUDSON NASH, RAMBLER HYPOID (TORQUE TUBE DRIVE)

Hudson Wasp (1956)
Hudson Hornet (Exc. Spec. V8) (1956)
Nash Statesman (1956)
Nash Ambassador (Exc. Spec. V8) (1956)
Rambler (1956)

► *HUDSON HORNET & NASH AMBASSADOR SPECIAL V8 REAR AXLE NOTE: A "Spicer" rear axle is used on this model. See "Spicer Hypoid Semi-Floating" Rear Axle, below.*

► *1956 PINION DEPTH SHIMS LOCATION CHANGE & DEPTH ADJUSTMENT PROCEDURE CHANGE:* In early production cars, the pinion depth adjusting shims were located between pinion gear head and bearing cone. In later cars, the pinion depth adjusting shims are located in bore of rear axle housing behind rear pinion bearing cup. The rear face of the pinion is now machine ground and the depth adjusting procedure has been changed on later cars having the pinion depth adjusting shim located between housing and bearing cup. *See "Pinion Setting (Later Cars)" under "Overhaul" below.*



► *1956 & EARLIER SERIES 50, 60, 80 TORQUE TUBE TRUNNION ASSEMBLY SERVICE REPLACEMENT:* Torque Tube Trunnion Kit, Part No. 3117235, containing a trunnion and six rivets is available for service replacement. For installation procedures, see "Overhaul".

DESCRIPTION: Semi-floating, hypoid gear type with torque tube drive and coil springs, of same design as used on corresponding previous models.

REMOVAL OF REAR AXLE ASSEMBLY: *See "Rear Axle" on Car Model pages.*

OVERHAUL: Service procedures are the same as for previous models except as noted below. *See "Changes, Cautions, Corrections" above, and "Hudson & Nash Hypoid" in 1955 Annual Data or later Manual edition.*

Pinion Depth Setting Adjustment (Later cars with pinion depth adjusting shims located between rear pinion bearing cup and bore in rear axle housing): The amount of shims used is determined by the amount of shims removed at disassembly and by the plus or minus figure etched on pinion. For example, if original pinion was marked + 2 and had a shim pack of .035" behind rear bearing cup and the new pinion to be installed is marked − 1, the shim pack must be increased by .003" to bring the new pinion to its correct position. Install the pinion front bearing cup with Replacer J-2534 or J-5367. Insert pinion in position and install front bearing cone and cup. Check pinion setting as follows: Mount discs J-2499-2 on Gauge Arbor J-6482-1 or discs J-5223-5 on Arbor Gauge J-5223. Install gauge seated squarely in housing bores. Place bearing caps in position and tighten bolts finger tight. Install Gauge Block J-5223-16 in position against end of pinion gear and clamp in place with Clamp Bar and Screw J-5223-6 and J-5223-14. Loosen thumb screw in end of gauge block and move plunger out until head contacts gauge arbor. Lock plunger in place with thumb screw, being careful not to disturb position of plunger. Loosen screw in clamp holding gauge block against pinion and remove gauge block.

HUDSON, NASH, RAMBLER HYPOID REAR AXLE

Measure distance from end of anvil to top of plunger head with a two to three inch micrometer. This measurement represents the distance from rear face of drive pinion to centerline of the rear axle and should be as follows: 2.095" (Rambler); 2.094" (Statesman & Wasp); 2.547" (Hudson Hornet & Nash Ambassador). This measurement applies only to correctly adjusted pinions marked "0". On a pinion marked + 2, the reading should be .002" less than this figure and with a pinion marked − 3, the reading should be .003" greater. If the micrometer reading shows pinion setting is incorrect by more than .002" plus or minus from the given figure, shims equal to that amount must either be added or removed from shim pack between rear bearing cup and housing.

Service Replacement Torque Tube Trunnion Installation (Series 50, 60, & 80, 1956 & Earlier): *(NOTE* - On models prior to 1956, the trunnion assembly is riveted to torque tube. On 1956 models, it is welded). On 1956 models, remove original trunnion by making a hack saw cut through one thickness of metal adjacent to weld. Strike trunnion a sharp blow with a hammer to break away portions that may not have been cut all the way through. Remove trunnion and grind off remaining portion of weld on torque tube. On earlier models, remove rivets, then remove trunnion. Place new trunnion on torque tube, then place trunnion and torque tube assembly on bench and block tube at truss rod brackets or studs and position trunnion so that distance from front face of trunnion flange to rear face of rear torque tube flange is correct for the model being worked on (see "Torque Tube Lengths" below). *(NOTE* - Trunnion must be installed on torque tube so that the wider flat surface on trunnion flange is upward. When properly installed, the lower narrow flat surface on trunnion flange will be parallel to truss rod bracket (Series 50); truss rod studs (Series 60 & 80). Weld trunnion to torque tube (1956 models), or rivet to torque tube (earlier models). *NOTE* - If desired, the trunnion may be riveted to torque tube on 1956 models. Use trunnion as a template and mark the six holes located on torque tube. Drill 21/64" diameter holes and install trunnion with rivets supplied in kit. Rivet heads are installed to inside of torque tube.

Series	Torque Tube Lengths	① Length
50 (Std. & Overdrive)		61 1/32"
50 (Hydra-Matic)		63 31/32"
60 (Std. & Overdrive)		62 3/8"
60 (Hydra-Matic)		65 7/32"
80 (Ultramatic)		65 7/32"

① - Front flange face to rear flange face.

Torqu Tube & Propeller Shaft Removal, Installation & Adjustment (Rambler Models): Procedures are the same as for 1955 Statesman & Wasp models except that on Rambler models with Hydra-Matic Transmission, the rear coupling is integral with the propeller shaft.

FORD PASS. CAR HYPOID (SEPARATE CARRIER TYPE)

Ford Pass. Cars (Exc. Sta. Wgn., Sed. Del., Thunderbird & Police Interceptor) (1956)

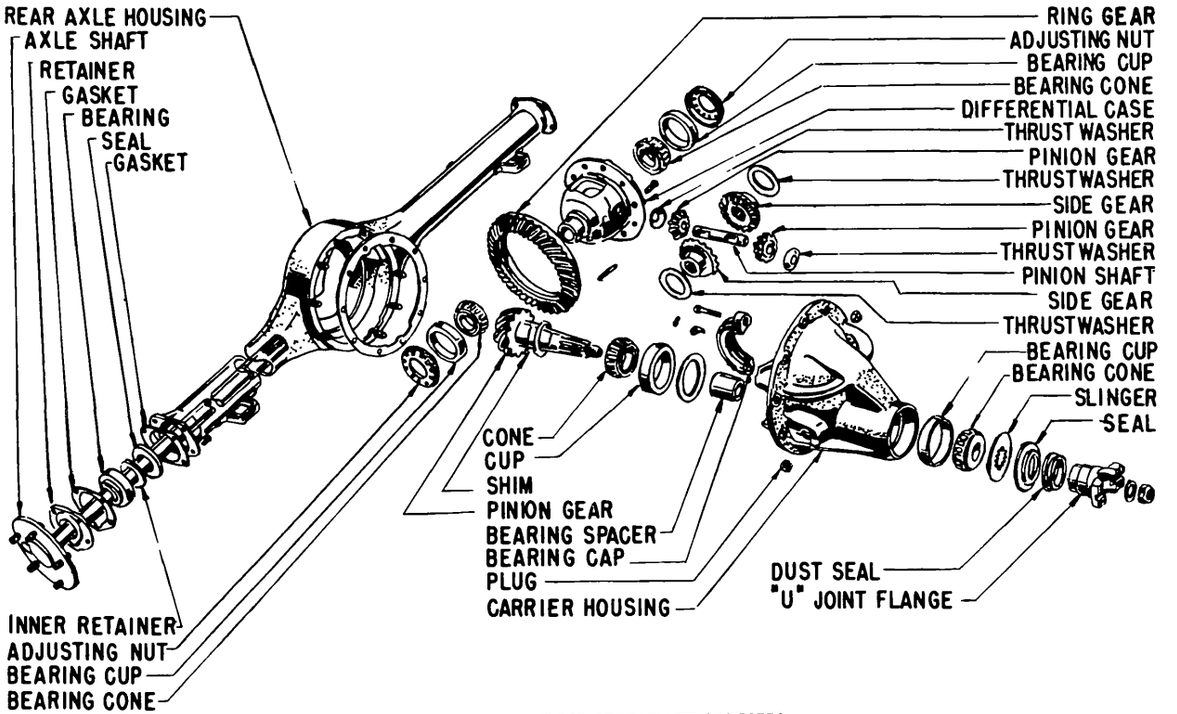
►*NOTE: "Integral Housing" Hypoid Rear Axle is standard equipment on Thunderbird, Police Interceptor, Station Wagons, Sedan Delivery, & Courier Models. See "Ford, Lincoln, Mercury (Integral Carrier) Hypoid".*

►*1956 PINION BEARING SPACER PRODUCTION CHANGE:* A new pinion bearing spacer, Part No. B6A-4662-A with indentations on the inner surface has replaced the earlier type paper lined spacer. The later type spacer will center correctly on pinion and prevent cocking of spacer. Do not use the paper liner with later type spacer.

►*1956 3.22-1 RATIO REAR AXLE RING GEAR CHANGE (CARS WITH 312" THUNDERBIRD ENGINE):* The ring gear diameter has been increased from 8 1/4" to 8 1/2" and the attaching bolts have been increased from 3/8" to 7/16". A limited number of ring gears and pinions were released with 3/8" bolts. If failure is encountered with this ring gear, and the B6A-4209-J gear set is not available, it will be necessary to use the B6A-4209-K gear set and replace the differential gear case with a B6A-4205-D gear case.

►*1956 DRIVE PINION OIL SLINGER PRODUCTION CHANGE (Also a service replacement change on all 1950-56 Models):* To prevent losing pinion bearing preload due to wear of drive pinion oil slinger, a new slinger, Part No. B6A-4670-A which is made of harder material, is being used in production and for service replacement. Install the later type slinger whenever disassembly of the rear axle is necessary.

►*1955-56 DIFFERENTIAL GEAR CASE REPLACEMENT CAUTION:* To prevent installation of the wrong differential case, the attaching flange thickness should be measured before installation. It is important that the proper length ring gear bolts be used with the differential case. When using differential gear case, Part No. B5A-4205-B (7/16" flange), the 43018-S (7/8" long) attaching bolts must be used. If differential gear case, Part No. B6A-4205-B (23/64" flange) is used, the 46027-S (3/4" long) attaching bolts must be used.



►*1955-56 RING GEAR TO DIFFERENTIAL CASE ATTACHING BOLT TIGHTENING SPECIFICATION CHANGE:* Tightening specifications for the 3/8" diameter bolts have been changed from 35-40 ft. lbs. to 45-50 ft. lbs. Assemblies using the 7/16" diameter bolt (see 3.22-1 Ratio Rear Axle Change above) must be tightened to 75-85 ft. lbs.

DESCRIPTION: Semi-floating, hypoid gear, with Hotchkiss drive. A separate differential carrier unit is used which can be removed for overhaul.

REMOVAL: *See "Rear Axle" on Car Model pages.*

OVERHAUL: Service procedures are the same as for 1955 models except as noted below. *See "Changes, Cautions, Corrections" above and "Ford Pass. Car Hypoid (Separate Carrier)" in 1955 Annual Data or later Manual edition.*

Drive Pinion Adjustment (Master Pinion Tool Method): Make sure bores in carrier are free of burrs and metal chips, then install drive pinion bearing cups in carrier

FORD PASS. CAR HYPOID (SEPARATE CARRIER)

using Tool T55P-4616-A. *(NOTE* - The same depth gauges are used on 1956 axles as used on earlier models, but the following cautions must be observed: Adapter rings must be used with depth gauges because differential bearing pocket diameters are 1/8" larger than earlier models. A spacer (approximately 1/8") must be inserted between universal joint flange and front pinion bearing when master pinion is installed in carrier housing). Place pinion bearing cone which will be used in final assembly, on master pinion Tool 4610-P or 4610-A. Place master pinion in housing. Install bearing, 1/8" spacer, universal joint flanges, washer, and nut. Hold flange and tighten nut to pre-load bearings to 15-20 inch-pounds. Check pre-load with Tool 4610-N. Alternately turn the drive pinion while tightening nut to seat bearing properly. Install pinion depth gauge in differential side bearing bores and measure distance between depth gauge and master pinion with a micrometer. Remove pinion depth gauge and master pinion from carrier. With the number painted on face of pinion to be installed, and the micrometer reading, select the total shim thickness required for pinion from Pinion Setting Shim Table. (For example: a reading of 2.135" from Tool 4610-P, with a pinion marked "17" requires .017" shim). Shims are available in 12 sizes from .010" to .021" in increments of .001". Install proper shim on pinion shaft, then press rear bearing on pinion until it is seated against shim. Install pinion assembly in carrier, then install a new bearing spacer, and the front bearing. Place oil slinger and seal on pinion shaft. Brush a thin coating of sealer on outer diameter of seal, then drive seal into place with Tool T55P-4676-A. Install washer and nut and alternately turn pinion while tightening nut until bearing pre-load is 18-24 inch-pounds (new bearings) or 13-18 inch-pounds (used bearings).

►*DRIVE PINION ADJUSTMENT (TOOTH PATTERN METHOD) NOTE:* Adjustment of pinion using this method is the same as for previous models, except that a starting shim pack of .015" should be used instead of a .030-.032" shim pack. *See "Ford Pass. Car Hypoid (Separate Carrier)" in 1955 Annual Data or later Manual edition.*

PINION SETTING TABLE

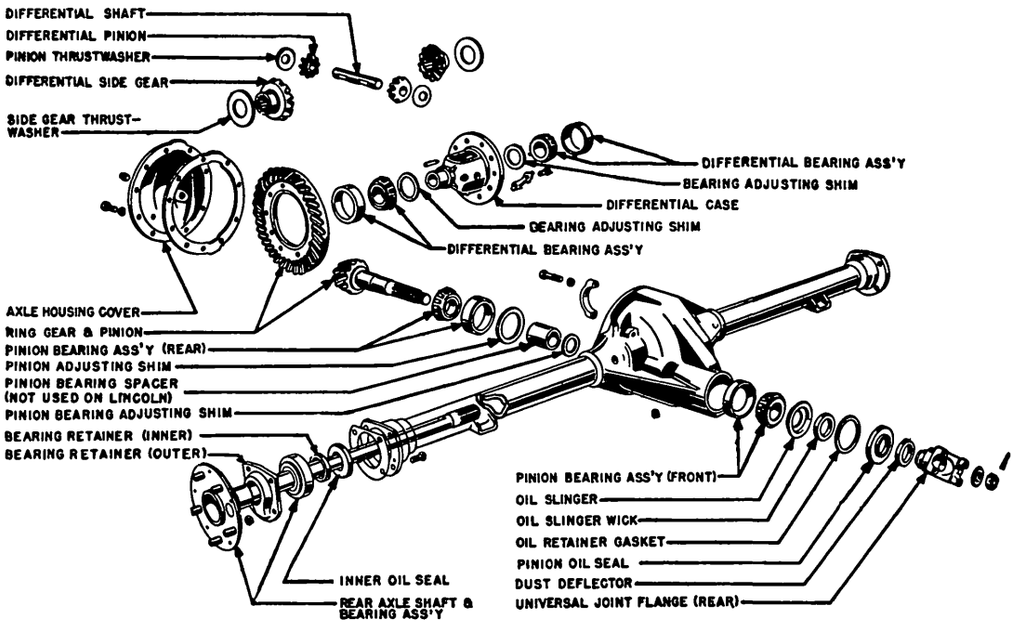
FORD, LINCOLN, MERCURY HYPOID (INTEGRAL CARRIER)

F rd Sta. Wgn., Sed. Del., Thunderbird, Police Interceptor & F-100 Trucks, (1956)
Continental (1956)
Lincoln (1956)
Mercury (1956)

►CHANGES, CAUTIONS, CORRECTIONS



►*1956 LINCOLN & MERCURY REAR AXLE PINION SEAL SQUEAL CORRECTION:* A new seal, Part No. MC-4676-A having two sealing lips may be used to replace the old seal. Coat lips of seal with Lubriplate before installation.

►*1949-56 MERCURY REAR AXLE SHAFT ENDPLAY CORRECTION:* A "Clunking" sound on rough roads or sharp turns caused by excessive axle shaft endplay can be eliminated by installing shims between rear axle bearing and shoulder in axle housing tube. Measure axle shaft endplay with a dial indicator. If endplay is over .030" add shims as required to reduce the endplay to not less than .019". Make shims of steel or brass in thicknesses of .010" & .015". Inside diameter should be 2 9/16", outside diameter should be 3 1/8".

DESCRIPTION: Semi-floating, hypoid gear type with Hotchkiss drive. **This axle does not have a separate differential carrier assembly.**

REMOVAL OF AXLE ASSEMBLY: *See "Rear Axle" on Car Model pages.*

OVERHAUL: *See "Ford, Lincoln, Mercury (Integral Carrier)" in 1955 Annual Data or later Manual edition.*

LINCOLN, MERCURY, FORD "INTEGRAL CARRIER" HYPOID AXLE

FORD TRUCK HYPOID (BANJO HOUSING)

F-350, F-500, C-500, B-500, P-500, F-600, C-600, B-600 (1956)

DESCRIPTION: Full-floating, hypoid gear type with Hotchkiss drive.

►*REAR AXLE NOTE:* Different axle assemblies are used for the different series trucks. Except for minor structural differences and variations in size and shape of parts, the various axle assemblies are similar. Service procedures apply to all assemblies unless otherwise noted.

REMOVAL OF AXLE ASSEMBLY: *See "Rear Axle" on Truck Model pages.*

AXLE SHAFT REPLACEMENT: Drain lubricant from housing, then remove axle shaft stud nuts and washers. Tap center of axle shaft flange to loosen tapered dowels, and remove the dowels. Remove axle shaft and gasket from housing. To install, place new gasket on hub and install axle shaft in housing, rotating axle to line up axle splines with splines in gears. Install tapered dowels, lockwashers and nuts on studs and tighten to 50-70 ft. lbs.

WHEEL BEARING ADJUSTMENT: Remove axle shaft (see above), bearing locknut and washer. Tighten wheel bearing adjusting nut while rotating wheel back and forth, until a noticeable drag is felt, then back off adjusting nut 1/8 turn. Install bearing lockwasher and locknut and bend one tab of lockwasher over adjusting nut and one tab over locknut. Install axle shafts.

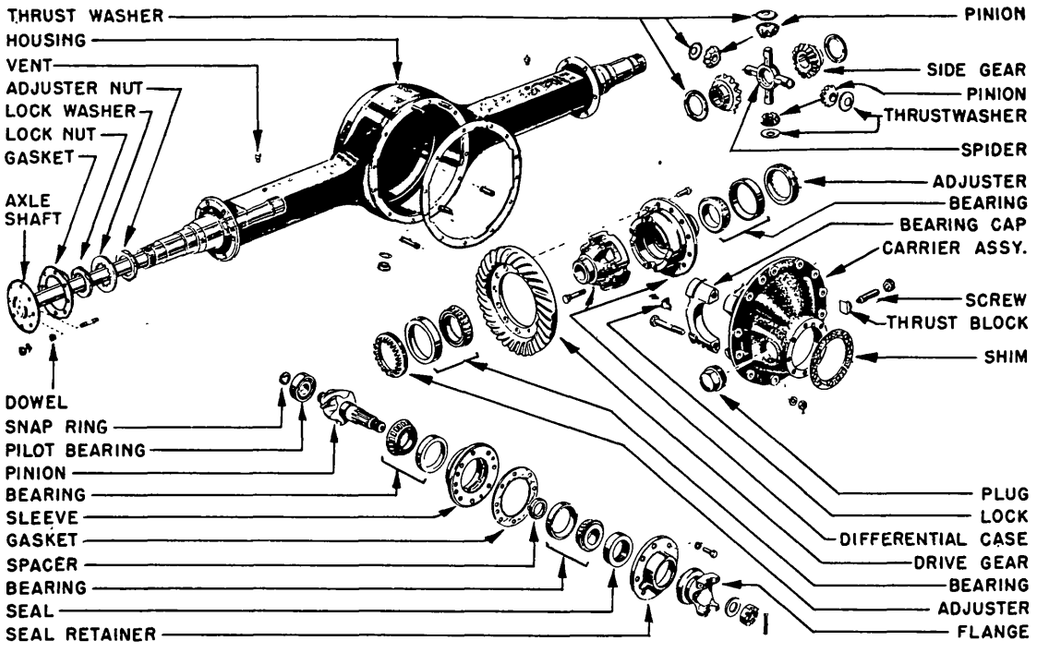
OVERHAUL: The following service procedures apply to all series trucks.

Differential Carrier Removal: Remove axle shafts (see above). Support carrier assembly properly with a roller jack, then remove carrier to housing bolts and lockwashers. Tighten the puller screws, when provided in carrier, until carrier is loosened from housing. Carefully withdraw carrier assembly from axle housing, then back off puller screws. Remove and discard axle housing gasket.

Differential Carrier Disassembly: Adjust differential bearing pre-load (if bearings are in good condition) then check runout of drive gear with a dial indicator. Make a note of runout for reference during reassembly. On 500 Series trucks, loosen the thrust block locknut, then back out the thrust screw and block to provide clearance for drive gear. On all models, mark differential bearing caps and carrier legs with a punch as a guide when reinstalling bearing caps. Remove adjuster locks. Remove bearing caps and remove differential assembly from carrier. Remove thrust block on 500 Series trucks.

Differential Disassembly: Clamp assembly in a vise with soft jaws, then remove differential side bearings with a suitable puller. Mark differential case halves with a punch before disassembling, and remove bolts or cap screws. Separate case halves, using a brass hammer if necessary, then remove side gears, spider, pinions and thrust washers. Center punch the drive gear rivet heads on drive gear end of rivets. Drill through the rivet heads using a drill 1/32" smaller than rivet body. Press out rivets, then tap drive gear off case with a soft hammer.

Pinion Removal & Disassembly: Hold universal joint flange, then remove cotter pin, nut and washer from drive pinion shaft. Remove flange using Tool T53T-4851-A. Remove bolts which attach oil seal retainer and pinion



CONTINUED ON NEXT PAGE

FORD TRUCK HYPOID "BANJO HOUSING" (C nt.)

bearing sleeve to carrier. Remove oil seal retainer then on 600 Series trucks, remove the universal joint flange spacer washer. Drive the drive pinion and sleeve assembly out of carrier, or remove it with puller screws. Remove pinion bearing sleeve shims, noting the number and thickness of shims used. Tie shim pack together and retain for future use. Tap or press drive pinion out of the front pinion bearing and sleeve, then press the drive pinion out of spacer and rear pinion bearing. Remove pilot bearing snap ring, then remove pilot bearing with Tool T56T-4625-A (F-350); T53T-4625-A (F-500 & F-600). Remove pilot bearing snap ring and remove pilot bearing.

Pinion Reassembly & Adjustment: Press drive pinion pilot bearing on drive pinion, then install snap ring. Press rear bearing on shaft until seated against back face of pinion gear. Press pilot bearing cups in sleeve. Insert drive pinion into pinion bearing sleeve, then install old pinion bearing spacer for a trial build-up. Install front bearing in sleeve. On 350 Series trucks, install universal joint flange and tighten flange nut to 175-250 ft. lbs. Wrap a strong cord or soft wire around the bearing cage and attach a pound-pull scale to cord. Measure the torque required to keep cage rotating (disregard torque required to start cage rotating). If torque required to keep cage rotating is not between 12-18 inch pounds, install a thinner spacer to increase or a thicker spacer to decrease the pre-load. This same procedure is used on 500 & 600 Series trucks, except that the universal joint flange nut is tightened to 300-400 ft. lbs. After pre-load is properly set, install a new oil seal in drive pinion seal in drive pinion seal retainer with Tool T53T-4676-B (350 & 500 Series); T53T-4676-C (600 Series). On 600 Series trucks, place the universal joint flange thrust washer on top of drive pinion outer bearing. Install oil seal retainer assembly, universal joint flange, washer and nut on drive pinion. Hold flange and tighten nut to 300-350 ft. lbs., then install cotter pin. Place original bearing cage shims on differential carrier, then place drive pinion and sleeve assembly into carrier and tap it into place with a soft hammer. Install cap screws and lockwashers, then tighten screws to 23-31 ft. lbs.

Differential Ass mbly: If the drive gear runout check during disassembly exceeded .008", the condition may be caused by a warped gear, defective case, or by excessively worn differential bearings. To determine cause of excessive runout, before riveting gear to case, press the differential side bearings in place on case hubs until seated against shoulders of case. Assemble the two halves of case, aligning marks made at disassembly. Tighten differential case capscrews or nuts to 23-31 ft. lbs. (350 Series); 50-70 ft. lbs. (500 Series); 80-105 ft. lbs. (600 Series). Install case in differential carrier, then check runout of case flange with a dial indicator. If runout exceeds .005", the drive gear is true and the condition is due to either a defective case or differential side bearings. Install new bearings on case hubs, and install case in carrier, then check runout again. If runout is still excessive, the differential case is defective and must be replaced. After the condition has been corrected, disassemble differential case. Position drive gear on case flange, then attach drive gear to case with rivets. *(CAUTION - Be sure drive gear and case are clean, and the drive gear is not cocked before riveting gear to case. Cold rivets must be used to attach gear to case).* Apply a thin coating of lubricant on spider, side gears and thrust washer, then assemble them in drive gear half of case. Install cap screws or bolts and nuts, and tighten to correct torque. Install lock wire.

FORD TRUCK "BANJO HOUSING" HYPOID AXLE

Drive Gear Adjustment: Place side gear bearing cups over side bearings, and position differential assembly in carrier. Position bearing adjusters in carrier, making sure the adjuster threads mesh with threads in carrier. Install bearing caps in their original position using the aligning marks made at disassembly, as a guide. Install bearing cap bolts and tighten to 81-106 ft. lbs. (350 Series); 80-100 ft lbs. (500 Series); 110-145 ft. lbs. (600 Series). *(NOTE - The bearing adjusters and bearing cups can be moved with the bearing cap bolts at normal torque).* Tighten bearing adjusters hand tight against side bearing cups. Turn left hand adjuster until drive gear is loosely meshed with pinion gear. Mount a dial indicator on carrier flange with the contact button bearing against back of gear or differential carrier, then loosen the right hand adjusting nut just enough to notice endplay on indicator. Tighten this adjuster until zero endplay is obtained. Tighten each adjuster one notch from the zero endplay position to pre-load differential bearings. Mount the dial indicator on the carrier so contact button bears against rear face of ring gear tooth, then adjust drive gear to obtain .006-.012" backlash. To reduce backlash, loosen right hand adjuster and tighten left hand adjuster equally. To increase backlash, perform the same operation in reverse. Check gear tooth contact for correct pattern. If tooth contact adjustment is necessary, the drive pinion position may be changed by varying the thickness of shim pack between pinion case and carrier. Adjust drive gear position by bearing adjusters.

Differential Carrier Installation: Place a new carrier to housing gasket on axle housing making sure the puller bolt holes in gasket are aligned with holes in housing. Place differential carrier assembly on a roller jack, then roll carrier into position. Start carrier into housing with four cap screws equally spaced. Tighten cap screws alternately to draw carrier squarely into housing. Install remaining carrier to housing screws, lockwashers and tighten to 53-59 ft. lbs.

INSTALLATION OF REAR AXLE ASSEMBLY: *See "Rear Axle" on Truck Model page.*

1956 SUSPENSION & WHEEL ALIGNMENT

BUICK

All Series (1956)

►*FRONT TIRE RUBBING ON FRAME CORRECTION (Turning Angle Too Great):* To correct, install a 1/32" thick plain washer under bolt head of rear steering arm bolt on both right and left sides. In order to install washer, it will be necessary to remove hub and drum assembly to gain access to nut on rear steering arm bolt.

►*1956 CASTER CHANGE:* Caster now specified is 0° to Neg. 2°, with Neg. 1° desired. This supersedes previous specification of Pos. ½° to Neg. 1½°

DESCRIPTION: Same design as used on previous models.

ADJUSTMENT & PARTS REPLACEMENT: *See "Buick" in 1955 Annual Data or later Manual edition and note the following:*

Trim Dimension (Front Springs): Before measuring, bounce both ends of car up and down several times to make sure there is no bind in suspension members, and to let springs take a natural position. When car is at rest, measure the trim height between top side of lower control arm and underside of frame cross-member (at bumper bracket). Trim dimension should be within limits shown in table below and lower control arm heights should be same on both sides of car.

►**Trim Dimension Correction–**If trim dimension is less than specified, or additional height is required to prevent "bottoming", install additional spring insulators, divided between upper and lower ends of spring. If more than three additional shims required, replace the spring. NOTE–New springs should not increase the trim dimension more than 1" over specified maximum limit.

Front Trim Dimensions

46C. 56C, 76C	3½-4"
All Other Models	3¾-4¼"

NOTE - When checking NEW car add ¼".

Trim Dimensi n (Rear Springs): Proceed as for front springs. Measure distance from pivot bolt to raised portion on forward end of bumper bracket.

Rear Trim Dimensions

46, 56, 66, 76C, R	4¼-5¼"
All Other Models	5½-6¼"

NOTE - When checking NEW car add 3/8".

Kingpin Inclination: 7° at 7/8° camber.

Caster: 0° to Neg. 2° (Neg. 1° desired). *NOTE* - Supersedes previous specification of Pos. ½° to Neg. 1½°.

Camber: Pos. 3/8° desired (Limits Pos. 7/8° to Neg. 5/8°). Both sides of car should be equal within 3/4°.

Toe-In: 1/16-1/8".

Toe-Out on Turns: With outer wheel turned 20°, inner wheel should be 22½°±¾°.

FRONT SPRING REPLACEMENT (Removal): Place jack under lower control arm and raise sufficiently to remove wheel. Disconnect stabilizer link from lower control arm and outer end of tie rod from steering arm. Remove shock absorber and remove lower pivot pin nut, pivot pin nut, pivot pin, lock washer, and dust seals. Support car frame with another jack, then slowly lower jack under lower control arm, and remove spring.

Installation: Before installing front spring, check the spring part number to make sure it is the correct spring (See "Front Spring" Table above). Make sure that rubberized fabric spring insulator is around spring centering flange on frame and is in good condition. Place one end of spring over centering flange, and as lower control arm is raised, position lower end of spring so that end coil seats in recess in spring seat. Support lower control arm on a jack. Slip lower pivot pin dirt seals over outer ends of lower control arm. Centralize lower end of knuckle support between outer ends of lower control arm, then install lower pivot pin and lock washer from front side and tighten securely. Install and tighten nut. Snap dirt seals into place over pivot pin. Connect tie rod outer end to steering arm, and connect stabilizer link to lower control arm (NOTE–When stabilizer rod nut is tightened, the overall length of each grommet assembly should be 1 11/16". Adjust nut as necessary to obtain this dimension) Reinstall shock absorber and wheel. Adjust front end alignment.

Front Spring Application

Synchro-mesh Trans.

Series	Std.	Air Conditioned
40	1171037 ①	1165048

① - 1171038 200 lb. overload.

Dynaflow Cars

Series	Std.	Air Conditi n d
40, 60	1171038	1165049
50, 70	1165049	1165050

REAR SPRING REPLACEMENT (R m val): Disconnect both rear shock absorber lower ends. Hoist rear end of car until all load is off rear springs, place floor stands under frame for safety. Remove spring clamps at lower and upper ends and remove spring.

Installation: Be sure spring insulator in upper seat is in good condition, then attach upper end of spring using clamp, bolt insulator, flat washer, lockwasher and bolt in order named. Attach lower end of spring with clamp, lockwasher and nut. Lower car and attack lower ends of shock absorbers. *NOTE* - Car weight must be on rear wheels when tightening shock absorber ends to clamp rubber bushings in a neutral position.

Rear Spring Application

Series	R ar Spring Part No.
41, 43, 48, 63, 63D	1341972
46C, R, 66C, R ①	1341972
46C, R, 66C, R	1174150
49, 69	1315231
40, 60 Exc. 49 & 69 ②	1315231
40, 60 Exc. 49 & 69 ①	1165116
52, 53, 72, 73	1165116
56C, R, 76C, R ③	1165116
50, 70 ①	1334701
56C, R, 76C, R	1168767
50, 70 ②	1315233
49, 69 ①	1315233

① - 200 lb. overload.
② - 500 lb. overload.
③ - 100 lb. overload.

►*UPPER SUPPORT ARM TORQUE NOTE:* Turn bushing until head is tight against arm, then torque to a minimum of 150 ft. lbs.

CADILLAC

All Series (1956)

DESCRIPTION: Same design used beginning 1950.

ADJUSTMENT & PARTS REPLACEMENT: *See 1950 Annual Data or later Manual editions and note the following:*

Front Spring Height: Measure distance from top of lower control arm to center of rubber bumper bracket front lower rivet on frame. Spring height should be equal on both sides of car within 3/8". If heights unequal, low side may be adjusted by addition of shims between bottom of spring and spring seat on lower suspension arm.

Front Spring Heights

Car Model	Spring Height
All Models (Exc. 75 & 86)	4½-5¼"
75	5 3/8-6 1/8"
86 (Commercial)	5½-6¼"

Rear Spring Height: Measure distance from top of spring U-bolt to a hole in frame side bar directly above U-bolt. Rear spring height should be equal within ½" on both sides of car.

Rear Spring Heights

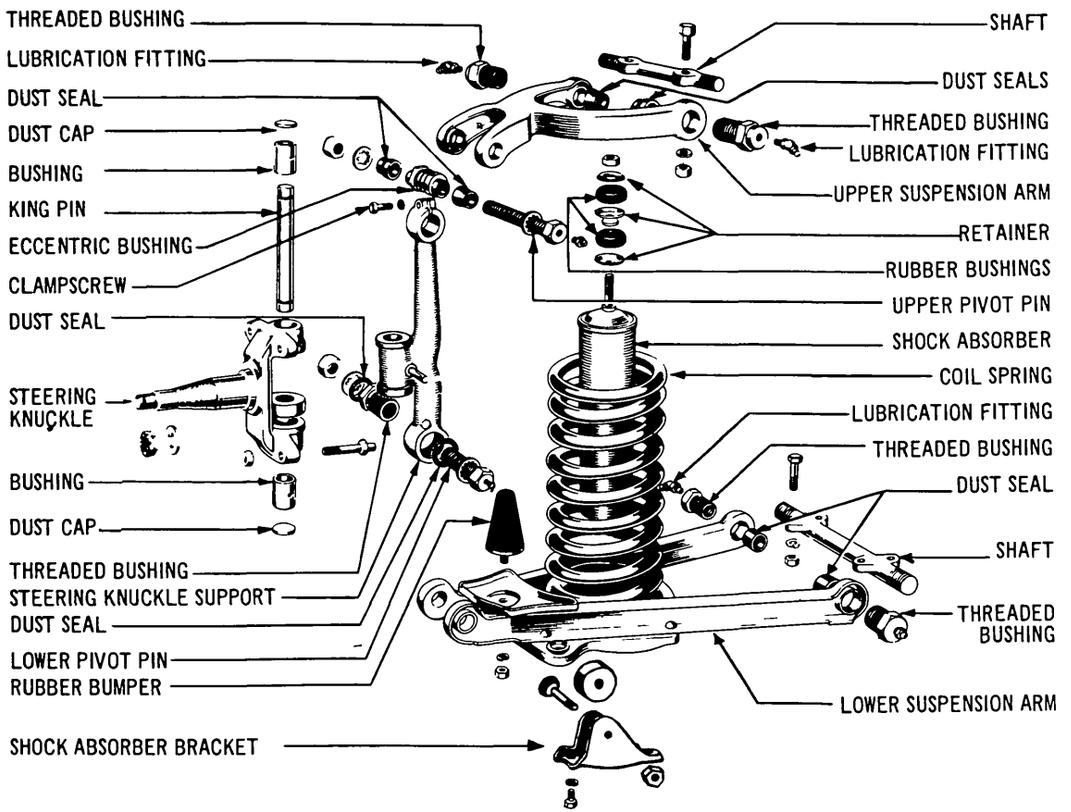
Car Model	Spring Height
All Models (Exc. 86)	8¾-9½"
86 (Commercial)	10¼-11"

Kingpin Inclination: 5°51' crosswise.

Caster: 0° to Neg. 1° and equal within ½°.

Camber: Neg. 3/8° to Pos. 3/8° with ¼-½° more positive camber on left wheel.

Toe-In: 5/32-7/32" at rest. Loosen clamp bolts and turn adjusters at outer end of each tie rod equally. *NOTE* - Be sure open side of clamp is over open side of adjuster before tightening clamp.



Toe-Out on Turns: With outer wheel turned 20°, inner wheel should be 22°40'.

► *FRONT SPRING INSTALLATION NOTE: Lower insulator no longer used.*

CADILLAC FRONT SUSPENSION ASSEMBLY

CHEVROLET PASS. CARS

Chevrolet Pass. Cars (Exc. Corvette) (1956)

►CHANGES, CAUTIONS, CORRECTIONS

► *1955 CAMBER ADJUSTMENT CORRECTION:* If it is found that proper camber cannot be obtained even after removal of all shims, it will be necessary to reposition lower control arm 1/8" inward. New position provides over 1° camber which in turn can be adjusted through addition of shims. Added shims can be moved forward or backward to obtain proper caster. To reposition lower control arm, remove lower control arm shaft. Scribe mark on forward and rear edge of front crossmember, corresponding to present centers of forward and rear inner lower control arm bolt holes in front crossmember. Weld both inner holes shut and redrill new inner holes 1/8" inward from marks scribed above. Weld both outer holes shut and reinstall lower control arm shaft on new inner holes. Using lower control arm shaft as a template, drill two new outer holes and secure with bolts. Recheck camber and add shims as required. Adjust caster by moving shims (see below).

DESCRIPTION: Front suspension utilizes short and long arms with spherical type joints connecting control arms and steering knuckles Coil springs and direct acting shock absorbers are mounted between spring seats on lower control arms and spring pockets in front cross member Inner ends of upper and lower control arms are mounted on rubber torsion bushings which, in turn, are on forged steel shafts bolted to front cross member (no lubrication required). System uses a forged steering knuckle that is connected directly to upper and lower control arms at spherical joints. This knuckle has brake backing plate, anchor pin, and steering arms bolted to it.

ADJUSTMENT & PARTS REPLACEMENT: *See "Chevrolet Suspension" in 1955 Annual Data or later Manual edition and note the following:*

Steering Axis Inclination: Pos. 3½° ±½°.

Caster: Pos. 1° ±½°.

Camber: Pos. ½° ± ½°.

Toe-In: 1/16-1/8" (per wheel), 1/8-1/4" (total). *NOTE* - Supersedes previous specification of 1/8-3/16".

Toe-Out on Turns: With inside wheel at 20°, outside wheel should be 18° 10".

Front Spring Height: Bounce and rock car several times on smooth level floor. Measure from lower face of knuckle lower spherical joint boss to floor and center of lower control arm inner front bushing to floor. Difference should be 2½-3". To correct, replace springs.

FRONT SPRING REPLACEMENT: Remove front shock absorber on side spring to be replaced (see above). Raise front end of car off floor and place stand jacks under frame side rails. Lower car on jacks. Remove tire and wheel assembly (*NOTE*–To avoid damage to spherical joints during spring operations). Remove four lower control arm cross shaft bushing bolts. Install

CHEVROLET CARS (Cont.)

Spring Compressor J-6318 through shock absorber mounting hole in front crossmember and through spring. Install nut washer and thrust bearing on Compressor shaft to keep Compressor from falling back through. Index Cross Shaft of Tool J-6318 through eye in Tool. Attach Cross Shaft to shock absorber pivot bar bolt holes in bottom of lower control arm. Use bolts from pivot bar, tighten securely. Tighten upper Compressor nut to slightly compress spring. Remove lower spherical joint cotter pin and nut. Loosen stud by hammering on side of steering knuckle joint boss, backing up the steering knuckle with a heavy hammer. Remove upper spherical joint stud from knuckle in similar manner, and hang drum and knuckle assembly without loading brake hose. Remove four lower control arm inner shaft-to-crossmember nuts and bolts. Unscrew spring compressor nut and remove spring and lower control arm. (NOTE - On some models generator may have to be loosened, then raised in order to compress spring compressor). To install, reverse removal procedure. Rotate spring to make certain it fits helical seats in lower control arm and crossmember.

CHEVROLET CORVETTE

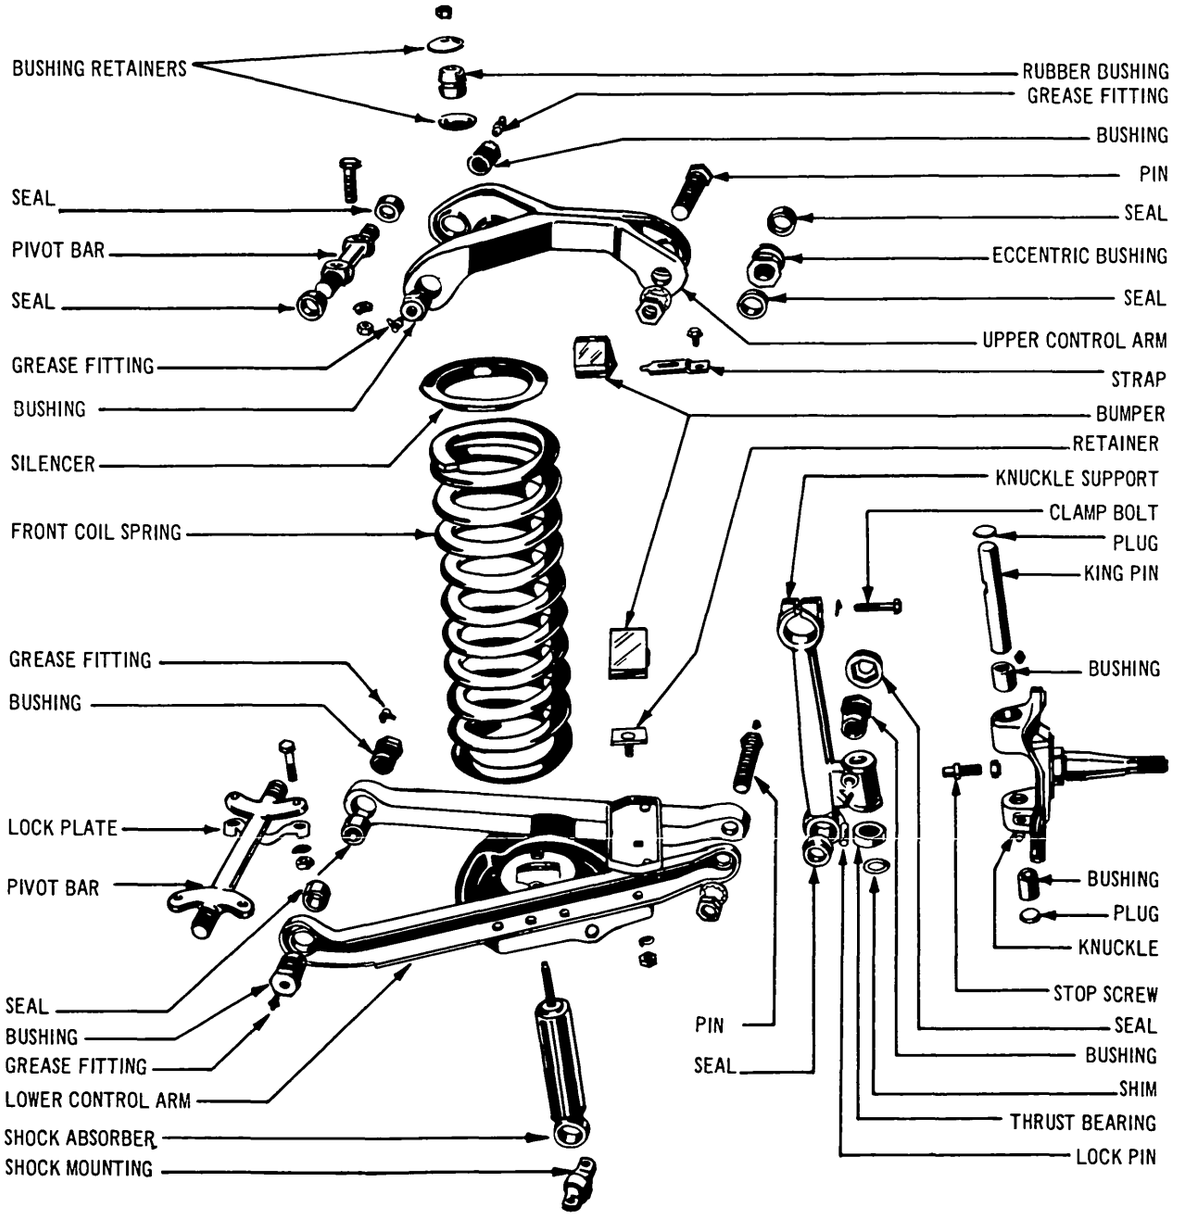
Chevrolet Corvette (1956)

DESCRIPTION: Independent, linked parallelogram type with direct acting shock absorbers, coil springs. "Threaded Bushing" type pivot points used on upper and lower control arms.

ADJUSTMENT & PARTS REPLACEMENT: *See 1949 or later Manual editions and note the following:*

Kingpin Inclination:- 3½-4½° crosswise.
Caster: 0° to Pos. 1°.
Camber: 0° to Pos. 1°.
Toe-In: 0-1/8"
Toe-Out on Turns: With outside wheel at 20°, inside wheel should be 23°.
FRONT SPRINGS: Chevrolet No. 3709497.
Front Spring Height: Bounce and rock car several times on smooth level floor. Measure from center of lower control arm outer pivot bolt to floor and center of lower control arm inner front bushing to floor. Difference should be 1 5/8" ±1/4". To correct, replace springs.

CHRYSLER, DE SOTO, DODGE & PLYMOUTH



Chrysler, DeSoto, Dodge, Plymouth (1956)

DESCRIPTION: Same design as used on previous models. Shock absorbers are mounted within front springs.

ADJUSTMENT & PARTS REPLACEMENT: *See "Chrysler, DeSoto, Dodge, Plymouth" in 1953 Annual Data or later Manual edition and note the following:*

Kingpin Inclination: **Chrysler** – 7° (C70), 5.5° (Others) at 0° Camber.
DeSoto & Plymouth – 5-6½° at 0° Camber
Dodge – 5½° at 0° Camber.
Caster (All Cars): Neg. 2° to 0° (Neg. 2° with Manual

CONTINUED ON NEXT PAGE

CHRYSLER, DE S T , D DGE, PLYM UTH FR NT SUSPENSI N (TYPICAL)

CHRYSLER, DE SOTO, DODGE & PLYMOUTH (C ntinu d)

Steering, 0° with Power Steering preferred), with left side 0-¾° more negative than right side.

Camber: Chrysler, D S t , Dodge – Pos. ¼° ± 3/8° (Pos. ½° on left, 0° on right preferred).
Plymouth – Neg. 1/8° to Pos. 5/8° (Neg. ½° on left, 0° on right preferred).

Toe-In: 3/32-5/32" (3/32" preferred on Dodge, 1/8" preferred on others).

To -Out on Turns: Chrysler, DeSoto, Dodge – With inside wheel at 21½° ± 1°, outside wheel should be 20°.
Plym uth – With inside wheel at 20°, outside wheel should be 17½ - 19°.

Front Spring Height: With car on level floor, tires inflated to recommended pressure, measure vertical distance from inner and outer ends of lower control arm to floor (center of control arm pin at outer end, center of grease fitting in control arm pivot bar on inner end). See table below for allowable variations between the two measured points on each side of car (Exc. Plymouth). Make measurements at right and left sides of car and compare. If measurements differ more than ¼" from one side of car to the other, check each front spring for correct installation at top and bottom. If springs are correctly installed and measurements made at right and left sides still differ by more than ¼", insert spacers at top of spring between seat and silencer or replace spring (*NOTE* - If more than two spacers required to make correction for a spring, replace spring). If measurements taken above for allowable difference of ¼" from one side of car to other, check rear spring heights.

R ar Spring Height: Measure distance from spring plate to frame on each side. Front spring height will be affected if rear spring heights differ more than ¾".

► *NOTE:* In following table, a plus sign (+) indicates the inner end of lower arm is higher than outer end and a minus sign (–) indicates that it is lower.

CHRYSLER	Allowable Variation
C70 (All)	+1¼" to –¼"
C71, 72, 73 Sedans & Coupes	+1" to – 0"
C71 Town & Country	+1¼" to +¼"
C72 Town & Country	+1¼" to –0"
DESOTO	
All (Exc. S23 Sta. Wgn.)	+1" to –0"
S23 Sta. Wgn.	+1¼" to +¼"
DODGE	
All (Exc. Suburban)	+0" to –1"
Suburban	–¼" to –1¼"
PLYMOUTH	
All Models	℄

℄ – No allowable variation given for each spring on each side. Follow procedures given above except for single spring variations.

FRONT SPRING: Removal – Raise front of car and place stands under frame side members behind suspension arm. Remove shock absorbers (see below) and place jack under lower control arm pivot bar where it is attached to frame crossmember. Raise jack and relieve pressure on pivot bar bolts and remove bolts (place tapered drift in each hole to keep pivot bar lined up until bolts are removed). Lower jack slowly allowing lower control arm to come down, and remove front spring.
Installation – Position lower spring silencer and spring in seat and rotate spring until it indexes with ramp. Install upper spring silencer and position jack and wood block under pivot bar. Make sure spring is seated properly at upper end. Raise jack to align pivot bar and frame bolt holes and attach bar to frame. Tighten nuts to 60 ft. lbs.

FRONT SHOCK ABSORBER: Removal–Disconnect upper end of shock absorber pushrod, and lower mounting. Pull assembly, with lower bushing washer, out through lower control arm. To remove mounting assembly from lower shock absorber eye, place mounting assembly in Tool C-3413, and using a vise, press out the assembly-*NOTE* – The mounting assembly is serviced as a complete unit.
Installation – If it is necessary to install a new upper rod mounting bushing, wet the bushing, press it into place and install spacer. To install lower mounting assembly in shock absorber eye, position assembly so that mounting holes are at right angles with shock absorber. With Tool C-3413, and a vise, press assembly into eye until centered (*CAUTION - To avoid damaging the assembly, always press against steel sleeve).* Place lower mounting washer on rod of shock absorber and push shock into position from lower side. Install upper washer and nut, and tighten down to spacer. Install lower mounting screws and tighten to 35 ft. lbs.

FORD, LINCOLN, MERCURY

Continental (1956)
Ford Pass. Cars, Sta. Wgn. & Sed. Del. (1956)
Lincoln, All Models (1956)
Mercury (1956)
Thunderbird (1956)

► *1955-56 FORD LOOSE UPPER SUSPENSION ARM CORRECTION:* When loose upper suspension arm bolts are found, remove old lockwashers and install reverse keystone lockwashers (Part No. 357626-S7) Tighten bolts to 65-90 ft. lbs

► *1955 FORD UPPER BALL JOINT STUD TIGHTENING CORRECTION (Due to Too Short Ball Joint Stud):* To correct, use Lockwasher, Part No. 34850-S7, as a spacer between nut and spindle. Tighten nut to 60-80 ft. lbs.

► *1952-56 LINCOLN REBOUND "THUMP" CORRECTION:* New Bumper, Part No. LD-3025-A, is available for service replacement on 1952-56 Lincoln. New bumper is shorter and has flat surface on top and is designed to correct above condition. Replacement should be made in pairs only.

DESCRIPTION: "Ball Joint" type of same design as used on previous models.

ADJUSTMENT & PARTS REPLACEMENT: *See "Ford, Lincoln, Mercury" in 1954 Annual Data or later Manual edition and note the following:*

► *THUNDERBIRD CASTER & CAMBER ADJUSTMENT: Addition or removal of shims for caster and camber adjustment on Thunderbird cars produces effect reverse to that on other Ford cars.*

Kingpin Inclination: 6-7° (Ford & Thunderbird). 7°10" (Lincoln), 7° (Continental & Mercury) with Pos. ¾° camber.

Caster: Pos 1°±¼° within ½° from one side of car to other (Continental) 0-Neg. 1½° (Lincoln & Mercury), Pos. ½-Pos. 1½° (Ford) within ¼° from one side of car to other.

Camber: Pos. ¾° ±¼° (Continental), 0-Pos. ¾° (Lincoln & Mercury), Pos. ¼-1¼° (Ford) within ¼° from one side of car to the other,

Toe-In: 3/32-5/32" (Continental & Mercury), 1/8-3/16" (Lincoln. See Note below), 1/16-1/8" (Ford).

► *LINCOLN TOE-IN NOTE:* Supersedes previous specification of 1/32-3/32".

► *1953-56 MERCURY POWER STEERING CONTROL VALVE INTERFERENCE CAUTION:* Use caution when installing the left hand drag link adjusting sleeve. Clamps should be installed with the bolts in a vertical position and forward of the steering link. If clamps are installed with bolts to the rear, or horizontal, it is possible for them to interfere with the power steering valve assembly.

Toe-Out on Turns (Lincoln & Continental): With wheels at maximum turning angle, outer wheel is at 26° and inner wheel is at 36°.

Toe-Out on Turns (Mercury): With wheels at maximum turning angle, outer wheel is at 27°40' (Exc. Conv.), 26°50' (Conv.) and inner wheel is at 38° (Exc. Conv.), 36° (Conv.).

Front Spring Heights: Spring Height at normal load should be
Continental - 9.87".
Lincoln - 10.00".
Mercury (Conv., Sta. Wgn., Hvy. Duty) - 9.56".
Mercury (Others) - 9 59".

HUDSON, NASH & RAMBLER

Hudson, Wasp & Hornet (1956)
Nash, Statesman & Ambassador (1956)
Rambler (1956)

► *RAMBLER CASTER & CAMBER ADJUSTMENT NOTE:* Lower control arm attaching bolts are provided with eccentric washers (one attached to bolt and the other keyed to the threaded end of the bolt). Loosening attaching bolt nut will permit turning the bolt and the eccentrics to provide adjustment for caster and camber. *NOTE - Supersedes previous Rambler procedures.*

► *POWER STEERING TOE-IN ADJUSTMENT CAUTION:* When adjusting toe-in on power steering equipped cars, operate engine. This will permit oil pressure supplied by power steering pump to center valve spool in power cylinder control valve. Steering wheel spoke may then be readily adjusted to desired center position.

► *FRONT TIRE RUBBING ON TURNS.* Inside wheel on right or left turns should be adjusted to a maximum turn angle of 38° (Rambler), 36° (Others) to avoid possibility of damaging front wheel tires as a result of contacting brake hose bracket on tight right or left turns. In addition, it is recommended that rear corner of brake hose brackets be trimmed 1/8" to prevent possible tire damage under abnormal turning conditions such as steep driveways. Effective April 11, 1956 brackets have been reworked in production.

DESCRIPTION: Similar to previous Hudson & Nash models. Eccentric bolts on lower control arm inner pivot controls the caster and camber adjustment on all models.

ADJUSTMENT & PARTS REPLACEMENT: *See "Nash Front Suspension" in 1952 Annual Data or later Manual edition. NOTE* - Rambler Caster & Camber procedures same as Nash & Hudson in 1956.

Kingpin Inclination: 3°36" (Hornet & Wasp), 6½° (Others).
Caster (With Pow. St.): Pos. ½-1° (Pos. 1° desired).
Caster (Without Pow. St.): 0-Pos. ½° (Pos. ½° desired).
Camber: Neg. ¼° - Pos. ¼° (0° desired).
Toe-In: 1/16 - 3/16".

Toe-Out on Turns:	Inside Wheel	Outside Wheel
Ambassador (Exc. V8 with P.S.)	25°	20¼°
Ambassador (V8 with P.S.)	25°	21¾°
Statesman	25°	20¾°
Hornet	26°	20°
Wasp	24°	20°
Rambler	25°	22°

Front Suspension Tightening Specifications: *NOTE*–It is very important that tightness of front suspension system be maintained The following torque values will insure correct tightness

	Ft. Lbs
Pivot Bar Bushing Retaining Nut	50-55
Lower Shock Mounting	90-95
Upper Control Arm Spacer Nut Screw	50-55
Lower Mounting Stud to Sill	75-85
Upper Mounting Stud to Sill	35-45
Upper Pivot Bar to Mounting Stud Nut	75-80
Lower Pivot Bar to Mounting Stud Nut	75-85

PONTIAC

Pontiac, All Series (1956)

►*PIVOT PIN INSTALLATION NOTE:* Effective 1956 production, upper and lower pivot pins are installed from rear **on right hand side.** This makes it necessary to lubricate pivot pins on right hand side from rear.

►*REAR SPRING ASSEMBLY CAUTION:* Effective early production new rear spring assembly, with Butyl rubber liners, was used on Catalinas, sedans, and convertibles **at P ntiac Assembly Plant only.** They are not being released for service. Rear spring U-Bolt torque has been reduced to 45-55 ft. lbs. and it is especially important that these torque limits be observed on springs with Butyl liners.

DESCRIPTION: Same design as used on previous models.

ADJUSTMENT & PARTS REPLACEMENT: *See 1954 Annual Data or later Manual edition and note the following:*

Kingpin Inclinati n: 1°20'.
Cast r: Neg. 1°±½°.
Camber: Pos. ½°±½°.
Toe-In: 0-1/16" measured 9" from floor.
To -Out on Turns: With inner wheel turned 20°, outer wheel should be 18° to 19°.

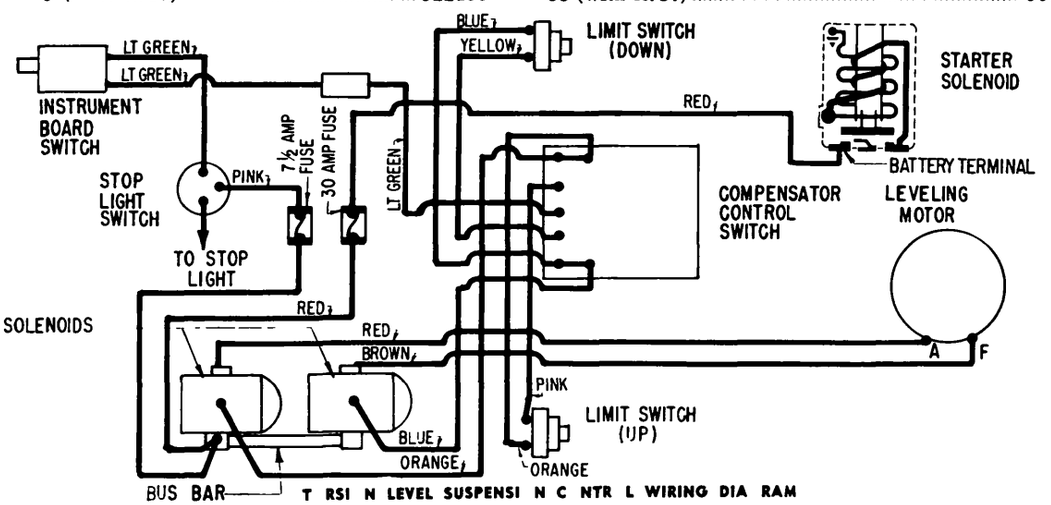
COIL SPRING REPLACEMENT: Disconnect lower end of stabilizer link and remove shock absorber on side on which spring being removed. Lift front end of car with chain hoist, or with jacks placed under frame side rails. Place additional jack under lower spring seat on control arm. Disconnect lower control arm from knuckle support by removing locknut and unscrewing lower pivot bolt. Lift car slowly (or lower jack under control arm) to relieve spring tension, lift spring out.

►*FRONT SWAY BAR INSTALLATION CAUTION:* Sway bar must be installed with the proper side up or grommets may be damaged due to improper contact with eye in bar.

OLDSMOBILE

All Series (1956)



DESCRIPTION: Independent "parallelogram" type with shock absorbers mounted within front coil springs.

ADJUSTMENT & PARTS REPLACEMENT: *See "Oldsmobile" in 1955 Annual Data or later Manual edition and note the following:*

Kingpi n Inclination: 5°51'10" at 0° camber.
Caster: 0° to Neg. ¾°. Variation between wheels should not exceed ½°.
Camber: Neg. ¾° to Pos. ¾°. Variation between wheels should not exceed ½°.
Toe-In: 1/16 - 1/8".
Toe-Out on Turns: With outer wheel turned 20°, inner wheel should be 23° ± ½°.

PACKARD (CONVENTIONAL)

5640 Series (Clipper) (1956)

DESCRIPTION: Same design as used on previous models.

►*SERIES 5660, 70, 80, 88 NOTE: "Torsion Level" Suspension used on these models. Front end alignment (as indicated below) is the same for both types of suspensions.*

ADJUSTMENT & PARTS REPLACEMENT: *See 1950-51 Annual Data or later Manual editions and note the following:*

Kingpin Inclination: Not adjustable.
Caster: Neg. 1°±½°.
Camber: 0° preferred (limits Pos. ¾° to Neg. ¼°).
Toe-In: 0" (plus 1/16", minus 0"). Adjust by turning adjuster at outer end of each tie rod equally.
Toe-Out on Turns: With outer wheel at 20°, inner wheel should be 23¾°.

PACKARD "TORSION LEVEL"

5660 Series (Clipper Custom) 1956
5670 Series (Packard Executive) 1956
5680, 5688 Series (Packard) 1956

►*1956 RAISING &LOWERING OF CAR CAUTION (To Perform Service Functions on "Torsion Level" Suspension):* Due to complete change in wiring and new type limit switches method of raising and lowering car by grounding at each side of limit switches or the "A" and "B" terminals of the control switch can no longer be used. To raise or lower car with later type switches proceed as follows: Remove four small screws from small cover plate on bottom of control switch. Lower plate slightly to expose wire terminals in control switch. The two outer terminals of the center group of three can be grounded with a screwdriver or jumper wire to raise or lower the car. *CAUTION* - Do not raise or lower the car by grounding wires on solenoids as limit switches will be by-passed and compensator gears may be damaged.

►*FUSE NOTE:* Control Circuit Fuse (AGW-7½ amps.) and Compensator Motor Feed Fuse (AGC-30 amps.) are located under hood on left side of engine compartment.

►*TROUBLE SHOOTING NOTE (Electrical System):* Procedure outlined in 1955 Annual Data & Manual edition are not applicable to 1956 "Torsion Level" Suspension. See "1956 Raising & Lowering of Car Caution" above for 1956 procedure.

DESCRIPTION: Same design as used in 1955.

ADJUSTMENTS & PARTS REPLACEMENT: *See "Packard 'Torsion Lev l' Suspension" in 1955 Annual Data or later Manual edition.*

STUDEBAKER

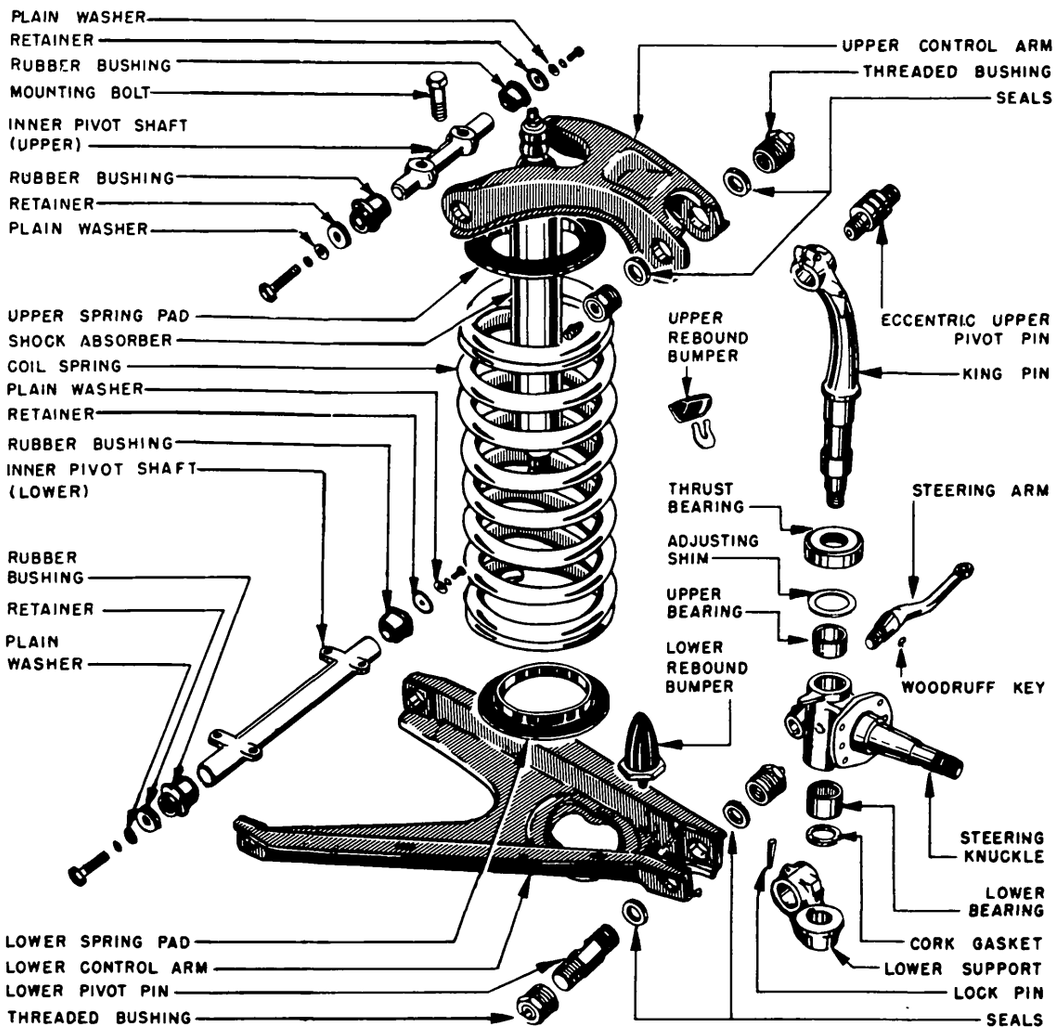
All Models (1956)

► *CONTROL ARM BUSHING RETAINER PRODUCTION CHANGE:* Plain washers formerly installed on the control arm in shaft bushing retainer are no longer used in production. It is necessary and important that bushing retainer be torqued to proper specification 60-65 ft. lbs.

► *FRONT SUSPENSION NOISE CORRECTION (When Due to Looseness at Upper Control Arm Inner Shaft):* Can be caused by retaining screw having backed out, bushing retainer being worn and not holding inner sleeve of bushing, or bushing itself being worn. Inner side of retainer should have six serrations in good condition. Outside of retainer should not have pronounced galled spots from lockwasher. If retaining screw has worked loose, install a "Nylok" self-locking screw (Part No. 1541700). Also a plain washer, Part No. G446211, has been released to replace original lockwasher used in production. Tighten new screw to 35 ft. lbs. *CAUTION* - Under no circumstances should any lubricant be applied to bushing or retainer to eliminate a noise condition.

DESCRIPTION: Same design as used on previous models.

ADJUSTMENTS & PARTS REPLACEMENT: *See "Studebaker" in 1950-51 Annual Data or later Manual edition and note the following:*



Kingpin Inclination: 5¼°. Not adjustable.
Caster: Neg. 1° to Neg. 2½°. Not more than ¾° variation between wheels.
Camber: 0° to Pos. 1° (with ½° more camber on drivers side).
Toe-In: 1/16-1/8".
T e-Out on Turns: With inner wheel at 20°, outer wheel should be 17-18°.

② – Before Serial No. G-1,359,504.
③ – Beginning Serial No. G-1,359,504 (Coupe & 2-Dr.).
④ – Before Serial No. 8,430,316.
⑤ – Beginning Serial No. 8,430,316.
⑥ – First 150 cars.

STUDEBAKER FRONT SUSPENSION ASSEMBLY

PIVOT SHAFT INSTALLATION (In Lower Control Arm): Insert one end of pivot shaft in member of control arm and push it as far as possible into member so opposite end of shaft can be swung into position and inserted in other member of control arm. Place J-5472-6 (Large Spacer) in position between ends of control arm. Start rubber bushings in holes at either end of control arm, then place J-5472-1 (Large Installer) in position on each bushing and, using an arbor press, force bushings into place until shoulder on outer sleeve of bushing is seated against control arm (*CAUTION*– Do not attempt to seat flange of bushing on control arm). Install bushing cap, flat washer, lockwasher, and capscrew. After control arm has been installed in car and with weight of car on springs, tighten the capscrews to 65 ft. lbs.

PIVOT SHAFT INSTALLATION (In Upper C ntr l Arm): Insert one end of pivot shaft in member of the control arm and push it as far as possible into member so opposite end of shaft can be swung into position and inserted in other member of control arm. Place J-5472-5 (Small Spacer) in position between ends of control arm.

Start rubber bushings in holes at either end of control arm then place J-5472-2 (Small Installer) in position on each bushing and, using an arbor press, force bushings into place until shoulder on outer sleeve of bushing is seated against control arm (*CAUTION*–Do not attempt to seat flange of bushing on control arm). Install bushing cap, flat washer, lockwasher, and capscrew. After control arm has been installed in car and with weight of car on springs, tighten the capscrews to 35 ft. lbs.

STEERING LINKAGE (MANUAL STEERING GEARS)

STEERING LINKAGE & ADJUSTMENT: Special linkage and adjustment on cars and trucks as follows:

Buick: Linkag –Consists of an intermediate rod between steering gear pitman arm and idler lever on right side of frame, and individual tie rods between intermediate rod and each wheel. Adjustable sleeves provided at end of each tie rod for toe-in adjustment.

Toe-In Adjustm nt–Turn steering wheel until lower spoke is vertical, with front wheels in straight-ahead position. Measure horizontal distance from near edge of front boss of lower control arm shaft to front edge of brake backing plate, on each side. Adjust tie rods, if necessary, to make measurements equal on both sides. To adjust toe-in, loosen clamp bolts and turn adjusting sleeves at tie rod ends as required. Decrease toe-in by turning left sleeve in same direction as wheel rotation when moving forward and turn right sleeve in opposite direction. To increase toe-in reverse direction of sleeve movement given above. *CAUTION*–Right and left sleeves must be turned equal amounts but in opposite directions when changing toe-in, in order not to disturb straight-ahead position of front wheels. Before tightening sleeve clamps, have slots in sleeve and clamps aligned.

Idl r L v r & Supp rt Adjustm nt–In order that idler lever ball stud is kept level with pitman arm ball stud, thread support into idler arm bushing until distance from center of support lower bolt hole to nearest face of idler lever is 2 21/32" to 2 3/4".

1956 STEERING LINKAGE

Intermediate Rod End Plug Adjustment–On idler lever end of rod, turn end plug up tight then back off 1/4-1/2 turn (1/2 turn preferred) and install cotter pin. On pitman arm end of rod, tighten end plug to 20-25 ft. lbs. torque, then back off 1 7/8–2 1/8 turns and install cotter pin.

Cadillac: Linkage–Consists of a drag link between steering gear pitman arm and idler arm mounted on right frame side rail, and individual tie rods between drag link and each wheel. Adjustable sleeves provided at outside ends of tie rods for toe-in adjustment.

Toe-In Adjustment–Loosen clamp screws on adjusting sleeves. Turning adjusting sleeves in direction of forward wheel rotation decreases toe-in. Turn sleeves equal amounts so that relation of steering gear high spot to straight-ahead position of front wheels will not be changed. When tightening clamp screws, be sure open side of clamp is over open side of adjusting sleeve.

Drag Link Adjustment–Place straight bar across two adjustable jacks, directly below drag link. Adjust height of jacks so that distance from top of bar to flat spot on frame is equal on both sides (Adjusting jacks to even number of inches will facilitate measurements). Measure distance from top of bar to bottom of drag link on both sides. Difference in measurement between 1st measurement (top of bar to flat spot on frame) and 2nd measurement (top of bar to bottom of drag link) should be 4 7/8" and equal at both ends of drag link within 1/8" (DRAG LINK MUST BE PARALLEL TO FRAME WITHIN 1/8"). If idler arm end of drag link not within limits, remove idler arm support mounting screws on frame side bar, and screw idler arm in or out of bushing until correct height obtained. (*CAUTION*–When turning idler arm into bushing to raise drag link, be sure idler arm is at least 1/2 turn off base to prevent interference on turns. When turning idler arm out of bushing, do not unscrew more than 2 1/2 turns from base or excessive play will result). If proper height cannot be obtained with this adjustment, replace idler arm. If pitman arm end of drag link is not within limits, pitman arm must be removed and bent as required.

Drag Link Adjustment - Install end plug in pitman arm end of drag link and adjust by turning down tight and backing off plug ¼ to ½ turn. Install cotter pin. Install right end plug and adjust by turning down tight and backing off ¼ to ½ turn. Install cotter pin.

Idler Arm Support Adjustment–Turn idler arm support with seal into idler arm bushing until it bottoms, and then back off 1/2 to 1 1/2 turns depending on position of bushing in idler arm.

Chevrolet Passenger Cars: Linkage–Consists of steering connecting rod between pitman arm and idler arm, bracketed on right frame side rail, and individual adjustable tie rods between steering connecting rod and each front wheel. Tie rods have adjusting sleeves at outer ends for making toe-in adjustment.

To -In Adjustm nt–Set steering gear on high point of worm, with mark on top end of steering mainshaft in

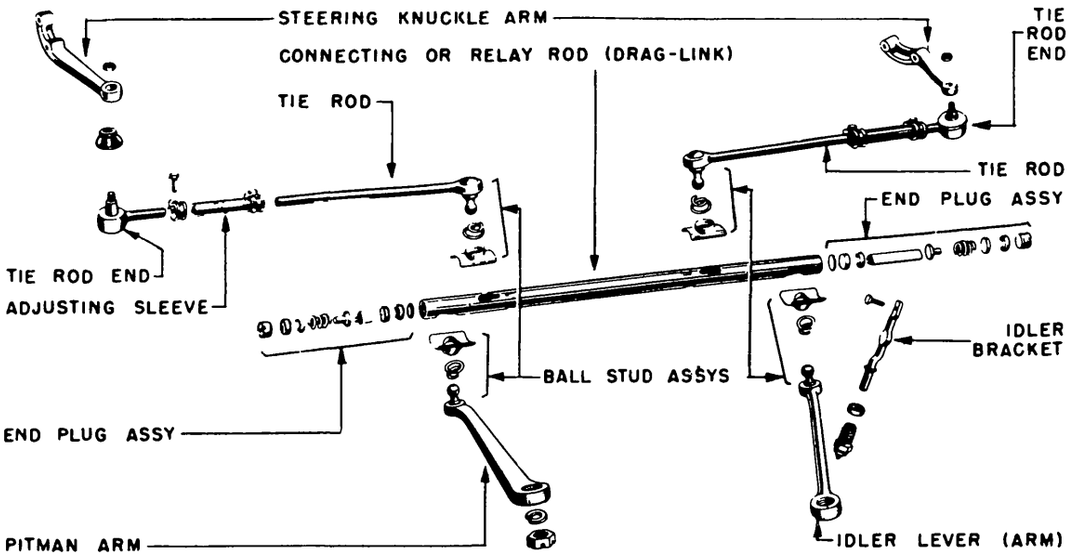
CONTINUED ON NEXT PAGE

(MANUAL STEERING GEARS) (Continued)

vertical position and steering wheel positioned for straight ahead driving Loosen clamp bolt at each end of each tie rod and adjust them individually for desired toe-in Position tie-rod clamp bosses below the tie rod to avoid frame interference and tighten clamps securely

Steering Connecting Rod Adjustment–If wheels not in straight-ahead position with steering gear on high point, set front wheels in straight-ahead position (can be checked by measuring distance between lubrication fitting on lower control arm shaft and the wheel fellow on each side). Remove ornamental cap or horn button and check position of mark on end of worm shaft designating gear high point (mark should be at top of shaft). If gear has been moved off high point when setting wheels in straight-ahead position, loosen steering connecting rod adjuster clamps and adjust as necessary to bring gear back on high point.

Idler & Third Arm Pivot Pin Bushings Replacement–Drive out old bushings using K-318 steering knuckle bushing driver. Press new bushings in bracket using Tool K-318. Ream bushings to 922- 923 using J-3189 bushing reamer. (*NOTE*–Reamer must be long enough to pilot one bushing while reaming the other to maintain alignment).



Idler & Third Arm Clearance Adjustment–If clearance between idler and third arm and bracket exceeds 006", when measured with a feeler gauge, install shim, Part No. 3687657, between bracket and lower face of idler and third arm assembly. If clearance between front suspension cross member and bracket at upper mounting hole exceeds .008", when measured with feeler gauge, add shims as necessary to bring space within allowable limits (.010" shims available).

Ch vrolet Trucks Linkage–Consists of three-piece tie rod (rod and two tie rod end assemblies) between front wheels. Tie rod end assemblies have right and left hand threads to facilitate toe-in adjustment. A connecting rod, between steering third arm (on left wheel) and pitman arm, has permanently installed studs in ends. Ends of studs are threaded and are attached to steering third arm and pitman arm with a nut and cotter pin

Toe-In Adjustment–Loosen clamp at each end of tie rod and turn tie rod to increase or decrease its length until proper toe-in is secured. Before locking clamps, be sure tie rod ends are in alignment with studs.

D dge 6 & Plymouth 6 Linkage–Consists of long and short tie rods (both adjustable) attached directly to steering gear arm

Toe-In Adjustment–Place front wheels in a straight-ahead position, loosen clamps on ends of tie rods, adjust tie rods an equal amount in opposite directions until desired toe-in is obtained. If steering wheel center spoke does not point straight downward, adjust both tie rods an equal amount in same direction until steering wheel centered When adjustment correct, pivot ends of tie rods on ball studs so they are both against front or back sides of studs, then tighten

CADILLAC, CHEVROLET, OLDSMOBILE, PONTIAC STEERING LINKAGE—TYPICAL OF BUICK

clamp bolts with clamping bolt on left end of long tie rod beneath tie rod to prevent interference on turns. *NOTE*–Steering wheel hub, steering gear arm, steering tube and steering gear sector shaft are machined with master serrations for a definite location. No attempt should be made to change relative position of these parts by altering master serrations. Improper positioning of steering wheel should be corrected only by adjustment of tie rods.

Chrysler, DeSoto, Dodge V8, Plymouth V8 Linkage–Consists of idler arm bracketed to right frame side side member and connected to right end of drag link Pitman arm is connected to left end of drag link Individual tie rods connected to drag link near its center have sleeve adjustment for toe-in at outside ends

Toe-In Adjustment–Loosen clamp bolts at each end of adjusting sleeves. Ends should be threaded evenly into tube sleeves to have a nominal length (center to center) of 21-3/8". When tightening sleeve clamps, make sure bolts are beneath tie rods to prevent interference on turns. *NOTE*–Steering wheel hub, steering gear arm, steering tube and steering gear sector shaft are machined with master serrations for a definite location. No attempt should be made to change relative position of these parts by altering master serrations. Improper steering wheel positioning should be corrected only by adjustment of tie rods.

Idler Arm Clearance Adjustment–Screw idler arm support bracket into bushing until it bottoms. Then back off approximately one full turn of idler arm or, until a clearance of 1 7/16" plus or minus 1/16" has been obtained between shoulder of bracket and flat surface of arm.

Idl r Arm Bushing R placem nt–If idler arm bushing play exceeds 1/8" when idler arm is moved up or down or, if noise has developed in steering linkage a new idler arm bushing, support bracket or both should be installed as follows Remove cotter pin, nut and spacer that holds drag link end ball stud to idler arm. Insert pry bar between idler arm and drag link. Jar drag link ball stud loose by driving on end of link. Separate link and arm, then remove seal. Remove two bolts and lockwashers that attach idler arm support bracket to frame side rail. Remove support bracket, idler arm and bushing as a unit. Unscrew idler arm support bracket from idler arm bushing, then remove seal. Clamp end of idler arm bushing in a vise and remove locknut. Now, unscrew idler arm from bushing. (NOTE—Before removing idler arm from bushing, mark flat of arm to indicate up or down side. Arm has tapered hole for ball stud and can only be installed in one position). To install, reverse removal procedure, noting "Idler Arm Clearance Adjustment" above. If straight fitting (lubrication) found on end of bushing replace with a 60° or 90° fitting for ease in lubrication.

Ford Passenger Cars: Linkag –Consists of steering arm-to-idler arm rod which transmits motion from steering gear through steering arm, attached to left end of steering arm-to-idler arm rod, to front wheels through spindle connecting rods (tie rods). Spindle connecting rods have adjustable sleeves on outside ends for toe-in adjustment. Idler arm attached to right frame side rail and to right end of steering arm-to-idler arm rod.

Toe-In Adjustment– (*NOTE*–Steering arm (pitman arm) should be pointing straight-ahead when steering wheel spokes are in horizontal position and steering gear worm is at mid-point of travel). To adjust toe-in, adjust sleeves equally. When tightening clamp bolts, make sure bolts are below top of tie rods.

CONTINUED ON NEXT PAGE

(MANUAL STEERING GEARS) (Con.inued)

Idl r Arm & Brack t Adjustments—Steering idler designed to operate with 1/8" vertical free play. To reduce, proceed as follows (same procedure used when replacing idler arm or bushings): Remove bracket from frame side rail. Thread bracket and bushing off idler arm, then remove idler arm from steering arm-to-idler arm rod. Remove bushings from idler arm bracket and steering arm-to-idler arm rod, remove lubrication fittings from bushings. Check face of side rail for squareness by placing car on level floor, then measure distance from each side rail to floor. If distances unequal, jack up lower side rail until even with other rail. Place spirit level against inside surface of right hand side rail, adjacent to idler arm position, then establish true perpendicular. Measure distance between edge of level and side rail. Distance represents amount of spacing washers that must be installed between bracket and side rail to correctly position idler arm bracket. Check idler arm bracket for 92° included angle (between inside faces of bracket) and correct if necessary. Replace bushings in bracket and in steering arm-to-idler arm rod. Tighten bushings to 85-100 ft. lbs. torque. Reinstall grease fittings. Place new seals on idler arm. Thread idler arm into idler arm rod bushing until shoulder on arm is 11/16" plus or minus 3/64" from top face of rod when arm is in straight-ahead position. Thread bracket and bushing assembly onto idler arm until shoulder on arm is 19/32" plus or minus 3/64" below bottom side of bracket when bracket is parallel to frame side rail. Mount bracket on frame side rail, installing necessary number of washers between bracket and frame. Tighten attaching bolts to 30-35 ft. lbs. torque.

Ball S ck t Adjustm nt—Whenever steering arm ball stud found to have play in socket, remove cotter pin from end of rod, tighten threaded plug in end of socket until all ball stud end play removed, then back off plug approximately 1 1/2 turns, install new cotter pin. Test adjustment by turning steering arm-to-idler arm rod by hand. Rod must move freely, but there should be no end play at ball stud.

F rd Trucks: Linkag—Consists of a connecting rod between front wheels. Rod has adjustable features at both ends. Spindle arm, attached to connecting rod at its left end, is in turn attached to a one-piece drag link with manual adjustment features at both ends. Rear of drag link is attached to sector shaft arm (pitman arm).

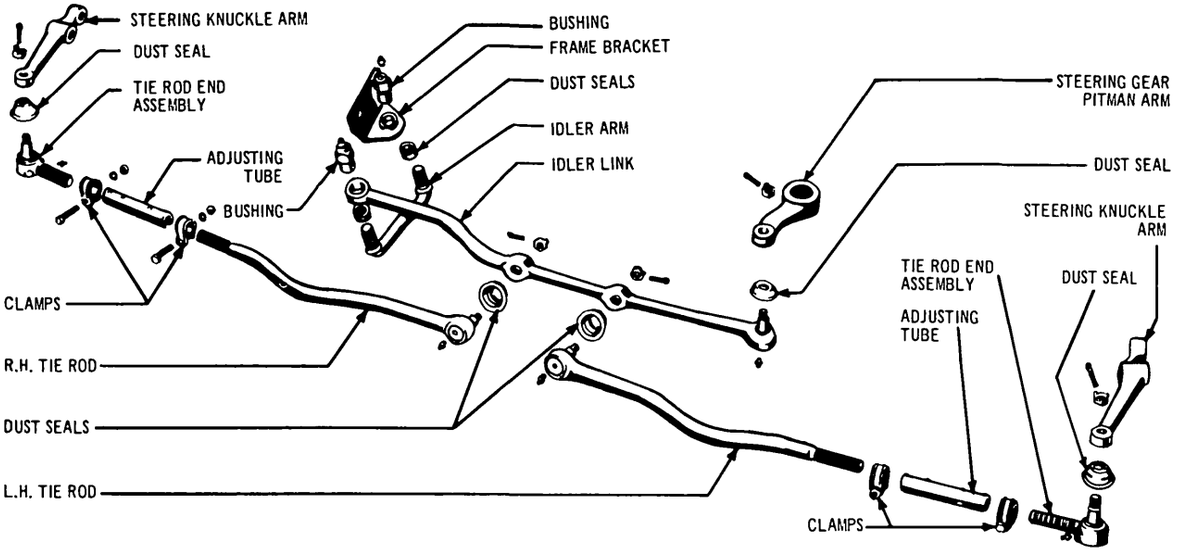
T -In Adjustm nt—Loosen clamp nut at each end of connecting rod, turn connecting rod to lengthen or shorten to obtain desired toe-in.

Drag Link Adjustm nt—Remove cotter pins from each end of drag link. Tighten each drag link plug until drag link ball springs are fully compressed. Back off each plug to first cotter pin hole, then install new cotter pins.

Linc In & Mercury: Linkag—Consists of steering connecting link between steering gear arm (pitman arm) and idler arm, mounted on right frame side rail, and adjustable tie rods between connecting link and each front wheel. Adjustable sleeves provided at outside ends of tie rods for toe-in adjustment.

Toe-In Adjustment—Loosen clamp bolts on adjustable sleeves. Adjust sleeves equally until proper toe-in obtained.

Connecting Link Plug Adjustment—Screw plug in left end of connecting link until it bottoms, back off 1-1/2 turns, align cotter pin holes, install cotter pin.



Metropolitan, Hudson & Nash Models: Linkage—Consists of adjustable cross tube (for toe-in adjustment). Idler assembly is attached to body sill at right of car and has a double arm, with front arm attached to cross tube and rear arm attached to right tie rod. Steering gear pitman arm is double-levered, with front lever attached to left of cross tube and rear lever attached to left tie rod. Idler assembly is not adjustable.

Toe-In Adjustment—Loosen lock nuts on ends of cross tube, lengthen or shorten cross tube until proper toe-in secured. Tighten lock nuts.

Cross Tube Plug Adjustment—Remove cotter pin, lightly screw plug in as far as it will go, back off to first cotter pin hole in alignment with castellation.

Hudson, Nash & Rambler (Exc. Metropolitan): Consists of steering linkage cross tube between steering arm and idler arm, bracketed on frame right side rail. Individual adjustable tie rods are attached to ends of cross tube. Adjusting tubes at outer ends of tie rods provide for toe-in adjustment.

T -In Adjustment—Loosen clamps on ends of tubes on tie rods. Turn tubes equally in opposite directions until desired toe-in obtained. Before tightening clamps on adjusting tubes, square ball joints on their studs to prevent excessive steering linkage friction or wear.

CHRYSLER, DE SOTO, DODGE V8, PLYMOUTH V8 STEERING LINKAGE

Oldsmobile: Linkage—Consists of steering relay rod between pitman arm and idler arm, bracketed to right frame side rail. Individual, adjustable tie rods are attached to center portion of steering relay rod and are provided with adjustable sleeves for toe-in adjustment.

Toe-In Adjustment—Loosen clamp bolts at each end of steering tie rod adjustable sleeves. With steering wheel in straight-ahead position turn tie rod adjusting sleeves to obtain proper toe-in adjustment. Insure that tie rod end ball seats are riding squarely in their seats, then position tie rod to relay rod ball studs to bottom of slot in relay rod. Position clamps on adjusting sleeves so that bolts are below upper surface of adjusting sleeves with edges of clamp **out of slot**, tighten clamp bolts.

Relay Rod Plug Adjustment—Draw nut tight, then back off 1/4-3/4 turn, install cotter pin.

Idler Lever & Support Adjustment—Whenever idler arm is disassembled from idler arm support, reassemble so that there is a dimension of 23/32" between upper face of idler arm and shoulder on support.

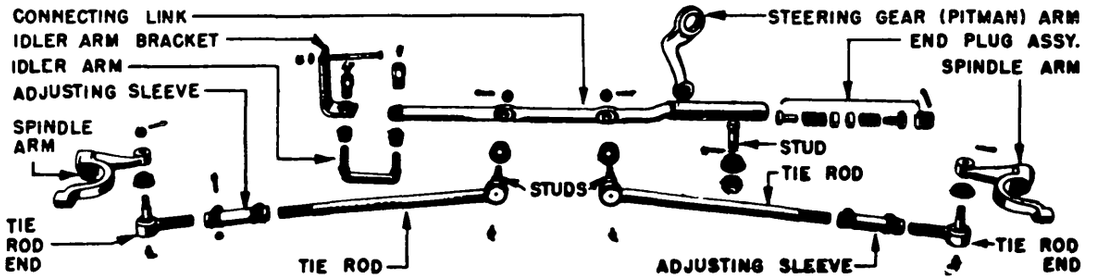
Packard: Linkage—Consists of steering connecting rod between pitman arm and idler lever, bracketed to right frame side member, and individual tie rods (steering cross tubes) between steering connecting rod and each wheel. Adjusting sleeves at outer ends of cross tubes provide means for toe-in adjustment.

Toe-In Adjustment—Loosen clamps on adjusting sleeves at ends of tie rods. Turn sleeves equally until desired toe-in obtained. Before tightening clamps on sleeves, check each cross tube outer ball socket for being properly centralized.

CONTINUED ON NEXT PAGE

(MANUAL STEERING GEARS) (Continued)

Connecting Rod End Plug Adjustment–Draw plugs up tight, then back up 1/4-1/2 turn to align slot with cotter pin hole.



Pontiac: Linkage–Consists of steering connecting rod between pitman arm and idler arm, bracketed on right frame side rail, and individual, adjustable tie rods between steering connecting rod and each front wheel. Tie rods have adjusting sleeves at outer ends for making toe-in adjustment.

T e-In Adjustment–Remove horn button and set gear on high point of worm by turning steering wheel until mark on shaft is exactly at top. Loosen tie rod end clamp bolts and turn tie rod adjusting sleeves equally until desired toe-in is obtained. Turn right tie rod in direction of rotation of wheels to increase toe-in, turn left tie rod in opposite direction to increase toe-in. If front wheels not in straight-ahead position turn both tie rods in same direction (so as not to change toe-in) until error corrected. Tighten clamps on adjusting sleeves with slots in sleeve toward bolts in clamp.

Idler Lever & Support Adjustment–With lever and support off car, thread idle lever support into bushing until distance between upper face of lever and shoulder on support is approximately 23/32".

St ering Connecting Rod Plug Adjustment–Screw end plugs in until tight, then back off to nearest cotter pin hole alignment and insert new cotter pins.

Studebaker· Linkage–Consists of two adjustable tie rods attached to bell crank mounted at center of frame cross member. Bell crank is attached to steering gear pitman arm by a reach rod (drag link).

LINCOLN & MERCURY STEERING LINKAGE—TYPICAL OF FORD

Toe-In Adjustment–If tie rods disassembled, count number of turns when unscrewing tie rod ends from rod to facilitate reassembly. To adjust toe-in, adjust **right** tie rod (left tie rod on right-hand control cars) When tightened, inner tie rod bolts should be at bottom and horizontal.

Bell Crank Bearing Adjustment–Insert shims between lower thrust washer and shaft until there is no end play. Shaft should, however, turn freely in bearings. Lock nut securely with cotter pin.

Willys Utility: Linkage–Bell crank on frame cross member, linked to each front wheel by adjustable tie rods and to steering gear pitman arm by a steering connecting rod (drag link).

Toe-In Adjustment–Set tie rod end of steering bell crank at right angles to front axle, place straightedge or line against left rear wheel and left front wheel to determine if wheels in straight-ahead position. If front wheel tire does not touch straightedge both at front and rear, adjust left tie rod by loosening clamps on each end and turning tie rod until tire touches straightedge. Check right side in same manner and adjust right tie rod. Adjust toe-in by shortening each tie rod 1/2 turn.

STEERING LINKAGE (POWER STEERING)

Steering linkage on cars equipped with power steering is essentially the same as for manual steering except as noted for "linkage" types below

Bendix Linkage Type (Ford & Mercury): Steering pitman-to-idler arm rod has been revised to accomodate the power cylinder. One end of power cylinder is bracketed to right frame side rail and the other to the steering pitman-to-idler arm rod. Control valve is mounted on right end of steering pitman arm-to-idler arm rod. Rubber bushing assemblies are used at each pivot point.

Monroe Linkage Type (Huds n Horn t & Wasp; Nash Statesman & Ambassador V8; Packard & Rambler): Power cylinder replaces conventional cross tube.

Bendix Linkage Type (Nash Ambassad r 6 Cyl. & Packard): Power cylinder replaces cross tube and is bracketed at right side body sill (Nash) Power cylinder is bracketed at left frame side rail and attached to connecting rod at center between tie rod studs (Packard).

Chevrolet Linkage Type (Pass. Cars): Power cylinder is connected to steering relay rod and piston rod is connected to bracket on right frame side rail

Chevrolet Linkage Type (Trucks): Power cylinder is anchored to front axle and piston rod is attached to steering cross rod

CHRYSLER, DE SOTO, DODGE, PLYMOUTH "CO-AXIAL"

Chrysler (1956)
DeSoto (1956)
Dodge (1956)
Imperial (1956)
Plymouth (1956)

►CHANGES, CAUTIONS, CORRECTIONS

► *1956 POWER STEERING GEAR WORM NUT PRODUCTION CHANGE:* A new worm nut, Part No 1673971 having a hexagonal shape and a built in staking collar is being used on steering gears identified by the date 12-15-55 or later stenciled on housing side of flange, where upper housing bolts to lower housing. The present tool, C-3320 can be modified to accomodate both early and later type nuts by removing the two opposing lugs

DESCRIPTION

DESCRIPTION: Same design as used on 1955 models with power steering.

Hydraulic Power Mechanism—Consists of a double-acting piston, a spool valve (which fits inside the piston), and an hydraulic reaction chamber (which gives the driver the "feel" of the road). Axial positioning of the valve directs high pressure oil to one side or the other of the double-acting piston. At the same time, valve movement opens an oil return line which carries oil from low pressure side of the piston to the oil reservoir. The direction of oil flow (which depends on direction of steering wheel rotation) is such that hydraulic force is added to the driver's effort and is transmitted through the rack and sector gear to the steering gear arm.

Pump and Reservoir Assembly—Consists of generator driven oil pump with pressure relief valve and flow control valve, and a filter with oil reservoir. Flow control valve limits oil flow to a predetermined maximum (2 gallons per minute) and thus holds the horsepower required to drive the oil pump to a minimum.

ADJUSTMENTS

SELECTOR LEVER & TRANSMISSION SHAFT LINKAGE: Loosen gear shift rod lever clamp bolt. Position selector lever in low or reverse, then holding the gear shift rod lever and spacer flush against gear housing, tighten nut. Place selector lever pointer lever in neutral position on indicator dial at top of steering column. Disconnect gearshift control rod at bellcrank on transmission. Make sure manual control lever (at the transmission) is in neutral position (second detent position from rear of vehicle). With selector lever pointer still in neutral position, adjust the gearshift control rod to the required length for a free fit in the lever of the bellcrank, then reinstall rod. Operate selector lever through all indicator positions. Road test vehicle.

GEARSHAFT ADJUSTMENT (1956 Cars): Center the steering tube coupling or steering wheel to the overall travel of the steering gear With gear in center position, loosen adjustment screw in end of shaft opposite pitman arm until there is some backlash Slowly turn adjusting screw in until the backlash disappears **Turn the adjusting screw in ⅛ of a turn and lock in position** *(CAUTION—Use a very light touch on steering wheel when checking for backlash).*

Installing Coupling at Center: Install steering tube coupling with slot in coupling in the vertical plane There are no master serrations on either worm shaft or the coupling. A mark is scribed on the coupling which must be set at 12 o'clock when the steering worm shaft is at center so that the steering tube master serration will be in position to allow for proper installation of steering wheel

MANUAL CONTROL VALVE NEUTRAL POSITION ADJUSTMENT (Power Steering Unit Removed): With unit secured in a vise or suitable fixture, connect test hoses to hydraulic pump on car and to steering assembly. Remove oil reservoir cover Start engine and operate at idle Fill reservoir to level mark and allow system to warm up *(CAUTION—Oil level must be maintained above filter while hydraulically centering valve)* Insert manual control valve centering tool C-3445 (slotted end first) into worm shaft and engage slot in tool with tang on control valve operating rod (tool can be rotated by using a tap wrench) *If pitman arm moves to one extreme or the other and stays there, rotate tool in either direction until arm starts to move Slightly rotate tool in opposite direction until arm stops moving.* Install a 1 7/16" socket on a torque wrench and place on pitman arm retaining nut Rotate gear shaft in both directions from one extreme to the other The torque required should be the same in both directions Where torque is higher in one direction than in the opposite, rotate the valve adjusting tool slightly in the opposite direction to the direction in which the pitman arm has the highest torque reading *(Change valve position in slight variations to prevent over adjusting).* When torque is the same in both directions, remove tool

MANUAL CONTROL VALVE NEUTRAL POSITION ADJUSTMENT (Power Steering Unit in Car): *(NOTE—The following procedure can be used when it is difficult to rotate the steering wheel in one direction but not in the other, or where the wheels turn of their own accord Before proceeding with the adjustment, make sure that unequal tire pressure is not the cause of steering wheel turning hard in one direction).* Remove all parts, as necessary to gain access to steering tube coupling Remove coupling retaining screw, lockwasher and plain washer from worn shaft Insert manual control valve centering tool C-3445, slotted end first into worm shaft and engage tool with tang on control valve operating rod *(NOTE—Two men are required to center the valve)* Move pitman arm through its travel from one direction to the other with a torque wrench and a 1 7/16" socket, observing the torque reading The torque should be the same in both directions Turn adjusting rod as required until an equal torque reading is obtained *(NOTE—Where gearshaft requires more than 40 ft lbs to rotate it, or where torque is uneven at any point through the full shaft travel, check for cocked gear shaft cover, dirt in unit or recirculating balls are defective or improperly installed)*

PUMP DRIVE BELT ADJUSTMENT: Sufficiently tight to prevent slippage

STEERING WHEEL & HORN BUTTON REMOVAL & INSTALLATION

STEERING WHEEL & HORN BUTTON REMOVAL: Chrysler & Imperial - Disconnect battery and center steering wheel in the straight-ahead position. Press down on horn blowing ring ornament and turn counter-clockwise Lift out ornament retainer spring and pad Disconnect horn wire from terminal on travel plate and insulator assembly Remove bushing, travel plate, horn blowing contact ring spring and triangular ground plate Curl and push horn wire into steering gear tube to make room for steering wheel puller pilot Remove steering wheel nut Attach puller and remove steering wheel

DeSoto: Disconnect battery ground cable at battery. Press down and turn horn blowing ring ornament counter-clockwise to remove Disconnect horn wire at stationary plate Remove the three Phillips head screws, washers, and horn blowing ring rubber bushings attaching horn ring and stationary plate to horn blowing ring mounting base Remove screws attaching horn ring mounting base Loosen steering wheel nut three turns and attach Steering Wheel Puller C 3428 When steering wheel has been released from serrations, remove puller, nut and steering wheel

Dodge: Disconnect battery Center steering wheel in the straight ahead position and remove two screws on under side of medallion and remove medallion Disconnect horn wire from terminal on travel plate and insulator Remove horn ring, travel plate and insulator assembly, contact spring plate and ground plate Push horn wire aside to make room for steering wheel puller pilot. Remove steering wheel nut then attach Puller C-612 and remove steering wheel

Plymouth: Remove steering wheel ornament and contact plate by depressing the center and rotating it counter-clockwise until it pops up Remove horn ring by loosening the three retaining screws. Install puller C-612 and pull steering wheel off the tube. If horn wire has been left in tube push it down into end of tube to avoid damage when using puller

Installation (All Models): When installing steering wheel, be sure the master serrations are in alignment and the direction signal cancelling cam on bottom of the wheel is inserted between switch levers

HYDRAULIC PRESSURE TEST

Connect Gauge C-3309 in pressure line between pump and hose Refill reservoir to proper level Open valve on gauge start engine, and run until power steering oil pump reaches operating temperature With engine at normal operating speed, turn shut-off valve on gauge to its closed position *(CAUTION—Do not keep valve closed more than a few seconds or accelerate engine with valve closed)* If pressure does not gradually increase to 700 lbs pressure (Chrysler & DeSoto), 600 lbs pressure (Dodge), 750-800 lbs pressure (Plymouth), it is possibly due to fan belt slipping, or flow control valve stuck in the open position or a broken drive coupling

PUMP CHECK: Remove cover from reservoir start engine and turn steering wheel If oil does not flow through filter, a stuck flow control valve is indicated Shut off engine Remove high pressure hose at pump fitting

CONTINUED ON NEXT PAGE

"CO-AXIAL" (C ntinu d)

and insert a ½" blunt probe against valve plunger If plunger moves inward 3/16-1/4", plunger was stuck and will probably function properly next time Recheck pressure and if found to be below normal (see above), remove flow control valve and clean thoroughly If this does not correct the condition, remove and repair pump assembly If oil does not flow through reservoir filter in above test, check for broken filter or slipping fan belt Check shaft rotation by hand if coupling found to be broken If shaft turns freely, install new couplings on both pump and generator shaft If pump shaft binds when turned by hand, replace both pump and couplings If armature shaft is damaged, replace necessary parts

TROUBLE SHOOTING

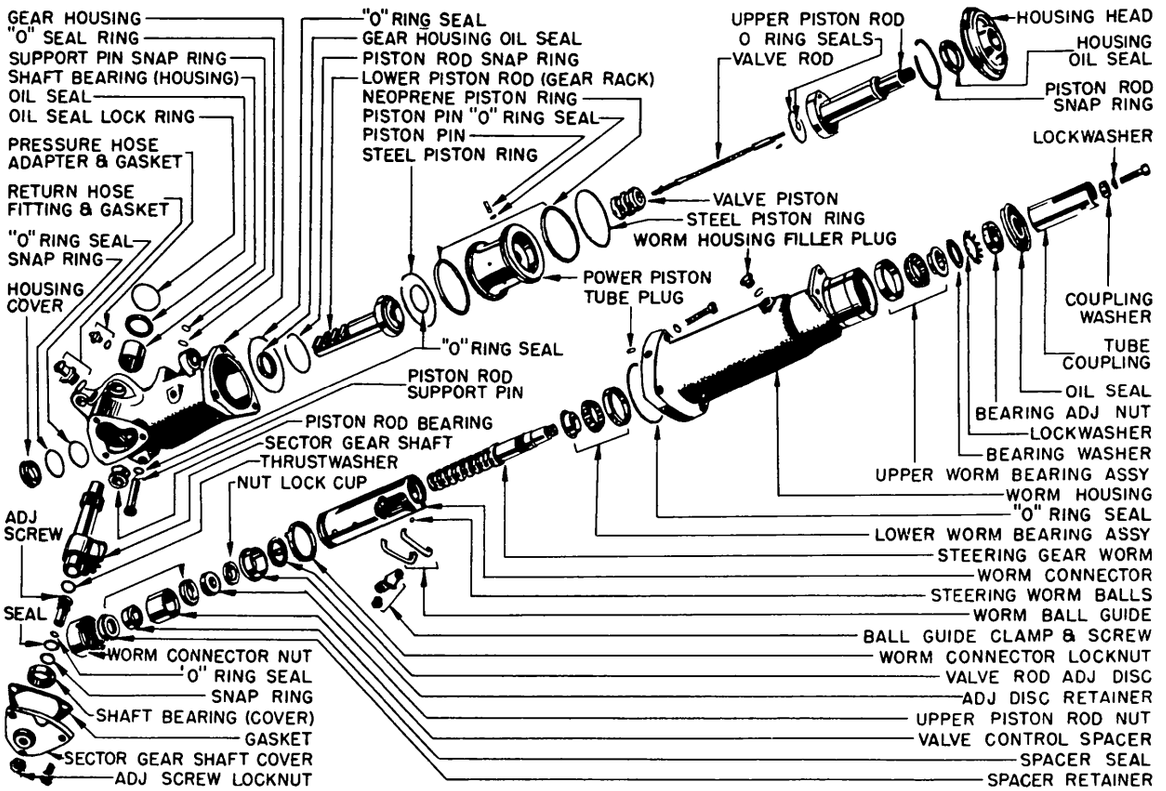
HARD STEERING IN BOTH DIRECTIONS: 1) Leak in steering system, pump belt slipping or broken, fluid level low.
2) Steering gear linkage not lubricated, tire pressure too low, bind in steering column or gear, improper front end alignment.
3) Low pump pressure (see Hydraulic Pressure Test above) with particular attention to following Relief and flow control valve, rotors (not turning or worn), pump body or cover worn.
4) Loss of pressure in power unit (see Hydraulic Pressure Test above).

SMALLER TURNING RADIUS IN ONE DIRECTION: 1) Wheel stops not adjusted properly.

HYDRAULIC LEAKS: 1) Check for leaks at hose adapters, pump body, between gear and worm housings, and gear shaft oil seal.

HARD STEERING IN ONE DIRECTION ONLY: 1) Tire pressure too low.
2) Control valve maladjusted.
3) Bind in steering column or gear, improper front end alignment.

VEHICLE ATTEMPTS TO TURN UNLESS FORCE APPLIED TO HOLD STEERING WHEEL: 1) Tire pressure uneven.
2) Control valve maladjusted.



POOR RECOVERY ON TURNS: 1) Tire pressure too low improper front end alignment.
2) Gear shaft adjustment too tight, worm bearing adjustment too tight.
3) Balls in worm connector binding, fit too tight.
4) Bind in steering column or gear, bind in steering knuckles.

NOISE IN CHUCK ASSEMBLY: Check belt adjustment Check for vibrating condition set up by control shaft rod Remove unit and install a new valve rod adjusting disc

HISSING NOISE (NO LOAD): Caused by low oil pressure or improper operation of back pressure valve

HISSING NOISE (RIGHT TURN ONLY): Caused by oil leaking past lower piston rod gear housing seal

HISSING NOISE & LOSS OF OIL THROUGH UPPER HOUSING VENT (LEFT TURN ONLY): Caused by oil leaking past upper piston rod housing head oil seal

CHRYSLER, DESOTO, DODGE, PLYMOUTH "CO-AXIAL" POWER STEERING GEAR

CREAKING NOISE ON TURNS: Check for loose gear-to-frame mounting bolts If noise persists after tightening gear-to-frame bolts install a new equal tooth sector or gear shaft

SNAPPING NOISE: Tighten gear-to-frame mounting bolts Check coupling screw for tightness Check lower piston rod bushing dowel pin for being too high Check bushing for seating properly Check lower piston rod for tight fit at piston

CHUCKLE NOISE: Check as follows Steering arm nut loose on gearshaft Loose front wheel bearing Gearshaft adjustment too loose Excessive kingpin endplay Steering tube coupling screw loose Worm bearing preload adjustment too loose Excessive worm shaft endplay

WANDER (STEERING WHEEL FREEPLAY): Check steering wheel freeplay which should not exceed 5/8" If freeplay excessive (without moving steering linkage), check in same manner as for "Chuckle" above, and also check steering linkage and front wheel alignment

POOR RETURNABILITY (BOTH DIRECTIONS): Check torque required to turn gearshaft from one extreme to the other with torque wrench on steering gear arm nut (linkage disconnected from steering arm) Torque should not exceed 40 ft lbs , ± 10 lbs. If torque reading not excessive, check wheel alignment and steering linkage. If torque excessive, check steering column jacket bearing. Check gearshaft adjustment. Check worm shaft bearing preload. Check wormshaft for binding in connector

POOR RETURNABILITY (ONE DIRECTION ONLY): Check tire pressure. Center control valve (see Adjustment). Check gearshaft adjustment

UNEOUAL STEERING EFFORT: Check control valve adjustment. Check for upper piston rod movement in piston. Check worm shaft connector nut for tightness Check control valve rod for looseness in valve Check upper piston rod nut for looseness. Check upper piston rod for being scored at reaction seal retainer. If the above fails to correct unequal steering effort, replace all reaction parts

UNABLE TO MAINTAIN CONTROL VALVE ADJUSTMENT: This may be caused by reaction spacer being too short or too long, or by burrs or out of squareness Check valve control rod for looseness in disc, or control valve looseness on rod. Upper piston rod nut may be loose, or upper piston rod may be loose in piston

LACK OF ASSIST(ONE DIRECTION): Check for damaged neoprene piston ring Check for damaged or improperly seated housing head oil seal. Valve rod lower "O" ring may be damaged, or piston rod "O" rings may be damaged.

CONTINUED ON NEXT PAGE

"CO-AXIAL" (C ntinu d)

LACK OF ASSIST (BOTH DIRECTIONS): Check the following: Low tire pressure. Drive belts slipping. Low oil pressure

LUBRICATION

Since there is no hydraulic connection between the worm and gear housing, the Power Steering has two separate fluid levels. Lubricate as follows

R s rv ir—Check every 1000 miles or every 30 days. Reservoir is mounted at rear of generator. Make sure top of reservoir is absolutely clean. Then, remove cover or filler cap and check oil level. Oil level should be 1/2" above filter element (if reservoir is tilted, oil level should be 1/2" above highest point of filter element). (NOTE—An oil level mark is stamped on the inside of the reservoir or on the dipstick on type using a filler cap). Replenish as necessary with SAE-10W engine oil. When temperatures are constantly below minus (-) 10° F., drain hydraulic system and refill with SAE-5W engine oil (see Draining and Refilling Hydraulic System below). When temperatures are consistently above minus (-) 10° F., drain the lighter lubricant which may have been added and replace with SAE-10W engine oil. Should the vehicle be operated at extremely high temperatures, it may be necessary to drain and replace the SAE-10W oil with SAE-30 oil for the time it is being operated in these extremely high temperatures. NOTE—When temperature is below minus (-) 10° F. run engine for at least three minutes before putting car in motion or turning steering wheel. Capacity is approximately 2 quarts.

W rm H using—*(NOTE*—It is not necessary to change oil in worm housing due to temperature). Worm housing does not require periodic checks (unless leakage occurs). However, should the steering gear assembly be removed for any reason, it is recommended it be checked at that time. The oil should be level with the filler plug opening when the gear assembly is in an installed position. Replenish as necessary with SAE-10W engine oil.

DRAINING HYDRAULIC SYSTEM: *(CAUTION—Extreme care should be taken to prevent dirt from entering reservoir while cover or filler cap is removed. To prevent damage to filter element, do not insert sharp objects into reversoir. Do not disturb filter element as periodic changes of this unit are not required).* Disconnect high pressure (small) hose at the gear housing and jack up front end of car sufficiently to raise wheels off floor. Place hose in suitable container. While holding hose in container start engine and allow to idle, turn steering wheel from one extreme to the other until all fluid is forced from unit. *(CAUTION—Do not run engine above idle speed. As soon as fluid starts to show great quantities of air bubbles, stop engine).* Reconnect high pressure hose and refill.

REFILLING HYDRAULIC SYSTEM: Bleed steering gear as follows Fill reservoir slightly higher than normal. Start engine and run for a short time to circulate oil through hoses. With engine running at idle speed, turn steering wheel back and forth several times from extreme right to left to bleed any remaining air out of system. Check oil level in reservoir. Add oil to reach level mark. Capacity is approximately 2 quarts.

REMOVAL & INSTALLATION

REMOVAL: Remove horn ring and ornament from steering wheel. Disconnect horn wire and remove horn ring. Remove steering wheel with puller C-612, and remove signal lever and plate. Loosen steering column to instrument panel bracket. Loosen steering column jacket clamp screws and raise front of car. Disengage drag link from pitman arm and pull pitman arm with Tool C-3402. Loosen three gear housing to frame attaching bolts. Remove floor mat retaining plate and rubber dust pad. Disconnect pressure and return hoses and drain gear assembly by slowly rotating steering wheel until all oil is expelled from unit. Fasten disconnected ends of hoses above oil level in reservoir to prevent loss of oil and cap hose ends to prevent dirt entering. Remove gear housing to frame bolts and alignment wedge and remove gear assembly from lower side of car.

INSTALLATION & ALIGNMENT: Install steering gear assembly from under the car and up through the dash panel into the jacket. Install housing to frame attaching bolts, flat washers, swivel washers and nuts, but do not tighten (swivel washers permit alignment to dash). Slide steering column jacket down over worm housing. Install turn signal lever, being sure column jacket does not restrict lever. Tighten jacket to steering gear housing clamp. Connect turn signal wires. Install steering column to instrument panel bracket and install steering wheel. If clearance between steering column jacket and steering wheel is less than 1/8", adjust steering column jacket to provide proper clearance. Install dust pads and retaining plates. Tighten front upper and lower gear housing to frame attaching bolts to 20 ft. lbs. Install wedge over rear bolt between housing and frame, so that tapered surfaces match, tapping it lightly in place. Tighten three attaching bolts to 70 ft. lbs. Install horn ring and horn wire in steering wheel and install horn ring ornament Connect hoses from steering gear to hydraulic pump.

STEERING GEAR OVERHAUL

►*CAUTION* Cleanliness in executing all overhaul procedures cannot be over-emphasized. Unit should be thoroughly cleaned in a suitable solvent when removed from vehicle. When disassembling, each p rt should be placed in the solvent, washed, then dried with compressed air. Careful handling of parts is necessary to avoid occurrence of nicks and burrs. Crocus cloth may be used to remove small nicks and burrs provided it is used carefully. When used on valve spool, use extreme care not to round off sharp edge portion. (NOTE—Sharp edge portion helps prevent dirt and foreign matter from getting between the valve and bore, thus reducing possibilities of sticking). Remove and discard all "O" ring seals, and seals, using new ones lubricated with Lubriplate when reassembling.

DISASSEMBLY & INSPECTION: Proceed as follows:

Removal of Worm Housing from Gear Housing: 1) Drain lower portion of steering gear through pressure and return connections, by turning steering tube coupling from one extreme of travel to the other. Using a 3/16" allen wrench, remove worm housing filler plug and drain worm (upper) housing.

2) Attach holding fixture C-3323 to unit and place in vise.

3) Remove tube coupling screw, lockwasher, and washer from center of coupling. Using tool C-3392, remove coupling from worm shaft. (NOTE—Tool C-3112 may also be used to remove coupling. However, to accomplish this, it will be necessary to cut one adapter plate SP-1409 in half and using these two parts instead of the two plates).

4) Using extreme care and a screwdriver, remove worm housing oil seal from housing and worm shaft.

5) Unlock bearing adjusting nut by bending tang of lockwasher. (NOTE—Only one tang locks nut in position). Place tool C-3320 over worm shaft followed by C-3319. Holding the worm stationary remove worm bearing adjusting nut, lockwasher, and thrust washer (NOTE—Worm bearing adjusting nut tapered on one side).

6) Remove worm outer bearing race and bearing roller from worm. Inspect bearing roller for wear or pitting.

7) Remove three worm to gear housing screws and belleville washers (Note installed position of washers on screws. Concave side of washers fit against housing). Remove worm housing. (NOTE—It may be necessary to tap housing lightly due to interference of "O" ring seal between housing head and housing

8) Remove inner bearing race from worm shaft and inspect for wear or pits.

9) Remove lower bearing roller from housing. Inspect bearing roller and the upper and lower bearing cups in housing. **Do not remove bearing cups unless inspection reveals it is necessary to do so.** To remove upper and lower bearing cups use tool C-3322.

Removal of Worm Connector: 1) Remove housing head "O" ring and discard (Use new rings when assembling). Unlock worm connector nut lock and slide lock back sufficiently to loosen worm connector nut.

2) With tool C-3321 attached to worm connector, remove connector nut using tool C-3326 (NOTE—It may be necessary to rotate steering gear shaft to raise worm connector and permit installation of tool C-3326).

3) Slide worm connector assembly from valve control spacer.

Disassembly of Worm Connector—*(CAUTION—Do not bottom worm shaft in the outward direction upon disassembly or assembly. Bottoming the worm shaft may damage the ball guides and cause a tight and rough operating worm).*

1) Remove the two worm connector ball guide clamp screws and lockwashers. Remove guide clamp.

2) Using care not to lose any of the worm balls, carefully remove the ball guide from the worm connector.

CONTINUED ON NEXT PAGE

"CO-AXIAL" (Continu d)

CAUTION—Worm balls are a select fit with each other. If any of them are damaged and require replacing, it is recommended that a complete set (40) be installed.
3) Turn worm connector over and carefully thread the remaining worm balls out of the worm connector by turning worm in and out. Count the worm balls which were removed so that the same number can be installed. There should be (40).
4) Remove worm from connector, slide connector nut lock from connector.
5) Inspect guide rails on connector for nicks and burrs.

R moval of Piston & Rods from Gear Housing: 1) Remove pressure and return hose adapters and copper gaskets.
2) Remove steering gear shaft oil seal lock ring (circular section), then, using tool C-3350, remove steering gear shaft oil seal.
3) Remove lock nut from shaft adjusting screw.
4) Remove three cover screws, belleville washers, and neoprene seals.
5) Remove steering gear shaft cover from housing by turning adjusting screw in. Remove cover gasket and discard (use new gasket when reassembling).
6) Using steering arm (if necessary) align steering gear shaft with cover opening in housing. Remove steering gear shaft assembly from gear housing by using a fiber hammer and tapping lightly.
7) Using tool C-3229, remove adjusting screw retaining snap ring. Remove adjusting screw, thrust washer and washer from steering gear shaft. Remove adjusting screw "O" ring.
8) Inspect needle bearings in cover for broken needles and inspect bearing surface on shaft for scoring or pitting. *CAUTION—Do not remove bearing from cover as bearing and cover are serviced as an assembly. Inspect condition of teeth on shaft.*
9) Using C-760 pliers remove gear housing cover snap ring (tapered) at bottom of housing, remove housing cover. Remove "O" ring from housing and discard (use new ring on reassembly).
10) Place a suitable container under the assembly (to catch trapped oil), then slide piston assembly and rods from gear housing. *CAUTION—Use extreme care in handling so as not to damage the sealing surfaces on housing head.*

Disassembly of Piston & Rods— 1) Remove valve rod adjusting disc from valve rod, slide valve rod adjusting disc retainer from upper piston rod, remove upper piston rod nut lock cap.
2) Using tool C-3328, remove upper piston rod nut. *CAUTION—Support upper piston rod on block of wood to help prevent damaging housing head when removing nut. Assembly may also be supported by wrapping several layers of masking tape around the rack teeth and sealing surfaces of lower piston rod and clamping it in a vise equipped with protective jaws.*
3) Slide valve control spacer, seal assembly, upper and lower valve control spacer seal retainers from upper piston rod. Remove spacer retainers from spacer, slide seal assembly from valve control spacer.
4) Remove worm connector nut from upper piston rod, slide housing head off upper piston rod. Remove housing head "O" ring and discard (use new ring on reassembly).
5) Using suitable drift, remove upper piston rod seal (lip type) from housing head.
6) Remove two backup (steel) and "D" type (neoprene) piston rings from piston.
7) Using C-760 pliers, remove lower piston rod snap ring and slide lower piston rod from piston.
8) Using care not to bend valve adjusting rod, slide valve assembly from piston assembly.
9) Using a 1/4" punch, drive piston pin into upper piston rod, then using C-760 pliers, remove upper piston rod snap ring. **Note position and construction of snap ring.**
10) Remove upper piston rod from piston. Using a wire hook, remove piston pin and "O" ring from piston rod, discard "O" ring (use new ring on reassembly). Make sure oil passage is open. Inspect sealing surface on piston rod for scoring. Remove the two valve rod "O" rings (one in each end of upper piston rod) remove upper piston rod "O" ring (discard rings, use new rings on reassembly).
11) Remove lower piston rod "O" ring (discard and use new ring on reassembly). Inspect rack teeth and sealing surfaces on lower piston rod. Make sure oil return hole is open.
12) Inspect piston for nicks and burrs. Make sure all oil passages are open and free of dirt.

Removal of Relief Valve Assembly: Thread a ¼"-28 bolt into threads provided in plug. Clamp bolt in vise and pull on lower piston rod to remove plug. If end plug is seized in rod, tap on retaining flange at lower end of piston with a fibre hammer. Inspect piston for nicks and burrs. Make sure all passages are open and free from dirt.

Disassembly of Steering Gear Housing: 1) Using C-3128 pliers, remove piston rod bearing support pin snap ring. Slide bearing support pin out of gear housing and remove roller support assembly. Inspect roller and needle bearings. Inspect bearing support pin for wear or scoring. Remove two bearing support pin "O" rings located in each side of gear housing and discard (use new rings on reassembly).
2) Inspect steering gear shaft needle bearing in gear housing for broken or rough needles. **Do not remove bearing unless inspection reveals it is necessary to do so.**
3) Using driver C-3333, drive steering gear housing shaft needle bearing from inside gear housing. Remove lower piston rod seal (lip type) from housing.

REASSEMBLY & ADJUSTMENT: Proceed as follows:

St ring Gear H using: 1) Remove garter spring from a n w piston rod seal (to prevent being damaged by tool when installing) and position seal over driver C-3331 (position seal so lip will be facing up or to inside of cylinder when installed). Insert seal aligning pilot of tool in end of driver and drive lower piston rod seal into position in gear housing. *CAUTION—Replace garter spring in piston rod seal.*
2) Using driver C-3333, install housing shaft needle bearing assembly into gear housing until driver marking on driver is even with side of housing. *CAUTION—Always drive on letter sid of b aring, oth rwise damage to bearing may result.*
3) Lubricate the two **new** piston rod bearing support pin "O" rings with Lubriplate and install into gear housing at outer edge of bearing support pin holes. Make sure they are properly seated in housing.
4) Start piston rod bearing support pin through hole in cover side of housing. Place roller support assembly into position in housing and push support pin through roller assembly until it protrudes sufficiently on opposite side of housing to install snap ring. Using C-3128 pliers, install snap ring, making sure it is properly seated.

Piston & Rods 1) Insert relief valve spring followed by plunger into valve body and insert assembly (milled end first) into lower piston rod. Press end plug into lower piston sufficiently to seat against relief valve body (*NOTE*—A suitable adapter will be required to press end plug into place. Otherwise, damage to rod will result. If plug is not pressed in far enough to properly seat against the valve body, it will produce a rattling or clattering sound when hydraulic pressure is applied. If the plug is pressed in too tightly, it will cause relief valve ports in valve body to collapse, restricting the plunger and creating high back pressure, resulting in lack of steering assistance). Lubricate the two **new** valve rod "O" rings with Lubriplate and install one in each end of piston rod. Make sure the rings are seated properly.
2) Lubricate the two **new** large "O" rings with Lubriplate and install one on each upper and lower piston rod. Make sure rings seat properly in ring grooves.
3) Install lower piston rod (with rack) into end of piston assembly opposite piston pin hole and using C-760 pliers, install snap ring. *CAUTION—When installing snap ring, minimum gap opening of 25/64" is specified. Care should be exercised to locate the gap at the middle port of the fiv ports without obstructing the middle port or adjacent ports with snap ring ends. Make sure snap ring is seated properly.*
4) Lubricate valve assembly with Lubriplate and slide into piston assembly. Using care not to damage "O" rings, slide upper piston rod over valve rod, aligning piston pin hole in the piston assembly with the hole in the upper piston rod.
5) Lubricate **new** piston pin "O" ring with Lubriplate and install on piston pin. With piston pin holes aligned in both the piston and upper piston rod, position piston pin (tapered end first) in piston. Using a 1/4" punch and hammer, tap lightly until piston pin is flush with bottom of piston pin groove. Using C-760 pliers, install upper piston rod snap ring. S *CAUTION und r 3) above.*

CONTINUED ON NEXT PAGE

"CO-AXIAL" (Continu d)

6) Remove garter spring from a **new** upper piston rod seal (to prevent being damaged when installing seal) and position seal on driver C-3331 (lip of seal facing tool). Insert seal aligning pilot of tool in end of driver. Drive upper piston rod seal (lip of seal out) into position in housing head. Replace garter spring and lubricate seal with Lubriplate. Install housing head assembly (sealing lip first) onto upper piston rod. *CAUTION– Use extreme care to protect sealing surfaces on housing head.*

7) Slide connector nut onto upper piston rod with open threaded end away from piston.

8) Lubricate the valve control spacer seal (new) with Lubriplate and install in center of valve control spacer. *CAUTION–Should it be necessary to replace the valve control spacer or upper piston rod for any reason, always select a spacer to match. The length of the valve control spacer selected, must be identical to the distance between the seat of the valve control spacer seal retainer and the seated upper piston rod nut.*

9) Slide one of the valve control spacer retainers (large diameter first) on upper piston rod. Lubricate with Lubriplate. Place tool C-3329 over threaded end of upper piston rod. Lubricate the valve control spacer retainer with Lubriplate and place into position (small diameter first) so it nests in valve control spacer. Slide spacer, seal and retainer over tool C-3329 and into position on piston rod, remove tool.

10) Install upper piston rod nut and using tool C-3328, tighten securely (25-30 ft. lbs. torque). Lock in place using piston rod nut lock by tapping outer diameter of lock into nut recess.

11) Slide valve rod adjusting disc retainer (largest diameter first) over end of upper piston rod. Thread valve rod disc (extended lock thread section being outward) onto valve rod until approximately three threads show (for aid in later adjustment).

12) Place lock ring on worm connector (tang of ring toward threaded end). Slide worm connector (less ball bearings and worm shaft) over valve control spacer, then screw worm connector nut onto connector. Hold worm connector with tool C-3321, then using tool C-3326, tighten nut. Stake ring with punch.

13) Lubricate the two "D" type (neoprene) piston rings with Lubriplate and install on piston. To aid in installation of rings, first slide rings over ring lands and to center of piston with lips facing away from each other. Next, slide rings into position in ring lands. Install backup (steel) rings one on each end of the piston, in extreme position from the center of the piston.

Installation of Piston & Rod Assembly into Gear Housing: 1) Lubricate lower piston rod, teeth of rack and tool C-3391 with Lubriplate, then position tool in teeth of rack.

2) Place ring compressing tool C-3344 on gear housing. Position piston and rod assembly so teeth on rack are 180° from roller support assembly and install into gear housing. *CAUTION–Use extreme care when performing this operation so as not to damage gear housing oil seal or piston rings. Do not use screwdriver to compress piston rings. To further aid in installation, piston and cylinder may be lubricated with Lubriplate. If rack is not positioned properly when it is installed, it may be corrected by rotating the lower piston rod with a screwdriver through opening in end of gear housing.* Remove ring compressing tool C-3344, and tool C-3391 from teeth of rack through opening in gear housing.

3) Lubricate large **new** "O" ring with Lubriplate and install on the side of housing head which faces piston assembly.

4) Carefully slide tool C-3324 (dummy housing) over worm connector and secure housing head to gear housing, tighten the three screws to 25-30 ft. lbs torque.

5) Install thrust washer on gear shaft adjusting screw and position tool C-3401 over thread of screw. Lubricate adjusting screw "O" ring with Lubriplate and slide over tool and into position on adjusting screw. Remove tool and insert adjusting screw thrust washer into gear end of steering gear shaft. Insert adjusting screw assembly into gear shaft and lock into position by inserting internal snap ring. Use C-3229 pliers and make sure snap ring is properly seated. Screw shaft adjusting screw with gear attached into the gear shaft cover assembly as far as possible.

6) Center the second tooth of the rack over center line of piston rod bearing support pin.

7) Lubricate a **new** gear shaft cover gasket with Lubriplate (to help hold it in place) and position it on cover of housing.

8) Center the center line of the middle tooth on gear shaft with second tooth **space** from end of rack. Insert gear shaft assembly with cover attached into gear housing, tap lightly into position. Place belleville washers and new seals on screws and secure cover to gear housing. Draw down evenly and tighten to 25-30 ft. lbs. torque.

9) Lubricate **n w** gear housing cover "O" ring with Lubriplate and install on housing cover. Push assembly (seal end first) into housing and install snap ring.

10) Before attempting to install a **new** seal, thoroughly clean sealing surface on the gear shaft and counterbore of steering gear housing. Lubricate a **new** steering gear shaft oil seal with Lubriplate and place (lip of seal down) on a piece of clean paper. **Carefully** install tapered end of sleeve (part of tool C-3350) in seal and slide seal back approximately 1/4" on sleeve. Install this assembly (lip of seal toward housing) over steering gear shaft until seal contacts counterbore in housing. Push seal into position by installing adapter over sleeve, and installing coupling nut on shaft threads until shoulder of adapter contacts housing. Remove nut and adapter. Wrap a new piece of friction tape around sleeve to provide a firm grip and with a turning motion, remove sleeve from seal and gear shaft. Seal is then positioned properly. Install oil seal lock ring (circular section) and make sure it is properly seated. Install gear shaft adjusting screw lock nut, but do not tighten.

11) Secure steering gear arm from stock or remove one from vehicle. Install steering gear arm, lockwasher and nut, and tighten nut from 30-40 ft. lbs. torque (low torque reading for checking purposes only). Work steering arm back and forth forcing piston to its full length of travel. Adjust gear, if necessary, into a backlash position, then tighten lock nut. *CAUTION–This adjustment necessary before hydraulically centering gear assembly and is not to be considered a final adjustment.*

12) Proceed as indicated under steps **7)** through **13),** Centering Control Valve, and Required Re-Assembly Operations After Adjusting Control Valve, outlined under "Control Valve" in ADJUSTMENT section above.

13) For final gear adjustment proceed as outlined under "Centering Steering Tube Coupling & Adjusting Backlash Between Gear Shaft & Rack Teeth" in ADJUSTMENT section above.

HYDRAULIC PUMP

►*PUMP COUPLING NOTE:* Two different types of pump drive coupling have been used and special Pump and Generator must be used with each type coupling (special shaft used with each coupling).

1) Rubber Insulated Coupling–Oilite coupling flanges are pressed on generator and pump shafts and retained by special "thread locking" type capscrew and **plain** washer (lockwashers should not be used with these screws). A rubber insulator and insulator sleeve are installed between the coupling flanges to transmit the drive.

2) Metal Tongue Coupling–Tongue-and-slot type metal coupling. Coupling members are retained on shaft ends by a retaining ring and slide off after ring removed.

HYDRAULIC PUMP REMOVAL: Disconnect the two hoses from pump reservoir assembly and catch oil from pump in a drain pan. Tie the loose ends of hoses out of the way above steering gear assembly to prevent loss of oil. Cover the ends of both hoses. Remove the three pump-to-generator screws and remove pump (*CAUTION*–do not lose coupling insulator and sleeve on pumps with rubber coupling).

CONTINUED ON NEXT PAGE

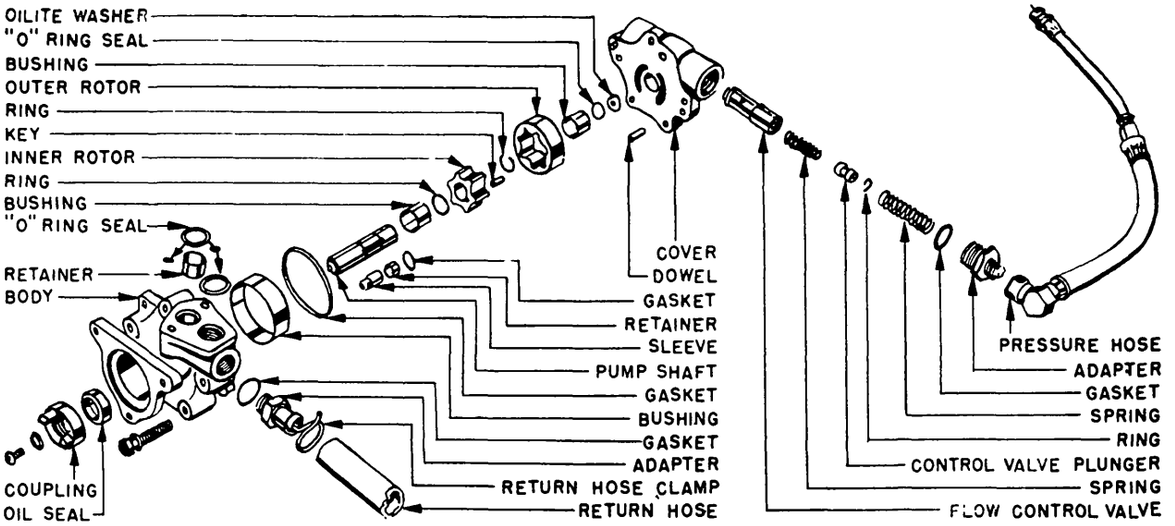
"CO-AXIAL" (C ntinued)

R moval of Reservoir From Pump:
1) Remove cover assembly from reservoir, lift out filter element and drain oil from reservoir.
2) Install the small tapered plug Tool C-3117 and the large tapered plug Tool C-3118, into the two holes that permit passage of oil to pump (this will prevent dirt entering pump).
3) Remove the four reservoir-to-pump attaching screws and lift reservoir from pump, being sure not to lose one large rubber "O" ring and five small rubber "O" rings which are used as gaskets between pump and reservoir.

OVERHAUL OF PUMP: *CAUTION*–Cleanliness is extremely important when working on hydraulic pump. Pump should be thoroughly cleaned before disassembling, work bench should be covered with clean paper, and all parts should be kept in clean kerosene until reassembled to protect them from dirt and corrosion.

Disassembly ("Single Rotor" type): Remove coupling lock screw, then remove coupling. Install pump in vise with protective copper jaws. Remove five body-to-cover attaching bolts, then remove cover. Remove shaft and rotor assembly, then "O" ring seal and "oilite" thrust washer in bottom of pump shaft hole.

Bushing & Seal Replacement–*NOTE*–New seal should always be installed whenever bushing replaced. Replace bushing and seals as follows:



Pump Cover Shaft Bushing–Place pump body in vise with protective copper jaws, install Tool C-3185, tap threads into bushing with outer section of tool, using an open end or adjustable wrench. After tool threaded into bushing sufficiently, screw T handle section of tool into hole until tool bottoms in cover, remove bushing. To install, drift bushing into place with Tool C-3233.

Pump Body Shaft Bushing–Place pump body in vise with protective copper jaws, mount pump cover to pump cover to pump body, install attaching bolts. Install Tool C-3185 in cover bushing hole, thread tool into housing bushing, remove bushing and seal. To install, mount bushing to Tool C-3235 and drift bushing into place.

Outer Rotor Babbitt Bushing–Remove pump cover from pump body. Thread Tool C-3214 into pump body using adapter Tool C-3234, remove bushing. To install, drift bushing into place with Tool C-3251.

Pump Shaft Oil Seal Replacement–With pump body securely clamped in vise with protective copper jaws, mount seal to Tool C-3230, drive seal into place.

Cl aning & Inspection: Clean all parts thoroughly in solvent and blow dry with compressed air. Wash bearings in clean kerosene and dry by blowing air through bearing (*CAUTION*–do not spin bearing with air).

HYDRAULIC PUMP (SINGLE ROTOR TYPE)

Inspect bearings for wear or roughness and replace if they do not rotate freely. Inspect babbitt rings in pump body for wear or scoring. Inspect rotors and pump shaft for wear, scoring, or burrs (remove burrs with a fine stone or crocus cloth). Check end clearance of rotors by installing them in pump body and using a feeler gauge to measure clearance from rotor to straightedge placed on face of body. End clearance limits are .001-.0017". Check valve plunger.

►*NOTE:* If rotors badly scored, or worn beyond limits given above, install complete new pump assembly.

Reassembly ("Single Rotor" type): Use NEW "O" ring seals and gaskets. Lubricate all parts with clean SAE 10W engine oil, coat "O" ring seals with Lubriplate. Assemble pump as follows: Install flow divider valve (ported end first) into pump body. Insert small spring plunger and ring, using Tool C-3229. Install large spring, gasket and adapter. Tighten adapter to 45-50 ft. lbs. torque. Install shaft protector thimble Tool C-3228 in pump body until tool bottoms, install rotor shaft assembly, using care not to damage babbitt bushings when installing rotor. Position "O" ring seal in body. Place cover in position, installing attaching bolts and washers. Tighten bolts to 15-20 ft. lbs. torque. Install coupling flange on pump shaft, then special lock screw and washer. Hold coupling with Tool C-3227 and tighten to 10-12 ft. lbs. torque.

Installation of Reservoir on Pump: Install one large circular section "O" ring, and five (5) small "O" rings which are used as gaskets between reservoir and pump. Install small tapered plug, Tool C-3117 and large tapered plug, Tool C-3118, into the two passage holes in bottom of reservoir. Insert the two pilots, Tool C-3116, into matching screw holes of reservoir and pump and install reservoir to pump. Install the four attaching screws and tighten to 7-12 ft. lbs. torque.

HYDRAULIC PUMP INSTALLATION:

►*PUMP DRIVE COUPLING CAUTION:* Make certain that pump and generator have same type drive coupling. Couplings are not interchangeable and SAME TYPE PUMP AND GENERATOR MUST BE USED TOGETHER. When installing pump with rubber type coupling, make certain that rubber insulator and sleeve installed in generator drive flange.

1) Attach pump and reservoir assembly to generator, using care to index pump shaft tongue into groove of generator coupling. Tighten three pump-to-generator mounting screws to 12-17 ft. lbs. torque.

2) Attach the two hoses, using 3/8-5/8 of a turn after initial finger tightening. The constant section hose is the return line and connects to the reservoir fitting. The dual diameter hose is the pressure line and connects to the pump body fitting. If the hose connectors are ever removed, they should be tightened to 25-30 ft. lbs. torque.

3) Clean out reservoir with lint free, clean cloth before removing tapered plugs, Tools C-3117 & 3118. Install filter element in reservoir, and fill with SAE 10-W engine oil to 1½" below gasket seat. See *BLEEDING* above.

4) AFTER bleeding of the system completed and reservoir refilled to correct level, install reservoir cover and gasket and tighten cover bolt to 5-8 ft. lbs.

NOTE–If relief valve assembly cap removed, tighten to 5-8 ft. lbs. torque.

SAGINAW "IN LINE" POWER STEERING

Buick (1956)
Cadillac (1956)
Continental (1956)
Lincoln (1956)
Oldsmobile (1956)
Pontiac (1956)

►CHANGES, CAUTIONS, CORRECTIONS

►*1956 END COVER, ADAPTER AND VALVE MOUNTING SEAL PRODUCTION CHANGE:* On later cars, the "O" ring seal has been increased in size and its position on the adapter has been changed slightly. Both the early and late type adapters are interchangeable provided the correct "O" ring seal is used.

►*POWER STEERING GEAR SEAL INSTALLATION CAUTION:* Particular care must be exercised when installing seals in the 1956 gear housing because fluid under pressure exists throughout housing whenever steering effort is applied. Extreme care must be exercised when installing the pitman shaft oil seal.

►*1956 BUICK POWER STEERING PUMP RESERVOIR VENT NOTE:* Aluminum and steel vent washers have both been used under the reservoir cover bolt. To prevent plugging the vent, the aluminum washer must be installed with the vent groove downward. The steel washer must be installed with the vent groove upward.

►*1956 BUICK PITMAN SHAFT LASH ADJUSTING SCREW LOCK NUT CHANGE (To eliminate leakage at this point):* A new lock seal nut, Part No. 5684554 having a nylon seal embedded at crimped end of nut, is available for service replacement.

►*CADILLAC PUMP SHAFT SEAL PRODUCTION CHANGE:* A new seal with same part number (5683898) has been released and is used in production beginning after Engine No. 021850. New seal has 30° angle on vacuum seal lip which reduces the possibility of the lip being torn, causing air leakage and a noisy pump. Extreme care should be used when installing seal. After lubricating with Hydra-Matic fluid or approved hydraulic fluid, shaft should be inserted slowly into seal with a rotary motion.

►*1956 CADILLAC POWER STEERING PUMP PRESSURE REDUCTION (To eliminate a squealing noise):* Pressure has been reduced to 875-975 lbs. Pump pressure can be reduced in the field by installing a shim, Part No. 5683875 under the screw head on control valve. Each shim used will reduce the pressure approximately 100 lbs. Two shims may be used if necessary, however, check the pressure before and after installation to make sure that cut-out pressure remains above 750 lbs.

►*1956 CADILLAC POWER STEERING SQUEAK CORRECTION (This squeak is noticed during a turn to left or right):* The squeak is caused by a dry needle bearing in gear assembly end cover. Apply 10W oil to felt washers under worm shaft flange. A small hole is provided in the felt protector on upper worm flange.

►*1956 CADILLAC STEERING GEAR "CLUNKING" NOISE CORRECTION:* This noise is heard on hard turns and when steering wheel is turned while car is standing still with engine running. This condition may be corrected by properly positioning the lower steering column seal seat between bearing and seal at lower end of steering shaft. Check to make sure a washer is located under the spring at lower end of steering shaft.

►*1956 CADILLAC POWER STEERING GEAR SIDE COVER & LASH ADJUSTER SCREW CHANGE (Air bleed screw has been eliminated):* This is a change in partial production and affects cars between Serial No. 139856 to 140136 and 140277 to 140557. Provision has been made for automatic bleed of trapped air in upper area of housing. Bleeding of air from system is accomplished in the same manner as in the past.

►*1956 CADILLAC STEERING KNUCKLE ARM CHANGE:* Starting at Engine No. 127270, steering knuckle arms, Part No. 1456119 (right hand), and 1456118 (left hand) are used on all models. When replacing a steering arm, make sure the correct type is installed to match the opposite arm.

►*1956 LINCOLN POWER STEERING HOSE INTERFERENCE WITH UPPER FRONT SUSPENSION CONTROL ARM:* If interference is found at this point, rotate the "Banjo" pressure hose fitting to between 8 and 9 o'clock positions as view from left side of car.

►*1956 LINCOLN POWER STEERING CONTROL VALVE PRODUCTION CHANGE:* Control valve assembly, Part No. LD-33577-A was used on approximately 9000 early cars. Part No. LD-33577-B is used in later production. Some of the detail parts of the assemblies are not interchangeable. The early type valve is identified by a brush mark of yellow paint across valve housing.

►*1956 STEERING COLUMN RATTLE CORRECTION:* Install a new nylon upper steering column bushing, Part No. FDT-3517-A. Before replacing the bushing, Polish all burrs from the shaft.

DESCRIPTION: Hydraulically operated in-line power steering gear, which combines the recirculating ball type gear with a concentric hydraulic booster. Hydraulic fluid is supplied to the steering gear by a constant displacement, belt driven type pump. System is designed to give hydraulic assistance when effort required to turn wheels exceeds 2½ lbs. at the rim of the steering wheel. Maximum effort required to turn wheels, even under most difficult turning conditions, is limited to 5½ lbs. at rim of steering wheel. Manual steering is available at all times when engine is not running, or when turning effort at steering wheel is less than that required for power assistance.

Control Valve Assembly: Located in valve housing directly above steering gear housing. Control valve assembly is an open center, three way valve containing a control valve mechanically connected by an actuator lever to the thrust bearing assembly on the worm shaft. Control valve has two annular grooves which, as the valve is moved fore or aft, open or close connecting passages between valve body and gear housing. In the neutral or straight-ahead position fluid flows from the pump, through open center of valve and back to the pump reservoir. When steering wheel is turned, resistance between roadbed and wheels must be overcome at the point where the power rack cylinder and pitman gear mesh. When the steering wheel is turned, this resistance, if higher than the preload which is built in the gear, will allow the wormshaft to move downward (right turn) or upward (left turn) causing thrust bearing to move downward (right turn) or upward (left turn), causing valve actuating lever to shift the control valve. As the valve moves, the connecting fluid passage between valve body and lower end (right turn) or upper end (left turn) is opened more fully to fluid from the pump, and the connecting passages between valve body and the upper end (right turn) or lower end (left turn) of the cylinder is more fully closed. Fluid from pump is then restricted in its flow back to pump reservoir and builds up pressure, forcing piston rack upward (right turn) or down (left turn) and providing power assist for the turn. Fluid in upper end (right turn) or lower end (left turn) of gear housing is forced back to pump reservoir through return line. The greater the resistance between roadbed and wheels, the more the control valve is displaced. "Feel of the road" is maintained through a reaction chamber built into the valve body. A ball check valve in the valve body allows steering gear to be operated manually when engine is not running or pump is inoperative (fluid circulates within valve body and gear housing. Return line to pump reservoir is open to assure a continuous flow of fluid).

Pump & Reservoir Assembly: Hydraulic pump is belt driven from engine crankshaft and supplies oil pressure for hydraulic assist. Pump operates continuously when engine is running but a flow control valve recirculates oil within the pump when it is not needed for hydraulic assist. A relief valve is provided to limit pump pressure. Reservoir is mounted directly above pump and supplies oil as needed.

ADJUSTMENT

PUMP BELT ADJUSTMENT: Buick – Tension should be set so that pulley will slip in belt when 40-45 lbs. (new belt), 30-35 lbs. (old belt) torque is applied to pulley nut.

Cadillac – Loosen pump to mounting bracket screws. Move pump outward until belt is tight, tighten bracket to pump mounting screws. With shift lever in "N", race engine while turning steering wheel. If belt squeals, it is too loose and must be retightened.

Continental & Lincoln – Depress belt at center. Deflection should be 1/4" approximately with a 5-7 lb. force.

Oldsmobile – Loosen pump to bracket attaching bolts. Place Tool J-5398 under pump body and over pivot cap screw. With a 0-50 lb. torque wrench adjust drive belt tension to 30 ft. lbs. This corresponds to a belt deflection of 7/8" with a 25 lb. pull applied midway between pump pulley and fan.

Pontiac – Loosen pump to bracket bolts two full turns so pump falls of own weight. Using Tool J-5574 over head of hinge bolt and torque wrench perpendicular to tool, tighten belt to 58-65 ft. lbs. (new belt), 51-53 ft. lbs. (old belt).

STEERING GEAR ADJUSTMENTS: Pitman Shaft Endplay Adjustment is the only adjustment that can be made on

CONTINUED ON NEXT PAGE

SAGINAW "IN LINE" (C ntinu d)

car. However, Ball Nut Preload and Thrust Bearing Preload should be checked before Pitman Shaft Endplay Adjustment is made. Disconnect pitman arm from pitman shaft or drag link, then proceed as follows

►*CONTINENTAL & LINCOLN ADJUSTMENT NOTE: Adjustments on car are not recommended, and should be performed when steering gear is removed for overhaul and during reassembly.*

Thrust Bearing Preload Check: Buick – Turn steering wheel to extreme right or left position. Attach spring scale to spoke of wheel at rim. While pulling at 90° angle to spoke, pull required to turn wheel through range where lash normally exists (1/8 turn of steering wheel from either extreme position) should be ¼ - ½ lb.

Cadillac – Turn steering wheel two turns off-center. Attach spring scale to spoke of wheel at rim. While pulling at 90° angle to spoke, pull required to turn wheel through 1" arc should be 8-14 ozs.

Oldsmobile – Turn steering wheel 2¼ turns off-center. Attach spring scale to spoke of wheel at rim. While pulling at 90° angle to spoke, pull required to turn wheel through a 6" arc should be ¼ - 1¼ lbs.

Ball Nut Preload Check: Loosen pitman shaft adjusting screw lock nut and turn adjusting screw counter clockwise a few turns. With spring scale attached as for Thrust Bearing Preload Check, preload should be as follows:

Buick – Pull through "high point" or no lash range (on-center) should be ¼ - ¾ lb. higher than for thrust bearing preload.

Cadillac – Pull through an arc of 1", ¾ - 1 turn off-center should be no greater than 9 ozs. in excess of thrust bearing preload.

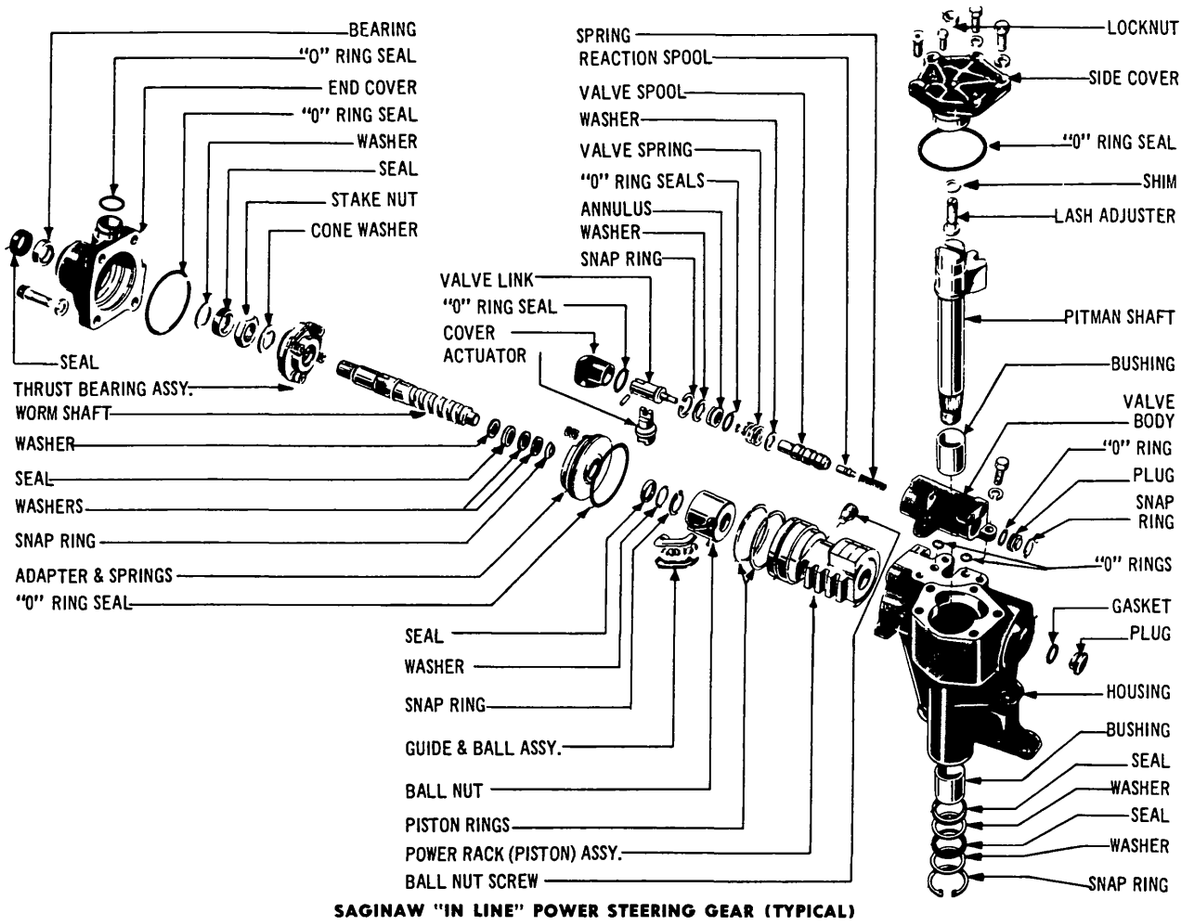
Oldsmobile – Same as for thrust bearing preload.

Pitman Shaft Endplay Adjustment: Adjust pitman lash adjuster screw so that pull through center is as follows:

Buick – ½ - 1 lb. higher than for ball nut preload but reading should be 1¼ - 1¾ lbs.

Cadillac – 8-15 ozs. higher than for ball nut preload but not to exceed 28 ozs.

Oldsmobile – Total over center preload must not exceed 1¾ lbs



Pontiac – Total over center preload should be 1¼ - 1¾ lbs.

LUBRICATION

LUBRICATION: Check level of fluid in reservoir every 2000 miles. Use Automatic Transmission Fluid "Type A" (marked AQ-ATF on container).

Checking Fluid Level: Buick, Oldsmobile, Pontiac – *(NOTE* – Reservoir is vented at cover bolt). Remove cover bolt, washer, and cover and gasket. Fill to full mark on side of reservoir. Bleed system if oil level low. Replace cover with new gasket, washer and cover bolt. Torque to 8-10 ft. lbs.

Cadillac – Remove cover bolt, washer, cover and gasket. Fill to full mark on side of cover. Reinstall cover, using new gasket. Torque bolt to 10-15 ft. lbs. Start engine, idle for three minutes, then check for leaks at cover. Bleed system if oil level low.

SAGINAW "IN LINE" POWER STEERING GEAR (TYPICAL)

Continental – Remove star nut and vented breather washer, cover and gasket. Fill to full mark on side of reservoir. Replace cover using new gasket. Tighten star nut securely.

Lincoln – Remove filler tube cap and fill to full mark on oil level indicator.

BLEEDING

BLEEDING SYSTEM: Buick, Oldsmobile, Pontiac – Remove cover, fill to full mark on side of reservoir. With front wheels off ground, engine running, and bleed screw in side cover loosened, turn steering wheel through its entire range two or three times until there is no evidence of air in system. Recheck oil level. Tighten bleed screw, replace cover with new gasket, and torque bolt to 8-10 ft. lbs.

►*1956 CADILLAC STEERING SYSTEM BLEEDING NOTE: See "Cadillac Power Steering Gear Side Cover & Lash Adjuster Screw Change" under "Changes, Cautions, Corrections" above.*

Cadillac – Remove cover, fill to full mark on side of reservoir. Allow fluid to remain undisturbed for about two minutes. Crack open air bleed screw on housing side cover. Crank engine (coil wire disconnected) and maintain fluid level in tank. Turn wheels (off ground) at same time to eliminate air pockets in system Start engine and run at idle for two minutes. Recheck fluid level and inspect gear, pump, hoses and connections for leaks. Increase engine speed to 1500 RPM and continue running at this speed until air bubbles cease to appear. Turn wheels (off ground) from right to left. Do not hit stops. Lower car and turn wheels on ground, recheck for leaks. Check fluid level, refill as required, and install cover using new gasket. Torque cover bolt to 10 - 15 ft. lbs. Tighten bleed screw.

Continental – Remove star nut, washer, cover and gasket. Fill reservoir to full mark on side of reservoir Replace star nut and washer **without cover.** Loosen bleed screw in side cover. Start engine. With wheels off ground, turn steering wheel through its entire travel two or three times. Tighten bleed screw, recheck oil level. Replace cover.

Lincoln – Fill reservoir to full mark on dipstick. Loosen bleed screw in side cover. Start engine and turn steer-

CONTINUED ON NEXT PAGE

SAGINAW "IN LINE" (C ntinued)

ing wheels through its entire travel several times (wheels off ground). Tighten bleed screw, recheck oil level. Replace dipstick.

TESTING

HYDRAULIC PRESSURE TEST: Buick, Cadillac, Oldsmobil , P ntiac – Disconnect pressure line at oil pump, attach Gauge J-5176 to pump, and connect hose to end of gauge where valve is located. With engine at warm idle and gauge valve open, note oil pressure while turning steering wheel from one extreme position to the other. Especially note the maximum pressure which can be built up with the wheel held in either right or left extreme position. *(CAUTION – Do not hold wheel in extreme position for more than 15 seconds because it will drastically increase the oil temperature and cause undue wear on the oil pump).* With oil temperature between 150° F. and 170° F., as measured with a thermometer in the reservoir, the maximum pressure should not be less than 875 PSI (850 PSI on Pontiac) for satisfactory power steering operation. If less than specified, it indicates trouble in the pump, hoses, steer ing gear, or a combination of these parts.

► *1956 CADILLAC POWER STEERING PUMP PRESSURE REDUCTION (to eliminate a squealing noise): See "Changes, Cautions, Corrections" above.*

Contin ntal & Lincoln – Remove pressure hose from pump and connect Gauge No. 3500 with adapter No. 3500-C between pressure fitting on pump and pressure hose that leads from pump to power unit. Let engine idle and turn wheel for a full right or full left turn. The gauge should read between 800 and 1000 lbs. If pressure is less than 800 lbs., close the valve at gauge and note pump pressure. If it is low with valve closed, it indicates that pump is not operating properly. If pump pressure goes up with valve closed, it indicates that the low pressure in system must be due to internal leakage in power unit, providing all connections are tight.

TROUBLE SHOOTING

TROUBLE SHOOTING: Hard Steering While Driving – Steering adjustment tight; linkage binding.

Hard Steering (Car rec ives more assist in one direction than the oth r): This condition may be caused by either of the following: Internal leaks at one or both of the white teflon seals. Correct by replacing seals. If this condition is not corrected by the above, align the valve body as follows: Loosen the three attaching bolts and allow the valve to seek its own location. Tighten the end bolt finger tight; then the two side bolts. Repeat bolt tightening sequence applying a final torque of 15-20 ft. lbs.

Poor Return of Steering Gear to Center: Tires not properly inflated; incorrect caster or toe-in; tight steering linkage; steering gear misalignment; tight sector to rack piston adjustment; sticky or faulty control valve; control valve improperly positioned on steering gear; ball nut and worm preload too tight; worm thrust bearing adjustment too tight; sticky valve actuating lever.

Car L ads to On Side or the Other: Due to front end alignment and not to steering gear.

Mom ntary Increase in Effort When Turning Wheel Fast to Right: Air in system.

External Oil Leaks (Wipe Gear Thoroughly and Make Sure Source of Leakage is Determined): Loose hose connection, damaged hose; housing end cover seal; housing end cover "O" ring seal; adapter "O" ring seal; side cover "O" ring seal; linkage cover "O" ring seals; valve to gear housing "O" ring seals; pitman shaft seal; valve end plug "O" ring seal.

Gear Noise (Rattle or Chuckle): Loose over-center adjustment. *NOTE* – A slight rattle may occur on turns because of the increased lash off "high point". This is normal, and the lash must not be reduced below specified limits to eliminate this slight rattle.

Gear Noise (Hissing Sound): *NOTE* – There is some noise in nearly all power steering systems. One of the most common is a "hissing" sound most evident when at stand-still parking. There is no relationship between this noise and performance of the steering. Hissing may be expected when wheel at end of travel.

Excessive Wheel Kick-back or Loose Steering: Lash in steering linkage; air in system; excessive lash between pitman shaft sector and rack piston; loose worm thrust bearing adjustment

Hard Steering When Turning or Parking: Loose pump belt; low oil level in reservoir; lack of lubrication in linkage or front suspension; tires not properly inflated; steering gear adjustments tight; insufficient oil pressure; low oil pressure due to steering gear seal leakage.

Buick: Horn Button Removal (Series 40 Std.)–Pry cap out with thin bladed tool, then remove contact cup and other parts by removing attaching screws and insulating spacer bushings. To install, reverse removal procedure.

Horn Button & Ring Removal (DeLuxe Steering Wheel)–Pry out monogram which is held by prongs of a retain-contact plate and spring with insulators, remove operating ring with cushion and contact spacer. To install, reverse removal procedure. *NOTE*–When contact adjusting nut is being installed, turn it down until contact is made and horns blow, then back nut off ½ turn to provide proper clearance between contact plate and spacer.

Steering Wheel Removal–Remove horn button or operating ring (see above), then re-install steering wheel nut, leaving it backed off several turns. Set direction signal switch in "Off" position to avoid damage to switch operating mechanism. Apply puller J-3274 and pull wheel back to nut *(NOTE*–If wheel hub very tight on shaft, apply a moderate strain with puller then tap end of puller screw to break hub loose from shaft without distorting wheel hub). Remove puller, nut, and steering wheel.

Steering Wheel Installation–Set signal switch in "Off" position. Location marks for proper installation are provided to insure vertical position of steering wheel lower spoke when front wheels are in straight-ahead position. Upper end of steering shaft has a small location notch, solid spoke wheel has a keyway, and flexible wheel has mark on hub. Location must be in line. With wheel properly located on shaft, install self-locking nut and tighten securely. *(NOTE*–Nut with nylon insert may be installed either way, but the optional type with locking feature in the threads must be installed with the score marked side UPWARD. Shaft must project above nut at least one thread). Install horn button or operating ring and connect wire to horn cable connector on steering column.

Steering Wheel Height–Clearance between column bracket and lower surface of instrument panel for normal steering height is 5/8-3/4" (Series 40 & 60), 3/8-1/2" (Series 50 & 70). Height of steering wheel may be set as much as 3/4" above or below normal height to suit drivers needs.

Cadillac: Horn Ring Removal–Disconnect horn wire from terminal underneath instrument panel on steering column. Loosen Allen head screws on underside of horn ring, one on each side of direction signal carrier, remove horn ring assembly. To install, reverse removal procedure.

Steering Wheel Removal–Remove steering wheel hub nut. Remove steering wheel using Steering Wheel Puller J-1859. To install, reverse removal procedure, tighten nut to 45-50 ft. lbs. Stake nut to steering wheel.

Continental & Lincoln: Horn Ring Removal – After removal of steering wheel (see below) remove screws from underside of steering wheel and remove horn ring. To install, reverse removal procedure.

Steering Wheel Removal–Pull cap and emblem outward from steering wheel hub. Remove steering wheel using Puller 3600-D (Lincoln), 3600-AA (Continental). To install, reverse removal procedure. Torque nut to 60-70 ft. lbs. (Lincoln), 40-50 ft. lbs. (Continental).

Oldsmobile: Horn Button Removal (Std. Wheel)–Insert sharp instrument under edge of horn button and pry upward. Remove steering wheel nut, then contact assembly.

Horn Ring Removal (Deluxe Wheel)–Two spring clips on ends of horn button engage horn ring hub and are accessible from underside of wheel. To remove horn button, use a small screwdriver to relieve spring tension on one end and lift button from its seat. Remove steering wheel nut to remove contact plate and horn ring.

►*NOTE:* To prevent horn from blowing during above operations, horn wire should be disconnected.

Steering Wheel Removal–Remove nut. With Puller J-1262, remove wheel. When installing, torque nut to 25 ft. lbs. minimum and stake to steering wheel.

Pontiac: Horn Button Removal (Std. Wheel)–Press down on button on one side, insert screwdriver underneath opposite edge, pry upward to remove button.

Horn Ring Removal (Deluxe Wheel)–Remove button by turning clockwise. Remove locknut, nut, washer, horn ring, horn insulator and contact assembly. To install, reverse removal procedure.

Steering Wheel Removal–Install Puller J-3044 after removing horn button and steering wheel nut or horn ring and allied parts. To install, reverse removal procedure, torque nut to 25-30 ft. lbs. and locknut finger tight plus ¼ turn. *NOTE*–Steering wheel spokes must not vary more than 5° from horizontal when front wheels are in straight-ahead position.

CONTINUED ON NEXT PAGE

SAGINAW "IN LINE" (C ntinu d)

REMOVAL & INSTALLATION

Buick. Place fender cover over left front fender. Disconnect pressure and return line hoses at steering gear and elevate ends of hoses higher than pump to prevent oil from draining out of pump. Disconnect flexible coupling by removing two bolts which attach flexible coupling to steering shaft. Jack up car and remove pitman shaft nut, then remove pitman arm. Remove four steering gear-to-frame bolts at outside of left frame rail. Remove steering gear. To install, reverse removal procedure. Check toe-in.

Cadillac: Remove reservoir cover, syphon all fluid from reservoir. Disconnect pressure and return line hoses at reservoir and pump, cap ends to prevent fluid drainage. Raise front of car and place stands near outer ends of lower suspension arms. Disconnect pitman arm from drag link. Remove upper flange-to-upper shaft retaining screw. Remove gear housing-to-frame side side bar screws, remove gear assembly. To install, reverse removal procedure. Torque upper flange-to-shaft retaining screw to 25-30 ft. lbs. *NOTE*–After installing gear, check flexible coupling for distortion. Coupling must rest in flat plane with no visible bend or twist. If distorted, remove lower steering column cover and lower clamp-to-jacket screw. Then loosen steering jacket clamp screws at instrument panel and slide complete steering jacket assembly up or down as required.

Continental: Working in engine compartment, remove ground cable from battery. Remove screws that retain steering column opening upper and lower cover plates to dash panel. Remove cover plates and insulator. Remove lock pin that retains shift rod to shift arm and remove shift rod from pin on shift arm. Remove spring from pin on shift arm. Working inside passenger compartment, cover front seat and back to protect upholstery. Remove steering wheel (see above). Remove two screws that retain dash panel trim pad to dash panel and remove trim pad. Remove sheet metal screws that secure instrument panel trim and remove trim panel. Disconnect turn signal wires at junction block. Disconnect neutral safety switch and back-up light wires attached to terminal block on steering column. Remove two Phillips head screws that secure upper steering column tube to instrument panel. Slide steering column tube from steering shaft. Raise car, using hoist or suitable jack. Remove nut that secures pitman arm to steering sector shaft. Remove pitman arm from shaft with Tool 3590-AA. Lower car to complete operation in engine compartment. Working in engine compartment, remove air cleaner and air duct as an assembly. Remove two nuts that secure exhaust flange pipe to exhaust manifold. Remove manifold capscrews and remove manifold. Remove number 7 & 8 spark plugs. Remove as much fluid as possible from reservoir with a suction gun. Place oil drain pan under car to catch oil drained from system. Disconnect hoses at power steering gear. Drain steering gear by turning from stop to stop several times. Remove capscrews that secure housing to frame. Mark position of any shims found under screws to assure reassembly in same location. *(CAUTION*–Do not attempt to remove rolled pin out of steering shaft coupling at this time). Working in engine compartment, rotate steering shaft so that coupling slot is in a vertical position to facilitate removal of gear assembly. Tilt gear housing down and rearward so that sector shaft is facing up. Lift gear assembly up between fender apron and engine and remove from engine compartment. To install, reverse removal procedure. Secure gear assembly to frame torquing three capscrews to 40-50 ft. lbs., steering wheel to 40-50 ft. lbs., pitman shaft nut to 120-130 ft. lbs. Before attaching pitman arm, count number of steering wheel turns from one extreme to the other and turn wheel back one-half number of turns. With steering wheel and front wheels in straight-ahead position, install pitman arm.

Lincoln: Working inside passenger compartment, remove battery ground cable from battery and cover front seat and back to protect upholstery. Pull speaker lead out of receiver and remove two screws that retain speaker to dash panel. Remove radio speaker. Remove steering wheel (see above). Disconnect speedometer cable at speedometer head. Disconnect accelerator rod at clevis pin connection. Remove brake pedal pad. Remove front carpet retaining screws and roll carpet away from steering column opening in dash. Remove clamp from steering column supports. Remove screws that retain supports to floor pan, and remove supports. Remove screws that secure access covers to floor pan and remove access covers. Remove lock pin that retains shift rod to shift arm and remove shift rod from pin on shift arm. Disconnect turn signal wires at junction block. Disconnect neutral safety switch and back-up light wires at terminal block. Remove two Phillips head screws that secure steering column clamp and steering column-to-brake pedal support, and remove steering column from steering shaft. Working through floor pan opening, remove rear manifold cap screw. Raise car using hoist or suitable jack. Remove nut that secures pitman arm to steering sector shaft. Remove pitman arm from shaft with Tool 3590-AA. Remove two nuts that secure muffler inlet to manifold. Remove two forward capscrews that secure steering gear to frame side rail. Leave remaining capscrew intact so that remaining operations can be performed. Lower car to complete operation in engine compartment. Remove manifold capscrews, remove manifold. Remove numbers 6, 7, and 8 spark plugs. Remove as much fluid as possible from reservoir with suction gun. Place drain pan under car to catch oil drained from system. Disconnect pressure and return line hoses at power steering gear. Drain steering gear by turning from stop to stop several times. Remove remaining bolt that secures steering gear to frame. Place steering gear with coupling slot in a vertical position to facilitate removal. Remove gear by tilting gear housing down and rearward until sector shaft can be removed first. To install, reverse removal procedure. Torque gear-to frame attaching capscrews to 40-50 ft. lbs. Torque steering wheel nut to 60-70 ft. lbs. Torque pitman arm-to-sector shaft nut to 120-130 ft. lbs. When installing steering column tube clearance between upper face of shifter dial and lower edge of horn rim hub should be approximately .18". Tighten steering column upper support-to-brake pedal support screws to 12-15 ft. lbs. Before attaching pitman arm, count number of steering wheel turns from one extreme position to the other and turn wheel back one-half number of turns.

Oldsmobile: Scribe alignment marks on coupling flange and steering shaft flange. Disconnect hoses from power steering pump and cap pump and hose fittings. Hoist car and remove engine filler plate. Remove the two flexible coupling-to-coupling flange attaching nuts and lockwashers. Remove the three assembly-to-frame bolts, then remove gear assembly with hoses attached from car. To install, reverse removal procedure. Torque frame-to-gear assembly bolts to 40-50 ft. lbs. and pitman arm nut to 90-120 ft. lbs.

Pontiac: Remove power brake (if so equipped). Hook front suspension in five passenger load position using Tool J-5571 front suspension hold-down hook. Remove steering wheel (see above). Remove direction signal switch handle and gearshift lever. Remove steering column-to-instrument panel bracket cap. Slide rubber grommet up steering column jacket. Roll back floor mat and remove pedal plates from floor. Remove neutral safety and back-up light switch on Hydra-Matic equipped cars. Disconnect gearshift and selector rods. Disconnect direction signal wires. Disconnect pressure and return line hoses at gear and secure lines so ends are higher than reservoir to prevent leaking. Install plastic plugs or tape to cover gear and line openings. Protect all finished surfaces on steering column with masking tape. Raise car on hoist. Remove starter, pitman arm and left side tie rod end, drop linkage. Remove engine left side apron. Remove brake pedal hair pin spring retainer. Slide pedal to right as far as it will go. If car is on twin post hoist it will be necessary to place stands under both front frame ends and lower front post approximately three feet to allow steering assembly to clear hoist. Push steering connecting linkage down and toward rear of car, remove steering assembly-to-frame attaching bolts, removing upper front bolt last. Lower assembly between lower control arm and steering connecting linkage. *(NOTE*–Check number of shims and avoid loss of shims that are between steering gear housing and frame). Thoroughly clean exterior of steering gear. Steering gear oil can be drained into a container by turning control valve down and turning the worm through steering range several times, To install, reverse removal procedure. Torque pitman arm nut to 100-125 ft. lbs.

OVERHAUL

STEERING GEAR DISASSEMBLY: 1) Mark alignment of coupling flange and worm shaft. Drive out coupling flange retaining pin *(CAUTION* - Coupling must be supported to prevent damage to bearing in end cover. 2) With the valve body facing down, remove plugs from hydraulic hoses, then turn coupling flange 2 or 3 times through its full travel to drain oil from gear. Remove hoses from valve body. Turn unit so valve body faces upward and remove three valve body capscrews. Remove valve body and linkage cover by pulling straight out from the housing. Remove two valve body to housing "O" rings from housing.

CONTINUED ON NEXT PAGE

SAGINAW "IN LINE" (C ntinu d)

3) Loosen pitman shaft adjusting screw locknut and remove the five side cover capscrews and rotate the cover ½ turn. Align pitman shaft gear with opening in housing. Tap pitman shaft with a plastic hammer and pull pitman shaft out of housing. Pull coupling flange.
4) Pull actuator from end of housing cover. Remove the four end cover attaching screws and pull end cover from housing. Pull out the worm shaft until centering ring springs are exposed, then remove the four centering springs from adapter. Pull rack-piston and worm assembly out of housing.

CONTROL VALVE: Disassembly – Pull linkage cover from valve body and remove "O" ring. Remove the large snap ring and pull valve assembly and washer from valve body. Remove washer and "O" ring from valve assembly. Remove valve body snap ring; then, using a wooden dowel, push plug from end of valve body. If disassembly of valve assembly is necessary, clamp end of spool valve in Tool J-6293, and using Tool J-6224 remove the valve link. Remove annulus, valve centering spring, and thrust washer from spool valve. Remove reaction control valve and spring from bore in spool valve. Remove inner "O" ring from annulus. If hose connections were leaking at connector seats, remove one or both connectors as follows: Thread a nut and place a washer over a 10-24 tap (for the small connector) or a 5/16" - 18 tap (for a large connector). Coat end of tap with petrolatum to prevent chips from falling into passage while tapping the connector. With valve body in a horizontal position, thread tap into connector not more than three turns. Tighten nut to remove connector by jacking tap and connector out of bore.

Cl aning & Insp ction: Wash all parts in clean solvent, blow out all passages, and dry parts with compressed air. Check control valve body for scores, chips or other damage. Control valve must be free to move back and forth in control valve body. Any minor nicks or scratches may be removed with a fine hone.

Reassembly: Install new "O" ring seal on valve body plug, coat "O" ring with Hydra-Matic oil, and install plug and snap ring in end of valve body. Clamp end of spool valve in Tool J-6293. Install reaction control spring and reaction control valve (open end out) into valve spool. Install inner and outer "O" rings on the annulus and coat with Hydra-Matic oil. Install thrust washer (bevel side down), valve centering spring, and annulus (narrow land next to spring) on spool valve. Thread link into spool valve and torque to 8-10 ft. lbs. To install new connectors, use Tool J-6217 to seat them in valve body. Carefully insert spool assembly into valve body (*CAUTION* - The spool and valve body are selective fits and have very little clearance. Spool must be properly started into valve body. Do not attempt to force it in). Place steel w a s h e r over link (chamfered side down), then install snap ring (with beveled side out) to retain valve assembly. Install new "O" ring on linkage cover and coat with Hydra-Matic oil. Install linkage cover and align valve link and linkage so that linkage slot is perpendicular with bottom of valve.

PITMAN SHAFT & COVER: Disassembly – Remove pitman shaft adjusting screw locknut. Thread adjusting screw through pitman shaft cover, then remove cover, adjusting screw and selective shim. Remove "O" ring from cover.

Cleaning & Inspection: Wash all parts in clean solvent, blow out all passages, and dry parts with compressed air. Check pitman shaft upper and lower bushings for scoring or damage. Make sure that bearing surfaces of shaft are not nicked or rough. Check sealing surfaces of worm shaft and pitman shaft. Make sure they are free from roughness, nicks or d a m a g e. Minor nicks and scratches may be cleaned up with crocus cloth. Check teeth on pitman shaft and rack-piston for nicks, burrs, or other damage. The pitman shaft adjusting screw has a small nylon plug imbedded in the threaded area which prevents oil from working up threads. This screw with proper shim must be replaced upon reassembly.

Reassembly: Check the endplay of a new adjusting screw in slot of pitman shaft. The screw should rotate freely but not have more than .002" end clearance. Check endplay with a feeler gauge inserted between head of adjusting screw and slot in shaft. If endplay exceeds .002", select the proper shim to give desired endplay. Shims are available in .063", .065", .067", and .069" thicknesses. Thread the adjusting screw through side cover until side cover bottoms on pitman shaft. Install locknut, but do not tighten. Install a new "O" ring into recess in side cover and retain with petrolatum.

END COVER: Disassembly – Remove the two "O" rings. If necessary to replace needle bearing, drive out needle bearing washer and seal. If bearing removal is not necessary, remove seal and washer by driving them out with a screw driver and hammer.

Cleaning & Inspection: Wash all parts in clean solvent, blow out all passages, and dry parts with compressed air. All mating surfaces must be free from nicks and burrs. Remove irregularities with crocus cloth. Inspect actuating lever bore in end cover for wear. If badly worn, the end cover should be replaced.

Reassembly: If needle bearing and seal were removed: Install washer in oil seal recess in cover. Place a new seal over large end of Tool J-5254 with the lip facing shoulder of tool. Install seal so it sits against washer. Coat lip of seal with seal lubricant. Place a new needle bearing over large end of tool J-5254 with the markings against shoulder of tool and drive bearing into end cover until tool bottoms on cover. Make sure needle bearings are free. If seal only was removed, install in same manner as indicated above. Pack needle bearing with a fine fibre grease. Install "O" ring in end cover flange and in "O" ring groove on side of cover. Coat both "O" rings with Hydra-Matic oil.

STEERING GEAR HOUSING: Disassembly – Remove pitman shaft seal by removing snap ring, steel washer, dust seal, and steel washer; then pry out oil seal. If pitman shaft bushing replacement is necessary, drive bushing out with Tool J-6278. If the housing plug shows evidence of leakage, remove the staking with a hack saw, remove any burrs that could score the housing and drive plug into housing to remove it.

Cleaning & Inspecti n: Wash all parts in solvent, blow out all passages, and dry parts with compressed air. Check housing for scores and undue wear. All mating surfaces must be free from nicks and burrs. Any irregularities may be removed with a crocus cloth. Check housing cylinder for a shoulder condition at either end of ring travel. If shoulder exists due to excessive wear, replace the housing.

Reassembly: If pitman shaft bushing was removed: Place Tool J-6278-2 over Tool J-6278, slide new bushing on tool and drive bushing into housing. With Tool J-6278-2 over Tool J-6278, slide seal on tool with lip of seal facing away from tool, and drive seal into housing. Coat lip of seal with seal lubricant. Install steel washer, dust seal, and steel washer, then install snap ring. If housing plug was removed, i n s t a l l a new "O" ring coated with Hydra-Matic oil on a new plug and tap plug into housing. Back up plug with another tool, and stake in 4 places, 90° apart.

RACK-PISTON, WORM SHAFT & BALL NUT ASSEMBLY: Disassembly – 1) Clamp assembly in vise and remove set screw with Tool J-6223. Turn ball nut 180° and pull worm shaft and ball nut assembly from rack-piston. Exercise care so that ball guides do not fall out of ball nut. Tape the end of a three-foot length of string onto the ball nut so that tape also retains ball guides. Tie other end of string to spring scale J-5178, then wrap string around ball nut 3 or 4 times. Slowly pull on spring scale and check over-center pre-load. Pre-load should be 1-6 lbs. (*NOTE* - If over-center pre-load is not within limits, a new set of balls must be installed upon reassembly. Note the size of ball which is stamped on end of the ball nut).
2) Remove the ball return guides. Rotate worm back and forth until all balls have dropped out of nut. Remove ball nut and adapter from worm. Remove adapter "O" ring. Remove Spiralox ring and push washer and seal assembly from the adapter. Cut and remove the worm shaft seal assembly, then remove the snap ring, retaining ring, bronze washer, and steel washer.
3) Tie a three-foot length of string on a thrust bearing centering spring and to spring scale J-544-A. Support the assembly in a vise, wrap string around center race two or three turns, and check pre-load by pulling slowly on string. Pre-load should be ¾-3 lbs. (*NOTE* - The above check will indicate one of three conditions: With the pre-load within tolerance and bearing not rough, further disassembly is not necessary. If bearing is not rough but pre-load is outside tolerance, it will be necessary to remove the adjusting nut, install a new one and adjust pre-load to 1½ lbs. If pre-load reading is erratic, indicating a rough bearing, it will be necessary to remove bearing).
4) If bearing replacement is necessary, remove oil rings from rack-piston. Check plug in end of rack-piston. If loose, restake, or replace plug.

Cleaning & Inspection: Wash all parts in solvent, blow out all passages, and dry parts with compressed air. Check bearing assembly for excessive wear or brinnelling of the races. Check sealing surfaces of worm shaft and pitman shaft. Make sure they are not rough and have no nicks or other damage. Clean up minor nicks and burrs with crocus cloth. All mating surfaces must be free of nicks and burrs. Inspect worm and ball nut

CONTINUED ON NEXT PAGE

SAGINAW "IN LINE" (Continued)

grooves and all the balls for wear or scoring. If either the worm or ball nut need replacing, both must be replaced as a matched assembly. Make sure that ends of ball return guides are not damaged.

R assembly: 1) If removed, install oil rings on a rack-piston. If thrust bearing was removed, oil a new bearing assembly and install over worm shaft with springs facing away from splined end of shaft.

2) Install washer with tang in keyway and facing splined end of shaft. Install a new nut and adjust pre-load to 1½ lbs., as outlined under "Disassembly" above. Stake nut into keyway of shaft and recheck pre-load. Install new adapter oil seal assembly, then install steel washer and Spiralox ring.

3) Install a new "O" ring on adapter, then slide adapter over worm with holes in adapter facing bearing centering springs. Slide ball nut over worm with beveled side of ball facing the seal end of worm shaft.

4) Install 17 balls into ball nut and lubricate with Hydra-Matic oil (*NOTE* - Worm shaft is cam ground (thicker at the center), and the balls can be installed more easily if ball nut is positioned near one end of worm). Install 6 balls into return guide and retain in place with petrolatum, then install assembly into ball nut. Recheck pre-load as outlined under "Disassembly" above. Place tape over ball guides to retain them in place.

5) If over-center pre-load was not correct (1-6 lbs. pull required to rotate ball nut), as determined at disassembly, install the next larger size balls (if less than specification), or next smaller size balls (if more than specification). Balls are furnished for service replacement in 13 sizes (Exc. Cadillac). On Cadillac, if the pre-load is not correct, a complete worm and ball nut assembly must be installed.

6) Install the steel washer, seal assembly, (neoprene next to steel washer), bronze washer and retainer ring. While holding assembled parts, press worm shaft into snap ring, then force snap ring into groove. Remove tape from ball nut assembly and install worm and ball nut assembly into rack-piston with set screw holes aligned. Clamp rack-piston in a vise and install a new set screw using Tool J-6223. Tighten screw to 20-25 ft. lbs., then stake set screw so that rack-piston metal enters both ends of screw slot.

STEERING GEAR REASSEMBLY: 1) Thread worm out of ball nut as far as possible, position ring gaps opposite each other, and coat oil rings and adapter "O" ring with Hydra-Matic oil. Turn housing so that valve body side is facing up, then place ring compressor Tool J-6216 in recess in housing.

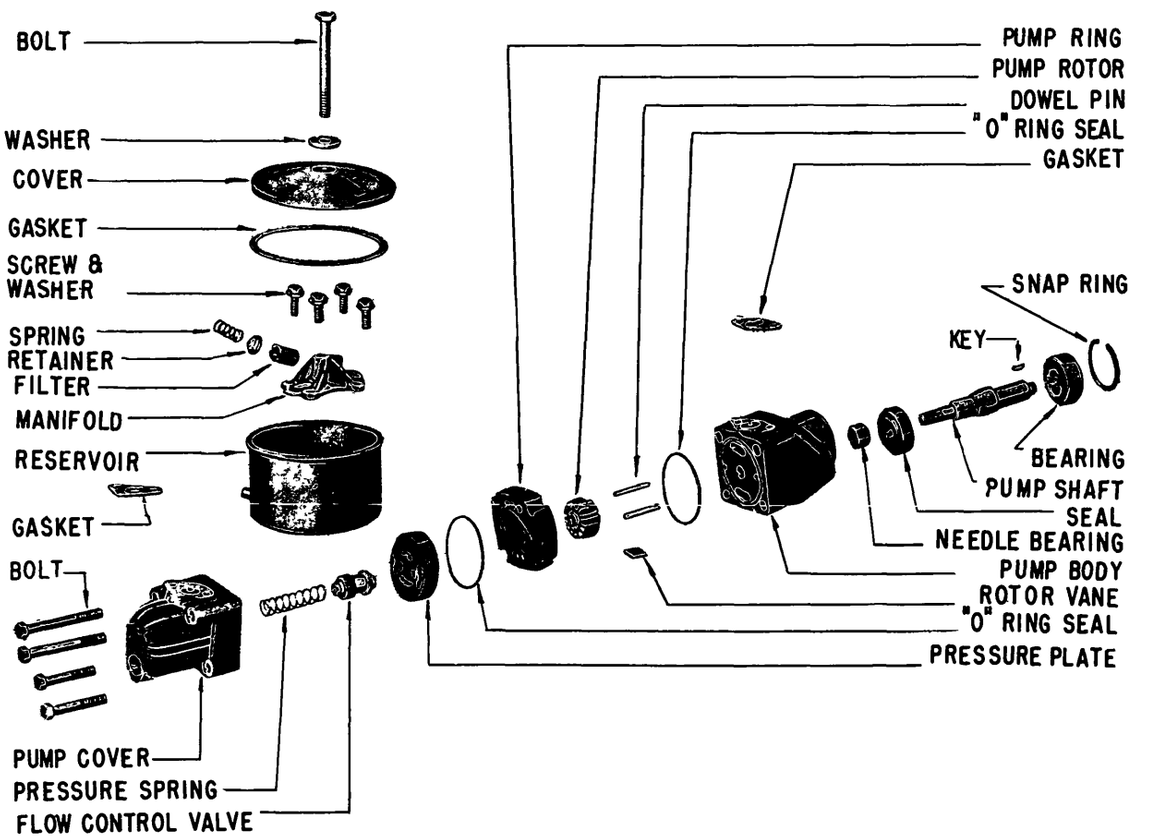
2) With rack-piston teeth facing the pitman shaft area, push rack-piston through ring compressor so that oil rings are just inside housing, then remove ring compressor. With notch in adapter facing machined side of housing, push adapter into housing recess. Install the four centering springs into shallow bores of the adapter.

3) With dowel hole in bearing assembly aligned with adapter dowel, push bearing assembly against the adapter. Place Tool J-6222 over splines of worm shaft, then install end cover and torque capscrews to 25-30 ft. lbs., remove Tool J-6222.

4) Saturate coupling flange wick with Hydra-Matic oil and place over worm shaft. Position coupling flange over worm shaft with alignment marks indexed, but do not install retaining pin. Turn coupling flange so that rack-piston teeth are centered in pitman shaft cover opening in housing. Make sure that rack-piston teeth are square with center-line of pitman shaft bushing.

5) Wrap a piece of masking tape around pitman shaft spline one turn so that tape starts and ends at same wide serration. Install pitman shaft and side cover assembly. The center tooth of pitman shaft must engage the center groove of rack. Install side cover capscrews and tighten the four 3/8" screws to 25-30 ft.lbs. Tighten the 5/16" screw to 15-20 ft. lbs.

6) Install actuator lever in end cover and engage lever with the "flat" on bearing assembly. Install the two "O" rings in housing. With actuator lever engaged with valve link pin, install valve body and torque capscrews to 15-20 ft. lbs. Make sure pitman shaft adjusting screw is backed all the way out.



7) Using Tool J-6281 and spring Scale J-544-A, check and record the combined ball nut and bearing pre-load with gear on center (2¼ turns from either end of travel) and not moving end of Tool J-6281 more than in a 6" arc. Thread pitman shaft adjusting screw in until pitman shaft gear touches rack-piston. While checking combined ball nut and bearing pre-load, adjust pitman shaft screw so that ½ to 1 lb. in excess of ball nut and bearing pre-load recorded above, is obtained. Tighten adjusting nut and recheck over-center pre-load.

8) Install oil hoses and drive in coupling flange pin while supporting worm shaft and flange. Make sure housing alignment pin extends approximately 5/8" from housing.

HYDRAULIC PUMP

►*CONTINENTAL & LINCOLN HYDRAULIC PUMP NOTE:* An Eaton (Rotor Type) hydraulic pump is used on these cars. *See "Vickers and Eaton Hydraulic Power Pumps" in 1955 Annual Data or later Manual edition for overhaul data.*

CONTINUED ON NEXT PAGE

SAGINAW HYDRAULIC PUMP ASSEMBLY

SAGINAW "IN LINE" (C ntinu d)

REMOVAL: Buick, Cadillac, Oldsmobile & Pontiac - Disconnect hoses at unions on pump and secure ends in a raised position, or cap the ends to prevent drainage of oil. Install two caps at pump fittings. Remove drive pulley attaching nut and loosen bracket-to-pump mounting bolts. Remove pump belt. Slide pulley from shaft *(NOTE* - Do not hammer pulley off the shaft).

Contin ntal & Lincoln: Remove washer seal, cover, and cover gasket and syphon or pump out as much oil as possible from reservoir. Loosen and move rearward, the clamp securing return hose to reservoir and remove hose from tube. Disconnect pressure hose at fitting on pump assembly and place in a raised position to prevent draining. Loosen pump adjustment capscrew and remove pump belt. Remove two pump adjusting bracket-to-pump support screws. Remove reservoir, pump and pump adjusting bracket as an assembly.

DISASSEMBLY (Saginaw): Remove reservoir cover bolt, flat washer, and reservoir cover with gasket. Remove filter screen, filter retainer and filter spring by pushing retainer back against spring. Remove four reservoir-to-pump bolts and remove reservoir and cork gaskets. Remove four pump cover-to-pump body attaching screws *(NOTE* - Do not clamp on front hub of pump as this may damage bearing housing). Lift pump cover with flow control valve assembly and spring from assembly (be careful that pump flow control assembly does not drop out). Mark position of pressure plate and remove plate from dowel pins. Mark position of pump ring in relation to pump body and remove ring from dowel pins *(NOTE* - Arrows on outer edge of pump ring point in direction of pump rotation). Remove ten pump vanes and remove pump rotor. Remove dowel pins from pump body. *(NOTE* - Any further disassembly should be avoided unless parts are dirty or repair operations are necessary on any of the remaining parts). Remove shaft bearing retainer snap ring from front hub of pump body using Tool J-4245. Remove drive shaft with large sealed bearing by lightly tapping on splined end. Remove oil seal from body with a long punch inserted through large hole in machined face of body. If it is to be replaced, remove inner needle bearing from pump body using Tool J-6279. Remove key from shaft. If outer bearing is to replaced, remove by pressing it from pump shaft.

CLEANING & INSPECTION: Wash all parts, except the drive shaft bearing (lubricant seal in bearing) in a solvent. Inspect "O" ring seals and gaskets. Replace seals if cut, or distorted. Inspect pump cover flow control valve bore for scores and wear. Inspect flow control valve for free movement in its bore. Inspect all passages in cover and body for obstructions or dirt. Inspect pressure plate for scoring. Inspect contour surface of pump ring for scoring and inspect rotor faces for metal pick-up or scoring. Check vanes for bind in slots of rotor. Inspect face of pump body for scoring or wear. Inspect drive shaft seal surface for scratches and wear. Inspect drive shaft inner and outer bearings for roughness or noisy operation.

► *FLOW CONTROL SERVICING NOTE:* If flow control valve is stuck, dislodge by jarring front of pump cover. If pump cover control valve bore is worn or scored, replace pump cover. If necessary to clean or repair pressure relief valve, grip flow control valve by small hub on end of valve and remove orifice screw, shims, ball, plunger and spring. If internal parts are found to be worn or scored, replace assembly. *NOTE* - The flow control valve assembly is calibrated at the factory and components of assembly cannot be serviced.

► *PUMP INTERNAL GROUND SURFACE NOTE:* If pressure plate, pump body, rotor or pump ring is scored, the following corrections can be made. Using a flat surface and lapping compound, lap the scored surfaces until they are smooth. *NOTE* - Thoroughly clean in solvent after lapping.

REASSEMBLY: *(NOTE - Before reassembling, make sure all parts are clean. Lubricate "O" rings and all moving parts as assembled).* Press large sealed bearing over threaded end of drive shaft with stamped face of inner race toward front of pump. Install key into shaft keyway, supporting shaft on opposite side when installing key. Install needle bearing into pump body with the stamped face toward front of pump using Tool J-6280. Make sure needles are free to turn after installation. Install shaft seal into pump body using Tool J-6348. Install seal with word "outside" toward front of pump. With pump body in a vise, drive shaft and bearing assembly into pump body. Install shaft bearing retainer snap ring. Install "O" ring in groove of pump body and install dowel pins. Tap lightly if necessary. Install rotor over splined end of drive shaft (Assemble rotor with countersunk side toward front of pump and be sure rotor is free on splines). Install vanes in rotor slots with radius edge toward outside. Install pump ring on dowels and position correctly according to scribed marks *(NOTE* - Arrow on outer edge of pump ring points to rotation of pump). Install pressure plate on dowel pins *(NOTE* - Pressure plate must be free with no binding on dowel pins). Install "O" ring around pressure plate. Install flow control valve and spring in pump cover. Be sure that end with screw goes into bore first *(CAUTION - If valve is installed backwards, the pressure regulator valve inside of the flow control valve will not operate and pump will build up an increasingly higher pressure which would result in breakage of the adapter in gear housing or failure at some other point in the system).* Position pump cover assembly over pressure plate being careful not to pinch "O" ring. Install four cover-to-body attaching screws and tighten alternately to 25-30 ft. lbs. Install gaskets on pump body and cover. Position reservoir on pump assembly with extrusions in reservoir bottom inside the smaller gasket holes and install four bolts. Tighten to 8-10 ft. lbs. Install filter spring, filter retainer, and filter. Be sure flared end of filter retainer is toward filter. Install reservoir cover with gasket, bolt and washer. Tighten cover bolt to 7-9 ft. lbs.

INSTALLATION: Buick, Cadillac, Oldsmobile & Pontiac - Position pump assembly on mounting bracket with holes lined up, and install bolts loosely. Slide pulley on shaft *(NOTE* - Do not hammer on pulley). Install pulley nut finger tight against pulley. Fill reservoir and bleed pump by turning pulley backward (counter-clockwise as viewed from front) until air bubbles cease to appear. Install pump belt over pulley. Move pump outward until belt is properly tensioned (See "Pump Belt Adjustment" above). Tighten pulley nut to 35-45 ft. lbs.

STEERING LINKAGE: *See "Steering Linkage" on Pg. 349.*

BENDIX LINKAGE TYPE (CHEVROLET TRUCK)

Chevrolet Trucks (1956)

DESCRIPTION: Hydraulic power cylinder assembly is mounted on front axle, at one end, and to tie rod at the other. Hydraulic control valve is attached to tie rod between pitman arm and steering arm (replaces pitman arm tie rod). The control valve regulates the flow of fluid under pressure from pump to either anchor end or rod end of cylinder, and the return fluid from either end is directed to fluid reservoir.

Hydraulic Pump & Reservoir Assembly: Vane type oil pump is mounted on end frame of generator and driven by a splined extension of the special generator armature shaft. Pump contains a combination overload relief valve which opens at 750-lbs., and a flow control valve which circulates oil within pump as required to regulate output volume.

BELT ADJUSTMENT: Loosen outer bracket-to-generator bolt on generator rear brace, and move generator to obtain correct belt tension. Tighten the retaining bolts. Push in on belt midway between water pump and generator pulleys with light pressure. If tension is correct, there will be 5/16" deflection (6 Cyl.), 13/16" (V8).

LUBRICATION: Checking Fluid Level - Check oil level in reservoir by removing dipstick, and fill to indicated level using Automatic Transmission Fluid Type "A" bearing an "AQ-ATF" number.

Refilling System (After Units Removed or Disconnected): Fill oil reservoir to proper level and let oil remain undisturbed for about two minutes. Raise front end of vehicle so that wheels are off ground. Start engine and run at idle speed for two minutes. Increase engine speed to approximately 1500 RPM. Turn wheels (off ground) right and left, lightly contacting stops. Lower vehicle and turn wheels right and left on ground. Recheck for leaks. Check oil level and refill as required.

Ch cking Pump Pressure: Disconnect pressure line at pump connection (smallest, top line). *(CAUTION* - Some fluid will leak out when line is disconnected so provision must be made to collect this drainage). Install checking gauge, Tool J-5176, with gauge valve closed on pump and hose connection *(NOTE* - Adapter Kit J-5900 must be used to adapt pressure gauge to pump). Open gauge valve and run engine at idle. Turn wheels (on ground) against stops. Pressure should not be less than 750 lbs. If pressure is less, slowly close gauge valve observing pressure increase. (Will increase as valve is closed if pump is good). *(CAUTION* - Do not leave valve closed for more than 15 seconds). If pressure does not increase when valve is closed, difficulty is in pump, which must be removed for service. Shut engine off, remove gauge and valve and reconnect hose to pump, if pressure satisfactory. Bleed hydraulic system.

HYDRAULIC PUMP: Removal - Loosen bracket-to-generator retaining bolts and remove fan belt. Pull generator away from engine. Place a container under the pump and disconnect hydraulic lines from pump allowing oil to drain out of reservoir. Remove retaining bolts from pump-to-generator and generator rear brace on 8 cylinder models and remove pump from vehicle. Drain remaining oil from reservoir.

Disassembly: Remove retaining bolts and sealing washers from pump reservoir-to-pump cover assembly, and remove reservoir. Remove oil filter spring retainer from pump cover assembly. Remove cover plate spring and cover plate and then remove plug and "0" ring, flow spring and pressure relief valve assembly from pump cover. Remove three retaining bolts from pump cover assembly and remove pump cover from pump body. Remove oil filter and retainer. Remove cam ring, pump rotor and vanes. Remove and discard "0" rings from pump body, cover, and cam ring. Remove and discard generator shaft oil seal from pump body.

Inspection: Wash all parts in solvent and dry with a lint free cloth. Check fit of vanes in rotor. Vanes must slide freely, but snugly in slots. Inspect flat face of pressure plate, cam ring, cover, rotor and pump body. If necessary, lap these parts for a good fit. Check surface of pressure relief valve and check fit of valve in pump cover. Correct slight irregularities by polishing.

Reassembly: Coat new "0" rings with Lubriplate and install in pump cover, cam ring and pump body. Install rotor and vanes in pump body with wear pattern or beveled edge of vanes against cam ring inner diameter. Install alignment sleeve in cam ring and install cam ring in pump body *(CAUTION - Wider edge of cam ring should be installed toward pump body. Be certain to align holes in cam ring to body bolt holes. Install rotor with rounded side of splines toward generator end of pump).* Install pressure plate in pump cover and install filter retainer and oil filter. Install cover assembly to pump body, then install plunger and flow control spring. Install plug and "0" ring assembly, cover plate and retainer spring. Install filter retainer spring in cover assembly and install reservoir, retaining bolts and sealing washers.

► *BRASS FITTING NOTE:* Brass fitting seats are of the pressed in type and are replaceable by tapping threads in hole in the seat and then pulling the seat by using a bolt threaded into tapped out seat and a flat washer and nut as an extractor. Install new seats by aligning seat in bore and pressing it into place using the correct hose or tube fitting as a pressing tool.

CONTROL VALVE: Disassembly - Remove three bolts and lockwashers from valve housing and separate drag link from valve housing. Remove ball stud and then remove outer sleeve and flange. Remove Huglock nut and remove inner sleeve with stop screw, and spool bolt as a group. Remove bushing plate. Drive out lock pin, thread stop screw out of inner sleeve, and remove spring seat, spring, and ball stud seats from inner sleeve. Remove spacer from spool bolt and remove spool bolt from stop screw. To remove spool from valve housing, press alternately on the spool end projections by hand sufficiently to expose the "U" cup seals. Remove spool seal bushings and "U" cup seals and spool. Remove control valve plug with a rod having a bent end, and pry against plug. Remove check valve with a screw driver. *NOTE* - The plug and check valve should only be removed to correct a faulty check valve.

Cleaning & Inspection: Wash all parts in solvent and dry then with lint free cloth. Inspect all parts for scratches, burrs, distortion, evidence of wear, and replace all parts where necessary. Replace all seals, gaskets, and covers.

Reassembly: Carefully assemble spool into bore of valve housing with the large diameter projection end of spool next to sliding sleeve end. Assemble large bore and small bore "U" cup seals over large and small diameter projections of spool with lips of seals facing each other. Assemble bushing plates on their respective ends of spool. Insert spool bolt through screw stop from side having the large diameter, and assemble spacer on bolt. Assemble lock pin in hole of screw stop and through slot in bolt head to secure bolt to screw stop. Place inner (sliding) sleeve in outer sleeve and flange assembly and then assemble the following parts in sliding sleeve: Ball seat, ball stud, ball seat, spring and spring seat. Assemble screw stop with bolt to sleeve assembly by threading screw stop into inner (Sliding) sleeve, and tighten securely. Assemble bushing plate over bolt and on shoulder of outer sleeve flange. Insert spool bolt through hole in spool and assemble Huglock nut and secure as follows: draw up nut tight then back off nut (less than ¼ turn) until the spool can be rotated with a minimum of endplay. Position drag link flange on valve housing so ball stud is on side opposite the valve ports. Align holes and assemble three bolts and lockwashers. Securely tighten bolts.

POWER CYLINDER: Disassembly - *(NOTE - The only repair to make in the field on the power cylinder is the replacement of piston rod seals).* Before removing piston rod seal parts from rod bearing end of power cylinder, clean the exposed portion of seal cavity with clean solvent, brush and compressed air. Remove snap ring. To dislodge scraper, washer, dust seal, seal back-up washer and "U" cup seal, use air hose and apply pressure to cylinder port (right hand port, looking down), and seal the left hand port. Remove seal parts from rod.

Cleaning and Inspection: Clean all parts in solvent and dry with compressed air. *(CAUTION* - Do not use waste to wipe off spool or inside bore of valve housing). Protect spool edges and bore of valve housing from damage during disassembly and reassembly. Inspect parts for nicks and burrs and excessive wear. Check cylinder scraper washer for fit on piston rod, which should be .001-.0035". Replace if worn.

Reassembly: Assemble open side of "U" cup seal over the rod and into bearing cavity, seal back-up washer, dust seal (with side away from seal cavity), and scraper washer. Slide parts in place on rod and lock in place with snap ring.

HYDRAULIC PUMP: Same as used on passenger cars. *See "Chevrolet Linkage Type" in 1955 Annual Data or later Manual edition.*

STEERING LINKAGE: *See "Steering Linkage" on Pg. 349.*

BENDIX LINKAGE TYPE (NASH & PACKARD)

Nash, Ambassad r 6 Cyl. (1956)
Packard, All M d ls (1956). See note below.

►*NOTE:* Monroe Linkage Type also used.

DESCRIPTION: Same design as used on corresponding previous models.

HYDRAULIC PUMP OVERHAUL: *See "Vickers & Eaton Hydraulic Power Units" in 1955 Annual Data or later Manual dition.*

STEERING GEAR ADJUSTMENT & OVERHAUL: *See "Gemmer Worm & Roll r" on Page 365.*

STEERING LINKAGE: *See "Steering Linkage" on Pg. 349.*

►*OTHER DATA: See "B ndix Linkage Type" in 1953 Annual Data or lat r Manual edition.*

STEERING LINKAGE: *S "Steering Linkage" on Pg. 349.*

►*OTHER DATA: S "Monroe Linkage Type" in 1954 Annual Data or lat r Manual edition and note the following:*

FRONT SUSPENSION ALIGNMENT: Adjustment is different for some models with power steering. *See "Susp nsions & Wh l Alignm nt on Page 339.*

BENDIX LINKAGE TYPE (FORD & MERCURY)

Ford Pass. Cars (1956)
Mercury (1956)

►CHANGES, CAUTIONS, CORRECTIONS

►*1956 FORD POWER STEERING SQUEAL CORRECTION & PUMP PULLEY PRODUCTION CHANGE:* A new pump pulley, Part No. B6A-3356-A and a new solid-type pump belt is used in production and may be used for service replacement to correct pump belt squeal. The early type belt, with serrations, can be used with either early or late type pulleys.

►*1956 FORD STEERING ARM & LINKAGE INTERFERENCE WITH POWER STEERING CONTROL VALVE CORRECTION:* Check the steering arm-to-idler arm rod and replace it if it is bent. If interference exists after new arm is installed, replace the spindle connecting rod assembly (Part No. AD-3280-B). If the two above corrections do not eliminate the interference, it may be necessary to replace the lubricant fitting or grind off the boss of the oil pressure line on power steering cylinder. *CAUTION* - A wall thickness of 3/32" must remain after grinding is completed.

►*1956 MERCURY POWER STEERING CONTROL VALVE INTERFERENCE CORRECTION & DRAG LINK ADJUSTING CAUTION:* When installing the left hand drag link adjusting sleeve, the clamps should be installed with bolts in a vertical position and forward of the steering link to prevent interference with the control valve.

DESCRIPTION: Same design as used on previous models.

HYDRAULIC PUMP OVERHAUL: *See "Vickers & Eaton Hydraulic Power Pumps" in 1955 Annual Data or lat r Manual edition.*

STEERING GEAR ADJUSTMENT & OVERHAUL: *See "Gemmer Worm & Roller" on Page 365.*

STEERING LINKAGE: *See "Steering Linkage" on Pg. 349.*

►*OTHER POWER STEERING DATA: See "Ford & M rcury Bendix" in 1953 Annual Data or later Manual edition and note the following:*

►*1956 FORD POWER STEERING CONTROL VALVE TORQUE SPECIFICATION CHANGE:* Tighten Control Valve Sleeve-to-Body Bolts to 17-22 ft. lbs. Tighten Centering Spring Cap-to-Valve Body Bolts to 4-6.5 ft. lbs.

SAGINAW POWER STEERING GEAR (NOT IN LINE)

Studebaker (1956)

►CHANGES, CAUTIONS, CORRECTIONS

►*1956 POWER STEERING GEAR NOISE CORRECTION:* If excessive gear "chuckle" is evident, check to see if the "T" mark on steering gear flange is properly located in relation to the mid-position or "high-spot" of gear. If this condition exists, the pitman arm will not be centered and the left tie rod will be short with the right tie rod longer than normal and the steering gear will be operating off the "high-spot" position. Check length of tie rods as unequal length will indicate an off-center steering gear. To correct, center front wheels, remove steering wheel and reposition it 90° clockwise in relation to existing mark. Install retaining nut and horn ring. Turn steering wheel back to normal horizontal position which should place gear on "high-spot". This should also center the steering bell crank. Readjust tie rods to obtain a straight ahead front wheel setting and adjust toe-in.

►*1956 POWER STEERING PUMP PRODUCTION CHANGE:* A new type power steering pump (vane type) is being used in production, replacing the earlier "Vickers Vane Type" unit. *See "Hydraulic Pump" in "Saginaw (In-Line) Power Steering" on Page 361.*

DESCRIPTION: Same design as used on previous models.

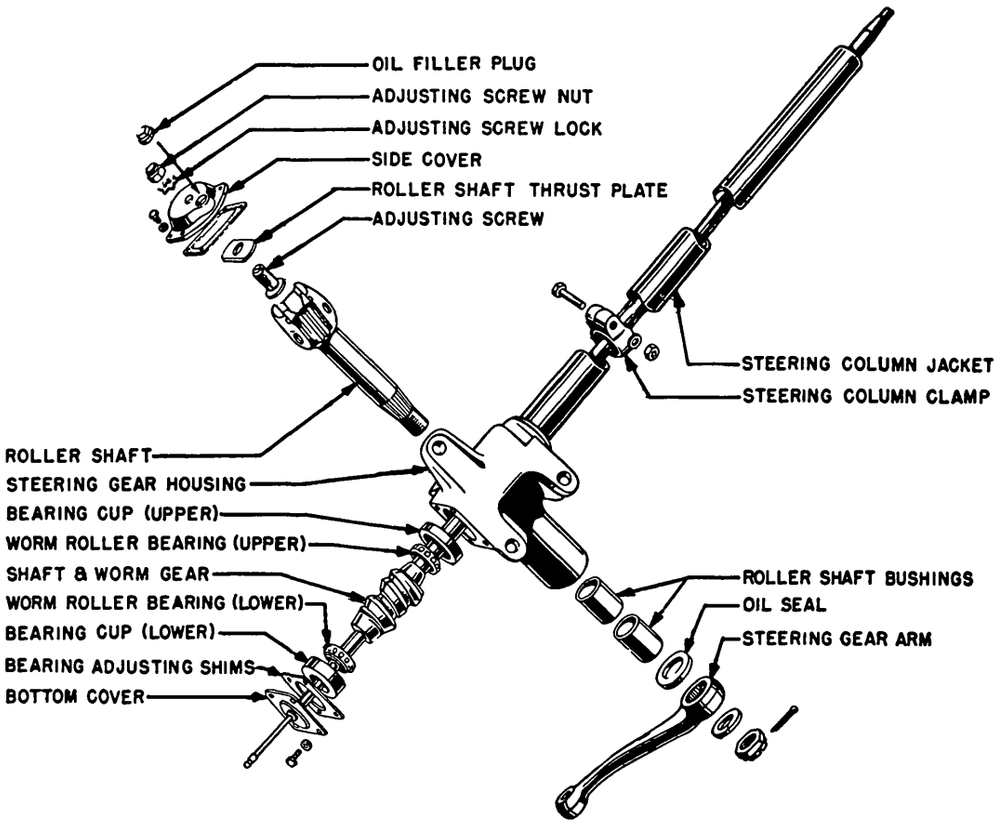
HYDRAULIC PUMP OVERHAUL: See production change above. *On early type units, See "Vickers & Eaton Hydraulic Power Pump" in 1955 Annual Data or later Manual edition. On later type pumps, See "Saginaw (In-Lin) Power Steering" on Page 361.*

STEERING GEAR ADJUSTMENT & OVERHAUL: *S "Saginaw (G.M.) Power Steering" in 1955 Annual Data or later Manual edition.*

STEERING LINKAGE: *See "Steering Linkage" on Pg. 349.*

GEMMER WORM & ROLLER

Chrysler (1956)
DeSoto (1956)
D dge (1956)
F rd Pass. Cars & Trucks (1956)
Hudson (Exc. Metropolitan) (1956)
Mercury (Early 1956) ①
Nash (Exc. Metropolitan) (1956)
Packard (1956)
Plymouth (1956)
Rambler (1956)



① - Saginaw Worm & Nut used in late 1956.

► *1956 FORD & MERCURY STEERING GEAR PRODUCTION CHANGE:* In later production cars a steering gear having a three tooth roller supported on ball bearings is used. Service procedures are the same as for previous models.

► *1956 FORD STEERING COLUMN CLAMP BREAKAGE CORRECTION* To prevent possible breakage of the steering column clamp, the tightening torque of the attaching bolt has been changed from 35-40 ft. lbs. to 25-30 ft. lbs.

► *1956 MERCURY STEERING GEAR PRODUCTION CHANGE* Later production cars have a Saginaw Worm & Nut type steering gear. *See "Saginaw Ball Bearing Worm & Nut" Steering Gear.*

► *1956 NASH AMBASSADOR SPECIAL V8 STEERING GEAR FILLER PLUG REMOVAL:* Because of the lack of clearance, the following suggested procedure is recommended With car on hoist, a 5/8" socket and ratchet can be used to remove plug. Add lubricant with a hand gun having a long flexible nozzle.

GEMMER MODEL 305 & 335 STEERING GEAR

DESCRIPTION: Similar to previous Gemmer Worm & Roller types (push pull adjustment).

HORN RING & STEERING WHEEL REMOVAL: *See "Gemmer Worm & Roller" in 1955 Annual Data or later Manual edition.*

STEERING GEAR REMOVAL & INSTALLATION: *See "Gemmer Worm & Roller" in 1955 Annual Data or later Manual edition.*

STEERING LINKAGE: *See "Steering Linkag " on Pg. 346.*

STEERING GEAR OVERHAUL: *See "Gemmer Worm & Roller" in 1955 Annual Data or later Manual edition*

SAGINAW WORM & NUT

Buick (1956)
Chevr let Pass. Cars (1956)
Chevrolet Trucks (1956)
Mercury (Late 1956) ©
Oldsm bile (1956)
Pontiac (1956)

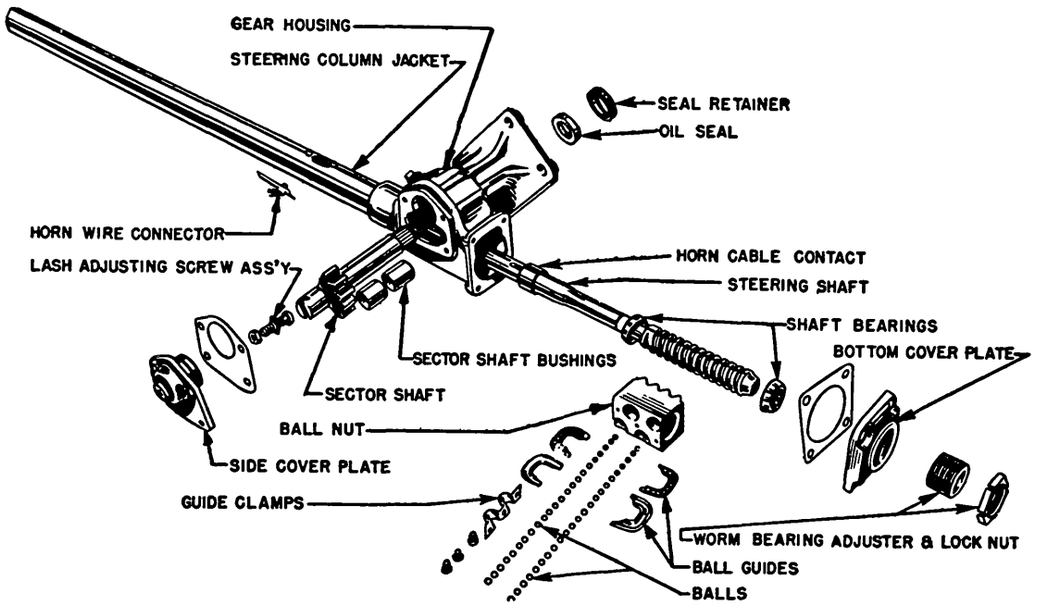
© - Gemmer Worm & Roller used in early 1956.

► *1956 MERCURY STEERING GEAR RATTLE CORRECTION:* May be caused by low lubricant level. Turn wheels to full left position and check lubricant, add lubricant and turn wheels to full right, then back to center. Recheck level to make sure it is up to proper level. If there is still a rattle, check steering sector adjustment, steering linkage & idler arm, ball nut preload or for play between sector shaft and sector adjusting screw.

DESCRIPTION: Recirculating ball nut type of same design as used in previous models.

ADJUSTMENT: *See "Saginaw Ball Bearing Worm & Nut" in 1955 Annual Data or later Manual edition and note the following:*

Worm Bearing Setting



Model	Setting
Buick	7/8-1 1/8 lbs.
Chevrolet Pass. Cars	3/8-5/8 lbs.
Chevrolet Trucks	1-1 1/2 lbs.
Mercury	1/4-3/4 lbs.
Oldsmobile	1/2-7/8 lbs.
Pontiac	3/8-7/8 lbs.

Backlash Setting

M del	Setting
Buick	2-2 1/4 lbs.
Chevrolet Pass. Cars	7/8-1 1/2 lbs.
Chevrolet Trucks	2-2 1/2 lbs.
Mercury	7/8-1 1/2 lbs.
Oldsmobile	1 1/2-2 lbs.
Pontiac	1-2 lbs.

STEERING WHEEL POSITION: *See "Saginaw Ball Bearing Worm & Nut" in 1955 Annual Data or later Manual edition and note the following:*

Buick St ering Wh l Height: Clearance between column bracket and lower surface of panel can be adjusted to change height of steering wheel by loosening steering gear to frame bolts and the two steering column upper bracket to dash bolts.

SAGINAW BALL BEARING WORM & NUT STEERING GEAR

Oldsmobile Steering Column & Mast Jacket Clearance: Clearance between lower edge of steering wheel and direction signal housing should be 1/8-3/16".

STEERING GEAR REMOVAL & INSTALLATION: *See "Saginaw Ball Bearing Worm & Nut" in 1955 Annual Data or later Manual edition and note the following:*

Buick: (Removal) - Remove battery. Disconnect shift rod from control shaft lower lever. On synchro-mesh cars, remove selector lever from jacket clamp by removing retainer and spring washer. Loosen bolt in clamp which secures column jacket to short tube in gear housing. Move front seal all the way back and cover seat and back. Disconnect and remove horn cable connector from steering column jacket. Remove screws holding fuse block and lower fuse block. Cover steering column jacket with masking tape to prevent damage to finish. Remove steering wheel (see above) and the upper bearing spring and spring seats. Cover horn contact and threaded end of steering shaft with masking tape. Measure vertical clearance between column jacket and lower surface of instrument panel and record this dimension so that column can be installed in same position. Remove bolts holding cap to steering column bracket, disconnect bracket from panel and move it upward on column jacket to free it from steering gear. Remove cranking motor splash pan from car frame. Remove steering gear to lower frame bolts and clamps, then loosen upper bolts enough so gear can be tilted sideways to provide room for pitman arm puller. Remove nut and lockwasher and pull pitman arm from shaft with Puller J-5504-B. With another man inside car to guide column, carefully lift steering gear assembly up and forward out of engine compartment, leaving column jacket assembly in the body. *NOTE* - As assembly is removed be careful not to lose the control shaft return spring, which will be either on end of control shaft or loose on steering shaft.

Installation - Reverse removal procedure.

STEERING LINKAGE: *See "Steering Linkage" on Pg. 346.*

STEERING GEAR OVERHAUL: *See "Saginaw Ball Bearing Worm & Nut" in 1955 Annual Data or later Manual edition.*

1956 SYNCHRO-MESH TRANSMISSIONS

BUICK, OLDSMOBILE, PONTIAC

Buick, Series 40 (1956), Standard
Oldsmobile, Series 88 (1956), Standard
Pontiac, All Models (1956), Standard

DESCRIPTION: All helical gear type. Constant mesh, synchro-mesh (second & high), sliding gear (low & reverse). Transmission is of same design as used on 1955 Buick, Series 50 & Oldsmobile, Series 88. *See "Buick 50 & Oldsmobile Synchro-mesh" in 1953 Annual Data or later Manual editions.*

REMOVAL: *See "Synchro-mesh Transmission" on Car Model pages.*

OVERHAUL: *See "Buick 50 & Oldsmobile, Synchro-mesh" in 1953 Annual Data or later Manual editions.*

CHRYSLER, DE SOTO, DODGE, PLYMOUTH

Chrysler, DeSoto, Dodge & Plymouth (1956)

► *1956 PLYMOUTH LOW & REVERSE SLIDING GEAR PRODUCTION CHANGE* A new Low & Reverse Sliding Gear, Part No. 1672299 is being used in partial production. The later type gear has hardened splines for increased gear life. Transmissions having the later type gears are identified by stamped letters next to the date on the transmission case, as follows CK-A (Std. Clutch), CK-ODA or CK-OD2-A (Overdrive), CK-10-A (10" or 11" Clutch). If gear replacement is required on cars built before Jan. 4, 1956, it is suggested that the later type gear be used.

DESCRIPTION: Synchro-mesh transmission of same design used on previous models.

REMOVAL: *See "Synchro-mesh Transmission" on Car Model pages*

OVERHAUL: *See "Chrysler, DeSoto, Dodge, & Plymouth Synchro-mesh Transmission" in 1953 Annual Data or later Manual editions.*

FORD & MERCURY PASS. CARS

Ford Pass. Cars (1956)
Mercury (1956)
Thunderbird (1956)

DESCRIPTION: Three speed all helical gear type with constant mesh, synchro-mesh (second & high), sliding gear (low & reverse). Transmission is the same design as used on previous models except that two different design transmission cases are used. On one type, the

CONTINUED ON NEXT PAGE

FORD & MERCURY PASS. CARS (Continu d)

shift lever assembly is integral with the transmission side cover, and on the other type, the shift levers are located in side of transmission case and a top cover is provided.

REMOVAL: *See "Synchro-mesh Transmission" on Car Model pages.*

OVERHAUL: Service procedures are the same for both transmissions excepı as noted below. *See "Ford & Mercury 3-Speed Synchro-mesh" in 1953 Annual Data or later Manual editions and note the following:*

►*1956 FORD TRANSMISSIONS WITH SHIFT LEVERS IN SIDE OF CASE (NOT IN SIDE COVER) OVERHAUL NOTE:* Shift forks are disengaged from shift levers by removing the pin located in shift lever boss of housing and pulling out on shift shaft. After disassembly of transmission, the shift shafts and interlock assembly can be removed from inside of transmission case.

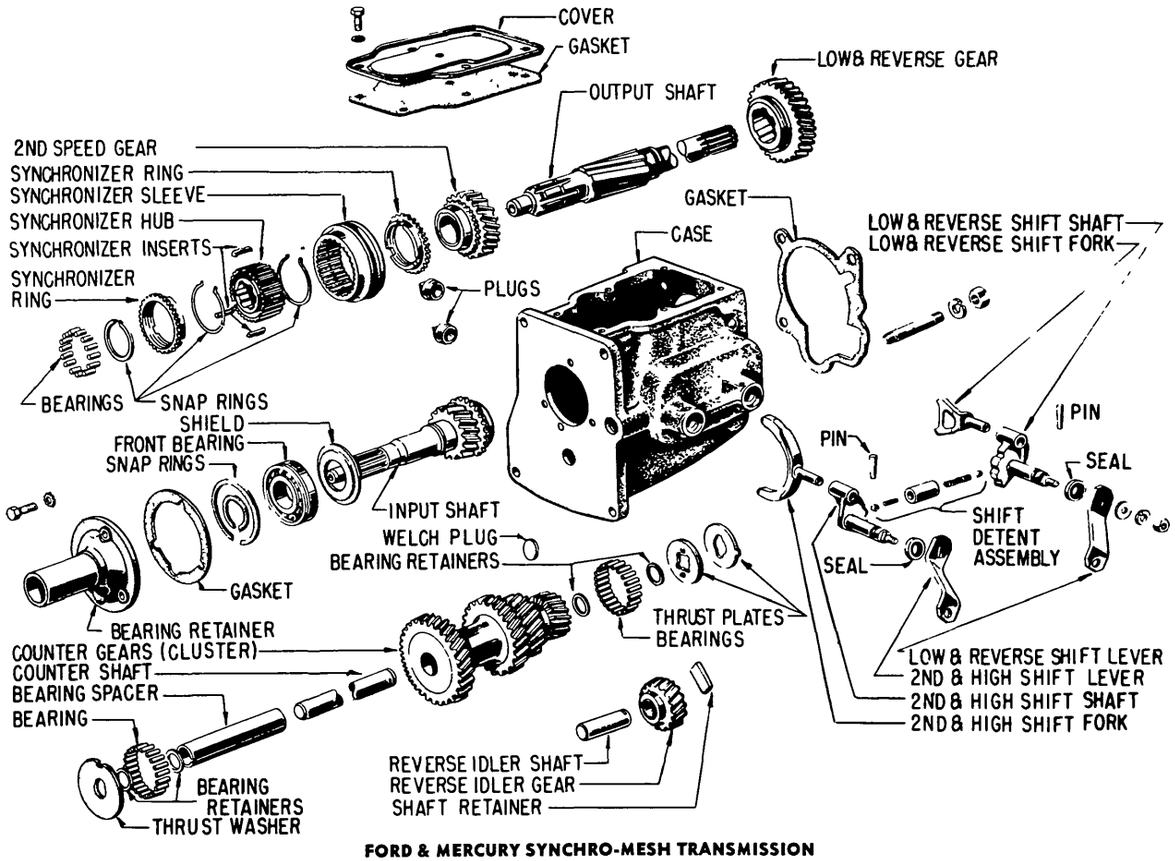
►*1956 MERCURY SYNCHRO-MESH TRANSMISSION NOTE:* Mercury transmissions differ from Ford transmissions as follows: Four rows of needle bearings around the countershaft. Countershaft and reverse idler shaft are retained in housing with woodruff keys at extension housing end(retaining pin has been eliminated).

►*1956 FORD TRANSMISSION GEAR REPLACEMENT CAUTION:* The gears in 1956 models are"shot-peened" and may be used as service replacement on earlier transmissions. *Do not use earlier type gears in the 1956 transmission.*

FORD TRUCK (HEAVY DUTY)

F-100 (1956), Opti nal
F-250 (1956), Standard. Se note below.
F-350 (1956), Standard
P-350 (1956), Standard
P-500 (1956), Standard

►*F-250 TRUCK NOTE:* This transmission replaced in production on March 15, 1956, with 3-Speed (Medium Duty). *See "Ford Truck 3-Speed (Medium Duty)".*



►*1956 HARD SHIFTING CORRECTION:* On "F" Series Trucks, install revised shift rods, Part No. B6Y-7326-B and B6Y-7328-B. On "P" Series Trucks, install revised shift rods, Part No. B6J-7325-C and B6J-7327-C. Adjust length of rods to assure full transmission lever travel into the detent with a properly aligned cross-over. This control rod change can be made on 1953 to 1955 models also.

►*1956 SHIFT SHAFT NUT BREAKING OFF CORRECTION:* Remove transmission cover assembly and remove high and intermediate lever and the low and reverse lever assemblies. Replace these levers with the revised levers, Part No. B6Y-7285-A and B6Y-7290-A

DESCRIPTION: Constant mesh, synchro-mesh (second & high). sliding gear (low & reverse).

REMOVAL: *See "Transmission" on Truck Model pages.*

OVERHAUL: *See "Ford Truck 3-Speed (Heavy Duty)" in 1953 Annual Data or later Manual editions.*

FORD & MERCURY SYNCHRO-MESH TRANSMISSION

FORD TRUCK 3-SPEED

F-100 (1956)
F-250 (1956) See note below.

►*F-250 TRUCK NOTE:* The 3-Speed (Medium Duty) transmission replaced the 3-Speed (heavy Duty) on these models beginning March 15, 1956.

DESCRIPTION: 3-Speed synchro-mesh. Constant mesh (second & high), sliding gear (low & reverse). Helical gear type. The design of both transmissions are similar and the service procedures are the same except as noted below.

REMOVAL: *See "Transmission" on Truck Model pages.*

OVERHAUL: *See "Ford Truck 3-Speed (Light Duty)" in 1953 Annual Data or later Manual editions and note the following:*

►*3-SPEED (MEDIUM DUTY) TRANSMISSION NOTE:* The counter-shaft and reverse idler shaft are retained in transmission case with woodruff keys located at rear of case (light duty reverse idler shaft is retained by a pin).

HUDSON, NASH & RAMBLER

Hudson Wasp (1956)
Nash Statesman (1956)
Rambler (1956)

►*1956 TRANSMISSION REAR BEARING SNAP RING FAILURE CORRECTION:* This condition may be caused by heavy duty operation or maladjustment of the torque tube trunnion. Correct by installing sleeve, Part No. 3149883, which is supplied for service only, as follows: Remove rear extension housing, three snap rings and speedometer drive gear. Install sleeve against bearing and replace the woodruff key and speedometer drive gear. Select fit one snap ring in the groove at rear of speedometer drive gear to provide zero end clearance (*NOTE* - When sleeve is installed, only one snap ring is required).

DESCRIPTION: Constant mesh, synchro-mesh (second & high), sliding gear (low & reverse).

REMOVAL: *See "Synchro-mesh Transmission" on Car Model pages.*

OVERHAUL: *See "Nash Synchro-mesh Transmission" in Manual.*

BUICK "VARIABLE PITCH" DYNAFLOW DRIVE

Buick, Series 40 (1956) Optional.
Buick, Series 50, 60, 70 (1956) Standard.

►CHANGES, CAUTIONS, CORRECTIONS

►*STARTING ENGINE BY PUSHING CAR:* Place shift control lever in "N" (Neutral) position until car reaches a speed of 15 MPH, then move control lever to "L" (Low) position and continue to increase speed until engine starts at approximately 25 MPH. After engine starts, return lever to "N" (Neutral) position for engine warm-up.

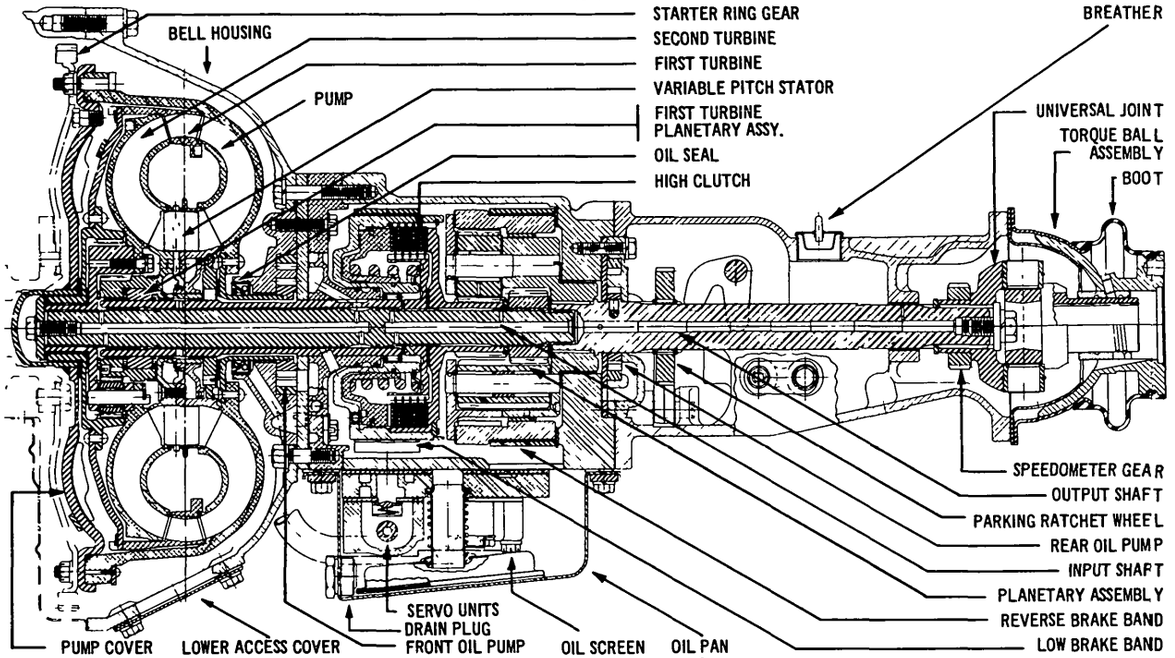
►*1956 TORQUE CONVERTER PUMP PRODUCTION CHANGE & SERVICE CAUTION:* Late 1956 cars will have two types of converter pump assemblies used interchangeably in production. The new converter pump is a steel stamping and is identified by an orange "X" on converter pump and also on top of bellhousing. The earlier conventional aluminum pump will also be used. When removing and replacing torque converter-to-flywheel and cover bolts the square head bolt, Part No. 1171053 must be used with the steel converter pump and the "D" shaped bolt head must be used with the aluminum casting pump. Transmission equipped with the steel torque converter pump will require one more pint of transmission oil than transmissions having the aluminum pump.

►*1956 DYNAFLOW TRANSMISSION OIL LEAKAGE CORRECTION (OIL BLOWING OUT OF BREATHER PIPE):* *See "Overhaul" below.*

►*1956 DYNAFLOW FRONT PUMP SEAL SERVICE REPLACEMENT (NEW TYPE SPRING LOADED CARBON SEAL FOR USE WITH TRANSMISSIONS HAVING ALUMINUM PRIMARY PUMP):* The new carbon seal is designed to seat against flat face of primary pump hub, making it possible to use the seal on pumps which would normally be replaced because of scored hub in area of the present seal. It is suggested the new seal be installed in transmissions having primary pump which would ordinarily be replaced because of sealing difficulties. *See "Overhaul" below, for installation procedures.*

►*TOOL MODIFICATION NOTE (REACTION SHAFT BUSHING INSTALLER TOOL J-5816):* Shoulder of tool must be ground off sufficiently to allow reaction shaft bushing to be driven deep enough so that it is located between the two snap ring grooves inside reaction shaft.

DESCRIPTION



"Variable Pitch" twin-turbine torque converter and a hydraulically operated planetary transmission similar in design to 1955 models. *See "Buick Dynaflow Drive" in 1955 Annual Data or later Manual edition.*

OPERATION

Planetary units and controls operate in same manner as on 1955 models. *See "Buick Dynaflow Drive" in 1955 Annual Data or later Manual edition.*

LUBRICATION

Check oil level at 1000 miles intervals and add oil as required. Drain and refill at 25,000 mile intervals.

BUICK VARIABLE PITCH DYNAFLOW DRIVE (SECTIONAL VIEW)

►*CAUTION: Oil must be warm and engine must be idling when checking oil level. Warm up engine before draining.*

Checking Oil Level: With oil warm and engine idling with control lever in "P" (Parking), position, check oil level as indicated on dipstick in filler tube in engine compartment (on right side between battery and engine). If level is more than 1" below FULL mark on rod, add recommended oil to bring level up to FULL mark *(CAUTION - Do not fill above FULL mark).* Distance between ADD OIL and FULL marks on dipstick is equal to approximately 1 pint of oil.

►*CAUTION: If oil level is consistently low when checked (indicating loss of 1 pint or more per 1000 miles), check transmission thoroughly for oil leaks.*

Draining & Refilling: With oil warm, drain transmission case by removing drain plug in oil pan, drain torque converter, after removing bellhousing cover for access to drain plug, by loosening one plug and turning converter until second plug is downward, and removing this plug. Re-install and tighten all drain plugs. Install three quarts of recommended oil through filler opening in case. Start engine and allow it to idle with control lever in "P" (Parking) position, add additional oil to bring level up to point 1 3/4" below FULL mark on dipstick. Recheck oil level after transmission warmed up. Oil level should be at FULL mark on rod. *NOTE* - Transmissions with steel torque converter require 1 pint more fluid than transmissions with aluminum converter. See Production Change above.

►*CAUTION: DO NOT FLUSH transmission when changing oil.*

Capacity - 10 qts. (refilling after draining); 11 3/4 qts. (after overhaul). *NOTE* - Transmission with steel torque converter requires 1 pint more oil than transmission with aluminum torque converter. See Production Change above.

Recommended Oil - Use only "Special Buick Oil for Dynaflow Drive" or Automatic Transmission Fluid, Type "A", with AQ-ATF number embossed on can.

LINKAGE ADJUSTMENT

Throttle Linkage Adjustment: *See "Carburetor" on Car Model pages.*

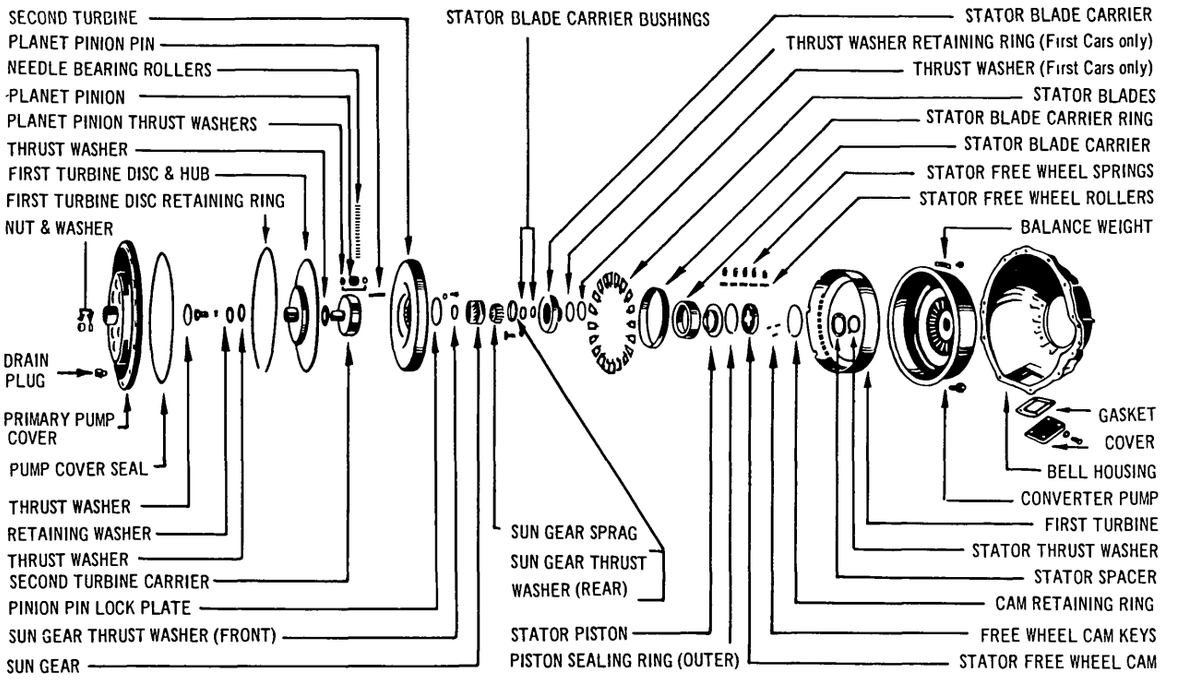
Manual Shift Control Linkage Adjustment: Warm transmission to normal operating temperature and make sure transmission oil is at proper level. With lower shift rod disconnected from idler lever and manual control lever on steering column in "D" (Drive) position, adjust the stop screw at lower end of steering column into slot of spring until the spring is deflected .030-.035". Carefully move lower shift rod forward and backward to determine when it is in center of slotted hole in transmission shift lever (approximately .060" movement is possible). Adjust clevis until pin enters hole in idler lever without moving rod in slotted hole in transmission shift lever. Remove pin and assemble anti-rattle washers, clevis pin and cotter pin. Park car on ramp or other grade with control lever in "P" (Parking) position to determine whether parking lock holds securely. Then let car roll with control lever in neutral position and listen for a clicking or ratchet noise which would indicate that parking lock pawl is contacting parking lock ratchet

CONTINUED ON NEXT PAGE

DYNAFLOW DRIVE (C nt.)

wheel. If parking lock fails to hold or ratchet noise exists, jack up car so a wheel may be turned to rotate propeller shaft. Loosen linkage adjusting lever lock bolt on side of transmission rear bearing retainer. With transmission in neutral, tap rear end of lever upward until a slight ratchet noise is heard when propeller shaft is turned, then tap lever down just enough to eliminate the noise. Tighten lock bolt securely. With engine idling at 600 RPM (engine warm), slowly move control lever from "N" (Neutral) position to "D" (Drive) position. The clutch should engage, as indicated by an immediate decrease in engine speed when the center of dial pointer is midway between "N" and "D" on speed ratio dial. Slowly move control lever from "D" (Drive) position to "N" (Neutral) position. Clutch should disengage, as indicated by an immediate increase in engine speed, when center of speed ratio pointer is midway between "D" and "N" on speed ratio dial. If points of clutch engagement and disengagement are not as specified, and all preceding linkage adjustments have been made correctly, it will be necessary to remove transmission oil pan and adjust position of the shift control valve. *See "Valve & Servo Body Reassembly" in 1955 Annual Data or later Manual edition.*

N utral Safety Switch Adjustment: With manual control linkage properly adjusted, ground primary terminal of distributor so that engine can be cranked without firing. Fully apply parking brake and place transmission control in "N" (Neutral) position. Place a narrow strip of masking tape on speed ratio dial so that ends of letters "D" and "N" are visible. With transmission control firmly engaged in neutral detent, make pencil mark on masking tape at **right edge** of pointer, then make two marks on tape at 1/8" and 3/16" to right of first mark. Move control lever to "D" position, turn ignition on and depress accelerator pedal to close accelerator vacuum switch. Slowly move dial pointer from "D" to "N" and note position of **right edge** of pointer at instant the cranking motor just starts to operate. Release accelerator pedal. The **right dg** of pointer should be between the two marks made on masking tape at 1/8" and 3/16" out of neutral. If neutral safety switch does not cut in within specified limits, move it sideways on column jacket as required to obtain proper timing. Tighten mounting screws.



BAND ADJUSTMENT

► *BAND ADJUSTMENT CAUTION: Bands cannot be adjusted with transmission in car and adjustment ordinarily required only when transmission overhauled. BANDS MUST BE CORRECTLY ADJUSTED BEFORE TRANSMISSION INSTALLED IN CAR. See "Band Adjustment" in 1955 Annual Data or later Manual edition.*

TESTING

If performance not satisfactory, make following tests **with transmission thoroughly warmed up and at operating t mp ratur :**

Oil L vel: Check oil level, add fluid as necessary to bring level up to FULL mark on dipstick, recheck performance with correct oil level. If car has been losing oil at rate of 1 pint or more each 1000 miles, make thorough check for oil leaks.

BUICK VARIABLE PITCH DYNAFLOW DRIVE TORQUE CONVERTER & BELL HOUSING

Manual Control Linkage: Check and adjust manual control linkage. See Linkage Adjustment.

Hydraulic Control System Pressures: Use Transmission Oil Pressure Gauge J-2575. Support rear end of car solidly with wheels off floor so that transmission can be operated. Remove transmission cover in floor pan for access to pressure take-off points.

Connect gauge and make tests as follows:

Front Oil Pump - Connect pressure gauge at pipe plug opening on left side of transmission case. Run engine at 500 RPM, check pressure with selector lever in **Low, Drive, and Reverse ranges.** Repeat tests at 1000 RPM, and at 1800 RPM **in Low and Reverse only.** See table below for correct pressures. Low or erratic pump pressures indicate air leaks in suction lines, improper pressure regulator valve action. or excessive pump clearances.

Front Oil Pump Pressures

Selector Lever–	Low	Drive	Reverse
500 RPM	120 lbs.	90 lbs.	120 lbs.
1000 RPM	180 lbs.	90 lbs.	
1800 RPM	180 lbs.	90 lbs.	

Rear Oil Pump - Connect pressure gauge at pipe plug opening in lower flange at front end of rear bearing retainer. Run engine at 500 RPM, check pressure with selector lever in **Low & Drive Range.** Repeat test 1000 RPM and 1800 RPM. See table below for correct pressures. Low or erratic pump pressures indicate air leaks in suction line (this will affect both pumps), improper pressure regulator valve action, excessive pump clearances or leaks in valve and servo body passages between pump and regulator valve.

Rear Oil Pump Pressures

Selector Lever–	Low	Driv
500 RPM	90 lbs.	90 lbs.
1000 RPM	180 lbs.	90 lbs.
1800 RPM	180 lbs.	90 lbs.

High & Low Accumulator - Connect pressure gauge at pipe plug opening on top of accumulator body (**High**–left side of car); (**Low**–right side of car). Place selector lever in **Drive Range** (High Accumulator Test); **Low Range** (Low Accumulator Test). Run engine and check pressures at speeds indicated in tables below. Low accumulator pressure may be caused by leakage past accumulator body gasket. If accumulator pressure more than 10 lbs. lower than front pump pressure, check for leakage between accumulator and multiple disc clutch and for restricted or plugged metering orifice in accumulator dump valve.

Accumulator Pressures

Selector Lever–	Low	Drive
500 RPM	115 lbs.	80 lbs.
1000 RPM	175 lbs.	85 lbs.
1800 RPM	175 lbs.	85 lbs.

Stator - Connect pressure gauge at pipe plug opening on left end of reaction shaft flange. Test pressure in **Drive Range** at 500 RPM, 1000 RPM, and 1800 RPM.

Stator Pressures

Selector Lever–	Low	Reverse	Drive
500 RPM	10 lbs.	10 lbs.	10 lbs.
1000 RPM	20 lbs.		70 lbs.
1800 RPM	100 lbs.		75 lbs.

CONTINUED ON NEXT PAGE

DYNAFLOW DRIVE (Cont.)

TROUBLE SHOOTING

▷*EXCESSIVE DYNAFLOW WHINE CORRECTION: (This condition is usually the result of excessive clearance between input shaft and bearing in the reaction shaft).* If transmission is to be disassembled to correct whine, perform the following:

1) Remove converter cover, twin turbine assembly, and sun gear, then mount dial indicator on end of input shaft with indicator button contacting reaction shaft. Position indicator button 90° to left of top center (facing end of shaft) then move input shaft away from and toward indicator while noting the gauge reading. Repeat this check at 45° to left of top center. If dial reading exceeds .005", excessive clearance exists between input shaft and bearing in reaction flange.
2) Before replacing bearing, remove reaction flange assembly and input shaft and observe the following: (a) Inspect bearing surface on input shaft. If surface appears abnormally rough or scored, replace input shaft; if not, polish journal area with crocus cloth. (b) Inspect the two oil seal rings toward rear of input shaft and the mating surface in the reaction shaft for scoring or other damage. If reaction shaft or input shaft shows evidence of scoring or other damage, replace worn or damaged parts.
3) If inspection reveals that condition of reaction shaft and input shaft are satisfactory, replace only the input shaft bearing (see Overhaul data).
4) If input shaft, reaction flange, or the bearing requires replacement, it will be necessary to replace the converter sun gear and planet pinions. *NOTE*—When installing reaction flange service bushing, be sure the assembly is supported on rear end of reaction shaft to prevent distortion of aluminum reaction flange.

CAR WILL NOT MOVE (Rear wheels may be locked or free).

1) With selector in any Range (rear wheels free). If car will not move for 1-3 minutes after standing over night—Check front pump oil pressure (see Testing) after allowing car to stand for several hours. If zero pressure noted, check pump for excessive clearances allowing pump to lose its prime. Check alignment of bell housing and converter primary pump hub.

▷*CAUTION—If this condition found, inspect Clutch and Bands for excessive wear due to slippage caused by low oil pressure.*

If car will not move after extended operation in Reverse—Check for air leaks in pump suction line (at rear oil pump gaskets), or excessive clearance in front pump (at pump gears and covers). Check alignment of bell housing and converter primary pump hub.
2) With selector in any Range (rear wheels locked). Parking lock engaged. Broken parts in transmission or rear axle. Parking brake applied.
3) With selector in Drive Range. Check front oil pump pressure and High Accumulator pressure. If OK, check for sticking Low Band Anchor Piston, remove and inspect Clutch for worn or sticking clutch plates, leaking clutch seal rings. If High Accumulator pressure low, also check rear pump Check Valve for correct installation and proper seating, check for leaks at accumulator body gasket, reaction flange gasket, clutch piston outer seal and clutch ball check valve, and leaks at sealing rings on reaction shaft flange and low drum.
4) With selector in Reverse Range. Check reverse band for displaced operating strut caused by too loose adjustment, improper installation, or broken band anchor (indicated by free up and down movement of band operating lever). If band assembly OK (no free movement of lever), check servo operation by running engine and shifting into Reverse. Remove Valve & Servo Body and check for reverse servo piston seal leaks.

EXCESSIVE SLIPPAGE (High engine speed in relation to car speed, or poor acceleration).
1) In all Speed Ranges. Low oil level. Incorrect manual control linkage adjustment. Air leak in oil pump suction pipe at oil screen sealing ring. Low front oil pump pressure caused by wear or excessive clearances in pump. Leaks at front pump cover or reaction shaft flange, pressure regulator valve, Valve & Servo Body gasket. Pressure regulator valve defective.
2) In Drive Range. Incorrect manual control linkage adjustment. If High Accumulator pressure low, check for leak at accumulator body gasket; if gasket OK, check for leaking clutch sealing rings, sticking clutch piston, worn or sticking clutch plates.
3) In Low Range. Incorrect manual control linkage adjustment. Incorrect low band adjustment. Low band and drum worn or scored. If Low Accumulator pressure low, check for leak at accumulator body gasket; if gasket OK, remove Valve & Servo Body and check for gasket leaks or leaks at low servo piston seal.
4) In Reverse Range. Incorrect manual control linkage adjustment. Reverse band out of adjustment, strut out of place, or anchor broken. If front oil pump pressure low, remove Valve & Servo Body and check for gasket leaks and leaking reverse servo piston seal.

CAR CREEPS (Forward or Backward).
1) Creeps forward with selector in Neutral. Incorrect manual control linkage adjustment. Sticking low servo piston (check by removing low band adjustment cover). Sticking clutch caused by warped, binding, or incorrectly assembled clutch plates (not stacked properly with "dish" in same direction). *If Car Creeps only when engine accelerated to 2500 RPM*—Check clutch vent ball checks in clutch piston and reaction shaft flange.
2) Creeps forward with selector in Reverse or backward with selector in Low. Incorrect manual control linkage adjustment.

SHIFTS ARE ROUGH.
1) Low-to-Drive Shift. Incorrect Low Band adjustment. If High Accumulator pressure low, check for leak at accumulator body gasket and for dump valve or accumulator piston sticking down (top land of piston should be visible through top port in body). Sticking low band anchor piston (remove Valve & Servo Body to check), or incorrect piston location (see piston shimming data in Valve & Servo Body Reassembly). Valve & Servo Body gasket leaks. Clutch plates worn or binding.

EXCESSIVE CHATTER OR CLUNK WHEN STARTING

▷*CAUTION—Slight "clunk" when shifting into Low or Reverse is normal, and slight chatter when car starting to move in reverse (disappearing as soon as car in motion) is also normal.*

1) In Low & Reverse Range. Incorrect Low or Reverse Band adjustment. Engine and transmission mountings loose or incorrectly adjusted, thrust pad at transmission mounting broken (see Engine Mountings in Buick Special Data). Clutch plates warped, sticking, or incorrectly assembled (not stacked properly with "dish" in same direction). Reverse ring gear bushing worn. Planet pinion needle bearing rough.

NOISE IN TRANSMISSION.

▷*CAUTION—Hum or low whine in Neutral or Parking is normal (due to free rotation of all planetary gears) and slight hum in Low and Reverse may be expected.*

1) Buzzing Noise. Low oil level. Front pump check valve hanging up on edge of gasket between valve and servo bodies. If noise noticed in Parking or Neutral, pressure regulator valve clearance in body may be excessive or orifice in valve land oversize (correct by replacing valve and body).
2) Clicking Noise. If noticed in all ranges, may be caused by foreign material in converter. If noticed only when car in motion, may be caused by parking lock pawl contacting ratchet wheel due to incorrect manual control linkage adjustment.

3) Abnormal Hum or Whine (see Caution above). If noted in all ranges, may be caused by worn parts or excessive front pump clearances (front pump noise will increase in Low and decrease at car speeds above 45 MPH. in Direct Drive). Check front pump for excessive clearances by testing for low pump pressure. If noise noted in all ranges except Direct Drive, may be caused by trouble in planetary gears (gears locked out in Direct Drive).
4) Squealing or Screeching following installation of Front Oil Pump. Pump driving gear installed backward.

▷*CAUTION—Above condition must be corrected WITHOUT FURTHER OPERATION OF TRANSMISSION or severe damage will result.*

REMOVAL FROM CAR

Transmission and torque converter are removed as an assembly as follows:

1) Raise car so that frame side rail is at least 20" off floor and place stands at front and rear to support car.
2) Disconnect torque tube from torque ball and move rear axle back to disengage propeller shaft from universal joint. Remove cranking motor splash pan, bell housing cover and bell housing hand hole cover.
3) Drain converter and transmission. Mark position of converter on flywheel to assure installation in same position and remove bolts attaching converter to the flywheel. Disconnect and remove all pipes from oil cooler. Remove the cooler. Disconnect oil filler pipe at rubber hose and disconnect exhaust pipe hanger at right accumulator. Disconnect shift rod and speedometer cable at transmission.

CONTINUED ON NEXT PAGE

DYNAFLOW DRIVE (Cont.)

4) Support transmission with a jack or hoist and remove four bolts attaching thrust plate to rear bearing retainer, then remove two nuts and plate which attach mounting pad to transmission support.
5) Raise engine and transmission just enough to relieve load on transmission support Remove bolts attaching both ends of support to frame, then remove support and thrust plate as an assembly *CAUTION*—If shims are found at this point, note their number and location so they can be reinstalled in the same position
6) Support engine at rear end of lower crankcase so it will be supported while transmission is removed. *CAUTION—Do not use bar with hooks placed over frame side rail. Brake lines will be damaged.*
7) On cars with air-conditioning, disconnect discharge and suction lines at compressor This will avoid damaging flexible couplings when engine is raised and lowered
8) Lower the transmission just enough so that bell housing bolts can be reached, then remove bell housing to crankcase bolts Move transmission rearward to disengage hub of converter pump from crankshaft, lower transmission and remove it from beneath car

TRANSMISSION OVERHAUL: Service procedures are the same as for 1955 models. *See "Changes, Cautions, Corrections" (above, and 1955 Annual Data or later Manual edition). Note the following*

▷*1956 DYNAFLOW TRANSMISSION OIL LEAKAGE CORRECTION (OIL BLOWING OUT OF BREATHER OPENING)* On transmissions having numbers "0-1" to "0-93", the above condition is caused by a 1/16" hole in output shaft (formerly used to lubricate rear bearing retainer) being uncovered by open end of horseshoe washer which is located in groove directly ahead of rear bearing retainer ball bearing *(NOTE- An unused groove will be found directly forward of the groove in which the 1/16" hole is located, and serves to identify shafts requiring correction This unused groove can be observed through breather hole when transmission is removed)* To correct this condition with transmission in car, remove the rear axle assembly, torque ball assembly and universal joint Flare one end of a 4" piece of 1/4" soft copper tubing until it fits snugly in the .290" diameter hole in end of output shaft. Cut off tube approximately 2" from flared end, then flare cut-off end to obtain a press fit in the 297" section of hole *(NOTE -* File flare outside diameter to obtain a suitable fit) Lightly tap copper tube in end of output shaft with suitable punch or 1/4" diameter rod, making certain that copper tube is fully seated with a snug fit *(CAUTION - Excessive or hard blows may collapse copper tube and restrict oil passage through tube)* Reinstall torque ball, universal joint, and rear axle assembly *(NOTE - The above procedure may also be used when transmission is removed from car for servic not requiring removal of rear bearing retainer).* When transmission is removed and removal of rear bearing retainer is required, proceed as follows Insert a 1/16" diameter welding rod approximately 1" long into oil hole until it bottoms, then insert a 1/4" diameter rod or punch in end of output shaft and tap with hammer to bend end of welding rod Leave punch in place in shaft and snip off end of welding rod flush with output shaft outside diameter, upset this end with a cold chisel to lock plug in place Install horseshoe washer on shaft so that welding rod plug is at open end of washer (this will allow washer to seat in groove). *NOTE - To indicate that the output shaft has been modified, as indicated above, use a chisel and make a dash (–) in front of the "0" of transmission code number*

▷*1956 DYNAFLOW FRONT PUMP SEAL SERVICE REPLACEMENT (NEW TYPE SPRING LOADED CARBON SEAL FOR USE WITH TRANSMISSIONS HAVING ALUMINUM PRIMARY PUMPS)* The new carbon seal is designed to seat against flat face of primary pump hub, making it possible to use seal on pumps which would normally be replaced because of scored hub in area of present seal. It is suggested that new seal be installed in transmission having primary pump which would ordinarily be replaced because of sealing difficulties. Install seal as follows After removal of old seal, inspect bore for burrs or damage. Correct any defects to be sure of a good press fit on seal outer diameter (leading edge of bore in pump body should have a slight radius). Clean up face of hub on primary pump with crocus cloth and inspect for burrs, dents or gouges. If deep marks are found, replace pump and install regular production seal. Coat outside diameter of seal with Permatex No. 3, then using crankshaft oil seal installer J-5250-1, press seal into pump body using an arbor press, drill press, or tap evenly into place with a mallet until flange of seal is down against face of pump body *(CAUTION - Do not mar or press on carbon face, and do not cock seal during installation as damage to seal will result. Also, under no circumstances should the carbon face seal be used with a steel primary pump).* Wipe both seal face and hub face on primary pump with a clean cloth to remove all traces of grit and other foreign material, then coat both faces with clean Dynaflow oil before assembling. When installing primary pump on transmission, use extreme care not to mar the carbon seal face with end of hub sleeve. When transmission is installed in car, the seal will automatically position itself and is constructed so as to compensate for normal play, deflection, and eccentricity.

INSTALLATION IN CAR

After transmission and torque converter completely assembled, install unit in reverse order of removal procedure and note following important points:
Alignment of Parts—See that flywheel, converter primary pump, and converter cover positioned so that paint marks (as made for removal) will be aligned when transmission installed.
▷*CAUTION—This alignment necessary to maintain converter assembly balance.*
Bell Housing Mounting Bolt Installation—Adjust lifting equipment so that bell housing meets engine crankcase squarely and engages the two dowels, then install all bell housing bolts with lockwashers. Tighten all bolts to 45-55 ft. lbs. torque.
Transmission Support & Thrust Pad Installation & Adjustment—*See ENGINE MOUNTING in Buick Special Data.*
Converter Mounting Bolt Installation—Use the shank of a 11/32" drill to align bolt holes in flywheel and converter, install bolts and tighten to 25-30 ft. lbs torque.
Shift Rod Installation—Check and adjust linkage when installing shift rod. *See LINKAGE ADJUSTMENT.*
Filling Transmission—*See LUBRICATION.*
Final Road Test—After transmission installed and all adjustments made, road test car by driving approximately 20 miles with frequent starts and stops to duplicate heavy traffic conditions. After transmission thoroughly warmed up, check transmission and all oil lines and connections for leaks. If vibration noted due to unbalance of replacement parts, correct this condition as follows:

ENGINE BALANCING

▷*IF VIBRATION NOTED AFTER INSTALLATION OF CRANKSHAFT, FLYWHEEL, AND OTHER ROTATING PARTS, CORRECT THIS UNBALANCED CONDITION AS FOLLOWS:*
▷*CAUTION:* Procedure below will correct minor unbalance caused by replacement of individually balanced parts Extreme vibration caused by parts abnormally out of balance, or different in weight from corresponding parts, should be corrected by replacement of these parts
Critical Speed of Vibration—Determine speed at which vibration is most evident (use tachometer) and operate engine at this speed to check results from the following corrective procedures
1)—Remove bell housing cover and bell housing hand hole cover for access to flywheel
2)—Install one 060" balance weight of correct type (see Balance Weight Note following step 5 below) under the head of one of the primary pump cover bolts, tighten bolt to 25-30 ft lbs torque
▷*CAUTION—DO NOT install weight at flywheel-to-converter driving bolt (bolts are too short for addition of weights).*
3)—Operate engine and check for vibration Mark location of balance weight on converter pump, then remove weight and tighten cover bolt to 25-30 ft lbs torque
4)—Repeat steps (2) and (3) at other converter pump cover bolts and compare engine vibration noted at each location
5)—At point where balance weight results in smoothest engine operation, vary weight thickness (see Balance Weight Note following), until vibration has been eliminated After balance weights selected and installed, tighten cover bolts to 25-30 ft lbs torque, attach weights permanently as follows Use 5/32" drill to spot center of both holes in weights, then drill pump flange with #32 (116") drill to depth of 3/8", use correct length drive screws 3/8" long (No 145067) or 1/2" long (No 450543) depending on the weight thickness to permanently attach weights to pump cover
Balance Weight Note—Balance weights furnished in three thicknesses for each type transmission as listed below *CAUTION—Use correct weights for first and later type transmissions as follows:*

Balance Weight Part Nos.

Thickness	Part No.
0345"	1166600
.060"	1166601
.120"	1166602

CHEVROLET POWERGLIDE

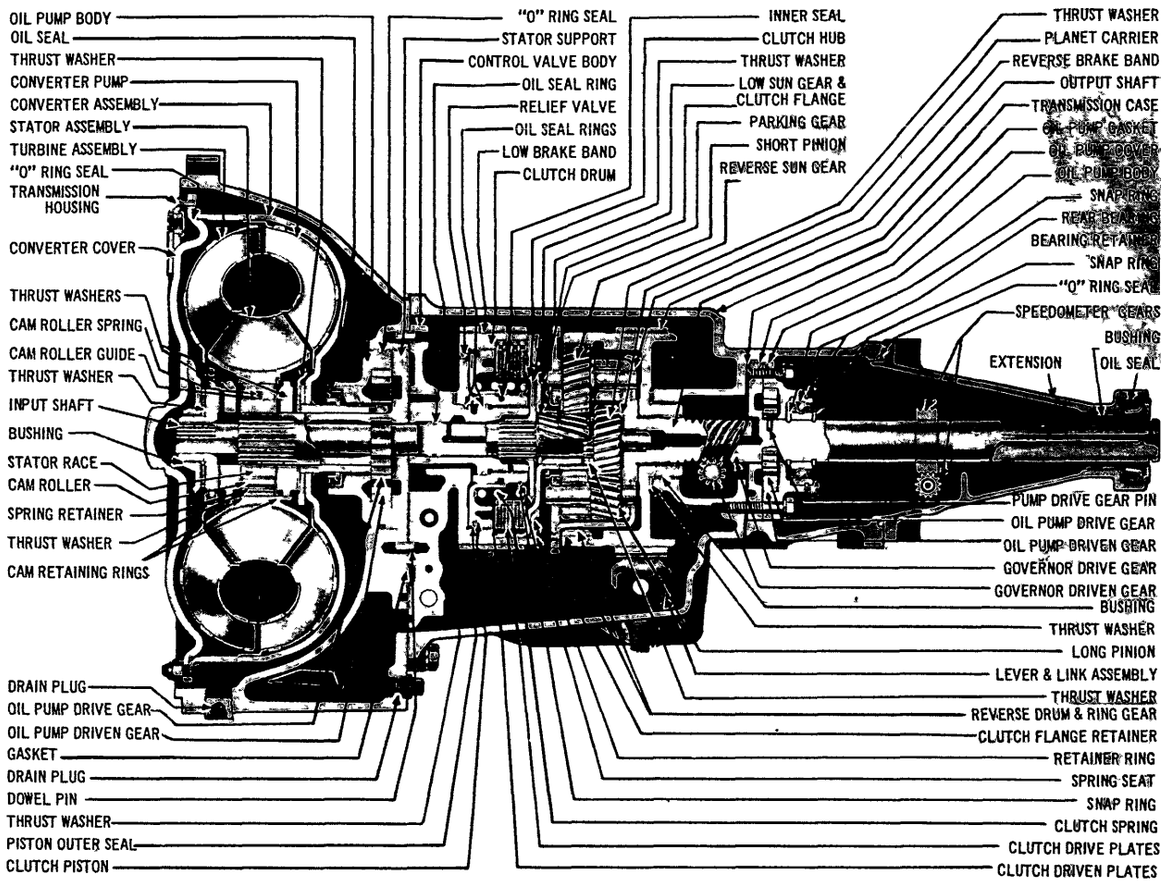
Chevrolet Pass. Cars (1956)
Chevrolet Corvette (1956)

►CHANGES, CAUTIONS, CORRECTIONS

►*STARTING ENGINE BY PUSHING CAR (Pushing recommended rather than towing):* Place selector lever in Neutral "N" position. When car reaches speed of approximately 16 MPH. (20 MPH if road wet or icy with resultant poor traction), move selector lever to Low "L" position to crank engine. After engine is started, move lever to "N" for engine warm-up.

DESCRIPTION

The 1956 Powerglide Transmission is similar to 1955 design, consisting of a torque converter and a hydraulically operated planetary transmission.



OPERATION

Operation of the Torque Converter and Transmission is similar to the previous type except for automatic shifting in "Drive Range" as follows.

Starting in Drive Range—With the selector lever in Drive "D" position, the manual valve is positioned to direct oil pressure to apply side of the Low Servo and to the Low Drive Valve Body so that the car starts out in low range (torque converter plus planetary gear) providing an equivalent gear reduction of 2.2-1 (torque converter) plus 1.82-1 (gears). Depressing the accelerator pedal applies throttle valve pressure behind the shifter valve in the low drive valve body which assists the spring in keeping the shifter valve closed and the transmission in low range. As soon as the car begins to move, the rear pump begins to operate and to supply oil pressure to the governor which controls the upshift as follows:

Normal Upshift—When the rear pump pressure balances the force of the centrifugal weights in the governor, the governor valve directs oil pressure to the Shifter Valve in the low drive valve body and moves the valve to the drive position. This directs main line pressure to the clutch assembly and to the release side of the low servo piston (balancing of low servo pressures allows spring to release band). Application of the clutch and release of the band places the transmission in Drive Range (converter drops out independently when reversal of pressure on stator vanes causes stator to "free-wheel" so that torque converter acts merely as a fluid coupling). Upshift can be delayed by greater throttle opening as follows:

Delayed Upshift—The shift from Low to Drive Range is dependent on the extent to which the accelerator pedal is depressed and will occur at a higher car speed with greater throttle opening. In addition, if the accelerator pedal is depressed beyond the "detent point" (this point reached just before throttle is wide open and will be noted as a definite resistance to further movement of the accelerator pedal), this movement of the pedal compresses the detent spring in the low drive valve body and moves the Detent Valve which then directs throttle valve pressure to the large plunger which assists in holding the shifter valve in the low range position (see Forced Downshift operation below). This delays the upshift to drive range until the car speed reaches 42 MPH. when the governor pressure becomes great enough to move the shifter valve to the high position regardless of the accelerator pedal position (governor pressure increases with car speed until it equals main line pressure).

POWERGLIDE TRANSMISSION SECTIONAL VIEW

Forced Downshift—At car speeds below 37 MPH., the transmission can be downshifted from drive to low range for rapid acceleration by depressing the accelerator pedal. The amount of pedal movement required, and the resulting action of the transmission control depends on car speed.

LUBRICATION

Check oil level at 1000 mile intervals, drain and refill transmission at 25,000 mile intervals.

►*CONVERTER DRAIN NOTE:* There is no drain plug on converter unit. Oil trapped in converter need only be replaced when transmission disassembled for overhaul.

Recommended Oil - Use only Automatic Transmission Fluid Type "A" (as furnished in containers bearing "AQ-ATF" number).

Capacity - Approximately 5 qts (refill after transmission case drained), 11 qts. (after overhaul with transmission and converter dry).

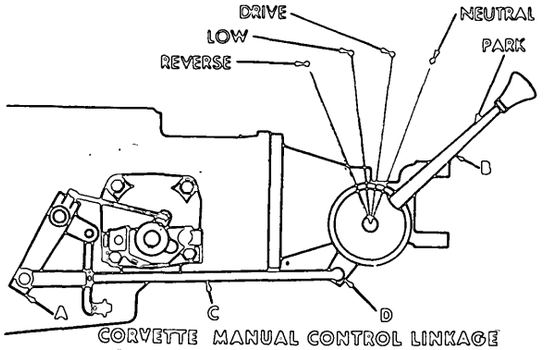
►**Warming Up Transmission (For Checking or Draining)**—Drive car approximately 5 miles with frequent starts and stops OR warm up transmission in shop as follows: Run engine for 15 minutes at 750 RPM with selector lever in "Dr" position. ***CAUTION*** —Set hand brake tightly to prevent car moving.

Checking Oil Level—Check only with transmission warm and engine idling with selector lever in Neutral "N" position. Remove dipstick from filler tube in engine compartment on right side. Add oil only if level down to "ADD ONE QUART" mark on stick, fill only to "FULL" mark on stick. ***CAUTION—High oil level (above "FULL" mark) will cause foaming and loss of fluid.***

CONTINUED ON NEXT PAGE

POWERGLIDE (Continued)

▷*OIL FILLER NOTE*—Use of Oil Filler Tube & Funnel No. J-4264 recommended to facilitate filling. This assembly is vented (transmission not vented and may blow back causing oil spillage if vented filler not used).



▷*LOW OIL LEVEL CAUTION—If oil level in transmission found consistently low, check for internal and external oil leaks. See "OIL LEAKAGE OR HIGH OIL CONSUMPTION" in TROUBLE SHOOTING.*

Draining & Refilling—Transmission must be warm. Remove drain plug in rear face of transmission housing under the case to drain the transmission. *NOTE*—It is not necessary to drain converter. Replace and tighten drain plug. Install 5 qts. of new fluid through filler tube on right side of engine (see Oil Filler Notes above). Idle engine with selector lever in "N" until transmission warm, check fluid level and add additional fluid, as required, to bring level up to "Full" mark on dipstick. *CAUTION—Do not overfill (will cause foaming).*

Filling (After Overhaul)—Install 3 qts. of fluid through filler tube, start engine and allow it to idle with selector lever in "N", install additional 8 qts. of fluid. Run engine until transmission warm and check fluid level.

LINKAGE ADJUSTMENT

▷*THROTTLE LINKAGE ADJUSTMENT NOTE: See CARBURETOR on car model pages.*

CORVETTE MANUAL CONTROL LINKAGE

Manual Control Linkage (Except Corvette): Loosen shifter tube lever clamp nut sufficiently to allow upper control rod to move freely in the swivel. Push control rod bellcrank (on left side of transmission case) toward front of car as far as it will go, placing transmission in "Park" position. Place shift control lever on steering column in "P" (Park) position. With both the control rod bellcrank and selector lever held in the "P" (Park) position, tighten shifter tube lever clamp nut securely.

Manual Control Linkage (Corvette): Set control rod bell crank (A) on transmission to reverse position (extreme rearward position). Place transmission selector lever (B) in reverse position (extreme forward position). Adjust rod (C) connecting lower end of selector lever with control rod bell crank so that rod will enter hole in lower end of selector lever (D) freely.

Neutral Safety Switch: Located on bracket on lower end of lower support assembly on steering column. To adjust, loosen two switch assembly mounting screws. Place selector lever in neutral, make certain that switch clip is over flats on end of shifter shaft. Insert locating pin through holes in switch mounting bracket and locating plate. Tighten switch mounting screws, remove locating pin.

BAND ADJUSTMENT

▷*BAND ADJUSTING NOTE: Band adjustment not ordinarily required in service (bands adjusted when reassembling transmission). Reverse band adjustment requires removal of Servo Cover Assembly (see Disassembly data).*

Low Servo Band - Adjusting screw located on left side of transmission case (under cover). To adjust band, remove adjusting screw cover. Use Tool J-4277 (see "Tool Modification Note" below), loosen adjusting screw locknut and tighten low band adjusting screw to 5-7 ft. lbs. *(NOTE - This procedure is new and supersedes the previous instructions which required that the screw be tightened firmly).* Back screw out four complete turns, and tighten locknut, taking care not to allow screw to turn. Replace adjusting cover.

▷Tool J-4277 Modification (for Low Servo Band Adjustment)—Adjusting screw has recessed head for ¼" Allen wrench. To use tool, remove screwdriver retainer and special screwdriver from tool, use ¼" Allen Wrench in place of the screwdriver in the tool.

Reverse Servo Band—Adjusting screw located on right side of case under servo cover. With servo cover removed, install tool J-4277 on adjusting screw, loosen locknut. Rotate reverse drum to center it in the reverse band. Tighten adjusting screw until all endplay between linkage and band is removed without compressing the band. The reverse drum must be free to rotate after this adjustment. If reverse drum is not free to rotate, back the adjusting screw ¼ turn at a time until drum is free to rotate. *(CAUTION—This is a sensitive adjustment and must be done carefully).* Tighten locknut taking care not to allow adjusting screw to turn.

TROUBLE SHOOTING

SEVERE CLOSED THROTTLE DOWNSHIFT "CLUNK": May be caused by a broken closed throttle cushion valve spring retainer. Check this condition by removing right hand side cover and inspecting retainer. *See "Closed & Forced Throttle Valve Spring Retainer Production Change" above.*

MOMENTARY RUN AWAY IN LOW UP TO 30 MPH (WIDE OPEN THROTTLE ACCELERATION): May be caused by a broken forced throttle cushion valve spring retainer. Check mainline pressure which will be lower just prior to shift, and the stall pressure will be low if the faulty transmission operation is caused by a broken retainer. *See "Closed & Forced Throttle Valve Spring Retainer Production Change" above.*

EXCESSIVE SLIPPAGE (High engine speed in relation to car speed, poor acceleration, or engine runs away on turns).

1) In all Speed Ranges—Low oil level. Incorrect control linkage adjustment. Air leak in oil pump suction pipe. Low front oil pump pressure.

2) In Drive Range—Incorrect control linkage adjustment. Damaged or leaking clutch piston seal (worn or burned clutch plates resulting from partially engaged clutch).

3) In Low Range—Incorrect control linkage adjustment. Low Band out of adjustment. Sticking accumulator valve, modulator lever, or modulator valve. Damaged or worn Low Servo Piston Ring resulting in poor band application or excessive oil leakage into clutch apply circuit causing partial clutch application and possibly burned clutch plates (check by connecting pressure gauges to Low Servo Apply and to High Clutch test points—there should be no pressure indicated at High Clutch point with selector lever in "L").

CAR CREEPS (Forward or Backward).

1) With Control Lever in Neutral—Incorrect control linkage adjustment. Clutch piston vent valve stuck closed. Clutch plates sticking or incorrectly assembled (not "stacked" in correct order).

2) Creeps forward with Control Lever in Reverse or backward with Lever in Low—Incorrect control linkage adjustment.

CAR WILL NOT MOVE (Rear wheels may be locked or free).

1) With Control Lever in any range (rear wheels free). If this occurs at other times than after reversing car, see causes listed under EXCESSIVE SLIPPAGE above. If this occurs only after reversing car (indicating loss of front pump pressure) check: Rear pump air leakage into front pump suction line (causing front pump to lose its prime). Rear pump gasket leakage. Front pump clearance excessive.

2) With Control Lever in any range (rear wheels locked). Parking pawl lock engaged. Broken parts in transmission. Parking brake applied.

3) With Control Lever in Drive Range (rear wheels free). If engine runs away and transmission is hot, check for: Low radiator water level, clogged oil cooler, sticking thermostatic valve, or dragging Low Range Band (causing over-expansion of clutch parts due to excessive heat).

SHIFTS ARE ROUGH.

1) Low-to-Drive Shift (car in motion). Incorrect Low Band adjustment. Clutch plates worn or binding. Modulator control lever or piston sticking (will cause excessive pressures). Accumulator dump valve orifice plugged.

If engine speeds up during this shift—Check for incorrect low band adjustment and worn or binding clutch plates.

2) Drive-to-Low Shift. Incorrect Low Band adjustment. Accumulator piston stuck closed. Modulator control lever or piston stuck (will cause excessive pressure).

3) Neutral-to-Reverse. Incorrect reverse band adjustment. Accumulator piston stuck closed. Modulator control lever or piston stuck (will cause excessive pressure).

CHATTERS WHEN STARTING.

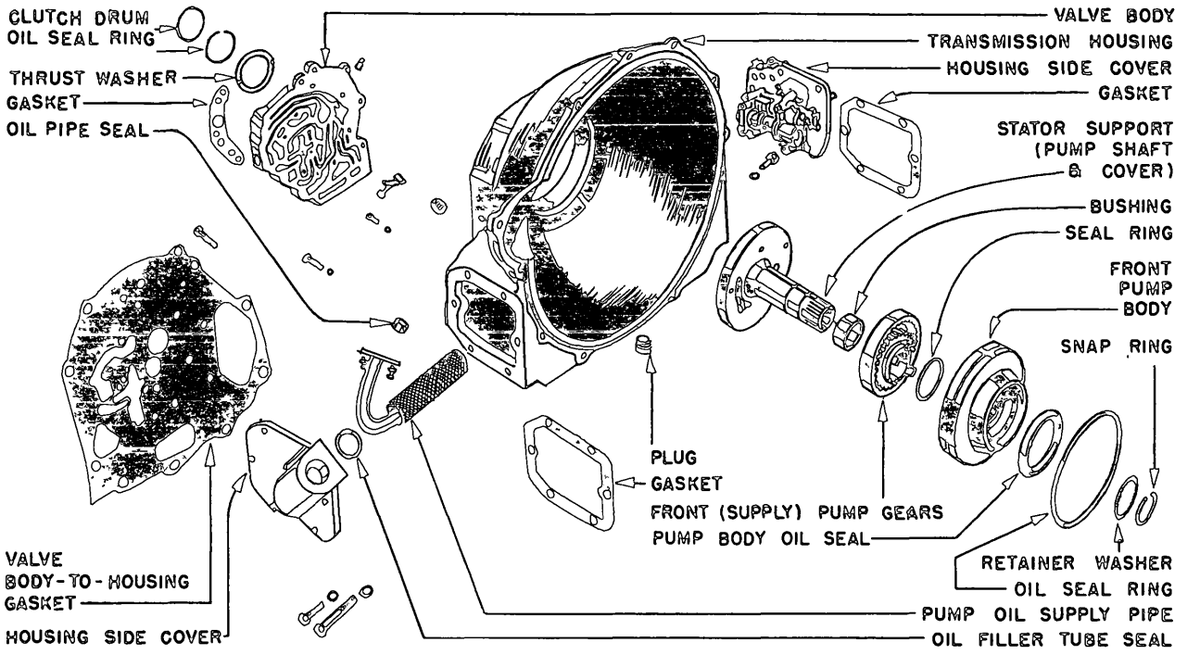
1) In Low Range. Incorrect Low Band adjustment. Worn or rough band, scored drum. Clutch not disengaging properly due to distorted or binding plates, sticking clutch piston, sticking piston vent valve, or damaged or worn Low Servo Piston Ring allowing oil leakage into clutch apply circuit and causing partial clutch application (see tests for Excessive Slippage in Low Range above).

2) In Drive Range. Incorrect Low Band or Reverse Band Adjustment. Bands worn or rough, drums scored.

CONTINUED ON NEXT PAGE

POWERGLIDE (Continued)

3) In Reverse Range. Incorrect Reverse Band adjustment. Worn or rough band, scored drum. Reverse ring gear and drum bushing worn or damaged.



REVERSE OPERATION JERKY OR DRAGGING.
1) Clutch plates are incorrectly assembled (not "stacked" properly) or sticking. Clutch piston vent valve stuck closed.

REVERSE CAN NOT BE ENGAGED WITH ENGINE RUNNING: If reverse can only be engaged when engine not running, check for accumulator snap ring being out of place (allowing accumulator valve and body to be forced against clamp nut on parking lock lever shaft and apply spring assembly, blocking shift into reverse). *NOTE*—Above condition will not prevent shift into Low Range).

DRIVE-TO-LOW or LOW-TO-DRIVE SHIFT DIFFICULT: May be caused by improperly drilled high clutch feed orifice in valve body resulting in slow clutch application in Drive Range and slow clutch release when shifting from Drive to Low (restricted orifice will cause slow oil flow). Check by connecting pressure gauges to Low Servo Apply and to High Clutch (low servo release side) and noting pressures as follows:
1) Move selector from Neutral to Drive with engine idling. If pressure builds up much more rapidly on Low Servo Apply gauge than on High Clutch gauge, a restriction in the passage (undersized orifice) is indicated.
2) Move selector from Drive to Low. Pressure in High Clutch gauge drops slowly, oil drainage from clutch is restricted. NOTE—This will result in slow Low Band application and clutch drag (may cause burned clutch plates).

HIGH CLUTCH PLATES BURNED OR CLUTCH FAIL
▷*CAUTION—When High Clutch failure noted, following tests should be made before transmission removed, and transmission should also be carefully examined after removal and disassembly.*
1) Connect pressure gauges to Low Servo Apply, High Clutch (low servo release side), and to Reverse Servo points. Operate engine to supply oil pressure.
2) Place selector lever in Drive position and note pressure build-up in High Clutch gauge. Slow build-up indicates restriction in high clutch apply orifice resulting in clutch slippage and burned plates.
3) Place selector lever in Low position. High Clutch gauge should not show any pressure. Pressure at this point indicates leakage past Low Servo Piston Ring resulting in partial clutch application and burned clutch plates.
4) Place selector lever in Reverse position. High Clutch gauge should not show any pressure. Pressure at this point indicates leakage between the converter "out" and low servo "release" channels in valve body or damaged Housing-to-Valve Body gasket. This condition will cause partial clutch application and burned clutch plates.

NOISE IN TRANSMISSION.
1) Buzzing Noise (All Ranges). Low oil level. Pump gear interference with crescent in pump. Pump check valve not seating.
2) Ringing Noise in Converter. Low oil level. Air leak in pump suction line (pump not seated properly) resulting in low oil level in converter. Pressure regulator valve stuck (closing converter inlet port). Leakage in oil line between front pump and regulator valve.
3) Clicking Noise. Incorrect manual linkage adjustment (causing interference between parking lock pawl and gear).
4) Whining Noise. Transmission gear teeth worn. Pump gear clearance excessive or pump gear bushings worn.

POWERGLIDE TURBINE HOUSING & FRONT OIL PUMP

FUEL CONSUMPTION EXCESSIVE.
1) Transmission Causes. Converter stator freewheeling cams and roller incorrectly assembled. Clutch piston vent valve stuck open.

TRANSMISSION OIL BEING FORCED OUT OF FILLER PIPE: Caused by aeration and foaming of the oil due to one or more of the following:

NOTE—This condition may also cause Loss of Power and Lower Stall Speed (due to converter turbulence and lower pressures in control circuits).

1) Oil level too high allowing planet carrier to revolve in oil and aerate it. Correct by lowering oil level to correct point (see LUBRICATION) and driving car for 5 miles to work out air bubbles.
2) Oil suction pipe split, seal damaged, bore for suction pipe in housing too deep, or suction pipe retainer ears bent (preventing proper compression of the seal) resulting in air leaks in oil suction line.
3) Sand hole in suction bore of transmission case or housing or in suction cavity in valve body resulting in air leaks in oil suction line.

TESTING

▷*TESTING CAUTION*—Transmission oil level must be checked and corrected (see LUBRICATION) and *transmission must be warmed up before tests made.*

Warming Up Transmission: Transmission must be warmed up by road driving or in the shop exactly as follows before checking for oil leaks or trouble.

Road Warm-Up—Drive car for approximately 5 miles with frequent starts and stops to approximate heavy-traffic conditions.

Shop Warm-Up—Set hand brake tight to hold car, place selector lever in "D" range, start engine and run for 15 minutes at 750 RPM. At end of 15 minutes, transmission will be warmed up sufficiently for testing regardless of initial temperature.

▷*CAUTION—Recheck oil level after warm-up and before making following tests.*

ROAD TEST: Road test car when endeavoring to determine the reasons for the following difficulties:

Clutch Slippage: Connect gauges to the test points of the low servo apply and high clutch (release side of low servo). Position selector lever in "D" range and when car starts to move on acceleration, carefully check the pressure readings. Before the upshift takes place, the gauge connected to the low servo apply test point should record between 85 and 95 lbs. After a normal upshift takes place and the high clutch has time to become fully engaged, both gauges should record 85-95 lbs. If on this type of shift, the gauge on the high clutch (release side of

CONTINUED ON NEXT PAGE

POWERGLIDE (C ntinu d)

low servo) test point records 85-95 lbs., and the clutch slips or does not fully engage, it indicates a mechanical fault in the clutch. If the gauges do not record between 50-60 lbs. with engine idling at 425 RPM, or from 85 to 95 lbs. upon acceleration, the following items will require checking as it indicates leakage in the oil circuits. (a) Pressure regulator valve stuck, (b) Leak at low servo piston ring (between bore and ring), (c) Leak at low servo piston rod (between bore and rod), (d) Leak at valve body to case gasket, (e) Leak between valve body and housing, (f) Front pump clearances not correct, (g) Leak at low drive valve body (check gaskets and shifter valve), (h) Check passages in transmission housing for porosity, (i) Loose suction screen connection.

Closed Throttle Downshift "Clunk": High engine idle speed, or Closed Throttle Downshift Cushion Valve stuck.

Harsh Abrupt Upshift Above 25 MPH: Forced downshift cushion valve stuck closed.

Improper Upshifts and Downshifts: Refer to "Shift Patterns" below. Connect gauges to throttle valve and governor test points *(NOTE—See "Governor Pressure Test Plug Production Change" above).* Throttle valve pressure ranges from 0 to 62 lbs , depending to what extent the accelerator is depressed. Governor pressure is governed by road speed. If difficulty is experienced with the "Shift Patterns" it is recommended that the governor pressure be checked first to determine whether the pressure is within proper range, for if not, it will effect the "Shift Patterns" and the governor assembly is the first thing that should receive attention. Throttle valve pressure is another thing that effects "Shift Patterns" and if governor pressure is correct it is indicative that trouble is in the low drive valve body, provided the positive linkage and throttle valve linkage is in proper adjustment

SHIFT PATTERNS
Drive Range—Automatic

Throttle Position	①Upshift	②Downshift
Light Throttle③	12-14 MPH	④10-13 MPH
To Detent	30-45 MPH	14-18 MPH
Through Detent	48-53 MPH	45-50 MPH

①—From Low to Drive Range.
②—From Drive to Low Range.
③—Light Throttle on Upshift.
④—Closed Throttle on Downshift.

STALL TEST: Check coolant level in radiator as a safety precaution. With tachometer connected to engine and service brakes securely locked, open throttle wide, with transmission in "D" (Drive) range, then in "L" (Low) range, and then in "R" (Reverse) range. Note maximum speed attained in each range and record. Speed should be almost identical in all ranges and be between 1560 and 1610 (6 Cyl.), 1600 and 1700 (V8). ***(CAUTION—Do not maintain stall condition longer than 10 seconds at one time to avoid overheating transmission fluid).*** If engine fails to attain minimum stall speed by several hundred RPM, it is likely that the stator is not locking up on the stator hub. If stall speed varies much between ranges or exceeds the maximum in all ranges, there is slippage which may be due to insufficient oil pressure or to a mechanical fault of clutch or bands.

PRESSURE TESTS: Connect pressure gauges at the following points and make the tests listed below.

►***TEST GAUGE NOTE:*** Five gauges are required. The four-gauge panel, No. J-4872, can be modified for use by installing an additional gauge furnished in conversion package No. J-5491 (reverse original gauges on panel, drilling additional hole to mount new gauge on lower edge of panel).

Gauge Connections—Connect gauge at each of the following points:

1) Low Servo Apply Pressure—Plug on lower front of servo cover on right side of transmission. ***CAUTION—Do not confuse this plug with Modulator Pivot Pin Retaining Plug which is slightly to rear of this Low Servo Apply Plug.***

2) Clutch Apply Pressure (Low Servo Release)—On bottom of transmission case at center and adjacent to servo mounting flange.

3) Reverse Servo Apply Pressure—On bottom of transmission case at rear and adjacent to servo mounting flange.

4) Throttle Valve Pressure—At hex-head plug in center of Low and Drive Valve Body Cover on left side of converter housing.

►***GOVERNOR PRESSURE TEST PLUG PRODUCTION CHANGE: Test plug on side of left hand side cover has been eliminated beginning in production with Trans. Serial No. C-428-D. Earlier model side covers will retain this plug.***

5) Governor Pressure—At plug on side or at upper end of channel in Low and Drive Valve Body Cover on left side of converter housing (upper plug is between second and third top cover screws (counting from top front corner of cover).

6) Main Line Pressure—At plug on upper end of channel in Low and Drive Valve Body Cover on left side of converter housing (plug is between third and fourth top cover screws (counting from top front corner of cover).

7) Clutch Apply or Main Line Pressure—At plug at outer end of channel in Low and Drive Valve Body Cover on left side of converter housing (this plug is at lower rear corner of cover).

Test Pressures—***CAUTION—Representative pressures listed below may vary 5% (higher or lower).***

FRONT PUMP PRESSURE

	Pressure
Idle (425 RPM)	50-60 lbs.
Above Idle	85-95 lbs.
Reverse (Idle 425 RPM)	50-60 lbs.
Reverse (Above Idle)	165-195 lbs

DRIVE (AUTOMATIC)
Transmission in Low Range

	Light Throttle (10 MPH)	Through Detent (45 MPH)
Low Apply	85-95 lbs	85-95 lbs.
Clutch Apply	0 lbs.	0 lbs.
Governor	8-13 lbs.	72½-76½ lbs.
Throttle Valve	①	①

Transmission in High Range

	Light Throttle (30 MPH)	To Detent (45 MPH)
Low Apply	85-95 lbs.	85-95 lbs
Clutch Apply	85-95 lbs.	85-95 lbs.
Governor	52-56 lbs.	72½-76½ lbs
Throttle Valve	①	①

①—Throttle valve pressure will vary from 0 to 62 lbs., depending on throttle position. At wide open throttle (through detent) pressure should read 61 to 63 lbs., on acceleration.

REMOVAL FROM CAR (EXCEPT CORVETTE)

Transmission & Torque Converter are removed as an assembly. ***CAUTION—Torque converter is not retained in housing as on previous transmission and special holding tool must be used to prevent converter falling out when transmission assembly removed.***

TRANSMISSION ASSEMBLY REMOVAL: (1) Raise car and install jack stands front and rear. Turn back floor mat and remove toe pan plate.
2) Remove spark plug wires on all models. Disconnect ground strap from battery and wires from starting motor solenoid on eight cyl models only Disconnect oil cooler lines retaining clip bolt from right side cover and disengage lines from retaining clip on engine. Move lines away from transmission and tie to right frame side rail.
3) Disconnect throttle valve control rod from throttle valve control outer lever and manual shift control rod (long rod) from bellcrank. Split rear universal joint. Then remove propeller shaft and front universal joint as an assembly by sliding it rearward until front joint is free of transmission output shaft.
4) Remove drain plug from rear of converter housing and drain transmission. Clean dirt from around filler tube, dipstick and transmission cover and remove side cover bolt retaining filler tube in position. Remove filler tube and dipstick. ***(CAUTION—Use masking tape or rubber stopper to cover filler tube opening.***
5) On V8 cars only, remove starter, and disconnect exhaust pipe from crossover pipe. On 6 Cyl. cars disconnect exhaust pipe from exhaust manifold.
6) Disconnect muffler from muffler support bracket and move the exhaust pipe and bracket as an assembly to the left and tie it to left frame side member.
7) Remove flywheel inspection hole cover and remove the three flywheel to converter attaching bolts through the opening that is adjacent to the starting motor, (opening on six cylinder cars is on left side of engine).
8) Remove all converter housing to flywheel housing attaching bolts except the top three. Install engine support bar or cradle to support engine Position jack under transmission (using a suitable transmission handling device). Remove both rear engine mountings making sure that engine is properly supported before removing mountings
9) Remove the three upper converter housing to flywheel housing attaching bolts through opening in toe pan. Move transmission to rear slightly and install converter holding tool J-5384. Lower transmission on jack and remove from under car.

CONTINUED N NEXT PAGE

POWERGLIDE (C ntinu d)

DISASSEMBLY—TRANSMISSION

►**DISASSEMBLY & REASSEMBLY CAUTION:** ***CLEANLINESS IS EXTREMELY IMPORTANT when opening up transmission. Thoroughly CLEAN exterior of case first, CLEAN each part as removed with cleaning solvent or gasoline and dry with air—do not use wiping cloths which will leave lint on parts. Store all parts in clean storage bins.***

DISASSEMBLY OF TRANSMISSION (Into Major Units): 1) Place transmission on bench (use holding fixture J-3361) and remove all units as indicated below.

2) Remove converter assembly holding tool J-5384 from housing, remove converter assembly by pulling it straight out of housing.

3) Take out right side cover attaching bolts, remove side cover, gasket, and oil pump suction screen.

4) Take out Low & Drive Valve Body attaching screws on left side of transmission, remove valve drive body assembly and gasket. CAUTION—Do not remove outer lever assembly from valve body (this retains inner lever assembly in body).

5) Loosen all servo cover bolts slightly and break servo cover loose if it sticks to case (reverse servo spring and pressure regulator spring bear against cover) using care not to allow cover to tip which may damage or break tip of pressure regulator valve. Use guide bolts to maintain cover alignment or turn all cover bolts out evenly while exerting pressure on cover, then lift cover and gasket straight off until cover clears tip of pressure regulator valve. Remove reverse servo spring and pressure regulator springs, lift regulator valve out.

►***CAUTION—Handle valve carefully to prevent damage and store it by itself to avoid nicking or scratching of the polished surfaces.***

6) Remove low band adjusting screw cover, loosen low band adjusting screw locknut using tool J-4277 (see Tool Modification below), and tighten low band adjusting screw to hold clutch assembly in place.

►*CAUTION—Make sure low piston assembly does not fall out of bore and become damaged.*

►**Tool J-4277 Modification Note**—Low band adjusting screw has recessed head for Allen wrench. To use tool, remove screwdriver retainer and special screwdriver from tool, use ¼" Allen wrench in place of screwdriver in tool.

7) Working from inside of converter housing, remove the converter housing-to-transmission case self locking bolt. Remove the converter housing-to-transmission bolts and lockwashers and install two ⅜"—16 x 3¾" guide pins (part of Pilot Stud Set J-3387). Shift transmission into Reverse and then carefully separate transmission from converter housing. Remove valve body to transmission case gasket.

8) Remove manual valve from valve body on rear of converter housing, remove manual valve lever from housing, remove bronze thrustwasher from valve body oil delivery sleeve.

►***CAUTION—Handle manual valve carefully to prevent damage and store it by itself to avoid nicking or scratching of the polished surfaces.***

9) Take out all bolts and lockwashers attaching valve body to converter housing and front pump to valve body. Remove valve body and gasket.

►***CAUTION—Handle valve body and valves carefully to protect them from damage.***

10) Use Front Pump Driver Tool J-4263-5 to remove pump assembly from converter housing.

11) Loosen low servo band adjusting screw to free clutch assembly, remove input shaft, clutch assembly, and low sun gear thrustwasher from transmission case.

12) Remove low servo band, strut assembly, low servo piston and piston return spring from transmission case.

13) Remove speedometer driven gear assembly. Take out universal joint retainer bolt and lockwasher on rear end of output shaft, slide universal joint yoke off end of shaft.

14) Take out attaching bolts and remove governor cover on left side of transmission case, remove gasket. Remove governor assembly (allow governor to turn in clockwise direction while withdrawing it from case).

15) Use tool J-3383 to rotate parking lock pawl spring until end unhooked from case, remove spring and parking lock pawl. Remove parking lock lever and steel washer, parking lock lever shaft assembly, and oil seal from case.

16) Remove transmission oil seal using tool J-5859 and remove transmission assembly and "O" ring seal. Remove speedometer drive gear from output shaft with tool J-5814.

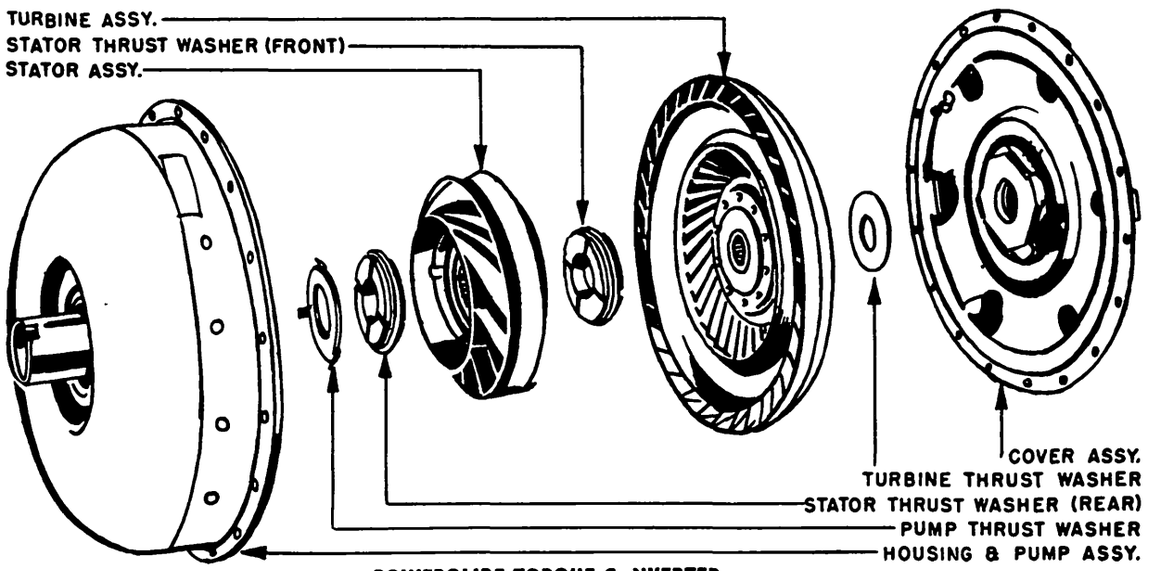
►*CAUTION—Do not attempt to remove planet carrier assembly until transmission rear bearing locating snap rings, retainer and bearing are removed.*

17) Remove the three bearing retainer screws and lockwashers and remove rear bearing retainer. Remove rear bearing locating snap ring from output shaft. Remove rear bearing from output shaft with tool J-5814, then remove bearing locating front snap ring from output shaft.

18) Working from front of transmission case, position the arrow on face of external gear of the planet carrier assembly at top center (this aligns the drive pin in output shaft with the eyebrow opening in the rear oil pump cover). Planet carrier assembly can now be removed through front of case. Do not lose rear oil pump drive pin.

►*CAUTION—Do not drive on end of output shaft.*

19) Remove reverse drum and thrust washer. Using tool J-4277, loosen reverse servo adjusting screw locknut, back off adjusting screw and remove reverse brake band assembly and reverse servo piston. Remove rear pump attaching bolts and lockwashers and remove rear pump assembly and gasket. Remove lubrication pressure relief valve from transmission case.



►***For DISASSEMBLY of above units, see OVERHAUL data following.***

OVERHAUL

►**"O" RING SEAL CAUTION:** ***These seals must be discarded when removed and a new seal installed exactly as directed below.*** "O" ring rubber seals are special design and are installed with side clearance in ring groove so that oil pressure on seal deforms the rubber and extrudes a portion of the rubber into the clearance space between the mating parts to provide a positive seal against loss of oil pressure. Seals **must not be re-used.**

"O" Ring Seal Installation—Make certain that parts are clean and that burrs and sharp edges are removed. Seal must be free of any twists (place ring on flat surface and allow it to assume natural position) and **must not be twisted during installation.** Engage one side of ring in groove, pull other side straight back until it can be fitted in groove

CONTINUED ON NEXT PAGE

POWERGLIDE TORQUE C NVERTER

POWERGLIDE (Continued)

without twisting. Work ring against trailing edge of groove (last side to enter when parts assembled) using flat tool entered between ring and leading edge of groove to move ring without twisting. Lubricate "O" ring and parts with transmission oil.

CONVERTER OVERHAUL (Unit on bench—after removal from transmission):

Disassembly: 1) Remove all converter cover attaching bolts and locknuts, use small punch to drive out split dowel pin in cover, lift cover off.

2) Remove turbine assembly, stator assembly, stator thrustwashers, and pump thrustwasher. Remove thrustwasher from turbine hub. Remove "O" ring seal from converter cover.

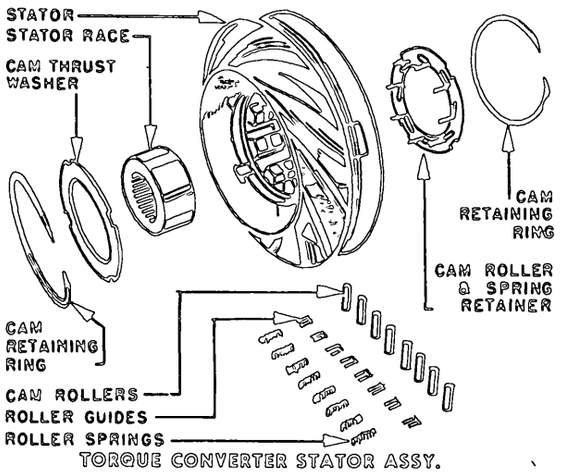
3) Remove stator race from stator assembly, remove snap ring and over-run cam retaining thrustwasher, remove cam rollers, springs, and guides (8 each).

▷*CAUTION—Use care when separating parts so that cam rollers, springs, and guides do not fall out and become lost.*

4) Remove snap ring on opposite end of stator and remove over-run cam roller and spring retainer.

▷*CAUTION—Use care to prevent damage to over-run cam and see that cam does not become disengaged from stator hub.*

Inspection: Wash all parts in cleaning solvent and dry with air. Inspect converter pump hub, turbine hub, and converter cover bushing for galling, scoring, or excessive wear. Inspect all thrustwashers for galling, scoring, or excessive wear. Check turbine vanes and stator vanes for looseness or damage. Inspect stator race and cam rollers for galling or scoring. Inspect cam springs for distortion. Check spring guides for wear or damage. Inspect over-run cam roller and spring retainer for wear or damage. If bushing in converter cover worn or damaged, install new bushing as follows:



Converter Cover Bushing Replacement: Precision type bushing, No. 3702079, furnished for field installation. Use bushing remover tool J-5381 to remove old bushing from cover. Place new bushing on pilot end of Bushing Replacer Tool J-5382 and press bushing into place in cover using an arbor press. *NOTE—Bushing is finished to size and does not require reaming.*

Reassembly: 1) Install over-run cam roller and spring retainer in stator with retainer prongs pointing toward rear of stator. *NOTE*—Stator has word "Front" cast in and stator vanes are thicker at front end.

2) Assemble cam rollers, springs, and guides in cam pockets *(CAUTION*—Guides are curved and this curvature must follow curvature of cam). Install over-run cam thrustwasher and retaining snap ring.

3) Coat stator race and loading tool J-5930 with light film of oil, place stator race on pilot end of loading tool and carefully rotate the stator over the tapered end of the loading tool and the stator race *(CAUTION*—rotate stator in clockwise or freewheeling direction and use great care not to dislodge cam rollers). Check operation of stator. Stator should turn freely in clockwise direction viewed from front end.

4) Place converter pump on bench, open end up Install thrustwasher on converter pump hub making certain that tabs are engaged in the hub flange notches. Assemble both thrustwashers on stator and install stator assembly on converter pump.

TORQUE CONVERTER STATOR ASSY.

▷*CAUTION—Make certain that cut-outs in over-run cam roller and spring retainer are facing upward or toward converter turbine.*

5) Install thrustwasher on turbine hub and assemble turbine on converter pump.

6) Install NEW "O" ring seal on converter cover, align dowel pin holes in cover with dowel pins in converter pump, install cover assembly. Install all cover attaching bolts and lockwashers and tighten evenly to 15-20 ft. lbs.

TRANSMISSION OVERHAUL: *After removal from case, overhaul sub-assemblies or units as follows:*

Planetary Unit Clutch: Place unit on bench with clutch flange upward.

Disassembly—1) Remove clutch flange retainer ring, lift out clutch flange retainer. Remove clutch flange assembly from clutch drum. Remove clutch hub thrustwasher, hub, and all clutch plates from clutch drum.

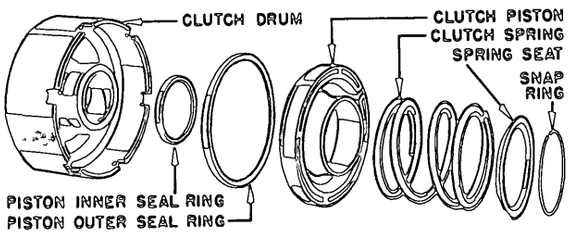
2) Place clutch drum in bench press, install spring compresion tool J-5133 and compress spring enough to remove snap ring, use KMO-410 pliers to remove snap ring. Relieve spring pressure, remove tool, lift out clutch spring seat and spring.

3) Rap clutch drum face down on a wood block to dislodge clutch piston, lift piston out, remove outer seal ring from piston and inner seal ring from clutch drum hub.

Inspection—Wash all parts in cleaning solvent and dry with air. Inspect drum brake band surface for scoring or burning, check drum bushing for scoring or excessive wear. See that clutch flange does not have any appreciable play in drum slots. Check all clutch plates for burning or galling, see that composition plates are free fit on clutch hub and that steel plates are free fit in clutch flange. Check low sun gear for nicked or burred teeth. Inspect relief valve steel ball in clutch piston and make certain that ball is free to move in hole and that orifice to rear of piston is open. If necessary, replace ball as follows:

Relief Valve Check Ball Replacement—Remove staking and remove ball. Inspect hole and ball seat and make certain it is free from burrs or nicks, see that new ball seats perfectly. Insert ball and carefully stake around edges of hole so that ball cannot fall out. *CAUTION—Ball must be free to move in hole after staking completed.*

▷*REPLACEMENT PARTS CAUTION: See Chevrolet Changes, Cautions, Corrections for clutch production changes and latest type replacement parts.*



Reassembly—1) Install new outer seal ring on clutch piston with lip of seal toward pressure side of piston *(CAUTION*—use care not to stretch seal). Install new inner seal ring on inner hub of clutch drum with lip of seal toward bottom of clutch pocket.

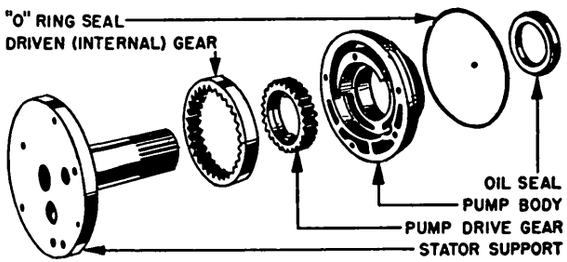
2) Lubricate inner diameter of clutch drum and both seals with transmission oil, carefully install piston in clutch drum using a piece of feeler stock to insure seating of outer seal ring in clutch drum.

3) Install clutch spring and spring seat, use tool J-5133 in an arbor press to compress spring *(CAUTION*—Make certain spring does not hang up in snap ring groove which would damage spring seat and groove), install snap ring. Release pressure, remove tool.

4) Install thrustwasher on clutch hub *(CAUTION*—see that four tabs on washer fit into slots in clutch hub), install clutch hub and thrustwasher on clutch flange with open side up. Install five steel and four composition clutch plates, starting with a steel plate and alternating plates *(NOTE*—Steel plates are "waved" and can be installed either side up). Install clutch drum assembly on clutch flange assembly, then invert entire unit, install clutch flange retainer and flange retainer ring.

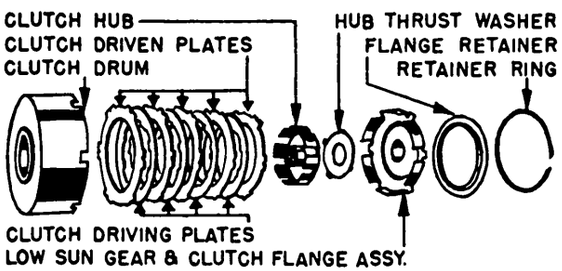
5) Check endplay using a feeler gauge inserted between clutch flange drive lug and drive slot in

POWERGLIDE CLUTCH PISTON ASSY.



drum. This endplay must not exceed .013". Adjust by installing retainer ring of correct thickness to provide correct endplay. *NOTE*—Retainer ring furnished .055", .064", .073" thick.

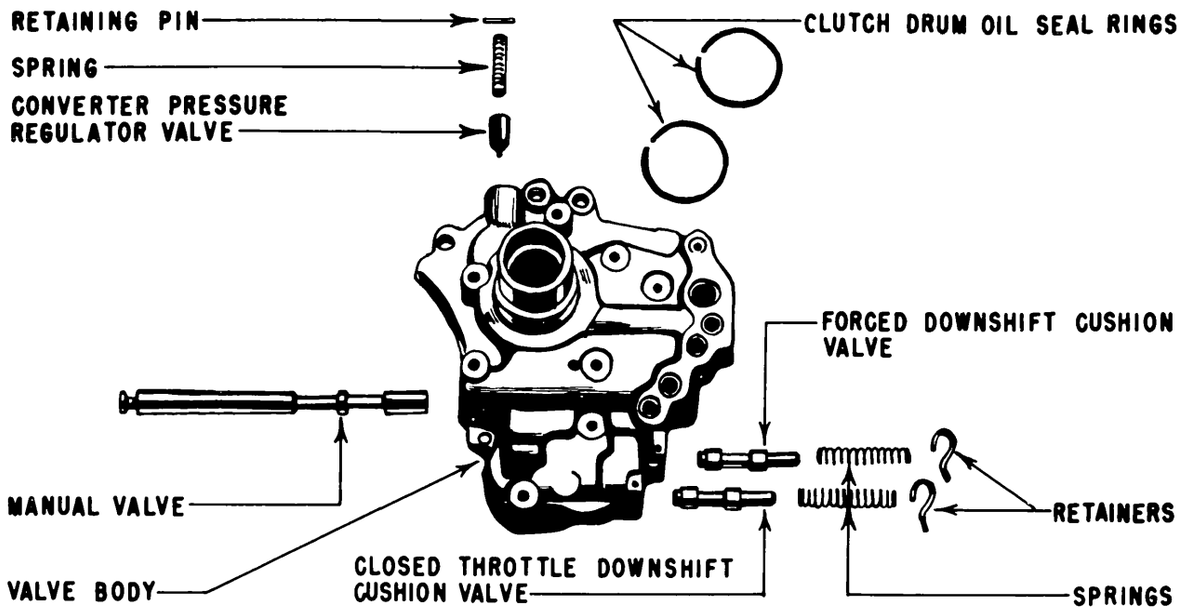
Servo Cover: Disassembly—Remove pressure regulator reverse booster valve and booster valve guide and seal assembly by holding servo cover in a stationary position and pulling on protruding end of booster valve. Remove booster valve spring and booster valve spring and seat.



CONTINUED ON NEXT PAGE

POWERGLIDE (C ntinu d)

Inspection—Inspect cover for nicks or cracks. Using a small punch or similar tool, and working through the opening in the by-pass disc seat, exert pressure on the disc to make sure disc and spring are free and that disc is seating properly *(NOTE*—Do not remove disc seat unless there is evidence of damage). Inspect pressure regulator reverse booster valve springs for distortion or damage. Inspect pressure regulator reverse booster valve for galling or scoring and make sure it operates freely in bore in guide. Inspect snap ring for loose fit in groove. Inspect bore in valve guide for galling or scoring and check seal for distortion or damage. Check valve guide bore in servo cover for roughness or burrs and make sure that valve spring and guide spring and seat will seat properly in bottom of bore.



POWERGLIDE FRONT OIL PUMP

POWERGLIDE MULTIPLE DISC CLUTCH

Lubrication By-Pass Valve Assembly Replacement—If during inspection it is evident that the lubrication by-pass valve assembly is not functioning properly, correct as follows: Using a suitable tool remove the nylon by-pass disc seat, then remove disc and spring. Inspect disc for burrs, and spring for distortion. Inspect wall of by-pass valve cavity for roughness, nicks or burrs. Insert by-pass disc in its cavity to make sure its movement is not restricted. Remove disc from cavity. Replace any part that is defective. Install by-pass spring in its cavity in servo cover and install by-pass disc. With servo cover inner surface facing upward, position a new disc seat over its opening in cavity and press into place using a socket of proper size. It should be flush to .005" below inner surface of servo cover. *CAUTION—Under no circumstances should the by-pass disc seat that was removed be re-installed.*

POWERGLIDE CONTROL VALVE ASSEMBLY

Reassembly—Install pressure regulator reverse booster valve spring seat in bottom of bore in servo cover, then install valve and valve guide springs. Assemble booster valve and valve guide with the double seat of guide toward special snap ring on valve. Place valve and guide into bore in servo cover, then with thumb and finger, press valve guide and seal into bore until guide is flush with surface of cover or slightly below. *(CAUTION—Do not press booster valve guide too far below surface of servo cover as this would place heavy spring pressure on guide).*

Front Pump: Disassembly—Slide stator support out of pump body, lift out pump gears (CAUTION—use extreme care not to drop or nick gears), remove and discard "O" ring seal.

Inspection—Wash all parts in cleaning solvent and dry with air. Inspect pump gears for wear, nicks, or other damage. Inspect pump body and pump face of stator support for nicks and scoring. Inspect pump body oil seal for excessive wear, damage, or evidence of leaking (see Oil Seal Replacement below). Inspect pump body bushing for galling or scoring, check bushing wear or clearance as directed below. Check pump gear clearances as follows:

1) Pump Gear Clearances—Install clean, dry gears in pump body, check clearances with feeler gauge:

Driven Gear Clearance—.0025-.0055" clearance between outer diameter of gear and pump body.

Driving Gear Clearance—.003-.009" clearance between end of gear teeth and crescent.

Gear End Clearance—Place scale across face of pump body, measure clearance between scale and face of gears. This clearance should be .0005-.0015".

2) Pump Body Bushing Clearance—Temporarily install pump body on converter pump hub, measure bushing-and-hub clearance with a feeler gauge. This clearance should be .0005-.0015".

3) Oil Seal Replacement—Pry out old seal, use special driver J-5386 to press new seal in place in pump body.

Reassembly—Install new "O" ring seal in pump body, oil pump gears thoroughly with transmission oil and install in pump body, install stator support through pump body and driving gear and line up attaching bolt holes.

Rear Pump: Disassembly—Take out two screws and remove pump body plate, lift out pump gears.

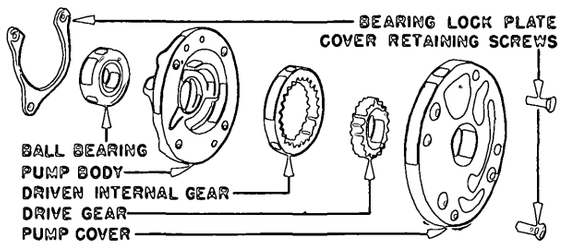
Inspection—Wash all parts in cleaning solvent, blow out all oil delivery holes, dry with air. Inspect pump body for nicks and scoring, inspect gears for wear, nicks, or other damage. Check gear clearances (clearances are same as for front pump—see Pump Gear Clearances above). Inspect rear bearing for roughness but do not remove bearing unless replacement required (see Bearing Installation below).

Pump Bearing Replacement—Remove tnree retaining capscrews, lockwashers, and lockplate. Drive old bearing out. Press new bearing in place, install lockplate and retaining screws and lockwashers, tighten screws securely.

Reassembly—Oil pump gears thoroughly with transmission oil and install in pump body. Install pump body plate and two slotted attaching screws, tighten screws to 3½-5 ft.lbs. torque.

Valve Body: ***CAUTION—Handle all valves with care to avoid damage, keep valve and spring assemblies separate to avoid confusing or interchanging parts.***

CONTINUED ON NEXT PAGE

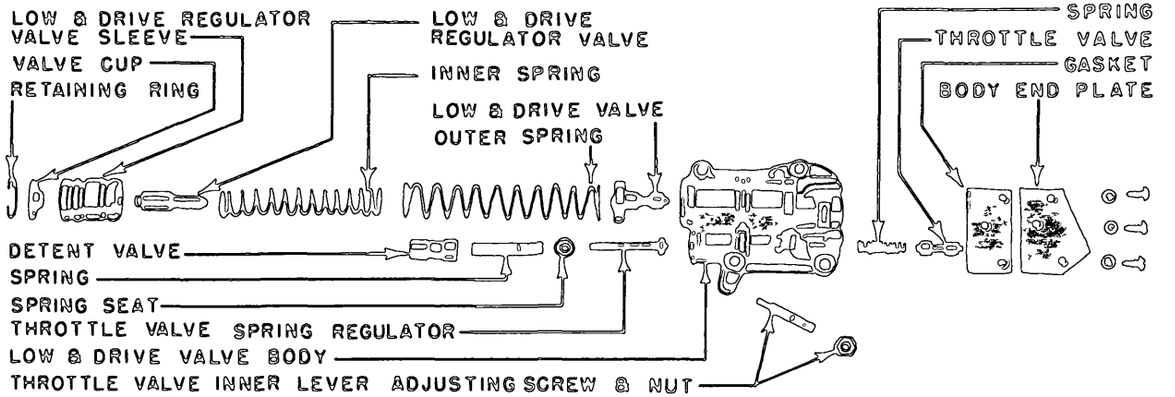


POWERGLIDE (Continued)

▷*VALVE BODY PRODUCTION CHANGES: See production and service replacement changes above.*

Disassembly—Using needle nose pliers remove the forced downshift cushion valve retainer from valve body and take cushion valve and spring from bore. Remove closed throttle downshift cushion valve in the same manner. Place valve body assembly, face down, on two wooden blocks of equal thickness and with a small pin punch drive out the converter pressure regulator valve retaining pin and remove spring and valve from bore. Remove the two clutch drum oil seal rings from oil delivery sleeve. Remove front and rear oil pump check valve from valve body.

Inspection—Wash all parts in clean solvent and blow dry with air. Do not use a rag to dry these parts. Check all springs for distortion or damage, and all valves for nicks, scores, burrs or galling, and for free movement of valves in their respective bores. Check oil seal rings for nicks or burrs and make sure that they are free in the ring grooves. Install rings in clutch drum and make sure that hooked ring ends have clearance.



Assembly—Place valve body, face down, on wood blocks. Assemble converter pressure regulator valve spring in valve and then, as an assembly, install in valve body bore. Install retaining pin. Assemble forced downshift cushion valve spring to valve and then as an assembly, install in valve body *(CAUTION*—Do not confuse the forced downshift cushion valve spring with the closed throttle downshift cushion valve spring. *The forced downshift cushion valve spring is the shorter of the two and is made of heavier gauge wire).* Assemble and install closed throttle downshift cushion valve spring in the same manner. Install front and rear oil pump check valve in valve body making sure it is flush with or below valve body face. Install the two clutch drum oil seal rings in grooves of oil delivery sleeve.

POWERGLIDE REAR OIL PUMP

Low-and-Drive Valve Body: *CAUTION—Do not disturb Throttle Valve Adjustments (two adjusting screws—one in boss on valve body and one in throttle valve inner lever) unless required by installation of new parts. THROTTLE VALVE MUST BE ADJUSTED IF THESE SETTINGS DISTURBED (see Throttle Valve Inner Lever Adjustment).*

Disassembly—1) Remove valve body-to-side cover attaching bolts and lockwashers. While holding detent valve in place, use soft hammer to carefully tap inner face of side cover until it is free of the locating pins *(CAUTION*—Use care to keep parts from falling out and being lost or damaged while performing this operation).

POWERGLIDE LOW & DRIVE VALVE ASSEMBLY

2) Withdraw detent valve, spring, spring seat, and throttle valve spring regulator assembly from valve body. Remove throttle valve spring and throttle valve.

3) Use Pliers J-5403 to remove special snap ring retaining low-and-drive regulator valve cap, then remove the valve parts as follows: Valve Cap, Sleeve and Valve (as an assembly), Inner and Outer Springs, and Valve.

4) Take out two attaching screws and remove clutch exhaust cover plate ("L" shaped strip) from the side of the valve body.

5) Take out three attaching screws and lockwashers in end plate (CAUTION—exert pressure on plate while removing screws to prevent parts flying out), remove plate, remove valve parts as follows: Clutch Exhaust Secondary Control Valve, Spring, Stop (from upper valve bore), Clutch Exhaust Primary Control Valve Spring, Stop, Valve (from center valve bore), and throttle valve and spring (NOTE—some early cars used two springs, one inside the other).

6) Remove throttle valve outer lever assembly, shield, and inner lever assembly (CAUTION—do not disturb adjusting screw in inner lever unless required by parts replacement). Remove throttle valve lever shaft seal.

Inspection—Wash all parts in cleaning solvent, blow out all passages, dry with air. Inspect all valves for nicks, burrs, scoring, or galling. Check all valves for free operation in their respective bores. Inspect all valve springs for distortion or damage. Inspect throttle lever assembly shaft for wear, scoring, or galling, see that shaft operates freely in side cover and that inner lever is tight on shaft. Inspect detent valve stop in side cover for distortion or damage, install new stop if necessary. Inspect locating pins in valve body and side cover for distortion or damage (one pin should be in side cover, other pin in valve body), replace pins if necessary. Inspect mating surfaces of valve body and side cover and make certain they are free of nicks or burrs.

Reassembly—1) Install low-and-drive valve in body bore (CAUTION—valve must be guided to prevent damage to the bore—use a piece of brake tubing inserted in valve shank bore at rear of valve body, engage nib on valve in end of tubing, move valve into position slowly). Install remaining low-and-drive valve parts in reverse order of disassembly (install regulator valve and cap on valve sleeve first and then install in valve bore as an assembly making certain inner spring is seated on sleeve). Compress assembly in valve bore while installing special snap ring, make certain ring properly seated in groove in valve body.

2) Install clutch exhaust secondary and primary valve assemblies (CAUTION—use care not to confuse these valve parts—primary control valve stop is the longer of the two stops, and primary control valve spring is the shorter of the two springs). Install throttle valve spring and valve in valve body, then install end plate and hold plate in position while tightening end plate attaching screws, tighten these screws to 2½-3½ ft.lbs. torque.

3) Install throttle valve spring regulator assembly in valve body and see that it is seated on throttle valve spring. Install detent valve spring seat, valve spring, and valve (thread pin of the throttle valve spring regulator assembly through the opening in the spring seat and valve).

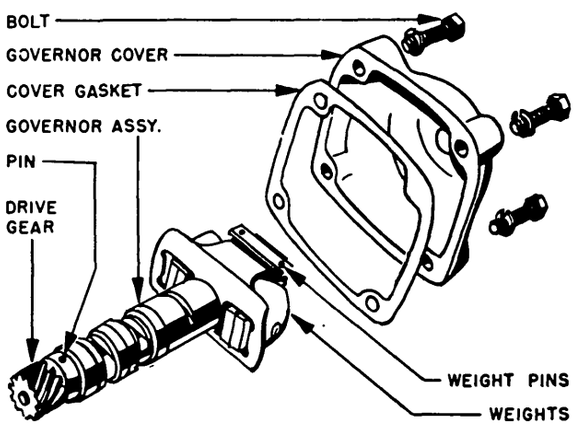
4) Clamp side cover in a vise (face upward), align locating pin in side cover with hole in valve body, exert pressure on valve body to keep locating pin in the hole and at the same time compress detent valve in valve body bore and rotate valve body counter-clockwise until the locating pin in the valve body enters the locating hole in the side cover (CAUTION—make certain face of detent valve is resting against stop pin in side cover). Install attaching bolts and lockwashers, tighten bolts evenly to 3½-5 ft.lbs. torque.

5) Install throttle valve inner lever assembly in side cover, install new seal on shaft and into counterbore in cover, install shield. Install outer lever assembly on inner lever shaft, install outer lever attaching bolt from underside, tighten nut securely.

If lever adjustments disturbed during overhaul, readjust throttle valve as follows:

Throttle Valve Inner Lever Adjustment: Rotate throttle valve inner lever until it just contacts face of the detent valve. Hold lever in this position and turn adjusting screw until it just contacts flat surface of

CONTINUED ON NEXT PAGE



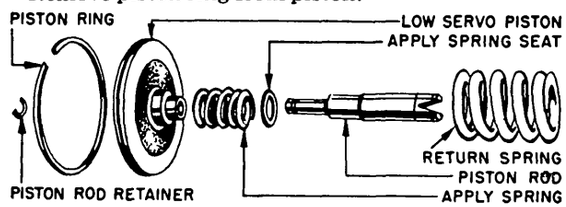
POWERGLIDE (C ntinu d)

the step in the lever. Back off one complete turn and lock in this position by tightening adjusting screw lock nut securely.

Governor: ***CAUTION—The only parts serviced for replacement are the governor assembly (complete), and driven gear. Governor should not require disassembly except for cleaning and removal of foreign material causing improper operation. See "Governor Driven Gear Replacement" below for disassembly & reassembly.***

Governor Driven Gear Replacement: A unit package containing a governor driven gear and pin, and two governor weight pins is available for service replacement. ***(CAUTION—The 1955 driven gear is not interchangeable with gears on previous models).*** Install new gear and pins in the following manner:

Installation—Cut off ends of governor weight pins and remove weights and governor valve. ***(NOTE***—Carefully protect governor valve to prevent damage. Weights are interchangeable from side to side). Drive out governor gear retainer split pin using a small punch. Support governor on 3/16" plates installed in exhaust slots of governor sleeve, place in arbor press and with a long punch, press gear out of sleeve. Carefully clean governor sleeve of chips and reinstall in arbor press. Position new gear in sleeve and with a suitable socket, press gear into sleeve until nearly seated. Then remove any chips that may have shaved off the gear hub and press gear in until it bottoms on shoulder. ***(CAUTION—It is important that a socket be used to prevent damage to thrust button on end of gear).*** Drill a new hole through sleeve and gear locating it 90° from existing hole, using a No. 24 (.152") drill. Install split pin retainer. Wash governor assembly thoroughly. Install governor valve and make sure that it operates freely. Install governor valve in bore of governor sleeve. Align governor weight pin holes in the governor thrust cap, governor weight assemblies and governor sleeve and install new pins. Crimp both pins to prevent them becoming dislodged. Check governor weight assemblies for free operation on pins.



GOVERNOR ASSEMBLY

Low Servo Piston: Disassembly—Place piston assembly in bench press supporting notched end of shaft on wooden block, install tool J-3377 (same tool used for Reverse Servo) on top of piston, compress spring sufficiently to enable rod retainer "C" washer to be removed from end of rod, relieve spring pressure, remove piston, spring, and washer from piston rod. Remove piston ring from piston.

Inspection—Wash all parts in cleaning solvent, dry with air. Inspect all parts for wear or damage. Install piston ring in low piston bore and check ring gap with feeler gauge. Gap should be .005-.010".

Reassembly—Assemble all parts on piston rod, compress spring in bench press and install piston rod retainer making certain that it is properly seated in groove. ***CAUTION—Spring pressure is 150 lbs. and assembly must be handled carefully.***

Reverse Servo Piston: Disassembly—Place assembly in bench press with spring end up, install tool J-3377 on spring retainer, compress spring sufficiently to enable retainer key locks to be removed, relieve spring pressure, lift off retainer, springs, and piston. Remove piston ring from piston.

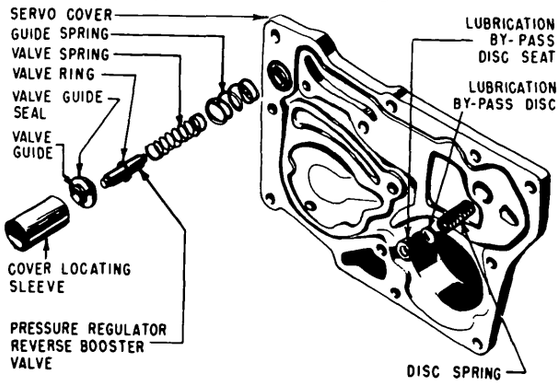
POWERGLIDE LOW SERVO ASSY.

Inspection—Wash all parts in cleaning solvent, dry with air. Inspect all parts for wear or damage. Install piston ring in reverse piston bore and check ring gap with feeler gauge. Gap should be .005-.010".

Reassembly—Assemble all parts on piston rod, compress spring in bench press and install retainer locks, make certain locks seated properly in rod groove.

Planet Carrier Assembly: ***Should not be disassembled unless inspection below indicates overhaul required. See Planet Carrier Overhaul below.***

►*PLANET REVERSE RING GEAR AND DRUM ASSEMBLY PRODUCTION CHANGE (to accommodate a new .020" steel thrust washer):* Beginning with transmission serial number C-128-D, a new steel thrust washer is used between planet carrier and reverse gear and drum to prevent galling of thrust surfaces. A service package, Part No. 3721564, consisting of a Planet Reverse Ring & Drum Assembly, Part No. 3720472, and an Output Shaft Thrust Washer, Part No. 3720474, is available for service replacement on 1953-54 & Early 1955 cars.



Inspection—Wash in cleaning solvent, blow out all passages, dry with air. Inspect all gear teeth for nicks, scoring, or other damage. Check end clearance of planetary pinions with feeler gauge inserted between ends of pinion and thrustwasher. This clearance should be .006-.030". Check reverse sun gear rear thrustwasher for wear or damage. Inspect drum bushing for wear, scoring, or damage; inspect outer diameter of drum for scoring or burning. Check output shaft bearing surfaces for wear, nicks, or scoring. Check input pilot bushing for wear or scoring.

Planet Carrier Overhaul: ***If inspection (above) indicates that parts require replacement, proceed as follows:***

Disassembly—Place assembly in holding fixture or clamp in a vise with front end upward. Mark each pinion shaft and also mark planet carrier (use prick punch or other means) so that shafts can be re-installed in same position ***(CAUTION***—pinion shafts are selective fit in carrier and location must not be changed). Then proceed as follows:

1) Remove pinion shaft lockplate screws, rotate plate counter-clockwise until it is free and remove the plate.

2) Starting with one short planet pinion, use a soft steel drift to drive on lower end of pinion shaft until shaft raised above the press-fit area of the output shaft flange, then insert tool J-4599 (one piece only —second piece of tool set used for reassembly) into short planet pinion from lower end and push shaft out until tool is centered in the pinion and shaft is removed. Remove short planet pinion from assembly. Remove tool from pinion, remove needle bearings and needle bearing spacer ***(CAUTION***—use care not to lose any of the needle bearings).

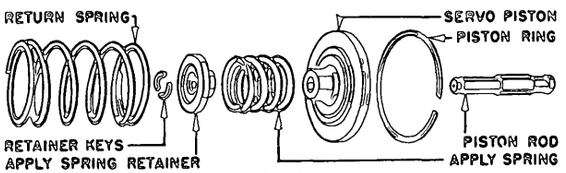
POWERGLIDE SERVO COVER ASSEMBLY

3) Remove **adjacent** long planet pinion (paired to the just-removed short pinion by using same thrustwashers) by repeating procedure in step (2) above. Then remove the pinion upper and lower thrustwashers.

4) Remove all remaining planet pinions **in pairs** (short pinion first, followed by long pinion) by following procedures in steps (2) and (3) above.

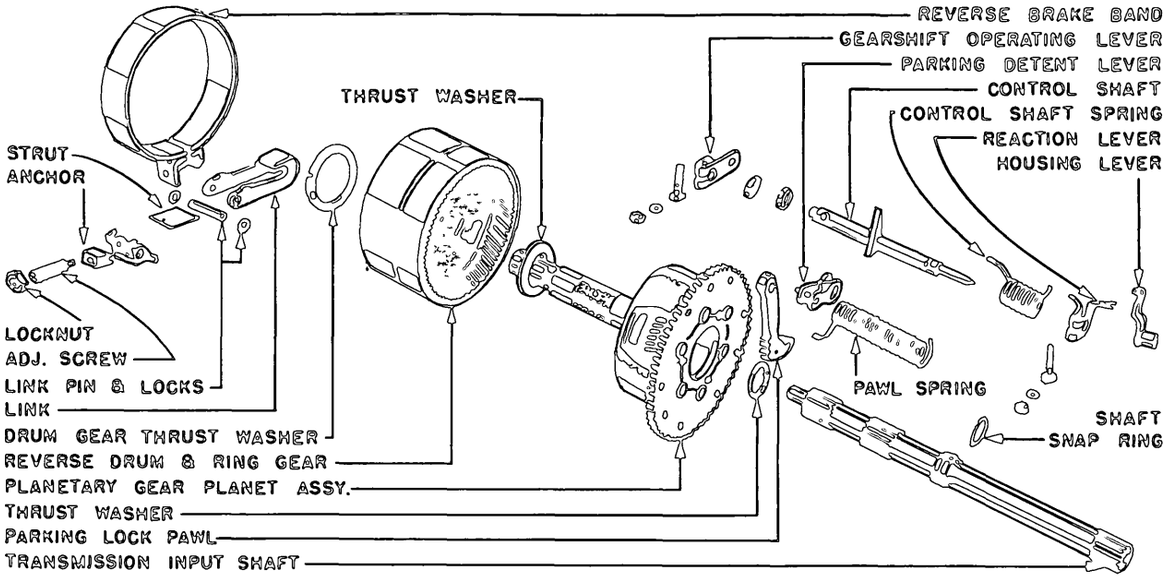
5) Remove reverse sun gear and sun gear thrustwasher.

Inspection—Wash all parts in cleaning solvent and dry with air. Inspect all pinion gears and reverse sun gear for nicked or otherwise damaged teeth, inspect all thrustwashers for wear, nicks, or scores. Inspect needle bearings for wear and replace **all** needle bearings if worn excessively.



Reassembly—***CAUTION—Pinion shafts must be reinstalled in accordance with marks made before disassembly (shaft is selective fit in particular hole in carrier).*** Assemble and install parts as follows:

1) Install tool J-4599 in one long planet pinion, assemble needle bearing spacer and needle bearings in pinion (20 at each end) using cup grease to hold needle bearings in position.



CONTINUED ON NEXT PAGE

POWERGLIDE (Continued)

2) Install pinion assembly in planet carrier with tool centered in assembly and with thrustwasher at each end of pinion. *NOTE*—Long pinions are located opposite closed portion of carrier, short pinions are located opposite carrier openings. Feed the second part of tool J-4599 in from the top of the planet carrier *(CAUTION*—make certain tool picks up thrustwasher) and push first part of tool down and out at the lower end *(CAUTION*—make certain this tool picks up thrustwasher as it is pushed down). Lubricate correct pinion shaft (see Reassembly Caution above) and install it from top pushing the assembling tools out ahead of it. Turn shaft so that slot in upper end faces toward center of assembly, tap shaft down with a brass or soft steel drift until lower end is flush with lower face of carrier.

POWERGLIDE REVERSE SERVO ASSY.

POWERGLIDE PLANET CARRIER, REVERSE BAND, & PARKING LOCK

3) Assemble and install adjacent short planet pinion (paired with just-installed long planet pinion by using same thrustwashers) by repeating procedure in steps (1) and (2) above.
4) Install reverse sun gear thrustwasher and reverse sun gear.
5) Install all remaining planet pinions in pairs (long pinion first, followed by short pinion) by following the procedure in steps (1), (2), (3) above.
6) Check end clearance of planet pinions using feeler gauge inserted between end of pinion and thrustwasher. This clearance should be .006-.030".
7) Install pinion shaft lock plate with extended portions in line with pinion shaft slots, rotate plate clockwise until plate locks all pinion shafts and attaching screw holes line up. Install lock plate attaching screws and tighten to 2½-3 ft.lbs.

Imput Shaft: Inspect shaft splines for wear, nicks, or other damage. Check spline fit in clutch hub, reverse sun gear, and converter hub. Inspect oil seal ring for wear and free fit in groove, remove ring (compress one end, push other end outward to free locked ends) and install ring in valve body bore to make certain hooked ends have clearance, then reinstall ring on shaft. Check snap ring in groove at forward end of shaft (this ring first used in 1953 transmissions and prevents shaft floating forward), replace if worn or damaged using snap ring pliers KMO-410.

Transmission Case & Rear Bushing: Check case for cracks, inspect rear bushing for wear or damage and replace if necessary.

Bushing Replacement—Place transmission case in an arbor press with rear end up. Using a cape chisel, cut bushing and remove from bore in case. Install rear bearing in its bore in rear oil pump assembly and install rear oil pump in case to serve as a pilot when installing new bushing. Place transmission case in an arbor press with front end up. Place new bushing on bushing installer J-4276, with the square end of bushing against shoulder of installer. Insert in case, entering pilot of tool into rear bearing, and press bushing into place. Bushing is precision type and does not require reaming.

Low & Reverse Brake Bands: Inspect bands for wear, cracks, and scored or burnt lining. Lining is bonded to band. Inspect linkage for wear.

REASSEMBLY

AFTER ALL MAJOR UNITS REASSEMBLED (See Overhaul above), install units as directed below using ALL NEW GASKETS AND SEALS and tightening all parts evenly to SPECIFIED TORQUES.

CONVERTER HOUSING ASSEMBLY: *Install units:*

Valve Body: First install suction screen in oil sump *(CAUTION*—screen must be thoroughly cleaned), see that sealing ring is in place. Install two ¼—20 x 3½" guide pins (part of Pilot Stud Set J-3387) in two valve body attaching bolt holes, place new valve body gasket in position over guide pins, install valve body assembly. Install all attaching bolts *(CAUTION*—lower left bolt over accumulator bore is special self-locking type and must be installed in this position), tighten all bolts evenly in a criss-cross pattern to 7½-10 ft.lbs. torque. Check manual valve and pressure regulator valve for free operation after all bolts tightened.

Front Pump: Align holes in stator support with mounting holes in pump body, install two ¼—20 x 3½" guide pins (part of Pilot Stud Set J-3387) in pump mounting holes, use Driver J-4263-5 to install pump in converter housing *(CAUTION*—line up suction and oil delivery holes on left side of pump). Install five self-locking bolts through valve body and into pump, tighten all bolts evenly to 7½-10 ft.lbs. torque. *CAUTION—Check pressure regulator valve for free operation after bolts tightened and make certain that pump operates freely.*

Low-and-Drive Valve Body: Install two 5/16—18 x 3" guide pins (part of Pilot Stud Set J-3387) in two valve body mounting bolt holes on left side of converter housing, place new gasket in position over guide pins, install valve body assembly. Install attaching bolts and lockwashers, tighten bolts evenly to 12½-15 ft.lbs. torque.

TRANSMISSION CASE ASSEMBLY: Install units:

Rear Pump: Install two 5/16—18 x 3" guide pins (part of Pilot Stud Set J-3387) in pump attaching bolt holes, place new gasket in position over guide pins, install pump *(CAUTION*—align oil suction and delivery holes), tighten pump mounting bolts evenly to 12½-15 ft.lbs. torque.

Lubrication Pressure Relief Valve: Make certain that valve is clean and openings free from obstructions, see that valve disc and spring operate freely. Install relief valve in mounting hole in rear of transmission case and tighten securely.

Reverse Servo Piston, Band, & Drum: Compress piston ring with Ring Compressor J-3365, install servo piston in case with notch in shaft toward front of case. Install reverse brake band and strut assembly with thin end of band away from piston, thread adjusting screw in until it indexes with hole in anchor. Install bronze thrustwasher on reverse drum hub, install drum in case and into brake band. *DO NOT adjust band at this point.*

Planet Carrier Assembly: Rotate rear pump drive slot to top of pump. Fill drive pin hole in output shaft of planet carrier with cup grease and install drive pin. *(CAUTION—Make sure that drive pin does not fall out of shaft during assembly).* Install planet carrier assembly in drum positioning the arrow on face

CONTINUED ON NEXT PAGE

POWERGLIDE (Continued)

of the external gear of planet carrier assembly at top center *(NOTE*—On late 1955 transmissions a steel thrust washer is used between planet carrier and reverse ring gear & drum. *See "Planet Reverse Ring Gear and Drum Assembly Production Change" above).* Install rear bearing locating front snap ring in its groove in output shaft and install rear bearing using tool J-5814 *(NOTE*—Groove in outer diameter of rear bearing should be to rear of transmission). Install rear bearing retainer in groove in outer diameter of rear bearing and attach to rear oil pump with screws and lockwashers. Tighten to 7-8½ lbs. Install rear bearing rear locating snap ring in its groove in output shaft. Using tool J-5814, install speedometer gear on output shaft. Center raised ground surface of output shaft so that it will mesh properly with the speedometer driven gear. Install new "O" ring seal on speedometer driven gear fitting. Assemble driven gear in fitting and then install as an assembly in bore in extension. Install retainer, attaching screw and lockwasher. Tighten to 3½-5 ft. lbs.

Reverse Band Adjustment: Adjust band at this point. *See BAND ADJUSTMENT.*

Transmission Endplay Check & Adjustment: After planet carrier assembly installed in case, the correct thickness of the low sun gear-to-reverse sun gear thrustwasher must be determined for the correct transmission endplay of .007-.035" as follows:

(1) Use Tool J-4260 to measure distance from face of transmission case flange to face of reverse sun gear in planetary unit (place tool bar against case flange, extend tool stem until it contacts gear face), tighten thumbscrew to retain this tool setting.
(2) Install bronze thrustwasher and clutch assembly temporarily on oil delivery sleeve.
(3) Without disturbing tool setting obtained in step 1 (above), place .120" steel washer over tool pilot (short plug on tool bar), install tool over clutch assembly with tool pilot entered in low sun gear and tool stem against gasket on rear face of housing. Use feeler gauge to measure clearance between face of low sun gear and steel washer on tool pilot. If clearance not within .007-.035", repeat this procedure with .095" or .145" steel washer on tool pilot.
(4) When correct clearance of .007-.035" secured in step 3 (above), note thickness of steel washer used on tool and select bronze thrustwasher of same thickness for installation on input shaft splines at final installation (below). Remove clutch assembly and thrustwasher from oil delivery tube.

▷**Thrustwasher Note**—This bronze thrustwasher furnished in three thicknesses as follows: Part No. 3694467—.095", No. 3694468—.120", No. 3694469—.145".

Parking Lock Mechanism: Install parking lock lever shaft assembly in case, install seal over end of parking lock lever shaft and into counterbore in case with lip seal toward inside of case. Install flat washer and parking lock lever on end of shaft, push lever on shaft for clearance of .000-.010" between lever and washer, tighten clampscrew to 8-12 ft.lbs. Install parking lock pawl over pawl support rod, install parking lock pawl spring, wind up pawl spring (tool J-3383) until spring catches on case.

Input Shaft & Clutch Assembly: Install input shaft in clutch unit. Install bronze thrustwasher selected in "Transmission Endplay Check & Adjustment" (above) on reverse sun gear splines of input shaft *(CAUTION*—flat side of washer must be toward reverse sun gear). Install assembly in case indexing input shaft pilot with pilot in output shaft and mesh low sun gear with short planetary pinions.

Low Servo Piston & Band Assembly: Install release spring on servo piston rod, use Ring Compressor J-3365 to compress piston ring and install assembly in transmission case. Install low brake band over the drum. Install apply strut guide spring over piston rod, engage apply strut in piston rod slot and engage opposite end of strut in the band. Engage anchor strut assembly in band groove and locate opposite end of anchor over the adjusting screw. *DO NOT adjust the band at this point.*

Governor: Install governor assembly in bore in transmission case *(CAUTION*—Governor must be allowed to rotate counter-clockwise as gear teeth mesh and care must be taken not to damage gear teeth). Install two 5/16—18 x 3" guide pins (part of Pilot Stud Set J-3387) in governor cover mounting holes, place new gasket in position over guide pins, install governor cover, attaching bolts and lockwashers. Tighten cover bolts evenly to 6½-8½ ft.lbs. torque.

Extension Housing: Position new "O" ring seal on transmission extension. Then carefully install extension on transmission case. Install attaching capscrews and lockwashers and tighten to 12-15 ft. lbs. Install transmission extension oil seal using tool J-5154.

TRANSMISSION & CONVERTER HOUSING ASSEMBLY:
1) Install manual valve in valve body and manual valve inner lever in converter housing. Index lever pin with pick-up slot in valve, set manual valve so that it protrudes 1 11/16" out from face of valve body. This places valve in Reverse position.
2) Install new valve body-to-transmission case gasket.

▷*CAUTION:* Two different valve body-to-case gaskets are used with the early and late type valve bodies. THESE GASKETS ARE NOT INTERCHANGEABLE. *See "Control Valve & Gasket Production Change and Service Replacement Note" above for control valve identification and gasket differences.*

3) Place transmission manual valve lever in top detent position *(NOTE*—this is Reverse position and will align reaction lever so that it will index with manual drive inner lever in converter housing).
4) Place clutch drum thrustwaher in position on oil delivery sleeve.
5) Install two ⅜—16 x 3¾" guide pins (part of Pilot Stud Set J-3387) in two opposite converter housing mounting bolt holes, carefully bring transmission case and converter housing together making certain that reaction lever indexes properly with manual valve inner lever. Install all case-to-housing bolts and tighten evenly to 25-30 ft.lbs. Install special self-locking bolt through front face of converter housing and tighten this bolt to 25-30 ft.lbs.
6) Install two 5/16—18 x 3" guide pins (part of Pilot Stud Set J-3387) in two servo cover attaching bolt holes, place new gasket in position over guide pins. Install pressure regulator valve and inner and outer valve springs (see Note below) through servo and into case, install reverse servo return spring. Install servo cover over guide pins *(CAUTION*—see that pressure regulator springs and reverse servo spring seat properly in pockets in cover), maintain pressure on cover while installing and tightening cover bolts, tighten bolts evenly to 12½-15 ft.lbs.
7) Adjust Low Servo Band. *See Band Adjustment.*
8) Install converter assembly in converter housing making certain that front pump drive lugs aligned with slots in converter pump hub. Install converter holding tool J-5384 using one housing bolt to hold tool (tool will prevent converter falling out while being installed on engine).
9) Check and adjust position of throttle valve outer lever. *See Throttle Linkage Adjustment.*

INSTALLATION IN CAR

TRANSMISSION ASSEMBLY INSTALLATION: 1) Install assembly in handling fixture on hydraulic jack and roll into position under car. Raise transmission until converter housing is in approximate alignment with flywheel housing.
2) Remove converter assembly holding tool from converter housing. Then carefully align "X" mark on converter cover with "X" mark on flywheel.

▷*CAUTION—After removing converter holding tool be careful that converter does not move forward causing disengagement of the pump hub drive slots from lugs of the front pump drive gear.*

3) Install one 5/16"—24 guide pin in converter cover. Rotate converter assembly until guide pin is in alignment with opening in flywheel housing. Maneuver transmission assembly until converter housing-to-flywheel housing bolt holes are in alignment and the flywheel pilot enters flywheel.
4) Install all but the uppermost three converter housing-to-flywheel housing attaching bolts. Through the opening in flywheel housing, remove guide pin from converter cover and install three flywheel-to-converter bolts, rotating flywheel as necessary. Tighten bolts to 25-30 ft. lbs.
5) Install filler tube and measuring dipstick. Install flywheel inspection hole cover. Install rear engine mountings (both sides). Remove engine support bar or cradle. Disconnect hydraulic jack handling fixture from transmission and remove jack.
6) On V8 cars, install starting motor. On all models, connect oil cooler lines and engage them in retaining clip on right side cover. Connect throttle valve control rod to throttle valve control outer lever and manual shift control rod (long rod) to bellcrank. On V8 cars, install breather pipe in cylinder block.
7) Engage internal splines of front yoke of front universal joint with external splines of transmission output shaft. Then slide front universal joint and propeller shaft as an assembly forward enough to connect rear universal joint.
8) Connect speedometer cable to transmission. On V8 cars, connect exhaust pipe to exhaust crossover pipe. On 6 Cyl. cars, connect exhaust pipe to exhaust manifold. Connect muffler to muffler support.
9) Lower car to floor and install the three remaining upper converter housing-to-flywheel housing attaching bolts through opening in toe-pan. Restore floor mat to its original position. Install spark plugs on all models. On V8 cars, connect battery ground strap and wires to starter solenoid.
10) Fill transmission with Automatic Transmission Fluid Type A. *See "Lubrication" above.*

POWERFLITE (CHRYSLER DE SOTO, DODGE, PLYMOUTH)

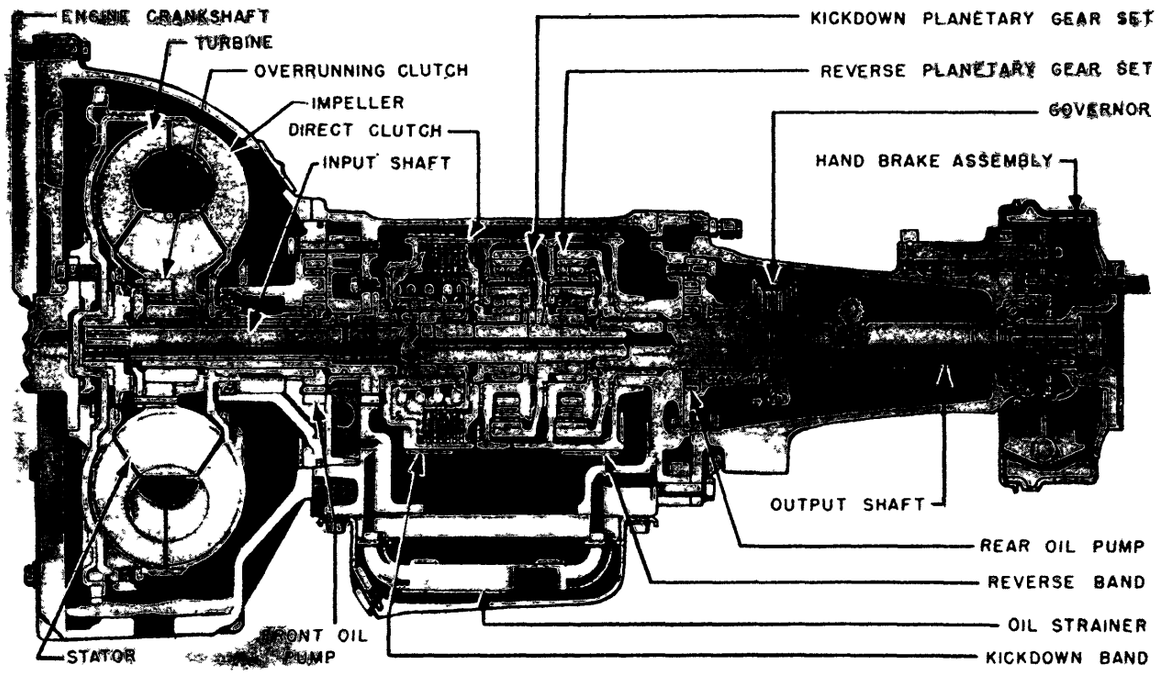
Chrysler, Desoto, Dodge, Plymouth (1956).

►CHANGES, CAUTIONS, CORRECTIONS

►*PUSHING CAR TO START ENGINE:* Pushing is recommended rather than towing. With the "N" (Neutral) button pushed in, turn the key to "ON" position. When car reaches a speed of approximately 25 MPH, push in the "L" (Low) button. This will allow the transmission to crank the engine.

►*TOWING POWERFLITE CARS:* Following procedure recommended.

Transmission Inoperative – Disconnect propeller shaft or tow car with rear end raised.



Transmission Operating – The car may be safely towed at moderate speeds with the "N" (Neutral) button pushed in. For long distance towing (over 100 miles), the propeller shaft should be removed.

►*1956 NEUTRAL STARTER SWITCH PRODUCTION CHANGE:* On later production cars, the neutral starter switch contact plunger spring tension has been reduced (the effort required to depress spring on the new switch is 8 ozs., at .030" depression). To determine if switch is later type, check with finger pressure. An "O" ring seal and cupped washer is used with the new switch and the transmission case has been changed by having a 60° (included angle) countersink in switch assembly hole. The later type switch must be used only on transmission cases having the angle countersink in switch hole. *NOTE* – The "O" ring seal and washer may be used on early type switches in transmission case not having the countersink provided the tolerance stack-up permits proper adjustment of the switch without exceeding 75 ft. lbs. torque, in which case the original washer should be used. *See "Neutral Starter Switch Adjustment" under "Manual Cable Adjustment" below.*

►*1956 POWERFLITE TRANSMISSION DRAIN PLUG ELIMINATED:* On later production cars, the drain plug has been eliminated. When necessary to drain the transmission, remove the filler tube connector at the oil pan.

►*1956 POWERFLITE DATE CODE NOTE:* Transmission building date is indicated by a code stamped on lower right side of case immediately after the transmission part number. Months are indicated by letters beginning with "A" (January), date and year by number.

►*1956 POWERFLITE PLANET PINION CARRIER (AND RELATED PARTS) PRODUCTION CHANGE:* On transmissions having a date code C-7-56 and later, aluminum planet pinion carriers are being used. The following parts are not interchangeable with previous transmissions: Kick-down Planet Pinion Carrier, Reverse Planet Pinion Carrier, Kick-down Annulus Gear, Reverse Annulus Gear, and Planet Pinion Carrier Housing. The Kick-down Annulus Gear used with aluminum pinion carriers can be identified by ¼" letters "A-L" stamped on flange. The later type Planet Pinion Carrier Housing is identified by a flat rear surface on housing (early type had a ridge machined on the rear, outer large diameter of the assembly). Dimensions of Reverse Annulus Gear are different from early type, and there are no special identifying marks on gear.

POWERFLITE TRANSMISSION (SECTIONAL VIEW)

►*1956 PLYMOUTH POWERFLITE TORQUE CONVERTER HOUSING & ADAPTER PLATE PRODUCTION CHANGE:* Dimensions have been changed on torque converter housings and adapter plates starting with Engine No. P-28-56973 and P-29-151148. Early and late type housings and adapters are not interchangeable The following table indicates dimensions for early and late types.

Part	Early	Late
Adapter Plate	① 3/4" thick	② 1 1/8" thick
Housing	③ 7 19/64"	③ 6 15/16"

① – Part No. 1613713 (P-28); 1613712 (P-29).
② – Part No. 1630850 (P-28); 1630841 (P-29).
③ – Measured from face-to-face.

►*1956 POWERFLITE THROTTLE VALVE AND SPRING PRODUCTION CHANGE (To Eliminate Valve Buzz or Flutter on Downshift):* A new throttle valve and spring (Service Pkg. No. 1752242) is being used in production and is available for service replacement. A chamfer on the reaction surface of valve, with a heavier valve spring eliminates valve buzz or flutter on downshift.

►*1956 POWERFLITE FRONT PUMP DRIVE SLEEVE & SEAL PRODUCTION CHANGE AND SERVICE REPLACEMENT NOTE:* A new front pump drive sleeve, Part No. 1630808, and drive sleeve seal, Part No. 1630809 is being used in production on transmission having a date code of A-23-57 and later (a letter "E" after the transmission part number also identifies this change). The later type "O" ring seal replaces the former metallic seal ring, and must be used in conjunction with the later type sleeve. It is preferable to use the early type drive sleeve and seal on transmissions built before the above date code.

►*1956 DESOTO ENGINE VALVE BENDING IN SERVICE (On cars having transmissions with date codes before B-9-56):* Valve bending results when the transmission downshifts at high speeds (above approximately 75 MPH). At the instant the downshift occurs, engine RPM is momentarily increased to a point where valve "pump-up" is encountered with consequent valve bending. To correct this condition, remove the rear pump housing and enlarge the .090" governor oil feed hole to 5/32" (governor oil feed hole is located in the smaller of the two depressions at ends of baffle under the pump gears). Check governor weight and valve for scoring and make sure governor has free movement after assembly. Adjust and correct push button control and manual shift lever. Check engine valve spring tension and replace springs not within specifications.

►*1956 POWERFLITE CLUTCH PLATE REPLACEMENT CAUTION:* The number of clutch plates and discs have been changed on some models. When replacing plates and discs, the same number should be used for replacement as those originally installed in transmission.

►*1956 DESOTO HISSING OR WHISTLING NOISE CORRECTION (In neutral or in forward driving ranges up to approximately 30 MPH):* Remove and disassemble

CONTINUED ON NEXT PAGE

POWERFLITE (C nt.)

valve body and transfer plate assembly. Remove rear pump check valve (one with small orifice in center) and discard the valve. Replace with a FRONT PUMP check valve in which a .030" square notch has been filed in the ridge on face of valve (a 32 tooth hacksaw blade can also be used to cut the notch). Use extreme care that only one notch is cut in the valve.

►*PUSH BUTTON CONTROL ASSEMBLY PRODUCTION CHANGE:* Early type control with locking pawl replaced in production with a new type having slide locks attached to slides, and no locking pawl. The new control unit prevents the possibility of releasing any one button until a newly selected gear range push button is completely engaged. The later type unit is identified by the absence of the locking pawl, and the slide locks attached to slides. Both units are interchangeable and have the same part number.

DESCRIPTION

DESCRIPTION: PowerFlite transmission consists of a torque converter and a two-speed hydraulically controlled planetary gear type automatic transmission of the same design as used on 1955 models. *See "PowerFlite Transmission" in 1955 Annual Data or later Manual edition.*

OPERATION

OPERATION: The PowerFlite transmission operates in the same manner as in 1955 models. *See "PowerFlite Transmission in 1955 Annual Data or later Manual edition.*

LUBRICATION

►*1956 POWERFLITE OIL LEVEL CHANGE:* With transmission cold (room temperature 70° F), oil level should be between the "low" mark and bottom of oil level indicator. With transmission hot (after normal highway driving), oil level should be 1/2" below full mark. These oil level specifications supersede previous specifications.

Checking Fluid Level (Engine Cold) – Start engine, set parking brake, and move selector buttons through all ranges. Allow engine to run approximately two minutes. Push in "N" (Neutral) button. Check oil level with engine idling. The oil level should be not higher than ½" above "low" mark on dipstick, and it should not be below the "low" mark.

Checking Fluid Level (Engine Hot) – With engine idling, the oil level should not be above the "full" mark on dipstick, after car has been driven sufficiently to bring engine and transmission up to operating temperature. If oil is slightly below desired level indicated in the above instructions, add a little oil at a time and recheck. Do not add a full quart unless checks indicate that it is needed.

Draining & Refilling (Every 20,000 Miles) – Remove transmission oil drain plug (If oil pan does not have a drain plug, remove connector at bottom of filler tube), and allow transmission to drain. Remove access plate from bottom of torque converter housing and rotate torque converter until drain plug is accessible. Drain torque converter. Install drain plugs (reconnect connector at bottom of filler tube) and tighten securely. Install access plate on housing. Apply parking brake. Add five quarts of Automatic Transmission Fluid Type "A", through transmission oil pan filler tube. Start engine and add approximately four quarts more while engine is running. Allow engine to idle for two minutes. Move push buttons through all ranges. Push in "N" (Neutral) button and add sufficient fluid to bring level to "low" mark on dipstick (all cars except DeSoto), to a point between "low" mark and bottom of dipstick (DeSoto), to a point between "low" mark and bottom of dipstick (DeSoto, See "Production Changes" above). Do not overfill transmission.

LINKAGE ADJUSTMENT

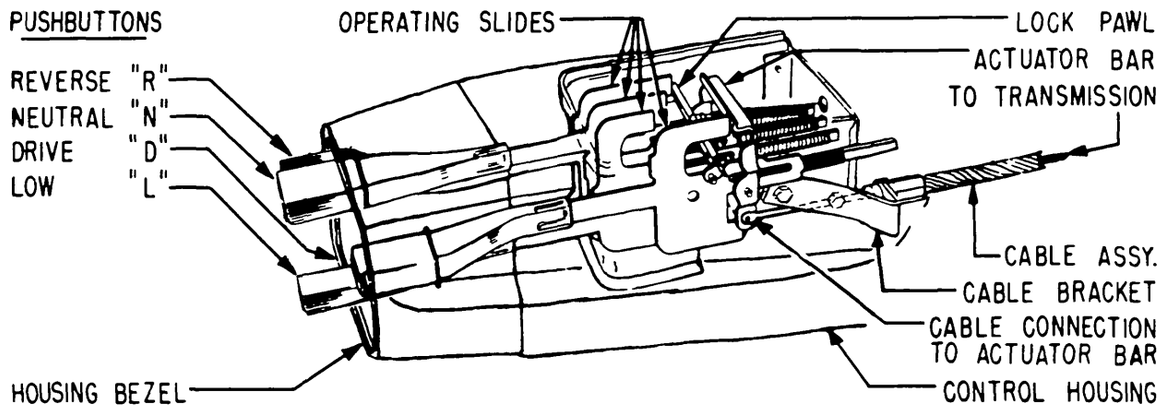
►*THROTTLE LINKAGE ADJUSTMENT NOTE: See "Carburetor" on car model pages.*

►*PUSH BUTTON CONTROL ASSEMBLY PRODUCTION CHANGE: Two types of control units have been used in production. See "Push Button Control Assembly Production Change" above.*

OPERATION (Early Type): When operating slide is pushed in, the slide contacts cable actuator, and when limit of travel is reached, a relieved portion on the slide passes under slide lock pawl. This action allows spring loaded pawl to lock push button in engaged position. When operator pushes another button to select a different range, the edge of the detent on slide strikes lock pawl during its initial movement, which allows the first push button to return to its normal position.

Later Type: After push button reaches its limit of travel, a lock spring (on push button operating slide) engages actuator bar shaft. This action allows the spring lock to hold push button in the engaged position. When operator selects a different driving range, the top or bottom portion of operating slide (depending which button was pushed) contacts the actuator bar, releasing first push button from lock spring.

Manual Control Cable Adjustment: Remove neutral safety starting switch from side of transmission. Loosen adjustable mounting bracket capscrew and move cable and bracket assembly (manually) as required, to position the manual valve lever in neutral position. Hold the "N" (Neutral) button tightly in at full travel (the neutral starting switch cam should then be practically centered in neutral starting switch mounting hole). Use a free fitting flat-faced shaft inserted through the neutral mounting switch hole, and apply very light pressure against the manual valve lever to maintain the neutral detent position of lever. *(NOTE - If tool is not available, lever may be held by finger pressure).* Carefully move cable assembly "in" and "out" **with ut moving** the manual lever, to determine total free-play travel of cable. Locate the cable midway in the free-play range, release pressure against the manual lever and tighten mounting bracket securely. *Do not allow cable to move when tightening the bracket.* Install neutral starting switch and check transmission fluid level.



Neutral Starter Switch Adjustm nt: *(NOTE - See "Neutral Starter Switch Production Change" above).* The early type switch can be adjusted by using an extra washer, Part No. 1113113, and reducing its thickness as required to secure proper switch contact. On the later type switch (having an "O" ring seal and dished washer) attach an electrical contact indicator to switch outer terminal and to transmission case, tighten switch until initial electrical contact is made, then tighten switch an additional 1/3 to 1/2 turn.

BAND ADJUSTMENT

BAND ADJUSTMENT: *Kick-down (front) band can be adjusted externally. Reverse (rear) band adjustment requires removal of transmission case oil pan.*

Kick-Down (Front) Band: Working from beneath car, loosen kick-down band locknut (located on left side of transmission case) 4 turns (Plymouth), 9 turns (Dodge). Check freeness of adjusting screw in transmission case. If it is free, set the click device on the small inch-pound torque wrench, Tool C-3380, for 72 lbs. (Chrysler & DeSoto), 60-72 lbs. (Dodge & Plymouth). Install a 3/8" 12 point socket (3/8" drive) on wrench. Tighten adjusting screw to specified torque. With chalk, mark a reference point on adjusting screw and transmission case. Using extreme care, **back off adjusting scr w exactly 2¼ turns** (Chrysler & DeSoto); **3 turns** (Dodge & Plymouth). Hold adjusting screw stationary and tighten the locknut securely.

CONTINUED ON NEXT PAGE

POWERFLITE "PUSH BUTT N" CONTROL ASSY. (FIRST TYPE SH WN)

POWERFLITE (C nt.)

Revers (Rear) Band: Drain transmission and remove oil pan. Remove reverse band adjusting screw locknut and tighten adjusting screw to 20-25 inch lbs. torque using Tool C-3380. Mark a reference point and **back off the adjusting screw 10 turns.** Hold adjusting screw, replace locknut and tighten to 30-35 ft. lbs. Replace oil pan and refill transmission with Automatic Transmission Fluid Type "A".

POWERFLITE TRANSMISSION (EXPLODED VIEW)

ROAD TESTING TRANSMISSION: If transmission operation not satisfactory, following complete procedure is recommended to check performance and diagnose trouble.

1) Move selector push buttons through their positions. Check for binding or hanging, or insufficient travel. Do not operate engine in reverse at wide open throttle.

2) Attach an electric tachometer to engine. Push in "D" (Drive) selector button. Check speed and smoothness of engagement. Apply both hand brake and foot brake and check for band slippage at wide open throttle *(CAUTION - Do not hold throttle wide open more than a few seconds).* See "Stall Speed Table" below. Check for kickdown band adjustment before proceeding with road test.

3) Accelerate engine at very light throttle. The transmission should upshift at speeds given in "Shift Speed Table" above. Check quality of shift.

4) Slow car to 15 MPH, and go quickly to wide open throttle (without going into kickdown). Check for possible clutch slippage. The transmission should not downshift at this time.

5) Make a kickdown at 15 to 20 MPH and check quality of shift. Release accelerator to approximately half throttle so that transmission upshifts at 25 to 30 MPH. Check quality of shift.

6) Make a kickdown, between kickdown limits as indicated in "Shift Speed Table" above, and check the quality of shift. Release accelerator to closed throttle and check quality of "lift foot" shift.

CONTINUED ON NEXT PAGE

POWERFLITE (C nt.)

7) Make a kickdown at 45 MPH and check quality of shift. Accelerate in kickdown, at wide open throttle, until transmission upshifts. The shift should occur at speeds indicated in "Shift Speed Table" above. Check quality of shift.

8) Slow down to 40 to 50 MPH and push in "L" (Low) selector button. The transmission should downshift. Push in "D" (Drive) button at approximately 20 MPH. The transmission will upshift. Coast to a stop. The transmission should downshift as indicated in "Shift Speed Table" above. Check for smoothness of shifts.

STALL TEST: Use an accurate tachometer to check engine speed. With engine idling, push in the "D" (Drive) selector button and note smoothness of shift. Set hand brake firmly and apply foot brakes to hold car. Accelerate engine to wide open throttle and check engine speed. Speed in excess of maximum RPM as indicated below may be caused by band slippage. *Do not hold engine at wide open throttle more than a few seconds.*

Stall Speed Test ℄

Car Model	Engine RPM
Chrysler C-71 (With Power Pack)	1920-2020
Chrysler C-71 (Std.) & C-73	1580-1680
Chrysler C-73 & C-70	1585-1685
DeSoto (All Models)	1400-1500
Dodge (All Models)	1400-1500
Plymouth V8 (180 HP)	1620-1720
Plymouth V8 (187 HP)	1640-1740
Plymouth V8 (200 HP, Power Pack)	1675-1775
Plymouth 6 (125 HP)	1280-1380
Plymouth 6 (131 HP, Power Pack)	1280-1380

℄ — Wide open throttle, "D" (Drive) selector button pushed in.

► *CAUTION — When making stall test, do not hold throttle wide open for more than a few seconds.* If engine speed excessive and is not corrected by band adjustment, make additional checks as follows: Check for incorrect manual control cable adjustment; leakage at valve body mating surfaces; defective throttle valve; defective shuttle valve or valve body and cover plug; defective kickdown servo parts.

HYDRAULIC PRESSURE TESTS: *CAUTION* - Pressure differences from 15 lbs. to 250 lbs. will be found in making following tests and correct pressure gauge must be used.

Gauge No. C-3292 (100 lbs.) — Use for throttle pressure, governor pressure, and lubrication pressure checks.
Gauge No. C-3293 (300 lbs.) — Use for line pressure check.

Line Pressure: Remove 1/8" pipe plug from line pressure take-off hole (front left side of transmission case), install C-3293 (300 lb.) pressure gauge at this point. Check reverse oil pressure first (brakes off), then apply brakes to hold car and check the other points. Run engine at speed indicated in table below, check line pressure for each selector button position.

Line Pressur

Selector Butt n Engag d	Eng. RPM	Pr ssure
"R"	1600 ℄	225-275 lbs.
"N"	800	85-95 lbs.
"D"	800	85-95 lbs.
"L"	800	85-95 lbs.

℄ — 1400 RPM on Dodge models.

► *NOTE:* If line pressure not correct, check for: Low oil level or clogged strainer; defective regulator valve and spring; manual valve and lever; throttle valve, cam and spring; oil leakage at valve body, or regulator body mating surfaces; defective kickdown piston and related parts; worn front pump or defective front pump drive sleeve or pinion.

Throttle Pressure: Remove 1/8" pipe plug from throttle pressure take-off hole (right center of transmission case between the servos), install C-3292 (100 lb.) gauge at this point. Apply brakes to hold car, push in the "D" (Drive) selector button, run engine at speed indicated in table below and note throttle pressure at each speed.

Throttle Pressure

Throttle Opening	Eng. RPM	Pressure
Closed	Idle	13-15 lbs.
Wide Open	℄	80-90 lbs.

℄ — See engine RPM for various models in "Stall Speed Test Table" above.

► *CAUTION: When making the above test, do not hold throttle wide open for more than a few seconds. If engine speed exceeds maximum as indicated in "Stall Speed Table" above (indicating band slippage), check the cause in the same manner as for "Stall Test".*

► *NOTE:* If throttle pressure not correct, check line pressure (above) and also check the following points: Incorrect throttle linkage adjustment; leakage at valve body mating surfaces; defective throttle valve, cam & spring; defective throttle pressure check ball or kickdown valve ball and rod; defective kickdown piston or related parts.

Governor Pressure: Remove 1/8" pipe plug from governor pressure take-off hole on lower left side of output shaft support (plate between transmission case and extension housing), install C-3292 (100 lb.) gauge at this point. Support car securely with rear wheels off floor so that they are free to turn, push in the "D" (Drive) selector button and run engine at speed indicated (as noted on speedometer). Note governor pressure in each speed range.

Governor Pressure Table

Car Model	℄ Governor Pressures 15 PSI	45 PSI	60 PSI
Chrysler C-71	13-15	23-31	51-58
Chrysler (Exc.C-71)	14-16	25-33	56-64
DeSoto S-23	12-14	22-29	48-55
DeSoto S-24	13-15	23-31	51-58
Dodge (All Models)	13-16	23-26	55-62
Plymouth 6 Cyl.	12-14	19-23	41-48
Plymouth V8	13-16	23-26	55-62

℄ — Governor pressure at indicated MPH.

► *NOTE:* If governor pressure not correct, check for leakat valve body mating surfaces or output shaft support gaskets; defective governor assembly, or defective rear pump.

Lubrication Pr ssure: Check only when there is reason to believe that it is incorrect. Remove pipe plug fitting at upper left side of output shaft support (Exc. Chrysler C-70, C-72, C-73; DeSoto S-24) and install a 1/8" flared tube connector. On Chrysler C-70, C-72, C-73; DeSoto S-24, disconnect oil cooler line at this point and install 1/8" flared tube connector. Connect gauge, C-3292. With engine running at 800 RPM, in "N" (Neutral) position, lubrication pressure should read 35 to 50 lbs.

► *NOTE:* If lubrication pressure is not correct, check for leakage at regulator body mating surfaces or at output shaft support gasket; defective converter control valve, defective front pump drive sleeve; defective reaction shaft bore; defective input shaft seal rings; plugged lubrication holes.

Clutch Pressure: Remove the 1/8" pipe plug fitting from pressure take-off hole tapped in kickdown servo (clutch pressure take-off plug on forward right hand side of transmission case) and install gauge C-3292. With rear wheels free to turn, accelerate the engine slowly until an upshift occurs. During the upshift, the pressure gauge attached to the kickdown servo should show a very rapid rise from 0 to final clutch or line pressure (see "Line Pressure Table" above). This rise should not take more than 1½-2 seconds. With engine speed not less than 650 RPM (trans. upshifted), the direct clutch pressure should not read lower than 10 lbs. below line pressure. Should a slow rise in clutch pressure be observed or a clutch pressure of more than 10 lbs. lower than line pressure be obtained, it is an indication of abnormal leakage.

► *NOTE* — If clutch pressure not correct, check oil level; throttle linkage adjustment; converter control valve; valve body mating surfaces; throttle valve, cam and spring; kickdown piston and guide; regulator valve body mating surfaces; front pump drive sleeve; clutch retainer bushing and reaction shaft seal rings; clutch discs and plates; clutch piston, seal rings and eheck valve ball.

1956 POWERFLITE DIFFICULT SHIFTING TO REVERSE RANGE CORRECTION: Remove valve body and inspect reverse lockout valve, valve port and spring. Valve and valve ports must be free burrs, and spring action must be checked to make sure it does not take a set when compressed. If spring is faulty, replace with spring, Part No. 1672079. Check operation of governor valve (if valve is not operating freely, it may apply reverse blocker valve when in neutral and prevent manual shift lever from going into reverse). With engine off, attempt to place transmission in reverse through use of push buttons. If transmission will go into reverse with the engine off, it is evident that a "no reverse" with engine running is due to a sticking governor valve holding the blocker valve open. Remove governor pressure checking plug and try to free-up the governor by applying short blasts of air into governor circuit. If governor cannot be freed up in this manner, remove governor assembly and clean it. Inspect governor support seal rings for score or gap (ring must have no gap when compressed). The governor oil passage in rear pump housing must be located between the wear pattern

CONTINUED ON NEXT PAGE

POWERFLITE (Cont.)

caused by governor support seal rings (the forward seal ring prevents line pressure entering governor outlet passage located between the two seal rings). Check governor for looseness, excessive output shaft endplay, or improperly drilled rear pump housing and correct as necessary. Check to see that seal rings seal on each side of governor pressure outlet passage in pump housing. If not, measure from center line of governor pressure hole-to-inside face of pump housing. If the specification of .443" ± 1/32" are exceeded, replace the pump housing. Check governor body pressure relief holes for obstructions. Make sure all assemblies are clean before reassembly.

TROUBLE SHOOTING & DIAGNOSIS

EXCESSIVE SLIPPAGE:

All Ranges—Inspect oil level. Adjust gearshift linkage. Check oil pressure; if low, inspect regulator valve and torque converter control valve for sticking. Inspect valve body in transmission case mating surfaces for evidence of oil leakage.

Kickdown—Readjust throttle linkage and kickdown band. Inspect valve body to transmission case mating surfaces for evidence of oil leakage. Check operation of throttle valve and note wear of valve bore and cam. Check spring. Check valve body end cover for oil leakage. Check shuttle valve for free movement. Inspect kickdown piston and guide for binding. Inspect spring. Inspect band lining for wear and band lever for free movement.

Kickdown (Over 25 MPH)—Inspect valve body end cover for oil leakage. Inspect shuttle valve and plug for free movement. Inspect spring.

Direct—Inspect valve body to transmission case mating surfaces for evidence of oil pressure leakage. Check kickdown piston for binding. Check shaft seal rings and clutch retainer bushing for wear. Check clutch discs, piston and clutch check valve.

Reverse—Check reverse band adjustment. Inspect transmission case to valve body mating surfaces for evidence of oil pressure leakage. Inspect reverse servo assembly for wear or binding. Inspect reverse lever and linkage for free movement.

Hill Climbing—Insufficient oil will result in low pressures to kickdown servo or direct clutch if oil level is low.

SHIFT PATTERN:

No Upshift—Check oil level and gearshift linkage adjustment. Check governor and throttle pressure. If there is no pressure rise when accelerating engine in direct drive, governor valve may be stuck closed. Check valve body to transmission case for parallelism. Check manual valve and lever for correct detent engagement. Check shift valve for free operation and shift valve spring for breakage. Check kickdown piston assembly. Check rear pump drive pinion. Drive pinion ball may be cracked or broken, permitting pinion gear to slip. Inspect clutch ball check for proper operation. Ball check valve must operate freely and seat properly.

No Shift in "D" (Drive) Range and an Upshift In Low Range—The cause is the governor valve sticking open. This can be verified by checking governor pressure (see "Governor Pressure Test" above). If governor pressure exceeds the pressures indicated in table, governor valve is possibly stuck and in most cases can be corrected in the following manner. Clean off area around governor pressure take-off plug and remove plug. Cover oil filler tube with a cloth or plug and hold firmly to prevent air from forcing transmission oil out through filler tube. Screw a piece of ⅛" pipe into hole to help direct air into unit. Apply clean filtered air to pipe in short blasts, tapping parking brake drum at same time with a rubber hammer just enough to jar governor. After applying air pressure, recheck governor pressure and see if valve has been freed up. In cases where governor pressure is still to high, it will be necessary to remove transmission extension case for further inspection.

Low Upshift Pattern—Readjust throttle linkage. Check governor pressure. Governor valve may be binding or sticking. Inspect the rear pump assembly. Check valve body to transmission case for parallelism. Check operation of throttle valve and inspect cam and spring. Check shift valve for free operation and spring for breakage.

Low Upshift Pattern at Heavy Throttle—Inspect regulator valve, throttle valve, and governor for burrs or dirt which may cause binding or sticking. Inspect the regulator spring.

High Upshift Pattern—Readjust throttle linkage and check both throttle and governor pressures. Adjust throttle pressure if necessary. If throttle pressure does not rise according to speeds on chart (see "Throttle Pressure" above), throttle valve may be sticking. Inspect for dirt or burrs. Inspect throttle cam for wear. Check valve body to transmission case for parallelism. Check shift valve spring. If governor pressure does not correspond to pressures indicated in "Governor Pressure" table above, remove governor and inspect valve for sticking. Check rear pump gears for wear, broken teeth or excessive clearance. Inspect pump drive pinion ball.

All Upshifts Below 14 MPH—Inspect throttle valve, cam and spring. Check throttle pressure check ball. Check governor valve for sticking.

Erratic Shifting—Check oil level. Inspect valve body to transmission case for parallelism. Check action of shift valve. Inspect governor support gaskets for oil leakage.

No Downshift—Check governor pressure. High initial pressure indicates valve is stuck open. Remove governor and inspect. Inspect shift valve action, check spring.

Low Downshift Speed—Governor valve is stuck open. Remove and clean and check for burrs and dirt.

High Downshift Speed—Readjust gearshift linkage. Inspect valve body to transmission case for parallelism. Inspect manual valve and lever. Inspect kickdown valve and ball.

No Kickdown—Adjust throttle linkage. Inspect valve body to transmission case for parallelism. Inspect throttle valve, cam and spring. Also inspect kickdown valve and shift valve components.

Low Kickdown Limit—Check governor pressure Governor valve may be sticking due to dirt. Inspect regulator valve and spring for proper operation. Inspect rear pump gears and drive pinion ball. Check valve body cover plate for parallelism.

SHIFT QUALITY:

Harsh Shift from Neutral to Reverse—Adjust engine idle speed. Readjust rear band. Inspect condition of the reverse band, strut and linkage. Inspect the reverse servo piston, spring valve and rings.

Harsh Shift from Neutral to Drive—Adjust engine idle speed. Adjust throttle linkage. Inspect kickdown servo pistons, springs, guide, rod and piston rings.

Delayed Shift from Neutral to Drive—Adjust kickdown band. Inspect condition of band, strut, lever and lever shaft.

Excessive Engine Speed Increase on Upshifts—Check oil level and adjust throttle linkage. Inspect regulator valve and spring and check operation of valve in regulator body. Check valve body mating surface for parallelism. Inspect throttle valve, cam and spring. Check operation of valve in valve body. Inspect kickdown piston components. Check mating surfaces of regulator valve body and transmission for parallelism. Inspect reaction shaft seal ring for deterioration. Inspect input shaft oil seal rings for wear or breakage and condition of reaction shaft bore. Inspect clutch retainer bronze bushing. If worn below bronze surface, replace retainer. Inspect condition of reaction shaft oil seal rings for wear or broken ends. Inspect condition of clutch plate and condition of friction material on seal ring. Check clutch check valve ball.

Excessive Engine Speed Increase on Upshifts at Light Throttle—Check line pressure. Inspect front oil pump gears for wear and excessive clearance.

Harsh Upshift—Adjust throttle linkage. Inspect regulator valve and spring. Check for sticking shuttle valve. Check valve body mating surfaces for parallelism. Inspect throttle valve, cam and spring. Inspect kickdown piston components. Check regulator valve body mating surfaces for parallelism. Inspect direct clutch spring, spring retainer, and snap ring.

Harsh Lift Foot Shift—Adjust throttle linkage. Check valve body mating surface. Check operation of throttle valve. Inspect valve, valve bore, cam and spring. Inspect servo pressure bleed valve for dirt. Check operation of shuttle valve. Inspect shuttle valve, plug, inner and outer springs, and guide pin.

Excessive Engine Speed Increase on Downshift at Part Throttle—Check oil level and adjust throttle and gearshift linkage. Check valve body mating surface. Check operation of manual valve and valve lever. Inspect servo restrictor valve and operating plug. Check plug for free operation. Check valve spring for distortion or looseness.

Harsh Downshift—Adjust engine idle speed and throttle linkage. Inspect valve body mating surface. Inspect throttle valve, cam and spring for proper operation. Inspect for dirt, burrs or wear, or breakage. Inspect servo restrictor valve for proper operation. Inspect clutch plates and disc friction material. Inspect the piston for wear or scoring. Check seal for wear or deterioration which would result in leakage. Inspect thrust washers for excessive wear.

Excessive Increase in Engine Speed on Kickdown—Readjust kickdown band. Check regulator valve and spring for proper operation. Inspect for dirt, wear, or breakage. Check valve body mating surface for nicks, burrs and trueness, which would cause leakage. Check operation of servo restrictor valve and shuttle valve. Inspect valve and plug for dirt,

CONTINUED ON NEXT PAGE

POWERFLITE (C nt.)

burrs or wear. Inspect all parts of kickdown piston assembly. Inspect piston rings for excessive wear or broken ends. Check governor valve for wear, dirt, binding or sticking. Inspect rear pump gears for excessive wear or broken teeth. Check pump clearance, drive pinion gear and pinion ball.

Harsh Kickdown—Adjust kickdown band. Inspect regulator valve and spring. Inspect for dirt, burrs or breakage. Inspect servo pressure bleed valve for dirt. Check operation of shuttle valve. Check valve and plug for burrs, dirt or excessive wear. Inspect all parts of kickdown piston assembly. Inspect piston rings for scoring, wear or broken ends. Inspect regulator valve body mating surface for nicks, burrs and trueness which would cause leakage. Inspect reaction shaft neoprene seal for deterioration. Inspect governor valve for free operation. Check for dirt which would cause sticking. Inspect rear pump gears for excessive clearance, worn or chipped teeth. Inspect drive pinion gear and drive pinion ball. Inspect the input shaft seal rings for excessive wear or broken ends, and reaction shaft bore for scoring. Inspect all parts of the direct clutch assembly.

OIL PRESSURE:

No Governor Pressure—Governor valve may be stuck in closed position due to dirt. To free valve, apply a short spurt of high air pressure (90 lbs.) to governor pressure take-off hole and at same time tap transmission extension housing with a rubber mallet. Before applying air pressure, cover filler tube with a cloth. In addition, drain two or three quarts of oil from transmission oil pan. After air is applied, reinstall governor pressure take-off plug and run transmission in Reverse a few seconds. Recheck governor pressure. This corrective procedure may not be permanent. If valve becomes stuck again, remove governor for servicing. If pressures do not correspond to those indicated in "Governor Pressure" table above, the governor may need service. However, before servicing governor, check the other points in the transmission that could cause low pressure as follows: Check the valve body mating surface for trueness, nicks or burrs. These could cause oil leakage. Check both output shaft support gaskets for evidence of internal leakage. Check operation of governor valve and inspect for foreign matter. Check the rear pump gears for broken teeth, wear, and excessive clearance. Check the mating surface of output shaft for trueness, burrs or nicks.

High Initial Governor Pressure—High governor pressure at low engine speeds is due to the governor valve being stuck in the open position, usually caused by dirt *(see "No Governor Pressure" above)*, for clearing with air pressure.

Line Pressure—If line pressure does not correspond to pressures indicated in "Line Pressure" table above, it will be necessary to investigate and make the following adjustments or corrections: Check transmission oil level. Inspect regulator valve for free operation, dirt or burrs, and condition of valve spring. Check valve body mating surface for trueness, nicks or burrs. Check operation of manual valve and lever. Inspect front pump gears for worn or chipped gears. Check clearance between gears and face of housing.

Throttle Pressure—If throttle pressures do not correspond to pressures indicated in "Throttle Pressure" table above, check line pressure and make the following adjustments and corrections: Adjust throttle linkage. Inspect operation and condition of regulator valve and spring. Check valve body mating surfaces for nicks, burrs and trueness. Check operation and condition of throttle valve, cam and spring. Check throttle pressure check valve ball for nicks and dirt. Inspect condition of kickdown rod and ball.

Direct Clutch Pressure—Direct clutch pressure should be approximately 10 lbs. lower than line pressure with transmission upshifted and engine speed not lower than 650 RPM. If not, refer to "Excessive Engine Speed on Upshifts" above. A pressure drop between line pressure and direct clutch pressure as high as 25 lbs. may be due to broken or damaged seal rings in the direct clutch circuit. These are: three interlocking type input shaft seal rings; the direct clutch piston retainer seal ring, direct clutch piston neoprene seal ring, the neoprene reaction shaft seal ring, and the two interlocking type reaction shaft seal rings.

Lubrication Pressure—Lubrication pressure is checked at the upper left side of the output shaft support, Remove the ⅛" pipe plug and use 100 lbs., pressure gauge C-3292 to check pressure. Lubrication pressure should be 35 to 50 lbs. pressure with transmission in neutral and engine speed at fast idle. If pressure readings are incorrect, check line pressure and inspect torque converter control valve. Low pressures may be due to internal oil leakage at the following points: drive sleeve seal ring, regulator valve body mating surface, reaction shaft seal ring, output shaft support gaskets, input shaft seal rings, and reaction shaft bore. Low oil pressure may also be caused by plugged lubrication lines.

IMPROPER RESPONSE TO GEARSHIFT SELECTOR LEVER POSITIONS:

Moves Forward in "N" (Neutral)—Adjust gearshift linkage. Adjust kickdown band. Inspect manual valve lever assembly. Check valve body mating surface for nicks, burrs and trueness which would cause leakage. Check operation of manual valve. Inspect all parts of kickdown piston. Check regulator body mating surface for nicks, burrs and trueness. Check clutch discs and plates for warpage which would cause dragging. Inspect clutch ball check.

Car Moves Forward in "N" (Neutral) at High Engine Speed—Clutch check valve ball bleed hole may be plugged causing centrifugal oil pressure to partially engage the direct clutch. A slight surge which is not continuous is normal.

Car Moves Backward in "N" (Neutral)—Readjust gearshift linkage and inspect manual valve and valve lever for proper engagement. Adjust reverse band, levers, strut, and shaft. Check for binding, dirt, excessive wear.

MISCELLANEOUS DIAGNOSIS PROCEDURES:

Starter Will Not Energize—Adjust gearshift linkage. Test neutral starter switch. Inspect manual valve lever for proper engagement.

Hard Shifting Into "N" (Neutral)—Check operation of neutral starter switch and inspect manual valve lever.

Hard Shifting Into "R" (Rev rse)—Check operation of backup light switch and manual valve lever.

Oil Foams From Filler Tube—Check fluid level in transmission. Inspect transmission breather vent.

GEARSHIFT CONTROL UNIT REMOVAL & INSTALLATION

MANUAL CABLE ADJUSTMENT: *See "Manual Cable Adjustment" above.*

► *PUSHBUTTON CONTROL ASSEMBLY PRODUCTION CHANGE: Two types used in production. See "Chang s, Cautions, Corrections" above.*

CABLE ASSEMBLY: Rem val (Transmissi n End) – Drain transmission fluid and remove oil pan. Remove neutral safety switch to provide access to cable lock spring and remove cable bracket and screw. Insert screwdriver through neutral safety switch hole and push gently against vertical projecting portion of cable lock spring and pull outward on cable. *(CAUTION – Move spring only a sufficient amount to permit removal of cable as undue pressure will dislocate spring).*

Installation: (Transmission End) – Move manual valve lever into reverse position which will place the cable adapter in close proximity with cable entrance hole in transmission case. Push in the "L" button on transmission control. Place "O" ring seal on cable ferrule *(NOTE* – Inspect "O" ring seal for cuts, abrasions, brittleness or cracking. If any of these conditions are present, replace "O" ring seal. Hold cable parallel to hole centerline in transmission case and push control cable in until spring lock engages groove in cable end. Position cable bracket and install bracket capscrew. Measure and adjust cable free play (See "Free Play Adjustment" below), being careful not to move manual lever *(NOTE* – Rubber sheath on cable must be pressed onto cable ferrule in order to prevent any possible leakage of oil at this point. On later model cable assemblies, the ferrule will be double grooved and the rubber sheath will be held to the ferrule by the crimped connector). Tighten cable bracket screw. Operate push buttons to check cable adjustment. Adjust as necessary *(CAUTION* – Make sure cable housing is not forced in or out during tightening procedure as backlash will be disturbed). Replace neutral safety switch and transmission oil pan. Refill transmission to correct level using Automatic Transmission Fluid Type "A".

Cable Backlash Adjustment: *See Manual Control Linkage Adjustment under LINKAGE ADJUSTMENT.*

PUSH BUTTON CONTROL UNIT: (R m val) – Remove three bezel retaining screws (one screw is located on underside of unit receiver), and remove bezel and push buttons. Remove the two hex head nuts and lockwashers holding push button control unit to instrument panel. Pull push button control unit from rear of instrument panel, down and toward front of car. Remove the two screws holding cable assembly bracket to control unit. Remove hairpin clip securing cable end to actuator bar and remove cable. (After cable is removed from transmission, see "Cable Assembly" above, pull cable through rubber grommet, or remove grommet on dash panel).

CONTINUED ON NEXT PAGE

POWERFLITE (Cont.)

Installation: Reverse removal operations and adjust cable free play.

Control Unit Light Bulb Replacement: Remove the three bezel retaining screws (one screw is located on underside of unit receiver) and remove bezel and "D" push button. Install light bulb, replace push button, reinstall bezel and test operation of unit.

PARTS REMOVAL & INSTALLATION (TRANSMISSION IN CAR)

▷*NOTE: Transmission must be removed from vehicle for the removal and replacement of parts other than those listed below.*

Oil Pan: Remove oil pan filler tube, drain transmission and remove oil pan attaching screws and oil pan. When installing pan, tighten screws evenly and torque to 12-17 ft. lbs.

Governor Servicing: *NOTE—It is necessary to remove transmission extension to remove governor assembly. See "Transmission Overhaul" below for Extension Housing Removal, Governor Removal, Overhaul & Installation.*

Valve Body & Transfer Plate Assembly (Removal): Remove oil pan and disconnect throttle and manual control lever linkage from levers. Loosen throttle and manual control lever assembly locking screws. Slide throttle valve operating lever assembly off shaft and remove throttle valve camshaft felt retainer and felt. Slide manual valve lever assembly off shaft and remove valve lever shaft seal cover. Remove the two oil strainer support screws and washers and take the strainer assembly off valve body and plate assembly. Remove transfer plate screws and lock washers and remove valve body and transfer plate assembly. For overhaul. *See "Valve Body Overhaul" below.*

Installation—Clean mating surfaces and check for burrs on both transmission case and valve body transfer plate. Place valve body and transfer plate assembly into position and install plate screws and lockwashers *(CAUTION—The two 1⅝" screws go through transfer plate cover on valve body. The three 1⅛" are used in the other holes).* Tighten evenly to 12-17 ft. lbs. torque. Make sure the two oil strainer tube seals are in position over oil strainer and place oil strainer assembly into position on transfer plate. *(CAUTION—Check to see that oil tubes on strainer properly enter valve body).* Install the two oil strainer support screws and torque to 12-17 ft. lbs. Place manual lever shaft seal cover over manual valve lever shaft and slide into position on transmission case. Install manual lever (arm side of lever against cover) on manual valve lever shaft, and tighten locking screw. Place throttle valve camshaft felt and retainer over throttle valve shaft. Install throttle valve lever assembly on throttle camshaft and tighten locking screw. Check operation of control by shifting into all positions. Check kickdown operation and manual lever contact on neutral safety and back-up light switches. Install oil pan and adjust throttle linkage and gearshift linkage.

Manual Control Valve Lever Shaft Oil Seal Removal & Installation: Remove oil pan, valve body and transfer plate assembly. Using a suitable brass drift, drive seal out of transmission case from below. To install, use tool C-3277. Start seal squarely into bore and tighten tool C-3277 until it is flush with the case. This properly positions seal. Install valve body and plate assembly and oil pan.

Kickdown Piston (Removal): Remove oil pan, valve body and transfer plate assembly. Loosen kickdown band adjusting screw locknut and back adjusting screw out sufficiently to permit kickdown band strut to be removed by compressing band ends. With kickdown band lever hanging down, install tool C-3289 on transmission case. Apply sufficient pressure on kickdown rod guide to permit easy removal of the snap ring. Loosen compressing portion of tool and remove piston rod guide, piston spring and kickdown piston rod assembly (the kickdown piston cushion spring will fall out of piston when rod assembly is removed). Using snap ring pliers, inserted inside of kickdown piston, remove piston from transmission case. *See "Overhaul" below, for disassembly and inspection.*

Installation—Make sure the two interlocking seals are locked in position and all seals are coated with Lubriplate, then place kickdown piston into transmission case. With one hand apply pressure to piston and at the same time carefully compress bottom seal and push piston into case. *(CAUTION—*After bottom seal has entered, piston will seem to hang at two different locations while being pushed into case. This is due to seals entering cylinder, do not use extreme force. If any rings should be broken when piston assembly is being installed, transmission will not operate properly.) Slide piston spring over kickdown piston rod assembly then balance piston cushion spring on rod assembly (Lubriplate may be used to help hold cushion spring in position on rod assembly), and install in piston. Holding it in this position, install kickdown piston rod guide assembly on piston rod assembly. Using tool C-3289, and extreme care, compress the kickdown piston spring to the point that piston guide seal slightly binds on transmission case. Work seal into position and gradually compress spring until seal enters case and snap ring can be installed. Install kickdown piston rod guide snap ring, making sure it is properly seated. Loosen compression portion of tool and remove tool from transmission case. With one end of band fit over adjusting screw, compress the other end sufficiently to install the kickdown band strut between kickdown band and band lever *(CAUTION—*Make sure band strut slot engages with kickdown band strut pin in band end). Install valve body, plate assembly and oil pan. Adjust kickdown band.

Reverse Servo (Removal): Remove oil pan, valve body and transfer plate assembly. Loosen reverse servo adjusting screw locknut and back adjusting screw out sufficiently to permit reverse band strut to be removed by compressing band ends. Remove reverse servo piston sleeve. Mount tool C-3289 on transmission case and compress reverse piston spring retainer. Using a screwdriver, remove the reverse servo piston and valve assembly spring retainer snap ring and loosen compressing part of tool (Spring retainer may require guiding out of transmission case). Remove spring retainer, spring, reverse servo piston and valve assembly from transmission case. Using C-3229 pliers, remove the reverse servo piston valve spring snap ring, and remove spring and valve from piston. *See "Overhaul" below, for disassembly and inspection.*

Installation—Place reverse servo piston valve and spring in reverse servo piston (shaft on valve protruding through hole in bottom of piston). Using snap ring pliers C-3229, install reverse servo piston valve spring snap ring, making sure it is properly seated. Coat reverse servo piston ring (neoprene) with Lubriplate. Insert reverse servo piston and valve assembly into transmission case in a cocked position, then by rotating piston, the ring will enter case without being damaged. Place reverse servo piston spring over piston and position spring retainer over spring. Using tool C-3289, compress spring sufficiently to install snap ring. Make sure retainer is correctly installed, and snap ring seated. Remove tool C-3289 from transmission case and install reverse servo piston sleeve. Make sure piston sleeve slides freely on piston by working it up and down. Hook one end of reverse band assembly in reverse link assembly, compress other end sufficiently to install reverse strut in slots of reverse band assembly and reverse band lever assembly. Adjust reverse band. Install valve body, transfer plate and oil pan.

Speedometer Pinion (Removal & Installation): Disconnect speedometer cable and housing from sleeve assembly on transmission, and remove speedometer pinion and sleeve. When installing sleeve and pinion assembly, torque it to 40-45 ft. lbs.

Neutral Safety and Back-Up Light Switch Removal & Installation Note: It is not necessary to drain transmission to remove these switches. A small amount of lubricant will drain from transmission when these switches are removed. When installing, tighten switches to 15-20 ft. lbs.

Transmission Output Shaft Rear Bearing Oil Seal (Removal): Disconnect the front universal joint and secure shaft to frame out of the way. Apply hand brake and remove propeller shaft flange nut and washers. Release hand brake and install puller C-452. Remove propeller shaft flange and drum assembly. Remove transmission support grease shield spring (small one). Remove brake support grease shield from extension housing *(CAUTION—If screwdriver or sharp instrument used to remove shield, do not damage the neoprene sealing surface at bottom of shield).* Install puller C-748 and remove rear bearing oil seal.

Installation—Install rear bearing oil seal with tool C-3205. Install brake support grease shield on extension housing *(CAUTION—Indent on grease shield must match groove in housing for correct positioning. Install grease shield far enough on housing to permit installation of spring).* Install brake support grease shield spring with opening in spring toward adjusting sleeve. Make sure spring is properly seated in groove. Make sure brake adjustment is backed off and install drum assembly (In some instances it may be necessary to use tool C-496 to press drum assembly on output shaft). Install propeller shaft flange washer, shakeproof washer and nut. Adjust hand brake. Apply hand brake and torque propeller shaft flange nut to 140-160 ft. lbs. Connect front universal joint.

Transmission Regulator Valve Assembly (Removal): Remove transmission regulator valve spring retainer, gasket, and spring. Using a mechanical retriever or a piece of welding rod inserted in end of valve, remove valve.

CONTINUED ON NEXT PAGE

POWERFLITE (Cont.)

Installation—Place valve in position in valve body. Install regulator valve spring, gasket, and retainer and tighten to 45-50 ft. lbs. torque.

Torque Converter Control Valve Assembly (Removal): Remove control valve spring retainer, gasket, and spring. Using a mechanical retriever or a piece of welding rod inserted in end of valve, remove valve.

Installation—Reverse removal procedure.

Oil Cooler (Removal): Drain radiator, remove battery and battery pan. Remove lower radiator-to-cooler hose. Remove inlet and outlet oil tubes. Remove oil cooler to water pump flange bolts.

Installation—Clean mating flanges thoroughly and install new flange gasket. Install cooler to water pump and tighten flange bolts. Install inlet and outlet oil tubes. Install lower radiator-to-cooler water hose. Install battery and battery pan. Refill radiator and start engine. Check carefully for water and oil leaks.

TRANSMISSION REMOVAL

REMOVAL: Drain transmission and torque converter, (see "Draining & Refilling" above). When fluid drained, replace drain plugs and tighten. *NOTE - If transmission oil pan is not equipped with a drain plug, remove filler tube connected at oil pan).* Disconnect oil pan filler tube from oil pan. Disconnect front universal joint and secure to frame. Remove hand brake adjusting screw cover plate and cable bolt from hand brake support. Disengage ball end of cable from operating lever and remove cable from brake support. Disconnect speedometer cable housing from drive pinion. Disconnect neutral starter switch and back-up light wires from switches *(NOTE* - To avoid damage to switches, remove from transmission before removing transmission from car). Disconnect throttle linkage from lever at transmission. Remove push button control cable (see "Gearshift Control Unit" above). Remove oil cooler lines (if so equipped). Remove nuts and lockwashers from rear engine mount. Install engine support fixture, C-3487. Adjust fixture to support weight of engine and raise engine slightly. Remove cross member to frame bolts and remove cross member, leaving engine support adapter attached to transmission. Work carefully when removing cross member to avoid damaging brake line. *(CAUTION* - When using fixture, Tool C-3487, do not lower engine more than three inches from floor pan to avoid moving the set position of water hose and other engine attachments). Remove two upper transmission case to converter housing screws and lockwashers and install guide studs, Tool C-3276. Remove two lower transmission case to converter housing screws and lockwashers. Slide transmission straight back to avoid damaging front pump drive sleeve, and remove from under car.

TRANSMISSION INSTALLATION

INSTALLATION: Install guide studs, Tool C-3276, in the two upper transmission case to converter housing bolt holes. Lubricate front oil pump drive sleeve ring and bearing surface with transmission fluid. Install drive sleeve in front pump housing (if not previously installed), making sure that driving lugs are properly engaged in front pump pinion gear. Note position of driving lugs on front pump drive sleeve, and position accordingly, to aid in proper engagement with torque converter when transmission is installed. Slide transmission over guide studs and into position. To avoid damage to front oil pump, the transmission must be properly aligned. Do not attempt to use transmission to converter housing bolts to bring transmission and converter housings together. If oil pump drive sleeve and input shaft have been properly aligned, transmission should slide easily into position. *(CAUTION - Do not force it into position).* Install two lower transmission case to converter housing bolts and lockwashers, but do not tighten. Remove guide studs and install two upper transmission case to converter housing bolts and lockwashers. Draw all bolts down evenly and tighten to 45-50 ft. lbs. Complete installation by reversing removal procedure.

TORQUE CONVERTER REMOVAL

1) With transmission removed, turn front wheels to extreme right and remove starter motor. Remove the transmission case adapter screws and lockwashers and remove transmission from car. Remove lower half of flywheel housing.

▷*NOTE*: If torque converter being removed because of excessive runout damage, check by using dial indicator on hub and mark the highest point of runout on both converter and crankshaft flange. The reason for this is so it may be determined later if runout was caused by the converter or crankshaft.

2) Using tool C-811, remove the eight torque converter stud nuts and lockwashers from crankshaft flange. Remove torque converter from crankshaft.

▷*NOTE*—Check crankshaft flange runout. Maximum is .002".

STARTER RING GEAR REPLACEMENT (REMOVAL): Support torque converter assembly in a vise and carefully remove staking lugs, retaining ring gear to torque converter, with a file *(CAUTION*—Be careful when supporting torque converter in vise to avoid distortion). Place torque converter on blocks of wood, and using a blunt chisel or drift, tap around ring gear until it comes off converter.

Installation of Ring Gear—Remove burrs or raised spots on torque converter with a file, being careful not to remove more metal than is necessary. Any of the following methods for expanding the ring gear can be used in the manner outlined.

Oven—Set temperature at 150° and allow ring gear to remain for 15 to 20 minutes.

Boiling Water—Place ring gear in shallow container, add water and heat for approximately two minutes.

Flame—Place ring gear on a flat surface. Using a medium size tip, direct a slow flame around inner rim of gear, being careful not to direct flame onto teeth of ring gear. Place a few drops of water on face of gear at short intervals during heating process. When gear is hot enough to boil the drops of water, installation of gear can be made.

When gear properly expanded, proceed as follows: Place starter ring gear over flange surface of torque converter, making sure that rear face of gear contacts flange on torque converter evenly around the entire diameter. Reweld ring gear to torque converter, *using extreme care to place as nearly as possible the same amount of metal in exactly the same locations as original assembly.* This is necessary to maintain proper balance of the unit. Place weld alternately on opposite sides of the converter to mimimize distortion. Clean thoroughly before installing in car.

▷*RING GEAR WELDING NOTE:* Use a welding current of 200 amps. and 5/32" Fleet-Weld No. 27, or General Electric No. W28 rod, or their equivalent.

▷*WELDING CAUTION:* To prevent burning through the torque converter, the arc should be directed at the intersection of gear and housing from an angle of approximately 45° from the face of the gear. DO NOT GAS WELD.

TORQUE CONVERTER INSTALLATION

▷*TORQUE CONVERTER HUB RUNOUT NOTE:* When torque converter assembly is removed for any reason from crankshaft drive flange, the converter assembly runout should be checked when reinstalled. There are two methods for adjusting the hub runout. *See "Torque Converter Hub Runout Adjustment"*

1) Inspect mating surfaces of torque converter and crankshaft flange for burrs and dirt. Install torque converter on crankshaft flange. Install eight torque converter stud nuts and draw down evenly and tighten. Install lower half of flywheel housing and starter motor.

2) Install transmission case adapter on flywheel housing and tighten to 25-30 ft. lbs. torque. Install transmission (see above).

3) Fill transmission with Automatic Transmission Fluid (Type A) to "full" mark on dipstick. This will take approximately 5 qts. Run engine at idle speed in neutral for approximately two minutes, then add 8 qts. of fluid to bring oil level to "full" mark on dipstick. Allow engine to run until normal operating temperature is reached. Set handbrake and shift selector lever through all ranges and return it to "N", recheck level and bring level to "full" mark.

TORQUE CONVERTER RUN-OUT ADJUSTMENT

Heat Method: *(CAUTION—When using this method, extreme caution must be used to prevent burning the metal and causing irreparable damage. Sufficient heating of this unit, to cause the necessary drawing of metal required, is accomplished in just a few seconds. DO NOT OVERHEAT).* Remove transmission, torque converter housing and dust shield. Mount Torque Converter Hub Alignment Indicator C-430 on adapter plate. Rotate converter through 360° and mark high point on converter with chalk, then rotate converter to move the high point to the top. Apply heat 180° from the high point at opposite side of converter shell at high point of radius. Use a No. 3 acetylene torch burner, moving the flames at all times in a circular motion about the size of a dime. When the spot begins to change color remove the flame and quench the converter with a water soaked rag. Change rags several times (the more quickly converter is cooled, the greater the drawing on the metal). Before checking hub runout make certain that both sides of the converter are the same temperature. If runout exceeds .004" at the same point, repeat operation. *(CAUTION*—It is possible to draw the metal excessively, thus causing runout at opposite side.

Shim Method: Determine hub runout in the same manner as for "Heat Method" above. Loosen converter drive flange nuts sufficiently to insert shims of proper thickness 180° from indicated high point.

CONTINUED ON NEXT PAGE

POWERFLITE (Cont.)

The thickness of shims used should equal half the total indicator reading, shim thickness not exceeding .008". New shims are furnished in the following sizes. Part No. 1610442 (.002"), 1610443 (.003), No. 1610444 (.005").

TRANSMISSION OVERHAUL

DISASSEMBLY

1) Place transmission assembly in stand C-3280 and turn upside down. Remove oil pan and gasket. Loosen throttle and manual control lever locking screws and slide levers off shafts. Remove throttle valve camshaft felt retainer and felt and manual valve lever shaft seal cover. Inspect these parts for wear.
2) Remove oil strainer support screws and remove oil strainer assembly. Inspect ring seals located at both outlet sides of strainer. Remove transfer plate screws and take off valve body and transfer plate assembly. *See "Valve Body & Transfer Plate Overhaul" below.*

▷*CAUTION: Mating surfaces are machined and extreme care must be used to avoid damage to these parts.*

3) Remove neutral safety switch and back-up light switch and gaskets.
4) Check transmission end clearance with a dial indicator or feeler gauge by prying direct clutch assembly toward rear and measuring the distance between direct clutch and carrier housing. Pry direct clutch forward and again measure the distance between direct clutch and carrier housing. Clearance should be .043-.069". If not within limits, record the measurement for reference at reassembly.

Hand Brake Assembly: Using tool C-3281 to hold transmission to flange, remove transmission flange nut and washers. Attach puller C-452 and remove brake drum assembly. Inspect oil sealing surfaces, and lining surfaces on drum for scoring or wear. Remove transmission brake support grease shield spring (NOTE—this spring acts as a guide for the brake shoes and retains the brake support grease shield to transmission extension housing). Place a rubber band around brake shoes to hold them in position and remove brake shoe return spring. Remove brake anchor shoe washer and brake shoe guide. Remove both brake shoe assemblies, adjusting sleeve, nut, screw and brake shoe operating lever link. Remove brake support grease shield from extension housing. *(CAUTION—*If a screwdriver or sharp instrument is used to remove the shield, care must be taken not to damage neoprene sealing surface at bottom of shield). Slide brake support assembly from rear extension housing and anchor. Inspect neoprene spacer for deterioration and note the steel sleeve used between spacer and extension housing.

Transmission Extension: Remove speedometer drive pinion. *(CAUTION—Nylon gear can be damaged if extension housing is removed without first removing the speedometer drive pinion).* Using puller C-748, remove the output shaft rear bearing oil seal and remove any burrs from counterbore of extension housing. Remove the transmission-to-extension screws and lockwashers. Install guide studs C-3283 and attach puller C-3282. Pull extension housing from output shaft support assembly and remove extension gasket. *(CAUTION—*Use care when removing extension housing to prevent damage to governor housing). Inspect extension housing for cracks in casting and remove burrs from gasket surface. Clean output shaft rear bearing and dry with compressed air. Check bearing for rough spots but do not remove from housing unless it is found to be defective. Using a pair of long nose pliers, remove output shaft rear bearing snap ring. Using driver C-3275, drive output shaft rear bearing out rear of extension housing. Remove vent from top of extension housing and make sure it is clear of foreign matter and is open.

Governor: Using a sharp instrument, remove either of the governor valve snap rings. Remove governor valve shaft and valve from governor body. With snap ring-pliers, remove governor weight assembly snap ring (large), and remove governor weight assembly from governor body. Using C-3229 pliers, remove governor secondary weight snap ring. *(CAUTION—*Keep thumb pressure against secondary weight when removing snap ring as it is spring loaded). Remove secondary weight and spring. Inspect all parts for burrs or wear. Check secondary weight for free movement in primary weight by placing secondary weight in primary weight without spring. Primary weight should fall freely when both parts are clean and dry. Check spring for distortion. Remove governor locating screw from governor body and output shaft *(make sure that screwdriver used fits slot in screw perfectly to avoid damage to governor body).* Slide governor body and support from output shaft. Remove the two governor support piston rings and inspect closely. *(CAUTION—*Governor support has pressed in steel sleeve which routes oil through the support. Make sure these passages are open. Do not attempt to replace sleeve if damaged, replace support). Clean passages with air and inspect valve and governor body for slight scores. Remove the four governor body-to-support screws and lockwashers and separate body from support.

Rear Oil Pump: Remove oil pump housing-to-output shaft support screws and lockwashers and remove housing and oil pump gear. Use prussian blue to mark front side of gear in housing *(DO NOT USE A SCRIBE).* Inspect machined surfaces for nicks and burrs, oil pump gear and housing for being scored or pitted, and pump housing plug for leaks. Remove rear oil pump pinion from output shaft and mark front side with prussian blue *(CAUTION—*Oil pump pinion keyed to shaft by a small ball. Use care when removing pinion not to lose ball). Check pinion keyway and ball pocket for pitting or scoring. Using tool C-3335 and feeler gauge, check clearance between pump housing face and face of gears. Clearance limits are from .001-.003".

Center Assembly (Output Shaft Support, Planet Pinion Carriers, and Direct Clutch Assemblies): Remove output shaft support-to-transmission case screw and washer. With one hand, work output shaft up and down, and at the same time apply pressure with the other hand to the input shaft. Slide output shaft rear support assembly, planet gear housing assembly and gasket from rear of transmission case. If rear support is stuck to transmission case and cannot be removed as just described, then proceed as follows: Install one of the oil pan screws into transmission case and with the aid of a pry bar, pry against support sufficiently to separate support from case. Remove direct clutch piston retainer assembly from torque converter reaction shaft. Remove direct clutch piston retainer thrust washer from torque converter reaction shaft. This washer is a select fit and controls end clearance between direct clutch assembly and carrier housing. Inspect washer for cracks, burrs and wear.

▷*INPUT SHAFT PRODUCTION CHANGE: Seal rings not used in late production. See Production Change above.*

Planet Pinion Carrier Removal from Housing Assembly: Place unit in an upright position in tool C-3285. Using a feeler gauge, check clearance between kickdown planet pinion carrier housing snap ring and kickdown planet pinion carrier assembly. This clearance should be .012-.038". If within these limits, then identify each thrust washer as it is removed. Using a screwdriver, remove transmission kickdown planet pinion carrier housing snap ring. Identify snap ring to aid in assembly (ring is not a selective fit). Proceed as follows:
1) Remove input shaft, kickdown planet pinion carrier assembly and kickdown annulus gear from carrier housing. Remove reverse planet pinion carrier thrust washer and inspect for cracks, burrs and wear. Remove kickdown annulus gear snap ring. Remove kickdown annulus gear from input shaft and inspect for worn, cracked or broken teeth.
2) Remove kickdown planet pinion carrier assembly from input shaft and carefully inspect stop ring on end of shaft which controls position of annulus gear on input shaft. Check all oil passages in both gear and shaft for obstructions. Inspect splines and bearing surfaces for burrs and wear. On early cars, inspect the three seal rings on input shaft for broken ends and make sure they are free to rotate in grooves.
3) Inspect planet pinion carrier for scores on thrust surfaces, broken and worn teeth. Using a feeler gauge, check end clearance on individual planet gears, clearance should be .006-.017". Inspect pinion shafts for tight fit in carrier and make sure pinions are free to rotate on shafts. Check oil holes in gears and shafts for obstructions. Inspect oil holes in the thrust washer of the kickdown carrier to make certain they are open *(NOTE—Do not replace planet pinion carrier assembly unless the above inspection indicates that it is necessary. This assembly is serviced only as a complete unit).*
4) Remove reverse planet pinion carrier assembly from planet pinion carrier housing. Inspect in the same manner as for planet pinion carrier (3 above). Remove output shaft and reverse annulus gear assembly from carrier housing and output shaft support. Remove reverse annulus gear snap ring and remove annulus gear from shaft. Inspect thrust surfaces, journals and inner bushings for scores. Check annulus gear for worn or broken teeth. Inspect ring grooves for burrs and ring for broken ends. Inspect splines on both shaft and gear for burrs and wear. Check speedometer pinion gear and gear output shaft, and shaft bushing for burrs, wear and scoring.
5) Remove planet pinion carrier housing thrust washer and check for cracks or wear. Remove planet pinion carrier housing from output shaft support and inspect driving lug slots inside of housing for wear. Inspect bearing and thrust surfaces for scores and burrs. Closely inspect band contacting surface for burned spots and scoring, especially if lining has worn excessively. Inspect all oil passages in output

CONTINUED ON NEXT PAGE

POWERFLITE (Cont.)

shaft and support for obstructions. Check rear oil pump mating surface for burrs and scores, and check for stripped threads in support.

Direct Clutch Piston Retainer: 1) Using a screwdriver remove kickdown sun gear snap ring. Identify this ring so it can be returned to the same position (selective fit). Lift out sun gear assembly. Check for clutch material obstructing oil passages and slinger and remove any metal pickup which might have accumulated on front side. Inspect for cracked or broken teeth.

2) Lift out direct clutch hub from center of direct clutch piston retainer. Inspect driving lugs for wear and remove any metal pickup accumulated on either side of hub. Invert the direct clutch piston retainer and remove clutch plates (steel) and driving disc assemblies (five or six of each used, depending on car model), noting position in which these parts were assembled. *(CAUTION*—If assembly was started with cork portion on outer top, the same sequence will follow all through the assembly and when unit is reassembled the same sequence should be followed to assure smooth operation). Inspect driving discs for evidence of wear, burning, glazing, and flaking off of facing material. Check discs by scratching with finger nail and if material collects under nail, replace discs. Inspect splines in discs, replacing any that are damaged. Inspect steel plates for burning, scoring, or damaged splines.

3) Using tool C-3302, compress direct clutch spring sufficiently to unseat clutch spring retainer snap ring. Release tool C-3302, and remove direct clutch spring retainer snap ring, spring retainer and spring from direct clutch piston retainer. Using a twisting motion remove direct clutch piston assembly from clutch retainer. Air pressure may be used to blow piston out if it is tight.

4) Inspect ball check in clutch retainer housing to make sure it is free. The bearing used in direct clutch piston retainer is a steel back bronze type and is not replaceable. If torque converter reaction shaft seal rings have worn or grooved the bearing so that bronze is no longer visible at that point replace the direct clutch piston retainer. Inspect band contacting surfaces for deep scores and burns, especially if band lining is worn to point where steel band has been contacting direct clutch piston retainer. *(CAUTION—Do not turn clutch piston retainer in lathe to remove score marks).* Inspect steel clutch plate contacting surfaces for deep scores, replace as needed. Make sure clutch driving lugs will slide freely into retainer. Inspect inside bore for score marks, and if light, remove with crocus cloth, if heavy, replace piston.

5) With tool C-3286, unlock direct clutch piston retainer seal ring and remove from retainer. Inspect for wear and broken ends. Remove direct clutch piston seal ring (neoprene) from piston. Inspect for deterioration and hardness.

Reverse & Kickdown Band Assemblies: Mark reverse band for installation purposes, then compress ends of band sufficiently to remove reverse band strut. Unhook reverse band assembly from link assembly and remove by rotating band ends through rear opening in transmission case. Repeat with kickdown band, noting that strut is grooved to act as a guide to strut pin on band end. Remove from case in same manner as for reverse band. Inspect linings for wear and bonding to metal band. If lining is worn to point where grooves are no longer visible, replace band. *(CAUTION—Do not attempt to reline bands.)* Check bands for distortion and cracked ends.

Reverse & Kickdown Band Lever Assemblies: *(CAUTION—Inspect these link assemblies and levers for cracks or wear, making sure they have side clearance and are free to turn on shafts. Do not remove these assemblies unless inspection reveals that it is necessary).* If necessary to remove, proceed as follows: Insert finger in back of reverse band and link assembly lever shaft, and holding the reverse band lever and link assembly with the other hand, push shaft out rear opening in transmission case. Remove kickdown band lever shaft plug in front of transmission case and remove kickdown band lever in same manner as for reverse band, except that shaft is removed from front of transmission case.

Front Oil Pump: 1) Remove transmission regulator valve spring retainer, spring, gasket and valve. Remove torque converter control valve spring retainer, spring, gasket and valve.

2) Remove front oil pump-to-transmission case screws and washers (discard aluminum or copper sealing washers, new ones must be used at reassembly). Remove housing by tapping gently with a fibre hammer (if front pump housing has two threaded holes, attach puller C-3287 and guide studs C-3288 and pull housing and gears from transmission case). Use prussian blue to mark front side of gears *(CAUTION—Do not scribe gears for identification).*

3) Remove front oil pump housing seal (large neoprene) from housing, and inspect for deterioration and hardness. Using a brass drift, drive housing dust seal out front of housing. Inspect housing bushing for scores. Remove light scores with crocus cloth and if bushing scored heavily, replace housing (bushing is not replaceable). Check housing and gears for scores.

4) Using tool C-3335 and feeler gauge, check clearance between pump housing face and face of gears. Clearance limits are from .001" to .003". Make sure all oil passages are clear by blowing out with compressed air.

Regulator Valve Body: Using the two holes provided in regulator valve body, attach puller C-3287, and install guide pins C-3288. Pull regulator body off torque converter reaction shaft. Place body and both valves in pan containing clean solvent, wash thoroughly and dry with compressed air. Check valves for free movement in body, these valves should fall in and out of bores when both valves and body are dry. *(CAUTION*—If crocus cloth is used to polish valves, care must be taken not to round off the sharp edges of valve.) Check for all passages for obstructions and all mating surfaces for burrs or distortion. If body has a slight nick or raised portion on a mating surface, it can be removed with a surface plate and crocus cloth. Check regulator valve spring seat (snap ring) for proper seating. Wrap valves and body in separate cloths until ready for installation.

Reverse Servo Piston: Lift out reverse servo piston sleeve. Inspect inside bore, lever, and contacting surface on piston sleeve for scores and wear. Make sure the two bleeder holes are open. Install tool C-3289 on transmission case and compress reverse piston spring retainer. Using a screwdriver, remove the reverse servo piston and valve assembly spring retainer snap ring, and loosen compressing portion of tool. Remove spring retainer, spring, servo piston and valve assembly. Remove servo piston ring (lip type neoprene) from piston and inspect for distortion and hardness. Remove reverse servo piston valve snap ring. Remove spring and valve from piston. Inspect servo bore for scores and remove light scores with crocus cloth.

Kickdown Piston: Using tool C-3289, apply sufficient pressure on kickdown piston rod guide and remove the snap ring. Loosen compressing portion of tool and remove tool from transmission case. Remove piston rod guide, piston spring, kickdown piston rod assembly, and kickdown piston cushion spring. Inspect riveting of kickdown piston rod to kickdown piston spring retainer. Remove seal ring from guide and inspect for light scores and wear on piston rod and guide. Using C-484 pliers, remove kickdown from transmission case. Remove the three snap rings (two locking and one open type) from kickdown piston. Inspect rings for scores or broken ends, and piston for wear.

Torque Converter Reaction Shaft: *(CAUTION—Inspect shaft seal rings (interlocking type) for broken ends and make sure they are free to rotate in grooves. Inspect inside of shaft for burrs, and splines for burrs and wear. Check thrust surfaces for wear and slight scores. Do not remove reaction shaft from case unless inspection reveals that it is necessary).* If shaft must be removed, proceed as follows: Remove shaft seal (neoprene). Using a suitable brass drift, remove shaft dowel pin from shaft flange and transmission case. Remove transmission case-to-reaction shaft screws and using tool C-3297, press shaft out of transmission case. Remove the two shaft seals (interlocking).

Manual Control Valve Lever Shaft Oil Seal: Drive seal out of case with a suitable drift.

Kickdown Band Adjusting Screw: Loosen locking nut and remove kickdown band adjusting screw and locknut. *CAUTION—When locknut is loosened, the adjusting screw must be finger free. If not, inspect screw and nut for pulled threads or foreign material on threads. Freeness of this screw is very important to adjustment.*

Transmission Case Inspection: Inspect case for cracks, sand holes and stripped threads. Check for burrs on mating surfaces. Blow compressed air through all passages to make sure they are open. Check oil hole plugs for tightness.

REASSEMBLY

Kickdown Band Adjusting Screw: Install adjusting screw in transmission case until there is approximately 1" of screw left outside case. Do not lock screw into position at this time.

Manual Control Valve Lever: Using tool C-3277, start seal squarely and tighten until seal is flush with case.

Torque Converter Reaction Shaft: *(NOTE—Reaction shaft should only be removed if inspection indicates that it is faulty).* Heat front face of transmission case to 170-190°, using sun lamps for the purpose.

1) Coat the two shaft interlocking seal rings with Lubriplate and install on shaft and lock in place.

CONTINUED ON NEXT PAGE

POWERFLITE (Cont.)

Make sure the rings are free to rotate in lands. Coat the portion of shaft that presses into case with Lubriplate and position shaft into front of transmission so holes in shaft line up with screw holes in case.

2) Place a 5/16" (.308-.311" outside diameter in unthreaded section), 2¼" long bolt through dowel guide pin holes in case and reaction shaft to act as guide, install nut. Using tool C-3297 press shaft into place. Do not remove 5/16" bolt at this time. Start the three transmission case-to-reaction shaft screws and washers and tighten slightly, but do not torque.

3) Remove 5/16" bolt from dowel hole and install the reaction shaft dowel from inside case. Torque the case-to-reaction shaft screws to 10-15 ft. lbs. Coat neoprene reaction shaft seal and install on shaft.

Kickdown Piston: 1) Coat the three kickdown piston rings (two locking and one open type) with Lubriplate and install on piston. Lock into position and make sure they are free to rotate in lands. Place kickdown piston assembly into transmission case, compress bottom ring with a brass rod (flatten end), and push piston into place.

▷*CAUTION: After bottom ring has entered, piston will seem to hang at two different locations while being pushed into case. This is due to rings entering cylinder. If any of the rings should be broken when piston assembly is being installed, transmission will not operate properly.*

2) Place cushion spring in piston and install tool C3289 on transmission case. Place piston rod assembly in piston and slide piston spring over piston rod assembly. Coat piston rod guide seal ring with Lubriplate and install on rod guide. Make sure ring rotates in groove.

3) Place piston rod guide assembly on piston rod assembly and using extreme care, compress the kickdown piston spring to the point where piston guide seal ring slightly binds on case. Using a piece of brass rod (flattened on end), work seal into position, gradually compressing spring until seal ring enters case and snap ring can be installed. Install snap ring, making sure it is properly seated.

Reverse Servo Piston: 1) Place reverse servo piston valve and spring in reverse servo piston, with shaft protruding through hole in bottom of piston. Using pliers C-3229, install reverse servo piston valve spring snap ring and make sure it is seated.

2) Coat servo piston ring with Lubriplate and install on piston. Insert piston and valve assembly into transmission case in a cocked position, then by rotating piston, the piston ring will enter case without damage.

3) Place servo piston spring over piston and position spring retainer over spring. Compress spring with tool C-3289 sufficiently to install snap ring, making sure it is seated. Inspect interior of servo sleeve for burrs, then place sleeve over piston, making sure sleeve slides freely on piston by working it up and down. Remove installing tool from transmission.

Regulator Valve Body: 1) Inspect regulator valve body and valves to make sure that no damage has occurred since disassembly and blow out passages with air.

2) Coat reaction shaft seal (neoprene) with Lubriplate if not already done, and place regulator valve and torque converter control valve in regulator valve body. Install guide studs C-3288 in front transmission case.

3) Place regulator valve body assembly, with oil passages to rear, over reaction shaft and onto guide studs *(CAUTION—When reaction shaft seal enters regulator body use care to prevent shaft screws damaging passages on regulator body)*, seat firmly to front of transmission case.

Front Oil Pump: 1) Position front oil pump housing dust seal in oil pump housing with metal portion of seal down. Using driver C-3278, bottom seal in housing. Coat housing seal (large neoprene seal) with Lubriplate and install on housing.

2) Place front oil pump gear and pinion (driving lugs on pinion facing up, and prussian blue marks made at time of disassembly toward front) in pump housing. *(CAUTION—Oil pump pinion must be installed correctly or damage will result when installed in transmission.)* Lubricate pump gears with transmission fluid.

3) Place pump housing assembly over reaction shaft and slide into position over guide studs until pump housing seal is flush with transmission case. Using new aluminum or copper washers on screws, start five of the screws and draw housing down evenly until it is seated into transmission case. Remove guide studs and install two remaining screws and washers. Torque all screws to 12-17 ft. lbs. *NOTE—After all screws have been installed and torqued, engage driving lugs of oil pump pinion to determine if pinion turns freely. Use the oil pump drive sleeve for this check. If not free, remove pump and check for foreign matter between gears and housing.*

4) Using a new gasket, install torque converter control valve spring and retainer. Torque to 35-40 ft. lbs. Install regulator valve spring and retainer, using a new gasket, and torque to 45-50 ft. lbs.

Reverse Band, Kickdown Band & Lever Assemblies: *NOTE—If lever assemblies were not removed, omit the operations covering their installation.*

1) Place kickdown band lever assembly in transmission case and slide band lever shaft into position from front of case, making sure it operates freely. Install band lever shaft plug and torque to 30-35 ft. lbs. Place kickdown band assembly into transmission case by rotating ends of band through opening in case. Fit proper end of band over adjusting screw and compress band sufficently to install band strut between other band end and band lever. *CAUTION—Make sure band strut slot engages with kickdown band strut pin in band end.*

2) Place reverse band lever assembly in reverse band link assembly and position into transmission case, aligning holes in lever and link assemblies to holes in transmission case. Slide band lever shaft into position from rear of transmission case. Shaft is held in position by rear output shaft support.

3) *(NOTE—If new reverse band is to be installed, back adjusting screw out until approximately 1" of screw is above lever on locknut side.)* Place reverse band assembly into transmission case by rotating ends of band through rear opening in case. Hook correct end of band (previously identified when band removed) in link assembly. Compress band sufficiently to install band strut in slots of reverse band and band lever assembly.

Direct Clutch Piston Retainer: 1) Coat direct clutch seal ring with Lubriplate and install on piston, with lip of ring facing away from the flange. Coat clutch piston retainer seal ring with Lubriplate and install on retainer hub. Using tool C-3286, lock seal into position and make sure it is free to rotate in lands. Place piston assembly in clutch retainer, and with a twisting motion, seat piston in bottom of retainer, being careful not to damage lip of seal.

2) Seat clutch spring into piston retainer and position spring retainer and snap ring on spring. Using tool C-3302, compress clutch spring sufficiently to seat the snap ring. *NOTE*—Piston spring retainer may require guiding past the snap ring grooves. Make sure snap ring properly seated.

3) Place clutch hub in center of clutch piston retainer. Lubricate all clutch plates and driving discs with automatic transmission fluid and assemble by placing one of the clutch plates in clutch piston retainer, followed by a driving disc. *(NOTE—Install discs in the same manner they were removed. If first driving disc was installed with cork portion on outer top, then the remaining discs must be installed in the same manner, or vice versa. Repeat this procedure until all six discs and plates have been installed.)*

4) Place kickdown sun gear assembly in direct clutch piston retainer and install snap ring (this ring is a selective fit and must be checked as follows): Using a feeler gauge, check clearance under kickdown sun gear snap ring. Clearance limits should be as close to zero as possible. Rings are furnished in three sizes for selective fitting. Part No. 1327729 (.059-.061"), No. 1327730 (.062-.064"), No. 1327731 (.065-.067").

Planet Pinion Carriers: 1) Place output shaft support in tool C-3285 with bearing surface up. Lubricate bearing surface of planet pinion housing and place bearing surface of housing over output shaft support bearing surface. Place reverse annulus gear on output shaft and install snap ring. (Output shaft may be placed in vise, providing vise is clean and equipped with brass jaws). *(CAUTION—Reverse annulus gear must be tight fit on shaft. End clearance is controlled by various snap rings which are furnished in the following three thicknesses: Part No. 1329608 (.078-.080"), No. 1329609 (.082-.084"), No. 1329610 (.086-.088"). Make sure that snap ring is properly seated.)*

2) Coat output shaft seal ring with Lubriplate and install on shaft. Lock into position and make sure ring rotates freely in groove. Coat planet pinion carrier housing thrust washer with Lubriplate, slide over output shaft and into position in reverse annular gear. Place output shaft and reverse annulus gear in position in carrier housing and through output shaft support, being careful not to damage shaft seal ring as it enters shaft support. *Check to see that planet pinion carrier thrust washer seats properly between annular gear and carrier housing.*

3) Lubricate thrust surfaces and gear teeth of reverse planet pinion gear and carrier assembly, and place carrier assembly in reverse annulus gear. *(CAUTION—Make sure driving lugs on carrier assembly properly engage slots in planet pinion housing.)*

4) On early cars, coat input shaft seal rings with Lubriplate and lock into position, making sure rings rotate freely in lands. (Later cars have a large bearing area (bushing) on shaft replacing the three

CONTINUED ON NEXT PAGE

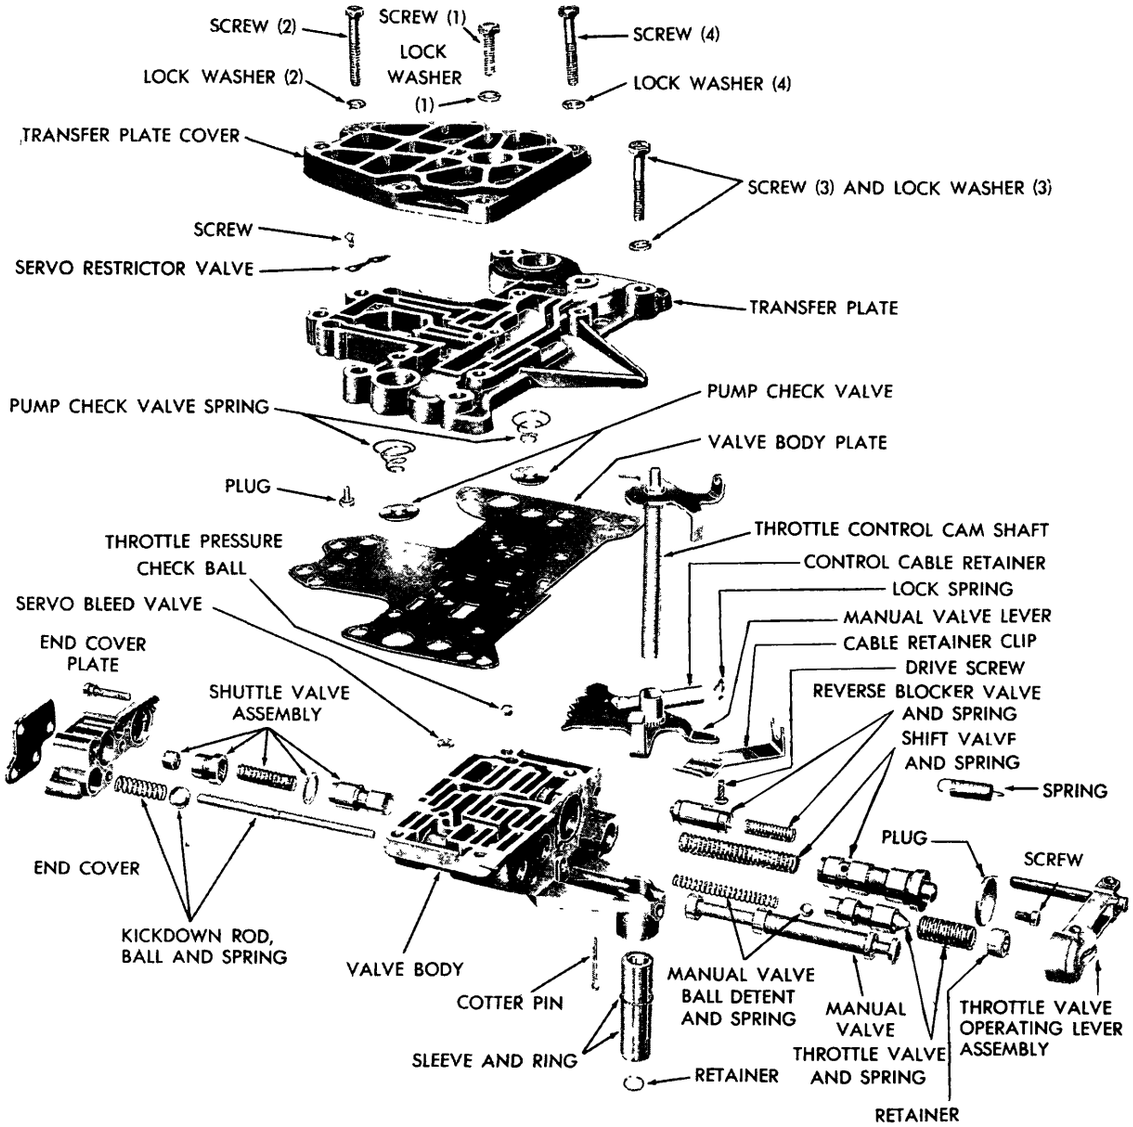
POWERFLITE (C nt.)

seal rings. *See "Input Shaft Production Change" above for installation of later type shaft in early cars). (CAUTION—Inspect stop ring for proper position in input shaft groove).* Lubricate thrust surfaces and gear teeth on kickdown planet pinion gear and carrier assembly. Slide assembly with collector ring up, carefully down on rear end of input shaft and over stop ring. Lubricate teeth and thrust surfaces and install kickdown annular gear onto input shaft, down to stop ring. Install kickdown annulus gear snap ring and make sure it is seated (Input shaft can be installed in vise providing it is clean and equipped with brass jaws).

5) Engage teeth of kickdown planet pinion gears with teeth on kickdown annulus gear. Slide pinion gear and carrier assembly into position in kickdown annulus gear. Coat reverse planet pinion carrier thrust washer with Lubriplate and install on kickdown annulus.

6) Place kickdown planet pinion carrier assembly, annulus gear and input shaft into position in planet carrier housing. Make sure planet pinion carrier thrust washer remains on annulus, and driving lugs on carrier assembly properly engage slots in planet pinion housing. Install planet pinion housing snap ring (not selective fit), making sure it is positioned and seated properly. Lubricate gears and splines.

7) Using a feeler gauge, check clearance between kickdown planet pinion carrier housing snap ring and the kickdown planet pinion carrier assembly. Limits are .012-.038". If not within these limits disassemble and recheck reverse planet pinion carrier and planet pinion carrier housing thrust washers.



Center Assembly (Output Shaft Support, Planet Pinion Carriers, and Direct Clutch Assemblies): 1) Coat kickdown planet pinion thrust washer with Lubriplate, place over kickdown sun gear and on to thrust surface of direct clutch piston retainer assembly. Place direct clutch piston retainer assembly over input shaft, engaging sun gear with kickdown planet pinion gears and engaging splines of input shaft with direct clutch hub. Make sure kickdown planet pinion carrier thrust washer remains in position.

►***DIRECT CLUTCH PISTON RETAINER THRUST WASHER CAUTION:*** This thrust washer controls transmission endplay clearance and is a selective fit. After transmission is reassembled, except for hand brake assembly, the endplay clearance must be checked and corrections made in the washer thickness as necessary. *See "Checking Transmission Endplay" below.*

2) Coat direct clutch piston retainer thrust washer with Lubriplate and install on torque converter reaction shaft inside transmission case. Use care when sliding washer over rings to prevent damage.

3) Install guide studs C-3283 in rear of transmission case, position new output shaft support gasket over guide studs and on to case. Place tool C-3306 over splines on front of input shaft.

4) Insert input shaft, with direct clutch assembly, planet pinion carrier housing, output shaft support and output shaft attached, through rear of transmission case and through transmission reaction shaft. Then guide assembly through bands and over guide studs into position in transmission case. Remove tool C-3306 from front of input shaft.

1956 POWERFLITE VALVE BODY & TRANSFER PLATE ASSEMBLY

►***CAUTION: Do not force assembly into case. Avoid damage to seal rings on torque converter reaction shaft.***

5) Install one output shaft support-to-transmission case screw and lockwasher finger tight.

Rear Oil Pump: 1) Coat oil pump pinion ball with Lubriplate and insert in ball pocket in output shaft. Lubriplate oil pump drive pinion, place over shaft and slide into position, aligning keyway in pinion with ball in shaft. ***Make sure pinion is installed with side marked with prussian blue at disassembly, is toward front.***

2) Slide pump housing assembly over output shaft and into position against output shaft support. Install five rear oil pump housing-to-output shaft support screws and lockwashers ***(CAUTION—There are two extra holes in housing which are used for vents. Make sure screws are not installed in these holes. Check each screw hole before installing screws).*** Draw screws down evenly and tighten to 15-20 ft. lbs. torque. When screws have been properly tightened, check output shaft for free rotation of pump gears. If not free, disassemble pump to determine cause.

CONTINUED ON NEXT PAGE

POWERFLITE (Cont.)

Governor: 1) Coat the two governor support piston rings with Lubriplate and install on governor support. Stagger rings and make sure they are free. Position governor body on support, install the four screws and lockwashers *but do not tighten at this point.*

2) Slide governor support and body assembly over output shaft and into position in rear pump housing, compressing governor support piston rings with fingers as support enters oil pump housing.

3) Align locating hole in output shaft to locating screw hole in governor body and install governor locating screw, tighten to 3½-4 ft. lbs. torque. *NOTE —Holes can be easily aligned by turning output shaft and holding governor body. Make sure screw driver attachment fits the screw slot when tightening locating screw.*

4) Tighten the four governor body screws to 5-10 ft. lbs. torque.

5) Dry governor parts with compressed air but do not lubricate when assembling. Place governor weight spring over secondary weight and position both in primary weight, making sure springs seat properly. Guide secondary weight, and compress governor weight spring sufficiently to install snap ring. Make sure ring is properly seated. Place governor weight assembly, with secondary weight snap ring up, into governor body and install snap ring, making sure it is seated.

6) Slide governor valve, with small end up, over governor valve shaft. Slide governor shaft into governor body through output shaft and governor weight assembly, at same time positioning valve into body. Install governor shaft snap ring and make sure it is securely locked to shaft. Check operation of governor weight assembly and valve by turning output shaft. Both should fall freely in body.

Transmission Extension: *NOTE—If output shaft rear bearing was not removed, omit operation covering its installation.*

1) Using driver C-3204, install output shaft rear bearing in extension housing. Make sure it is properly seated then lubricate with automatic transmission fluid. Install output shaft bearing snap ring, bevel side up, making sure it is properly seated.
2) Replace extension breather and tighten to 10-12 ft. lbs. torque. Install new transmission extension gasket over guide studs and into position against output shaft support. *Do not use sealing material on gasket.* Using care not to damage governor housing, place extension housing over output shaft and onto guide studs. Using tool C-496 with adapter C3284, press extension housing into position against output shaft support.
3) Start the seven transmission extension-to-case screws and lockwashers, then draw down evenly and tighten to 25-30 ft. lbs. torque. Tighten output shaft support-to-case screw to 25-30 ft. lbs. torque. *Check to see that output shaft turns freely.*
4) Coat nylon gear and threads on speedometer drive pinion with Lubriplate and install in extension. Tighten to 40-45 ft. lbs. torque.

Checking Transmission Endplay: Using dial indicator C-430 or feeler gauge, measure the distance between direct clutch assembly and carrier housing when clutch is in rearward position. Using a screwdriver inserted between the direct clutch assembly and carrier housing, carefully pry direct clutch forward. Remove screwdriver and measure again. The difference in measurements is the end clearance and must be .043-.069". If it does not fall within these limits, proceed as follows:
1) Remove the seven screws and lockwashers from transmission extension and install guide studs C-3283. Then remove the one output shaft support-to-case screw and washer, and remove extension housing, output shaft, support, and planet pinion carrier housing assembly as a unit.
2) Slide direct clutch piston retainer from torque converter reaction shaft and remove direct clutch piston thrust washer. Using a micrometer, measure thickness of the washer and then select a washer to give correct clearance. These washers are available in the following five thicknesses: Part No. 1406442 (.125-.130"), No. 1406443 (.135-.140"), No. 1406444 (.145-.150"), No. 1406445 (.155-.160"), No. 1406446 .164-.170").
3) To install, reverse removal procedure. Using driver C-3205, install output shaft rear bearing oil seal.

Hand Brake Assembly: 1) With brake support spacer in position on back of brake support and spacer sleeve in center of support, slide brake assembly over rear extension housing and anchor pin. Make sure spacer sleeve remains in center of support. Install brake support grease shield on extension housing. *NOTE—Indent in shield for correct positioning on extension housing. Shield must be located on housing far enough to permit installation of spring later.*
2) Place both anchor brake washers on brake shoe anchor and install locking washer. Place both shoe assemblies with adjusting sleeve nut and screw into position on anchor. Make sure brake shoes are between the anchor washers. Use a rubber band around shoes to help hold them in position.

3) Install operating link (marked for correct installation), and brake shoe support grease shield spring (with opening in spring toward adjusting sleeve). Make sure spring is properly seated in groove. Slide brake shoe return spring behind grease shield spring and hook into position in holes in brake shoes.
4) Make sure adjustment is loose enough and install brake drum assembly. If necessary, use tool C-496 to press brake drum on output shaft. Install transmission flange washer, shakeproof washer and nut, and tighten to 140-160 ft. lbs. torque.

Kickdown Band Adjustment: Turn transmission on side and using tool C-3291, loosen locknut and tighten kickdown adjusting band adjusting screw to 60-72 inch lbs. torque. With the counter on C-3291, back adjusting screw out 3 turns, then holding adjusting screw stationary with short handle, tighten locknut securely. *Use extreme care to assure correct adjustment.*

Reverse Band Adjustment: Remove reverse band adjusting screw locknut and tighten adjusting screw to 20-25 inch lbs. torque, then back out adjusting screw 10 turns. Holding adjusting screw in this position, replace adjusting screw locknut and tighten to 30-35 ft. lbs.

Valve Body & Transfer Plate: 1) Install neutral safety switch, back-up light switch and gasket, and tighten to 15-20 ft. lbs. torque. Clean mating surfaces and check for burrs on transmission case and valve body. Place valve body and transfer plate into position on transmission case and install five transfer plate screws and lock washers *(Install the two 1⅝" long screws through transfer plate cover on valve body)*, tighten to 12-17 ft. lbs. torque. Make certain the two oil strainer tube seals are in position on oil strainer, and place oil strainer in position on valve body. Install oil strainer support screws and lock washers and tighten to 12-17 ft. lbs.
2) Place manual valve lever shaft seal cover over manual shaft and install manual control lever with arm side of lever against cover, on manual valve shaft. Tighten locking screw. Place throttle valve camshaft felt and retainer over throttle valve shaft. Install lever assembly on throttle camshaft, and tighten locking screw. Check operation of controls by shifting manual control into the four operating positions.
3) Check throttle cam position in throttle operating lever assembly and throttle camshaft assembly for kickdown operation. Visually check manual lever contact on neutral safety and back-up light switches.
4) Install oil pan, using a new gasket, and tighten attaching screws to 12-17 ft. lbs., drawing screws down evenly. Tighten drain plug to 20-25 ft. lbs. torque.

VALVE BODY OVERHAUL

Control Valve Assembly: A reverse blocker valve has been added to the control valve assembly. Remove the reverse blocker valve by removing the cotter pin and spring, then rotate valve out of its bore. Donot remove push button unit control adapter, lock spring, or cable adapter clip unless inspection indicates that it is necessary. See "Control Valve" illustration for removal and installation of valve components.

Valve Body & Transfer Plate Disassembly: Place valve body and transfer plate assembly in holding fixture C-3294. DO NOT USE VISE TO HOLD TRANSFER PLATE ON VALVE BODY.
1) Remove two of the long transfer plate cover screws and lock washers and install guide studs C-3295. Keeping finger tight pressure against transfer plate, remove the three remaining transfer plate cover screws, (two long & one short), and remove transfer plate cover. Using care not to lose the servo restrictor valve operating plug from transfer plate, remove transfer plate from valve body plate. *NOTE—Rear pump check valve has metering hole in it. Note position of this valve in relation to the front pump check valve (without metering hole).*
2) Remove valve body plate from valve body, noting position of throttle pressure check valve ball, and servo bleed valve (servo bleed valve may stick to valve body plate). Remove these parts and place in clean container. Remove throttle valve cam spring from cam and operating lever. Compressing the throttle valve operating lever assembly against throttle valve spring, slide throttle valve cam assembly from manual lever assembly *(CAUTION— Remove any burrs from throttle valve camshaft and*

CONTINUED ON NEXT PAGE

POWERFLITE (C nt.)

manual valve lever shaft before sliding them from valve body).

3) Swing throttle valve operating lever out of way and remove throttle valve spring and retainer from throttle valve. Remove throttle valve from valve body core. Check distance from valve body to end of throttle valve operating lever adjusting screw. This distance should be 1 11/16". Using tool C-3279, remove throttle valve adjusting screw, lock nut and throttle valve operating assembly. ***NOTE—It is not necessary to remove throttle valve operating assembly unless parts are to be replaced.***

4) Remove the four (three long and one short) valve body end cover plate screws and lock washers and remove valve body end cover plate. Remove valve body and cover screw, keeping pressure against cover to avoid losing the three springs behind it. Carefully remove valve body cover so as not to lose any of the springs or kickdown valve ball. Remove shuttle valve plug *(CAUTION—This plug has an adjustment, but do not disturb this setting as it is adjusted during manufacture).* Remove kickdown valve ball from body. Remove shuttle valve by using shuttle valve spring (shuttle valve stop ring will come out with valve).

5) Remove direct clutch shift valve spring from valve body. Mark the direct clutch shift valve plug with prussian blue (in order to reinstall with right side out), then loosen plug screws sufficiently to allow removal of plug by pushing on open end of shift valve with finger. Remove shift valve, and remove valve body from tool C-3294. Place valve body on clean paper. Remove kickdown rod from cover end of valve body.

►***MANUAL VALVE AND LEVER ASSEMBLY NOTE—It is not necessary to remove this assembly unless damaged parts are to be replaced. If assembly must be removed, proceed as follows:***

6) Place manual control valve lever on lever assembly and turn it counter-clockwise until manual control valve is in low range position (last detent). Using a screwdriver, compress detent plunger and spring and continue to turn manual valve lever assembly until manual valve becomes disengaged from manual valve lever assembly. Remove manual valve from valve body bore. Remove manual control lever and slide manual lever assembly from valve body. Remove manual valve lever detent plunger and spring from valve body.

Valve Body & Transfer Plate Inspection: Wash all parts in clean solvent and dry with compressed air. Check all passages for obstructions and check for porous coating. Inspect all mating surfaces for burrs and scratches. Light scratches and burrs can be removed with crocus cloth. With a light, check bores in valve body for pits and scores. Check springs for distortion and collapse. Check mating surfaces on a surface plate for distortion. Check all moving parts for free operation, and valves for freeness in body bores. Inspect servo restrictor valve in transfer plate to make sure it is seating properly. If valve is defective, carefully remove drive screw. Install new valve and new drive screw, making sure drive screw is tight, and being very careful not to distort transfer plate when installing drive screw. Check all points in valve for wear and replace defective parts.

Valve Body & Transfer Plate Reassembly: ***CAUTION—When assembling valve body and transfer plate assemblies, handle parts carefully to avoid damage, such as nicks, etc., to mating surfaces. Use a twisting motion when placing valves in their respective bores.***

1) Place manual valve lever detent plunger spring and plunger into place in valve body. Slide manual valve lever assembly into valve body. Using a twisting motion place manual valve into valve body sufficiently to engage manual valve with manual valve lever pin. Then using valve lever assembly, turn slowly in clockwise direction and at the same time using a twisting motion, guide manual valve into valve body to low range position. Make sure detent plunger is seated.

2) Place kickdown rod (small end toward end cover) into valve body, making sure it is properly seated. Place valve body in tool C-3294 and install direct clutch shift valve. Place direct clutch shift valve into position (same as when removed, and with marks made at disassembly in correct position) in valve body. Draw the two screws down evenly and torque to 24-30 inch lbs. Install direct clutch shift valve spring in valve.

3) Install shuttle valve in valve body. Coat stop ring lightly with Lubriplate and place into recess in valve body. Place shuttle valve spring in valve. Place kickdown valve ball into valve body.

4) Place valve body end cover plate on end cover. Install one short screw and lock washer. Tighten securely. Place shuttle valve plug into position in end cover, and install kickdown valve spring. Install valve body end cover onto valve body. ***CAUTION—*** Make sure direct clutch shift valve, shuttle valve and kickdown valve spring are in correct position and properly seated when cover is being installed. Install valve body end cover screw and lock washer, but do not tighten.

5) Install the three (long) valve body end cover plate screws and lock washers. Draw down evenly and tighten to 24-30 inch lbs. Tighten valve body end cover screw and the remaining end cover plate screw to 24-30 inch lbs.

6) Using tool C-3279, install throttle valve adjusting screw, locknut and throttle valve lever assembly. Adjust to where there is approximately 1 11/16" distance between valve body and end of throttle valve operating adjusting screw. Install throttle valve (point outward) in valve body. Place throttle valve spring and retainer over throttle valves. Swing throttle valve operating lever over spring and retainer. Compressing the throttle valve lever assembly against throttle valve spring, slide throttle valve cam assembly into manual lever assembly, indexing cam portion on throttle valve in slot of operating lever. Install throttle valve cam spring to cam and operating lever.

7) Install servo bleed valve and throttle pressure check valve ball into position in valve body and install guide studs. Position transfer plate cover on transfer plate and install the center screw (short) and lock washer finger tight. Install the servo restrictor valve operating plug (long end first) into transfer plate.

8) Make sure pump check valves and springs are properly positioned in transfer plate. The pump check valve with the metering hole should be toward the rear of transmission. Place valve body plate flush into position on transfer plate by compressing pump check valve springs. ***CAUTION—Be sure pump check valves enter transfer plate, otherwise valve body plate will be damaged when assembly is later drawn down onto valve body.***

9) Keep sufficient pressure on transfer plate and valve body to hold them together. Place over guide studs and into position on valve body, and install two of the transfer plate cover screws and lockwashers (one on each side) finger tight. Recheck to see that pump check valves remained in position in valve body plate. Remove guide studs and install two remaining transfer plate cover screws and lock washers. Draw transfer plate down evenly and torque all five screws to 45-50 inch lbs. torque.

CAUTION—Avoid over tightening as this will cause valve body to warp which will result in sticky valves. Check operation of pump check valves to make sure they can be unseated by pressing down on them.

TORQUEFLITE (CHRYSLER)

Chrysler Imperial (1956)

►CHANGES, CAUTIONS, CORRECTIONS

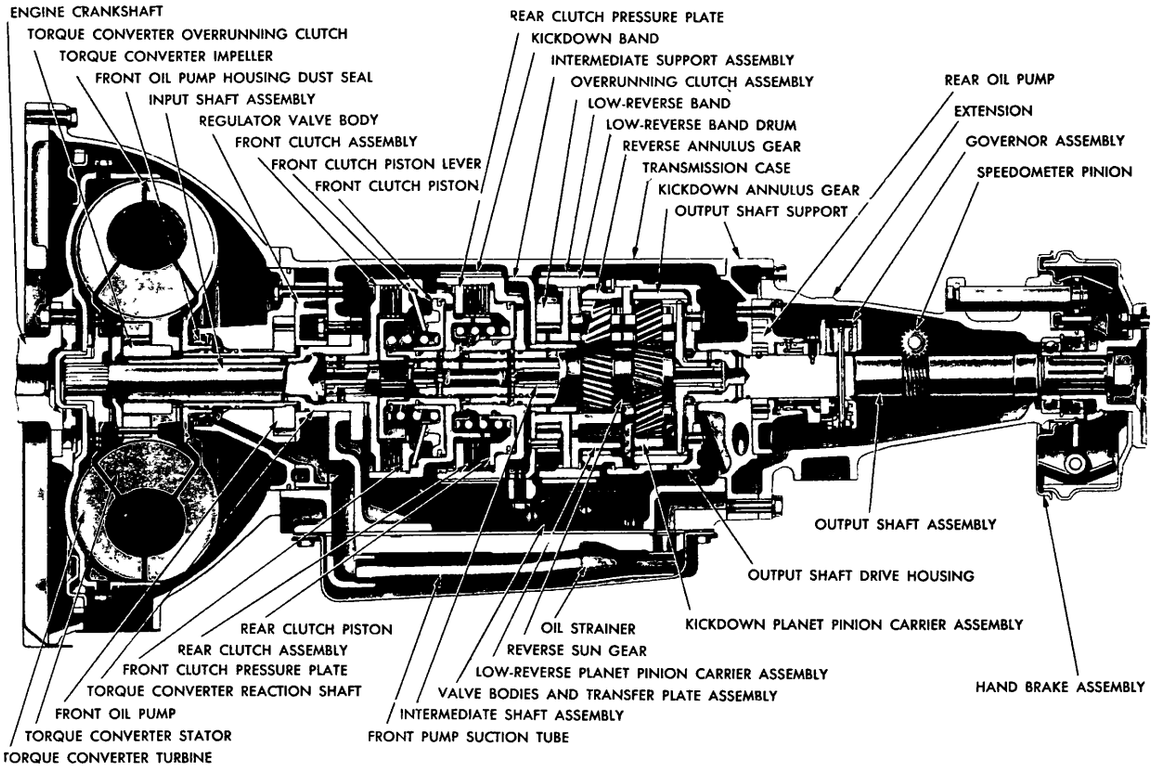
►*STARTING ENGINE BY PUSHING CAR: (Towing car to start is not recommended because of sudden surge of power wh n engine starts).* Turn ignition switch on, then push the "1" (Low) button in and depress accelerator pedal slightly. After car attains a speed of 15 MPH, the transmission will start engine.

►*TOWING TORQUE-FLITE CARS: Following procedure is recommended:*

Transmission Operating Properly—Car may be towed safely in "N" (Neutral) position at moderate speeds. For long distance towing (over 100 miles), the propeller shaft should be disconnected.

Transmission In perative—Tow car with rear end raised or remove the propeller shaft.

DESCRIPTION



DESCRIPTION: Torque-Flite Transmission consists of a wide range torque converter and a hydraulically controlled automatic planetary transmission. Two multiple disc clutches, an overrunning clutch, two bands and two planetary gear sets provide three forward ratios and one reverse ratio. The oiling system consists of two pumps (front & rear) which circulate oil through transmission, torque converter and oil cooler (where oil cooler is used), with oil supply carried in transmission case oil pan. Transmission speed range selection is controlled by a five button (push button) control located to left of steering wheel in drivers compartment.

OPERATION

OPERATION: Transmission operation in each position of the push button control is outlined below. In "D" (Drive) position (normal driving position), operation varies in accordance with car speed and operating conditions. *See "Shift Speed Tables" below.*

"D" (Drive) Position—Breakaway: Power flow is from converter turbine through input shaft and front clutch retainer. Front clutch is applied and the drive continues through clutch hub to intermediate shaft and kickdown annulus gear. Kickdown annulus gear drives the kickdown planet gears, rotating them in the same direction. Kickdown planet gears are meshed with kickdown sun gear which is integral with the reverse sun gear. Both sun gears are forced to rotate in a reverse direction by reaction of the kickdown planet pinion carrier together with the reverse annulus gear, both of which are splined to the output shaft drive housing. The reverse planet pinion carrier is attached to and prevented from turning backward by an overrun clutch and becomes stationary in forward drive (overruns on coast). Therefore, the reverse carrier pinions are forced to rotate in a forward direction and force the reverse annulus to rotate in the same direction transmitting power flow to output shaft with the combined ratio of the kickdown and reverse planetary gear sets of 2.45-1.

"D" (Drive) — 2nd Speed, and "2" (Second) Positi n — 2nd Speed: Power flow is from torque converter turbine through output shaft to front clutch (which is applied). From front clutch through intermediate shaft to the annulus gear of the kickdown (rear) planetary gear set. Kickdown band is applied which holds the sun gear stationary. The annulus gear drives the kickdown planet pinions which rotate in the same direction as input and intermediate shafts. Kickdown planet pinions are meshed with the sun gear, therefore, they walk around this gear and exert force through kickdown planet pinion shafts to rotate the kickdown planet pinion carrier. The carrier, which is splined to output shaft drive housing, moves at a slower speed than the annulus gear, thus providing a gear ratio of 1.45-1.

TORQUEFLITE TRANSMISSION (SECTIONAL VIEW)

"D" (Drive) Position — Direct: Power flow from converter goes directly through transmission because the planetary elements of the gear train are locked up by two multiple disc clutches and both bands are released. The torque converter provides all the torque multiplication. Gear ratio is 1.00-1.

Kickdown (Forced Downshift) in "D" (Drive) Position Below 25 MPH: This will force transmission to downshift and the power flow will be the same as "D" (Drive) Position — Breakaway.

"1" (Low) Position — Low Speed: In "1" (Low) position, the power flow is the same as "D" (Drive) position — Breakaway or "2" (Second) Position — Breakaway, with one exception, the low-reverse band is applied, locking the overrun clutch to provide engine braking.

"R" (Reverse) Position: Rear clutch and low-reverse band are applied; all other friction elements are released. The power flow is from torque converter turbine through input shaft to rear clutch hub (part of front clutch retainer). The rear clutch is splined to reverse sun gear. The carrier of reverse (front) planetary gear set is held stationary by the low-reverse band; therefore, the set acts as a simple reverse train through reverse planet pinions to reverse annulus (which is splined to output shaft drive housing) and provides a reverse ratio of 2.20-1.

LUBRICATION

Checking Fluid Level: With transmission in "N" (Neutral) position and engine idling, oil level on dipstick located at rear of engine on right side, should be at the "L" mark for cold (room temperature) transmission and at "F" mark for a hot (normal operating temperature) transmission. Add Automatic Transmission Fluid Type "A" to bring fluid to correct mark on dipstick.

Draining & Refilling: Remove transmission drain plug. Remove plate from bottom of torque converter housing and rotate converter until converter drain plug is accessible. Drain oil from both units. Install drain plug. Tighten converter plug to 10-12 ft. lbs., and transmission drain plug to 15-17 ft. lbs. Install plate on

CONTINUED ON NEXT PAGE

TORQUEFLITE (C nt.)

torque converter housing. Pour approximately 5 quarts of Automatic Transmission Fluid Type "A" through oil pan filler tube. With engine idling in neutral, add enough fluid to bring fluid level to "L" mark on dipstick (approximately 3 quarts). Shift transmission through all ranges and recheck. Add fluid to bring level to "L" mark on dipstick. *CAUTION*–Make sure oil level indicator seats on filler tube to prevent dirt entering transmission.

►*WINTER DRIVING NOTE:* During extreme cold weather (for which 5W oil is recommended for the engine) should slow engine turn-over be experienced on starting, it is permissable to drain one quart of fluid from transmission and replace with one quart of kerosene. If additional lubricant is required, Automatic Transmission Fluid Type "A" should be used to make up the difference. *It is not necessary to drain and refill transmission with regular fluid as the weather warms up, as the increased operating temperatures will gradually drive off the kerosene.*

LINKAGE ADJUSTMENT

►*THROTTLE LINKAGE ADJUSTMENT NOTE: See "Carburetor" on car model pages.*

Manual Control Cable Adjustment: **1)** Push the "R" (Reverse) button in. Drain approximately two quarts of fluid from transmission. Remove control cable adjusting clip, flat washer and lockwasher, and screw. Remove neutral starting switch. Place point of a screwdriver through neutral starting switch opening in transmission case and against neutral starting switch operating portion of manual control lever.

2) While holding manual lever in reverse position, adjust control cable for free play by pushing in until cable stops. Mark position on cable in relation to adapter housing. Withdraw control cable to stop, and measure travel. Push control cable in adapter housing one-half of total travel. With cable in this position, install control cable adjusting clip, flat washer, lockwasher, screw, and tighten. Install neutral starter switch and wires.

3) To check for proper adjustment, push the various push buttons, return to neutral each time and check starter operation. A test light attached to starter neutral switch may be used instead of the starter for checking proper operation and adjustment. Refill transmission to proper level.

BAND ADJUSTMENT

Kickdown (Front) Band: Kickdown band adjusting screw is located on left side of transmission case. Using a ¾" wrench, loosen locknut and back off approximately 5 turns. Check freeness of adjusting screw in transmission case. Tighten the adjusting screws to **70-75 inch pounds,** using wrench C-3380. Using a reference mark of chalk or colored pencil on the corner of adjusting screw square and the transmission case, back the adjusting screw out **exactly two turns.** While holding adjusting screw stationary, tighten locknut to 35-40 ft. lbs.

Low-Reverse (Rear) Band: Low-reverse band adjusting screw is located on right side of transmission case. Using a ¾" wrench, loosen locknut and back off 9 turns. Check freeness of adjusting screw in transmission case. If free, set the click device on the small inch-pound torque wrench C-3380 for **70-75 inch pounds** and tighten the adjusting screw. Using a reference mark of chalk or colored pencil on the corner of adjusting screw square and the transmission case, back the adjusting screw **exactly two turns.** While holding adjusting screw stationary, tighten locknut to 35-40 ft. lbs.

TESTING

TRANSMISSION SHIFT SPEEDS (MPH)

UPSHIFTS

Throttle Position	1-2	2-3
Light	10	15
To Detent	25	60
Wide Open	40	75

DOWNSHIFTS

Throttle Position	2-1	3-2	3-1
Closed	8	①	8
To Detent	8	8-12	
Kickdown Limit	8-25	25-70	8-25

① —Not possible.

ROAD TESTING TRANSMISSION: If transmission operation not satisfactory, the following complete procedure is recommended to check performance and diagnose trouble.

►*ROAD TESTING NOTE:* Before road testing, engine must be properly tuned. Adjust idle speed to 400-450 RPM (Single 4-Barrel Carb. Cars); 650 RPM (Two 4-Barrel Carb. Cars), with engine and transmission at normal operating temperature and with transmission in "N" (Neutral) position. Bring transmission fluid level to correct mark on dipstick. If throttle linkage has been disturbed in tuning engine, linkage must be adjusted before making tests.

►*STALL TESTING CAUTION: DO NOT stall test the torque converter. To prevent damage to transmission, wide open throttle stall operation is not recommended.*

1) Push in "N" (Neutral) button and check for dragging up to an engine speed of 800 RPM.

2) Push in "R" (Reverse) button and note shift time and smoothness of the shift.

3) Push in "D" (Drive) button and note shift time and smoothness of engagement.

4) Accelerate car at very light throttle. The transmission should upshift into second at approximately 8-10 MPH and into direct speed at approximately 15-17 MPH. Check quality of the shifts.

5) Slow the car to approximately 15 MPH, then depress accelerator pedal quickly to wide open throttle (without going into kickdown). Check for slippage of front and rear clutches. The transmission should not downshift at this time.

6) At a car speed of approximately 20-22 MPH, depress accelerator pedal fully. The transmission should downshift to breakaway gear. Check quality of shift.

7) Release accelerator pedal and allow transmission to upshift. Accelerate car to 40 MPH. Depress accelerator pedal fully. The transmission should downshift to second gear. Check quality of shift.

8) Release accelerator pedal to closed throttle. Check quality of the "lift-foot" upshift.

9) Accelerate car to 60 MPH and depress accelerator pedal fully. The transmission should downshift to second gear. Check quality of the shift.

10) Accelerate car to kickdown (second gear) at wide open throttle until the transmission upshifts. The shift should occur at approximately 70 MPH. Check quality of the shift.

11) Slow car down to 30-40 MPH and engage the "2" (Second) button. The transmission should downshift to second gear. Check for gear noise.

12) Slow car to 15 MPH and depress accelerator pedal quickly to wide open throttle without going into kickdown. Check for kickdown band or front clutch slippage. The transmission should not downshift at this time.

13) Release accelerator pedal and push the "1" (Low) button. The transmission should downshift at approximately 25 MPH.

14) With accelerator pedal at light throttle, push the "D" (Drive) button at approximately 20 MPH (the transmission will upshift), coast to a stop. The transmission should downshift at approximately 8 MPH. Check quality of downshift.

HYDRAULIC CONTROL PRESSURE TESTS: *NOTE–Use Pressure Gauge C-3293 (300#) for all the following tests.*

Line Pressure: Remove the 1/8" pipe plug from line pressure take-off hole located on left side of transmission case (lower plug forward of control lever and cable connection). Install pressure gauge at this point and make the following tests:

Line Pressure Tests

Push Button Position	Rear Wheels	Engin Speed (RPM)	Pressure
R	Free	1600	225
N		800	90
D	Locked	800	90
2	Locked	800	90
1	Locked	800	90

►*NOTE: If line pressure not correct, see "Trouble Shooting & Diagnosis" below.*

Governor Pressure: Remove 1/8" pipe plug from governor pressure take-off hole located on lower left side of transmission case (at rear of case in output shaft support). Install pressure gauge at this point and make the following tests:

Governor Pressure Tests

Push Button Position	Rear Wheels	Car Speed (RPM)	Pressure
D	Free	8	2-3
D	Free	27	27-32
D	Free	38	44-47
D	Free	75	75-82

►*NOTE: If governor pressure n t correct, and does not correspond to car speed, see "Trouble Shooting & Diagnosis" below.*

Lubrication Pressure: Remove 1/8" pipe plug from lubrication pressure take-off hole located on left side of transmission case (middle plug forward of control lever and cable connection). Install pressure gauge at this point and proceed as follows: With engine running at 800 RPM in "N" (Neutral), lubrication pressure should be approximately 10-30 lbs. If pres-

CONTINUED ON NEXT PAGE

TORQUEFLITE (Cont.)

sure is incorrect, check line pressure and see "Trouble Shooting & Diagnosis" below. If pressure is extremely high (above 50 lbs.) it is an indication of a restriction due to dirt or foreign matter in lubrication passages.

Front Servo Release & Rear Clutch Apply Pressure: The front servo release and rear clutch apply pressure can be checked simultaneously with line pressure or immediately after line pressure has been determined. Remove the 1/8" pipe plug from front servo release and rear clutch apply pressure take-off hole located on lower right side of transmission (in servo boss just above transmission lower flange). Install the pressure gauge at this point. The pressure should not be less than 15 lbs. lower than line pressure in the "D" (Drive) position – **in direct only.**

AIR PRESSURE TESTS: The front clutch, rear clutch, kickdown servo, and low and reverse servo may be checked by applying air pressure to their respective passages when valve body is removed *(CAUTION – Air supply must be free of all dirt and moisture).* Refer to "Oil Passages in Transmission Case" illustration for location of air passages.

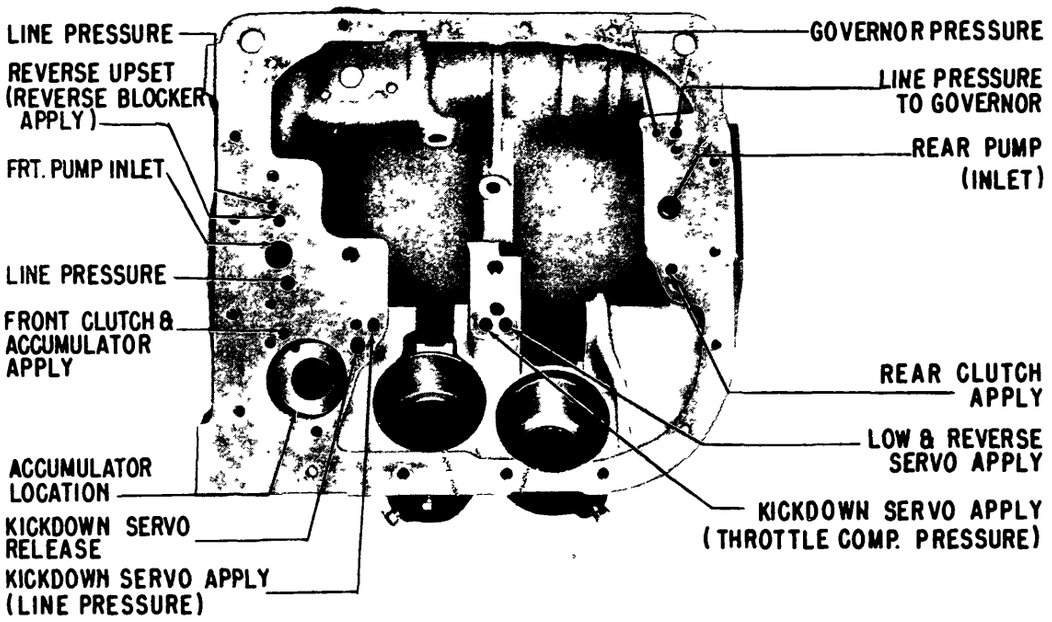
1) Raise car on hoist, drain transmission fluid and remove transmission oil pan.

2) Front Clutch–Remove accumulator cover. Apply pressure to front clutch passage. Listen for a dull thud which indicates that front clutch is operating. Hold air pressure on for a few seconds and check for excessive oil leaks in system.

3) Rear Clutch–Remove valve body assembly and apply air pressure to rear clutch passage. Listen for a dull thud which indicates that rear clutch is operating. Check for excessive oil leaks.

4) Kickdown Servo–Apply air pressure to kickdown "apply" (line)) pressure passage. Observe operation of kickdown servo, lever and band when air pressure is applied. Apply air pressure to "apply" (compensated throttle) pressure passage and observe operation of kickdown servo.

5) Low & Reverse Servo–Apply air pressure to low & reverse servo passage and observe operation of servo, lever, and band.



6) Governor–Apply air pressure to "line pressure-to-governor" passage. Rotate propeller shaft slightly to bring governor flyweight down while applying the pressure. Operation of the governor will be indicated by a sharp click when air pressure is applied.

►*AIR PRESSURE TEST NOTE: If all the above units operate properly, "no drive", "erratic" and "no upshift" conditions are caused by trouble in the control valve assembly.*

TROUBLE SHOOTING & DIAGNOSIS

►*TROUBLE SHOOTING & DIAGNOSIS NOTE: Except where noted, the following operations can be performed without removing the transmission from the car.*

LINE PRESSURE INCORRECT: Oil level incorrect. Check for stuck or scratched regulator valve or buckled spring. Check kickdown servo for broken seal rings, stuck piston or broken linkage. Check low & reverse servo for torn seal, stuck piston sleeve, broken band or linkage. Check for possible leak at front pump suction tube, tube elbow or rear pump suction tube. Check for loose bolts, burrs or scratches on mating surfaces of valve body. Clean valve assembly and check for stuck valves, dirt, scratched valve or body, and burrs on valves. *Transmission must be removed for the following:* Clean and inspect front pump and drive sleeve for side and diametral clearance. Examine oil pump inner and outer rotor for scoring. Check front pump drive sleeve seal rings. Check regulator valve body for scratches and scoring on valve bores and face which bears against front pump housing. Examine regulator valve body to determine if secondary reaction orifice is free of dirt. Check gasket for uniformness of compression by valve body.

TORQUEFLITE OIL PASSAGES IN TRANSMISSION CASE

GOVERNOR PRESSURE INCORRECT (Does not correspond to car speeds): Clean governor assembly, and check weight assembly and valve for burrs, scratches or sticky operation. Examine governor valve shaft, shaft snap rings and seal rings. Clean and inspect rear pump assembly for side or diametral clearance. Note whether rear oil pump pinion ball is in place. Examine output shaft support face for scoring.

LUBRICATION PRESSURE INCORRECT: Check for stuck or scratched regulator valve or buckled spring. Check for stuck or scratched converter control valve or buckled spring. *Transmission must be removed for the following:* Clean and inspect front pump and drive sleeve for side and diametral clearance. Examine oil pump inner and outer rotor for scoring. Check front pump drive sleeve seal rings. Flush out converter and check converter-to-housing runout.

HARSH NEUTRAL-TO-DRIVE OR NEUTRAL-TO-REVERSE SHIFT: Check hydraulic control pressures. Adjust low and reverse band. Adjust engine idle speed. Check Low & Reverse servo for torn seal, stuck piston sleeve, broken band or broken linkage. Check accumulator cover screw torque and piston for broken rings. *Transmission must be removed for the following:* Clean and inspect front clutch discs, plates, drive hub, return spring and piston. Check front clutch circuit for leakage. Clean and inspect rear discs, plates, return spring and piston. Check rear clutch circuit for leakage.

DELAYED NEUTRAL-TO-DRIVE SHIFT: Check transmission oil level. Check hydraulic control pressures. Check control valve body for loose bolts, burrs or scratches on mating surfaces. Check for stuck valves, dirt, scratched valves or body, and burrs on valves. Tighten valve body bolts to correct specifications. Check accumulator cover screw torque and piston for broken rings. Test transmission units with air pressure (see above). *Transmission must be removed for the following:* Clean and inspect front pump and drive sleeve assembly for side or diametral clearance. Examine oil pump inner and outer rotor for scoring. Check front pump drive sleeve seal rings. Clean and inspect front clutch discs, plates, drive hub, return spring and piston. Check front clutch circuit for leakage.

RUNAWAY ON UPSHIFT & 3-2 KICKDOWN: Check transmission oil level. Adjust throttle linkage *(see "Carburetor" on car model pages).* Check hydraulic control pressures. Adjust kickdown band. Check kickdown

CONTINUED ON NEXT PAGE

TORQUEFLITE (C nt.)

servo for broken seal rings, stuck servo piston or broken linkage. Check control valve body for loose bolts, burrs or scratches on mating surfaces. Check for stuck valves, dirt, scratched valves or body, and burrs on valves. Tighten valve body bolts to correct specifications. Check accumulator cover screw torque and piston for broken rings. Test transmission units with air pressure (see above). *Transmission must be removed for the following:* Clean and inspect rear clutch discs, plates, drive hub, return spring and piston. Check rear clutch circuit for leakage.

HARSH UPSHIFT & 3-2 KICKDOWN: Adjust throttle linkage *(see "Carburetor" on car model pages).* Check hydraulic control pressures. Adjust kickdown band. Check kickdown servo for broken seal rings, stuck servo piston or broken linkage. Check control valve body for loose bolts, burrs or scratches on mating surfaces. Check for stuck valves, dirt, scratched valves or body, and burrs on valves. Tighten valve body bolts to correct specifications. Check accumulator cover screw torque and piston for broken rings. *Transmission must be removed for the following:* Clean and inspect rear clutch discs, plates, drive hub, return spring and piston. Check rear clutch circuit for leakage.

NO UPSHIFT: Proceed as for "Runaway on Upshift & 3-2 Kickdown" above, and clean governor assembly and check weight assembly and valves for burrs, scratches and sticky operation. Examine governor valve shaft, shaft snap rings and seal rings.

NO KICKDOWN OR NORMAL DOWNSHIFT: Proceed as for "Runaway on Upshift & 3-2 Kickdown" above. Check control cable adjustment. Adjust low and reverse band. *Transmission must be removed for the following:* Clean and inspect overrunning clutch assembly for brinnelled rollers and cam, and improperly assembled rollers and springs.

SHIFTS ERRATICALLY: Check transmission oil level. Adjust throttle linkage *(see "Carburetor" on car model pages).* Check control cable adjustment. Check hydraulic control pressures. Check for stuck or scratched regulator valve or buckled spring. Check output shaft rear bearing for roughness or an unseated snap ring. Check for possible air leakage at front pump suction tube, tube elbow or rear pump suction tube. Check control valve body for loose bolts, burrs or scratches on mating surfaces. Check for stuck valves, dirt, scratched valves or body, and burrs on valves. Test transmission units with air pressure (see above). Clean governor assembly and check weight assembly and valve for burrs, scratches and sticky operation. Examine governor valve shaft, shaft snap rings and seal rings. *Transmission must be removed for the following:* Clean and inspect front pump and drive sleeve assembly for side or diametral clearance. Examine oil pump inner and outer rotor for scoring. Check front pump drive sleeve seal rings.

SLIPS IN FORWARD DRIVE POSITIONS: Check transmission oil level. Check hydraulic control pressures. Check control valve body for loose bolts, burrs or scratches on mating surfaces. Check for stuck valves, dirt, scratched valves or body, and burrs on valves. Tighten valve body bolts to correct specifications. Check accumulator cover screw torque and piston for broken rings. Test transmission units with air pressure. *Transmission must be removed for the following:* Clean and inspect rear clutch discs, plates, drive hub, return spring and piston. Check rear clutch circuit for leakage. Clean and inspect the overrunning clutch assembly for brinnelled rollers or cam, and improperly assembled rollers and springs.

SLIPS IN LOW-REVERSE ONLY: Check hydraulic control pressures. Adjust low-reverse band. Check low-reverse servo for torn oil seal, stuck piston sleeve, broken band or linkage. Check control valve body for loose bolts, burrs, scratches on mating surfaces. Check for stuck valves, dirt, scratched valves or body, and burrs on valves. Tighten valve body bolts to correct specifications. Test transmission units with air pressure. *Transmission must be removed for the following:* Clean and inspect regulator valve body for scratches and scoring on valve bores and face which bears against the front pump. Examine valve body to determine if the secondary reaction orifice is free of dirt. Check gasket for uniformness of compression by valve body.

SLIPS IN ALL POSITIONS: Check transmission oil level. Check hydraulic control pressures. Check for a stuck or scratched regulator valve or buckled valve spring. Check control valve body for loose bolts, burrs or scratches on mating surfaces. Check for stuck valves, dirt, scratched valves or body, and burrs on valves. Tighten valve body bolts to correct specifications. Test transmission units with air pressure (see above). *Transmission must be removed for the following:* Clean and inspect front pump and drive sleeve assembly for side and diametral clearance. Examine oil pump inner and outer rotor for scoring. Check front pump drive sleeve seal rings. Clean and inspect regulator valve body for scratches and scoring on valve bores and face which bears against the front pump. Examine valve body to determine if the secondary reaction orifice is free of dirt. Check gasket for uniformness of compression by valve body.

NO DRIVE IN ANY POSITION: Proceed as for "Slips in all Positions" above, and in addition, check for possible air leakage at front pump suction tube, tube elbow or rear pump suction tube.

NO DRIVE IN FORWARD RANGES: Check hydraulic control pressures. Adjust kickdown band. Check kickdown servo for broken seal rings, stuck servo piston or broken linkage. Check control valve body for loose bolts, burrs or scratches on mating surfaces. Check for stuck valves, dirt, scratched valves or body, and burrs on valves. Tighten valve body bolts to correct specifications. Check accumulator cover screw torque and piston for broken rings. Test transmission units with air pressure (see above). *Transmission must be removed for the following:* Clean and inspect front clutch discs, plates, drive hub, return spring and piston. Check front clutch circuit for leakage. Clean and inspect rear clutch discs, plates, drive hub, return spring and piston. Check rear clutch circuit for leakage. Clean and inspect overrunning clutch assembly for brinnelled rollers or cam, and improperly assembled rollers and springs.

NO DRIVE IN REVERSE: Check hydraulic control pressures. Adjust low-reverse band. Check low-reverse servo for torn seal, stuck piston sleeve, broken band or linkage. Test transmission units with air pressure (see above). *Transmission must be removed for the following:* Clean and inspect rear clutch disc, plates, drive hub, return spring and piston. Check rear clutch circuit for leakage.

DRIVES IN NEUTRAL: Adjust gearshift control cable. Check control valve body for loose bolts, burrs or scratches on mating surfaces. Check for stuck valves, dirt, scratched valves or body, and burrs on valves. Tighten valve body bolts to correct specifications. *Transmission must be removed for the following:* Clean and inspect front clutch disc, plates, drive hub, return spring and piston. Check front clutch circuits for leakage.

DRAGS OR LOCKS: Adjust kickdown band and the low-reverse band. Check handbrake for excessive drag. Check kickdown servo for broken seal rings, stuck servo piston or broken linkage. Check low-reverse servo for torn oil seal, stuck piston sleeve, broken band or linkage. *Transmission must be removed for the following:* Clean and inspect discs, plates, drive hub, return spring and piston of both front and rear clutches. Check front and rear clutch circuits for leakage. Clean and inspect planetary gear set for worn thrust washers, nicked or rough gear teeth, and excessive pinion clearance. Clean and inspect overrunning clutch assembly for brinnelled rollers and cam and improperly assembled rollers and spring.

GRATING & SCRAPING NOISES: Check handbrake for excessive drag. Check output shaft rear bearing for roughness or an unseated snap ring. Clean governor assembly, and check weight assembly and valves for burrs, scratches, or sticky operation. Examine governor valve shaft, shaft snap rings and seal rings. Clean and inspect rear pump assembly for side or diametral clearance. Note whether rear oil pump pinion ball is in place. Examine output shaft support for scoring. *Transmission must be removed for the following:* Clean and inspect front pump assembly for side or diametral clearance. Examine oil pump inner and outer rotor for scoring. Check front pump drive sleeve seal rings. Clean and inspect front and rear clutch discs, plate, drive hubs, return spring and pistons. Check front and rear clutch circuits for leakage. Clean and inspect planetary gear set for worn thrust washers, nicked or rough gear teeth, and excessive pinion clearance.

BUZZING NOISES: Check transmission oil level. Check for stuck or scratched regulator valve or buckled spring. Check for stuck or scratched converter valve or buckled spring. *Transmission must be removed for the following:* Clean and inspect regulator valve body for scratches and scoring on valve bores and face which bears against the front pump housing. Examine valve body to determine if secondary reaction orifice is free of dirt. Check gasket for uniformness of compression by valve body.

CONTINUED ON NEXT PAGE

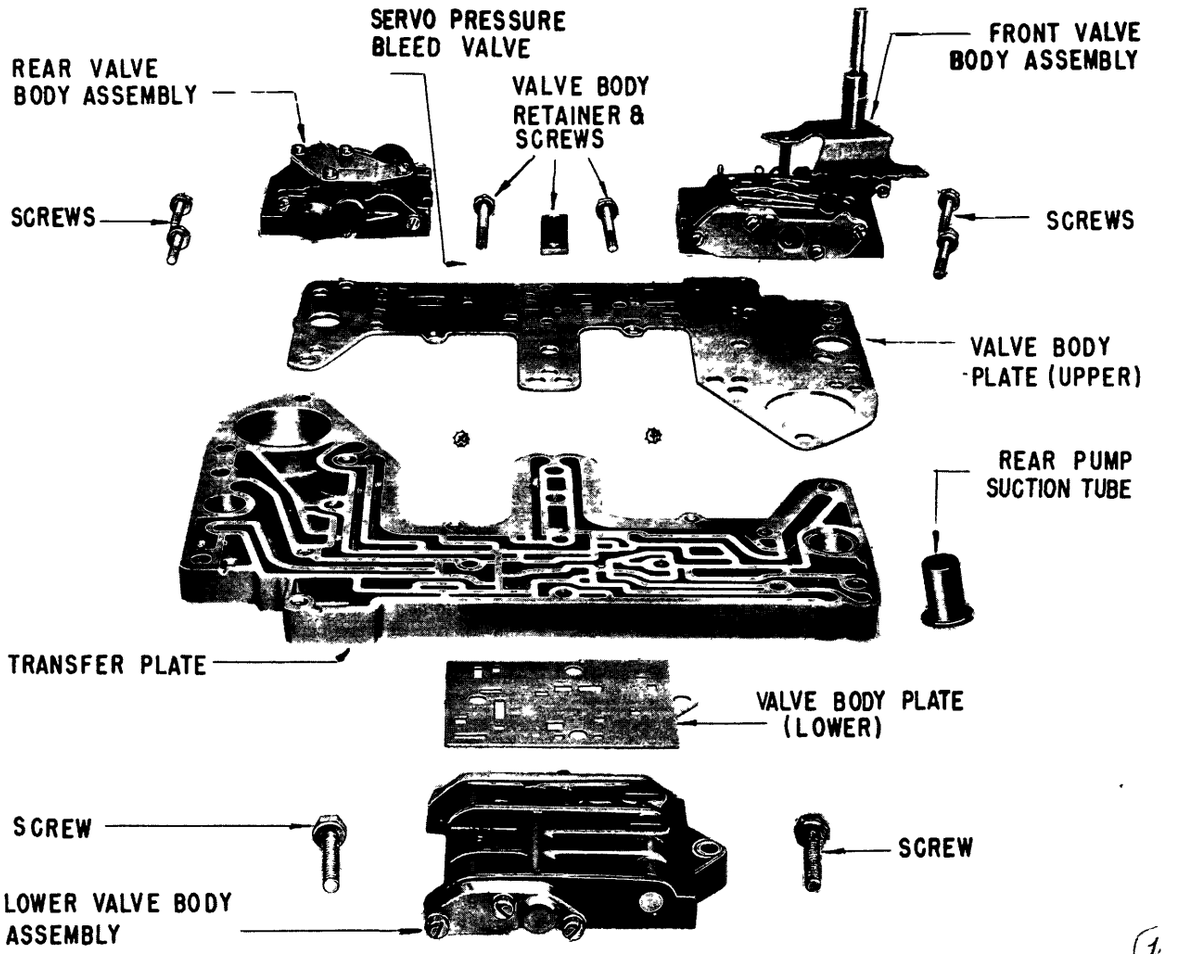
TORQUEFLITE (Cont.)

TRANSMISSION HARD TO FILL (Oil blow out filler tube): Check transmission oil level. Check for stuck or scratched regulator valve or buckled spring. Check for stuck or scratched converter valve or buckled spring. Check to determine whether tube is free of dirt. Check for possible air leakage at front pump suction tube, tube elbow or rear pump suction tube. *Transmission must b removed for the following:* Clean and inspect front pump assembly for side and diametral clearance. Examine oil pump inner and outer rotor for scoring. Check front pump drive sleeve seal rings. Clean and inspect regulator valve body for scratches and scoring on valve bores and face which bears against front pump housing. Examine valve body to determine if secondary reaction orifice if free of dirt. Check gasket for uniformness of compression by valve body.

TRANSMISSION OVERHEATS: Check transmission oil level. Adjust kickdown band and low-reverse band. Check handbrake for excessive drag. Check regulator and converter valves for stuck or scratched valves or buckled springs. Check for mud, dirt, or other foreign material on screens or torque converter cooling fins. Clean and inspect rear pump assembly for side and diametral clearance. Note whether rear oil pump pinion ball is in place. Examine output shaft support face for scoring. *Transmission must be removed for the following:* Clean and inspect front pump and drive sleeve assembly for side and diametral appearance. Examine oil pump inner and outer rotor for scoring. Check drive sleeve seal rings. Check and inspect regulator valve body for scratches and scoring on valve bores and face which bears against the front pump housing. Examine the valve body to determine if secondary reaction orifice is free of dirt. Check gasket for uniformness of compression by valve body. Clean and inspect front and rear clutch discs, plate, drive hubs, return spring and piston. Check front and rear clutch circuits for leakage.

IMPOSSIBLE TO PUSH CAR: Check hydraulic control pressures. Adjust low-reverse band. Check low-reverse servo for torn seal, stuck piston sleeve, broken band or linkage. Check valve body for loose bolts, burrs or scratches on mating surfaces. Clean valve body assembly, check for stuck valves, dirt, scratched valves or body, and burrs on valves. Tighten valve body bolts to correct specifications. Clean and inspect rear pump assembly for side and diametral clearance. Note whether rear oil pump pinion ball is in place. Examine output shaft support face for scoring.

STARTER WILL NOT ENERGIZE: Adjust gearshift control cable. Adjust engine idle speed.



GEARSHIFT CONTROL UNIT

OPERATION: Mechanical connection between gearshift control unit on instrument panel and the transmission manual control valve is by a single push-pull cable. One end of wire cable is secured to cable actuator in push button control unit while other end enters control cable adapter housing on transmission case to engage manual control valve lever assembly. When button is pushed in, the operating slide contacts the cable actuator, causing it to pivot, and movement of actuator about its axis moves that attached wire cable. When push button reaches its limit of travel, a spring lock on the operating slide engages actuator shaft, holding the push button in an engaged position. When another button is pushed to select a different range, the top or bottom portion (depending on which button was pushed) of the slide contacts the actuator which releases the first push button from restraint of spring lock and allows it to return to the original position.

► *NOTE:* The back-up light switch is located on the push button control unit and is operated by the "R" (Reverse) push button slide.

GEARSHIFT CONTROL UNIT (Removal): Remove three bezel retaining screws (one screw is located on underside of unit) and remove bezel and push buttons. Remove two hex nuts and lockwashers holding control unit to instrument panel casting. Pull gearshift control unit from rear of instrument panel, down and toward front of car. Remove two screws holding cable assembly bracket to control unit. Remove hairpin clip securing cable end to actuator bar and remove cable from control unit. Remove wires from back-up light switch.

Installation: Install end of control cable on actuator and install hairpin clip. Place cable bracket in position on control cable, install two screws and tighten securely. Connect wires to back-up light switch. Position control unit in instrument panel (with lamp socket assembly wire over top of upper stud and between control unit and mounting plate). Place lamp socket bracket over upper studs, install two nuts and lockwashers and tighten securely. Install push buttons in their respective operating slides (fingers of slide may be compressed slightly to aid in retaining button on slide). Center the bezel on buttons and install retaining screws. Adjust manual control cable.

TORQUEFLITE VALVE BODY & TRANSFER PLATE ASSEMBLY

CONTINUED ON NEXT PAGE

TORQUEFLITE (C nt.)

MANUAL CONTROL CABLE (Removal): Remove gearshift control unit from instrument panel. Remove control cable clip screw, lockwasher and clip on transmission. Remove control cable adaptor housing plug, insert screwdriver through hole and release the control cable spring lock. While releasing the spring lock, remove cable. Using the same screwdriver, insert through hole in adaptor housing and push lever rearward to last detent. Reinstall housing plug and tighten. From inside of car pull assembly through rubber grommet (or remove grommet) in dash panel.

Installation: From inside car, install transmission end of cable through rubber grommet in dash panel. Install gearshift control unit. Install control cable at transmission making sure spring lock engages cable. Adjust manual control cable. *(See "Manual Cable Adjustment" above).*

GEARSHIFT UNIT LAMP BULB REPLACEMENT: Remove the three bezel retaining screws (one screw is located on under-side of unit) and remove bezel and "D" (Drive) push button. Replace defective bulb. Replace push button, install bezel, and test operation of unit.

BACK-UP LIGHT SWITCH REPLACEMENT: Remove push button control unit. Back-up light switch is fastened to control unit by four tabs (straighten tabs to remove switch). Install by reversing removal procedure.

TROUBLE SHOOTING & DIAGNOSIS

LOW & REVERSE BUTTONS REQUIRE HEAVY PRESSURE TO LOCK: Adjust manual control cable. *See "Manual Control Cable Adjustment" above.*

"CLUNKING" NOISE WHEN BUTTON RETURNS: Remove control unit and replace rubber bumper if missing or damaged.

PUSH BUTTON WILL NOT RETURN: Remove control unit and replace broken or defective return spring.

PUSH BUTTON WILL NOT LOCK: Replace operating slide.

PUSH BUTTON BINDS: Replace operating slides if warped. Align bezel so push buttons are centered. Position light lead wire as outlined under "Gearshift Control Unit Installation" above. Carefully relieve area where push button contacts felt. This can be done by inserting a .005" feeler gauge between push button cover and the felt mask. Gently moving the gauge in and out in this area will usually relieve the binding condition. Should it become necessary to replace or reglue the mask, use a suitable adhesive and place glue in an area where it will not interfere with operation of the push buttons.

LOOSE PUSH BUTTON COVER: Remove bezel to expose push button. Using a small screwdriver, exert sufficient pressure to force tang into plastic recess on push button.

TRANSMISSION UNIT REMOVAL (TRANSMISSION IN CAR)

►*NOTE: When units are removed from transmission, each unit must be inspected before assembly as outlined under "Transmission Overhaul".*

NEUTRAL STARTER SWITCH (Removal): Drain approximately two quarts of fluid from transmission and reinstall drain plug. Remove wire from switch and remove switch and gasket.

Installation: Reverse removal procedure and tighten switch to 15-20 ft. lbs.

REGULATOR VALVE ASSEMBLY (Removal): Remove regulator valve spring retainer, gasket and spring. Using a mechanical retriever or a piece of welding rod (5/32") inserted in end of valve, remove valve.

Installation: Reverse removal procedure and tighten spring retainer to 45-50 ft. lbs.

TORQUE CONVERTER CONTROL VALVE (Removal): Remove torque converter control valve spring retainer, gasket and spring. Using a mechanical retriever or a piece of welding rod (1/8") inserted in valve, remove valve.

Installation: Reverse removal procedure and tighten retainer to 35-40 ft. lbs.

OIL PAN (Removal): Drain transmission, install drain plug and tighten. Remove oil pan filler tube from pan and loosen support bracket screw. Remove oil pan.

Installation: Reverse removal procedure. Tighten pan screws to 12-17 ft. lbs. Tighten filler tube nut to 35-40 ft. lbs.

VALVE BODIES & TRANSFER PLATE (Removal): Place gearshift control in "L" (Low) position (it is necessary that control adaptor be in this position when removing cable). Remove oil pan. Disconnect throttle linkage from throttle lever on transmission. Remove all dirt and foreign material from around cable control housing. Loosen throttle control lever screw and remove lever assembly. Remove flat washer and seal from throttle lever shaft. Remove control cable clip screw, lockwasher and clip. Remove control cable (see "Gearshift Control Unit" above). Loosen manual valve control lever screw and slide lever off shaft. Remove the two oil strainer elbow screws (with Belleville washers) and remove oil strainer assembly. Loosen (to relieve load) and remove the three accumulator cover screws (with Belleville washers). Remove cover and spring from transfer plate. Remove the five transfer plate screws (with Belleville washers) and remove valve bodies and transfer plate assembly from transmission case.

Installation: Reverse the removal procedure and note the following: Clean mating surfaces on both the transmission case and valve body transfer plate. Install transfer plate screws and tighten to 14-16 ft. lbs., evenly. *(NOTE - Dished portion of Belleville washers should face away from head).* Check position of front pump elbow (opening in suction tube should be facing oil pan). Tighten accumulator cover screws evenly to 14-16 ft. lbs. Install manual lever with locking screw to rear, on manual valve lever shaft. Position lever on shaft so there is 7/32" clearance (without gasket) between lever and transmission case. Adjust throttle linkage.

KICKDOWN PISTON (Removal): After removal of valve bodies and transfer plate (see above), loosen kickdown band adjusting screw locknut and back adjusting screw out sufficiently to remove anchor. Remove kickdown band strut. Install Tool C-3529 or C-3289 (modified), apply sufficient pressure on kickdown piston rod guide, and remove snap ring. (Oil will drain from servo when compression portion of tool is loosened). Loosen compression portion of tool and remove piston rod guide, piston spring and piston rod. Using pliers, Tool C-484, remove kickdown piston from transmission case.

Installation: Lubricate piston rings and place kickdown piston assembly into position, compress outer ring, and start assembly into case. With piston properly centered (so not to damage rings) tap lightly and bottom piston into transmission case. Slide piston spring over kickdown piston rod assembly and install in piston. While holding in this position, install the kickdown piston rod guide assembly on kickdown piston rod. Using Tool C-3529 or C-3289 compress the kickdown piston spring to the point that piston guide seal ring slightly binds on transmission case. Work seal ring into position and gradually compress spring until seal ring enters case and snap ring can be installed. Install kickdown piston rod guide snap ring, making sure it is properly seated. Loosen compressing portion of tool and remove tool from transmission. Place kickdown band strut in position in band and lever and compress band end sufficiently to install anchor over adjusting screw. Adjust kickdown band. Install valve bodies and transfer plate assembly.

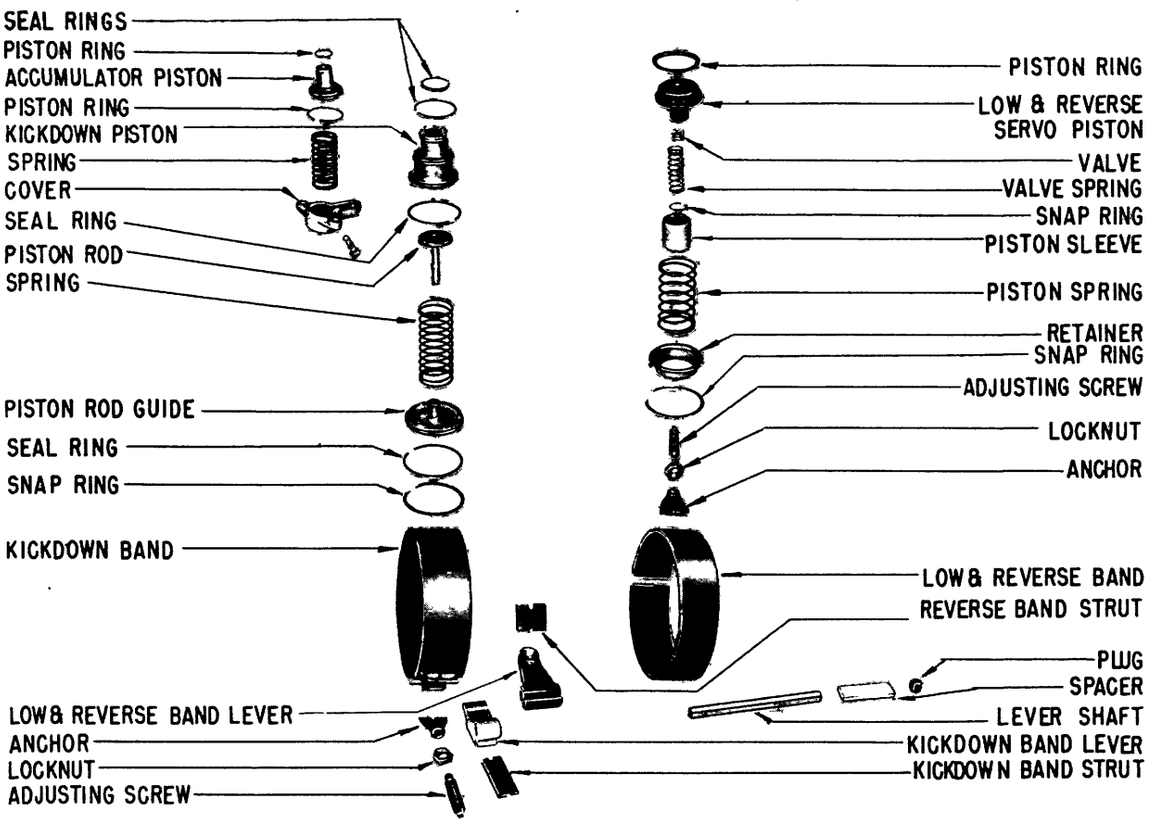
ACCUMULATOR PISTON (Removal): Remove valve bodies and transfer plate (see above). Using pliers, Tool C-484, remove accumulator piston from transmission case.

Installation: Lubricate seal rings and place accumulator piston into position. Compress outer seal ring and tap lightly into transmission case. Install valve bodies and transfer plate assemblies.

OUTPUT SHAFT REAR BEARING OIL SEAL (Removal): Disconnect front universal joint. Apply hand brake and remove propeller shaft flange nut and Belleville washer. Release hand brake and install puller, Tool C-452 (if necessary). Remove propeller shaft flange and brake drum assembly. Remove transmission brake support grease shield spring (small one). Remove brake support grease shield from extension *(CAUTION* - If screwdriver or sharp instrument is used in performing this operation, care must be taken to prevent damage to neoprene sealing surface at bottom of shield), Install puller, Tool C-748, and remove transmission output shaft rear bearing oil seal.

Installation: Using driver, Tool C-3205, install output shaft rear bearing oil seal (metal portion of oil seal facing in) until driver bottoms on extension. *(CAUTION* - Indent on grease shield must match groove in extension for correct positioning. Also, shield must be located on extension far enough to permit installation of spring). Install brake support grease shield spring (opening in spring toward adjusting sleeve). Make sure spring is properly seated in groove. Install propeller shaft flange,

CONTINUED ON NEXT PAGE



TORQUEFLITE (C nt.)

Belleville washer, and nut. Apply hand brake and tighten propeller shaft flange nut to 200 ft. lbs. Connect front universal joint and torque nuts to 33-37 ft. lbs. Refill transmission (if necessary).

EXTENSION HOUSING (Removal): Drain approximately two quarts of fluid from transmission. Disconnect front universal joint. Apply hand brake and remove propeller shaft flange nut and Belleville washer. Release hand brake, and using puller, Tool C-452 remove propeller shaft flange and drum assembly. Remove brake adjusting screw cover plate and loosen cable clamp bolt on hand brake support. Disengage the ball end of cable from operating lever and remove cable from brake support. Disconnect speedometer cable and housing at transmission extension and remove speedometer drive pinion and sleeve assembly. Remove nuts and lockwashers holding engine rear support insulator to crossmember, leaving insulator attached to extension. Remove the two top extension to case screws and lockwashers. Using a suitable jack and extreme care to prevent damage to oil pan, raise transmission sufficiently for insulator on extension to clear crossmember. Remove four of the remaining extension to case screws and lockwashers and install guide studs, Tool C-3283. *(NOTE* - Due to interference of the insulator, it will be necessary to remove the bottom extension to case screw with the extension, that is, back out the screw as far as possible and slide extension back and continue loosening screw). *(CAUTION - Do not remove the one output shaft support to transmission case screw).* Remove extension and hand brake as one assembly. Remove extension gasket. *NOTE* - If care is used, it is not necessary to remove hand brake support and shoe assemblies from extension to replace output shaft rear bearing.

Installati n: Reverse removal procedure and note the following: Start bottom extension to case screw as the extension is pushed into position against support. *(CAUTION - Do not attempt to pull extension in with aid of the scr ws; damage to extension may result).* Tighten extension to case screws to 25-30 ft. lbs. Tighten propeller shaft flange nut to 200 ft. lbs. Tighten universal joint nuts to 33-37 ft. lbs. Tighten speedometer pinion and sleeve assembly to 40-45 ft. lbs.

GOVERNOR (R m val): Remove extension housing, see above. Remove governor valve shaft and valve from governor body assembly. Using pliers, Tool C-3229, remove governor weight assembly snap ring (large) and remove weight assembly. *(NOTE* - The primary cause of governor operating failure is usually due to improper operation of governor valve which may be sticking in housing or travel restricted by chips or other foreign matter. If inspection indicates complete removal, proceed as follows): Remove governor support locating screw and remove governor and support assembly from rear oil pump housing. Normal servicing does not require removal of governor body from support. If condition warrants removal of governor body from support, when reassembling, do not tighten governor body screws until governor body support is located on output shaft.

TORQUEFLITE SERVO & BAND ASSEMBLIES

Installation: Slide governor body and support assembly into position in rear oil pump housing, using extreme care, compress governor support seal rings as support enters oil pump housing. DO NOT FORCE. Align locating hole in output shaft to locating screw hole in governor support and install screw. Tighten to 5-7 ft. lbs. Holes can be aligned by turning output shaft and holding governor body. If governor body has been removed and reinstalled, tighten the four governor body screws to 6-8 ft. lbs. Place governor weight assembly (secondary weight snap ring facing out) into governor body; and using pliers, Tool C-3229, install snap ring. Make sure snap ring seats properly. With governor valve (small end up) on governor valve shaft, slide shaft into governor body through the output shaft and governor weight assembly; at the same time position valve into body. Install governor valve shaft snap ring. Make sure it is locked securely to shaft. Replace snap ring if distorted *(NOTE* - After snap ring installation, apply sufficient pressure to both ends of valve shaft to force snap ring to outer portion of snap ring grooves). Check operation of governor weight assembly and valve by turning output shaft. Both should fall freely in valve body. Install extension housing.

REAR OIL PUMP (Removal): Remove extension housing, see above. Using a screw driver, remove governor valve shaft snap ring from weight assembly end. Remove governor valve shaft and valve from governor body assembly. Using pliers, Tool C-229, remove governor weight snap ring (large) and remove governor weight assembly from governor body. Remove governor locating screw from governor support. Remove oil pump-to-output shaft support screws and Belleville washers, and install guide studs, Tool C-3288. Remove pump housing, gear, and governor assembly from output shaft.[1] Use prussian blue and mark pump gears in relation to pump housing face *(CAUTION - Do not scribe).* When removing oil pump pinion, use care so as not to lose the small ball used as a key. Remove rear oil pump pinion from output shaft and mark in same manner. Remove governor assembly from oil pump housing.

Installation: Install governor support and body assembly into position in rear pump housing. Compress governor support seal rings as support enters oil pump housing. DO NOT FORCE. Place rear oil pump pinion ball in ball socket in output shaft. Place rear oil pump pinion (as marked when removed) over output shaft and into

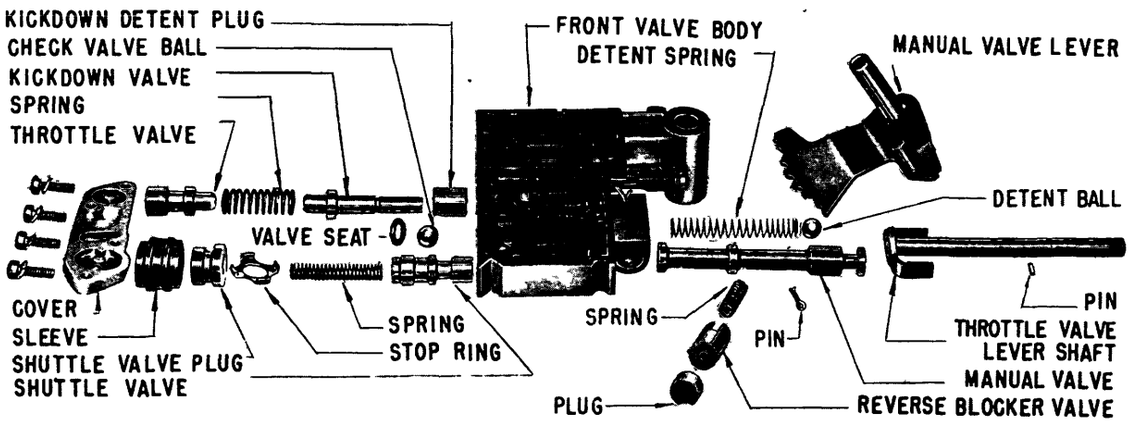
CONTINUED ON NEXT PAGE

TORQUEFLITE (Cont.)

position aligning keyway in pinion with ball in shaft. With rear oil pump properly positioned in pump housing (check marking), slide rear oil pump and governor assemblies over output shaft and guide studs into position against support. *(CAUTION - There are two extra holes in housing which are used for vents. Make definitely sure no attempt is made to install screws in these holes).* Remove guide studs and install pump housing-to-output shaft support screws and Belleville washers (install washers with dished portion facing away from head). Tighten screws evenly to 10-12 ft. lbs. Rotate output shaft to make sure pump gears are free to rotate. If not, remove pump to determine cause. Align locating hole in output shaft-locating screw hole in governor support. Install locating screw and tighten to 5-7 ft. lbs. Complete installation by following governor installation procedure outlined above.

REMOVAL & INSTALLATION

REMOVAL: 1) Disconnect battery. Push in the "1" (Low) button and raise car off floor *(NOTE -* Push button must be in the "1" position to remove cable from adaptor housing on transmission). Drain transmission and torque converter (see "Draining & Refilling" above). Disconnect oil pan filler tube assembly from oil pan and loosen support bracket screw.



2) Disconnect the front universal joint and secure propeller shaft out of the way. Remove brake adjusting screw cover plate and loosen cable clamp bolt on hand brake support. Disengage the ball end of cable from operating lever and remove cable from brake support. Disconnect speedometer cable and housing at transmission extension. Disconnect neutral starter wire at switch. Unclip wires from crossmember.

3) Disconnect throttle control linkage from throttle lever on transmission. Remove gearshift control cable clip screw, lockwasher, and clip. Remove control cable adaptor housing plug, insert screwdriver through hole, and release control cable spring lock. While releasing control cable spring lock, remove cable from adapter housing. Using the same screwdriver, insert through cable opening in adaptor housing and push lever rearward to last detent. Reinstall housing plug and tighten.

4) Disconnect the two oil cooler lines from transmission (if so equipped). Remove nuts and lockwashers holding engine rear support insulator to crossmember, leaving insulator attached to extension. Remove starter.

5) Install engine support fixture, Tool C-3487. Insert hooks of fixture firmly into holes in side of frame member with support ends up against underside of oil pan flange. Adjust fixture to support weight of engine. Raise engine slightly, remove crossmember-to-frame bolts and remove crossmember. *(CAUTION - Do not lower engine more than three inches from floor pan).*

6) Remove the two transmission case-to-torque converter housing screws and lockwashers from right side and install guide studs, Tool C-3276. With transmission supported, remove the two transmission case-to-converter housing screws and lockwashers from left side. Slide transmission straight back to avoid damage to front oil pump driving sleeve, then lower to floor.

TORQUEFLITE FRONT VALVE BODY ASSEMBLY

INSTALLATION: 1) Install guide studs, Tool C-3276, in the two transmission mounting holes in right side of torque converter housing. With front oil pump drive sleeve lubricated, install, making sure driving lugs are properly engaged with oil pump pinion. *(NOTE -* Main portion of drive sleeve will be flush with front of pump housing when properly installed). Note position of driving lugs inside torque converter hub, then position front oil pump drive sleeve on transmission accordingly, to aid on proper engagement when transmission installed. Slide transmission over guide studs and into position against converter housing. Make sure driving lugs on front oil pump drive sleeve properly engage torque converter.

► *CAUTION - To avoid damage to front oil pump, do not attempt to use torque converter housing screws to bring transmission and housing together. If oil pump drive sleeve and input shaft have been properly aligned, the transmission should slide into position relatively easy. DO NOT FORCE.*

2) Install the two transmission-to-torque converter housing screws and lockwashers in left side (do not tighten). Remove guide studs and install the two transmission-to-housing screws and lockwashers in right side, then draw the four down evenly and tighten to 45-50 ft. lbs. Place crossmember into position and install crossmember-to-frame bolts. Tighten to 50-55 ft. lbs.

3) Lower engine and at the same time align mounting studs in insulator with holes in crossmember. Install the two nuts and lockwashers holding engine rear support and insulator to crossmember and tighten to 30-35 ft. lbs. Remove support fixture from side of frame member.

4) Install bracket holding oil cooler lines to cylinder block (if so equipped) on transmission case and tighten. Connect neutral starter-to-switch wire. Install oil pan filler tube and tighten filler tube nut to 35-40 ft. lbs. Tighten support bracket screw.

5) Connect speedometer cable and housing at extension. Engage ball end of hand brake cable in operating lever and tighten cable clamp bolt. Install adjusting brake screw cover plate on hand brake support. Connect front universal joint and tighten nuts to 33-37 ft.lbs.

6) Connect throttle control linkage to throttle lever on transmission. Install gearshift control cable in adapter making sure spring lock engages cable. Install starter, connect battery, refill transmission and adjust throttle linkage and gearshift control cable.

TORQUE CONVERTER REMOVAL

REMOVAL: Remove transmission, see above. Remove torque converter housing-to-adaptor screws and lockwashers. Remove torque converter housing. *(NOTE -* If torque converter is being removed because of excessive runout damage, check runout by using a dial indicator on hub, and mark the highest point of runout on both converter and crankshaft flange. This will aid later in determining if runout is due to converter or crankshaft). Using wrench, Tool C-589, remove the stud nuts and lockwashers from crankshaft flange. Remove converter from crankshaft. Check crankshaft flange runout which should be a maximum of .002".

CORRECTING HUB RUNOUT: Permissible converter hub runout, when mounted on the crankshaft is .004" total indicator reading. When mounting a new torque converter, make sure all foreign matter, raised metal around studs, burrs, chips and dirt are removed from converter and crankshaft drive flanges. Check crankshaft runout (maximum .002").

1) Check converter runout by mounting a dial indicator to adaptor plate or some other unit which is mounted rigidly to the engine block. Rotate converter 360° and determine converter hub, outside diameter, runout. If this exceeds .004" total indicator reading, then correct by using heat in the following manner: Mark position of hub low spot as accurately as possible on the impeller shell. Rotate converter so this mark is downward. Remove dust shield from front of adaptor plate. Using a piece of chalk, mark front cover radius directly opposite the hub low spot previously marked on impeller shell. The subsequent heating operation can now be done through the opening in adaptor plate. *(CAUTION - Drain converter housing before heating).* The size of

CONTINUED ON NEXT PAGE

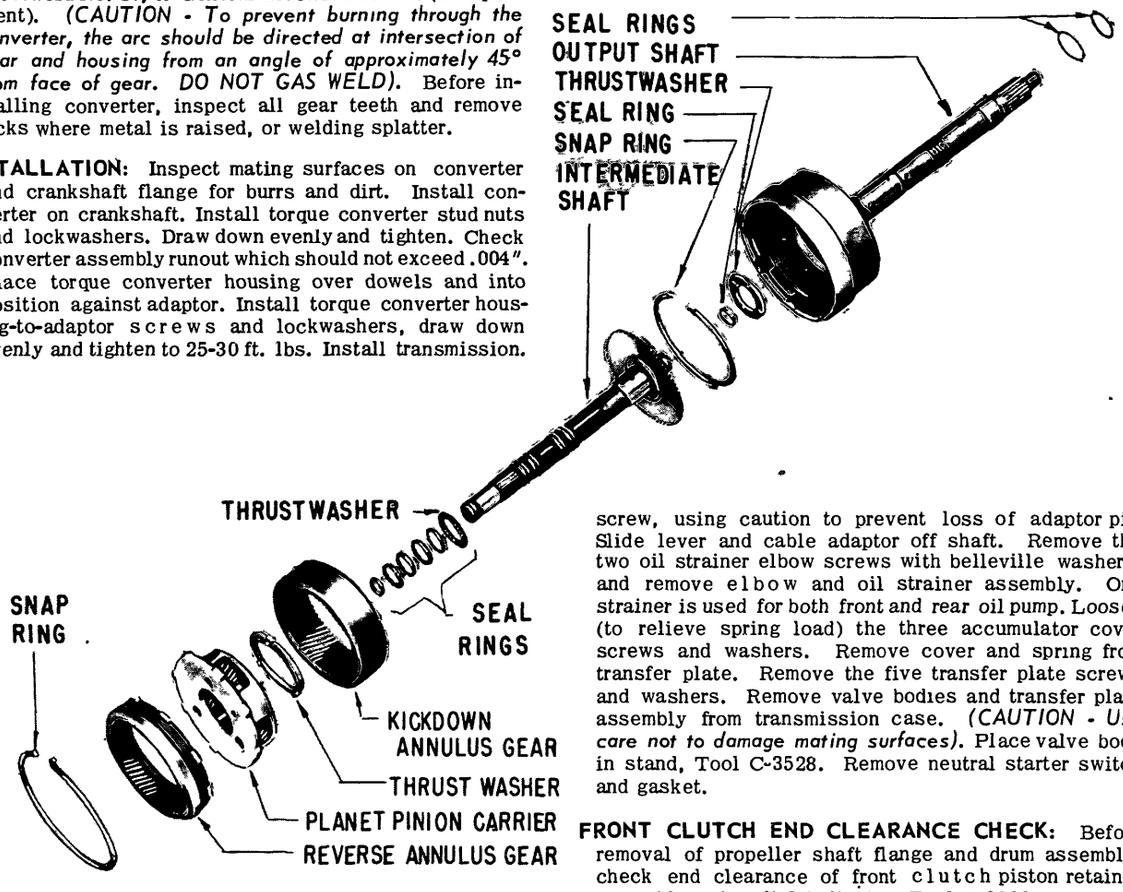
TORQUEFLITE (Cont.)

the spot to be heated is governed by amount of hub runout and is usually 1/2" diameter for .008" total indicator reading. Using an acetylene torch having a No. 3 tip (set to maximum heat) apply to selected spot until it becomes a dull red. Rapid heating of the local area is essential and if the torch is adjusted properly, the spot will become red within a few seconds *(CAUTION - If sparks are noted, it is an indication that torch is too close and metal is starting to burn; move torch back slightly. Care should be taken to remove torch the instant the selected spot becomes a dull red to avoid overcorrection or damage to the unit).* The area is then quenched as rapidly as possible with cold water (hose or wet rags). It is suggested this be done by starting around the heated area and working in toward the spot. This prevents heat from spreading. *(NOTE* - The hub runout should not be rechecked until the converter has returned to a uniform room temperature). If the converter hub runout exceeds .016" total indicator reading, remove converter and recheck drive flanges for chips, burrs, etc. Check crankshaft flange runout (max. .002"). If runout remains in excess of .016", install a new converter.

STARTER RING GEAR (Removal): Support torque converter assembly in a vise and with a file carefully remove the staking lugs which retain ring gear to converter. *(CAUTION - Be careful when supporting converter in the vise to avoid distortion).* Place converter on blocks of wood for support while removing. Using a blunt chisel or drift, tap around ring gear until it comes off torque converter.

Installation: Remove burrs or raised spots (left on gear contact surface of converter), with a file, being careful not to remove more metal from converter than is required to remove burrs and rough surfaces. Any of the following methods may be used to heat starter ring gear for installation on converter:

Oven - When available, use oven C-794 and set temperature at 150° F. Allow ring gear to remain in oven approximately 15-20 minutes.



Boiling Water – Place ring gear in a shallow pan, add water, and heat approximately 8 minutes after water has come to a boil.

Steam – Place ring gear on a flat surface and direct steam flow around gear for approximately two minutes.

Flame – Place ring gear squarely on a flat surface. Using a medium tip, direct a low flame around inner rim of gear, being careful not to direct flame onto teeth of ring gear. Place a few drops of water on face of gear at short intervals during the heating process. When gear is hot enough to boil the drops of water, installation of gear on converter can be made.

Reweld ring gear to converter using extreme care to place as nearly as possible the same amount of metal in exactly the same location as original assembly. This is necessary in order to maintain proper balance of unit. Place welds alternately on opposite sides of converter to minimize distortion. In making the weld, use a welding current of 200 amps. Use a D.C. welder that is set at straight polarity or an A.C. welder. Use a 5/32" dia. Fleetweld No. 47, or General Electric No. W28 (or equivalent). *(CAUTION - To prevent burning through the converter, the arc should be directed at intersection of gear and housing from an angle of approximately 45° from face of gear. DO NOT GAS WELD).* Before installing converter, inspect all gear teeth and remove nicks where metal is raised, or welding splatter.

INSTALLATION: Inspect mating surfaces on converter and crankshaft flange for burrs and dirt. Install converter on crankshaft. Install torque converter stud nuts and lockwashers. Draw down evenly and tighten. Check converter assembly runout which should not exceed .004". Place torque converter housing over dowels and into position against adaptor. Install torque converter housing-to-adaptor screws and lockwashers, draw down evenly and tighten to 25-30 ft. lbs. Install transmission.

TRANSMISSION UNIT NO. 1

TRANSMISSION DISASSEMBLY

DRIVE SLEEVE & OIL PAN (Removal): Place transmission in stand, Tool C-3280 and invert. Remove drive sleeve and inspect front seal ring (neoprene) for nicks, deterioration and hardness. Inspect the interlocking seal ring for wear or broken locks, and make sure it turns freely in the groove. (It is not necessary to remove rings unless condition warrants). Inspect driving lugs for excessive wear, and bearing surface on outer diameter for nicks, burrs, or scratches. Remove oil pan and gasket.

VALVE BODY & TRANSFER PLATE ASSEMBLY (Removal): Remove throttle control lever, flat washer, and felt washer. Remove control cable adaptor housing screws and Belleville washers, and remove housing and gasket from transmission. *(NOTE* - Manual valve lever must be moved to the reverse position before housing can be removed). Loosen manual valve control lever screw, using caution to prevent loss of adaptor pin. Slide lever and cable adaptor off shaft. Remove the two oil strainer elbow screws with belleville washers, and remove elbow and oil strainer assembly. One strainer is used for both front and rear oil pump. Loosen (to relieve spring load) the three accumulator cover screws and washers. Remove cover and spring from transfer plate. Remove the five transfer plate screws and washers. Remove valve bodies and transfer plate assembly from transmission case. *(CAUTION - Use care not to damage mating surfaces).* Place valve body in stand, Tool C-3528. Remove neutral starter switch and gasket.

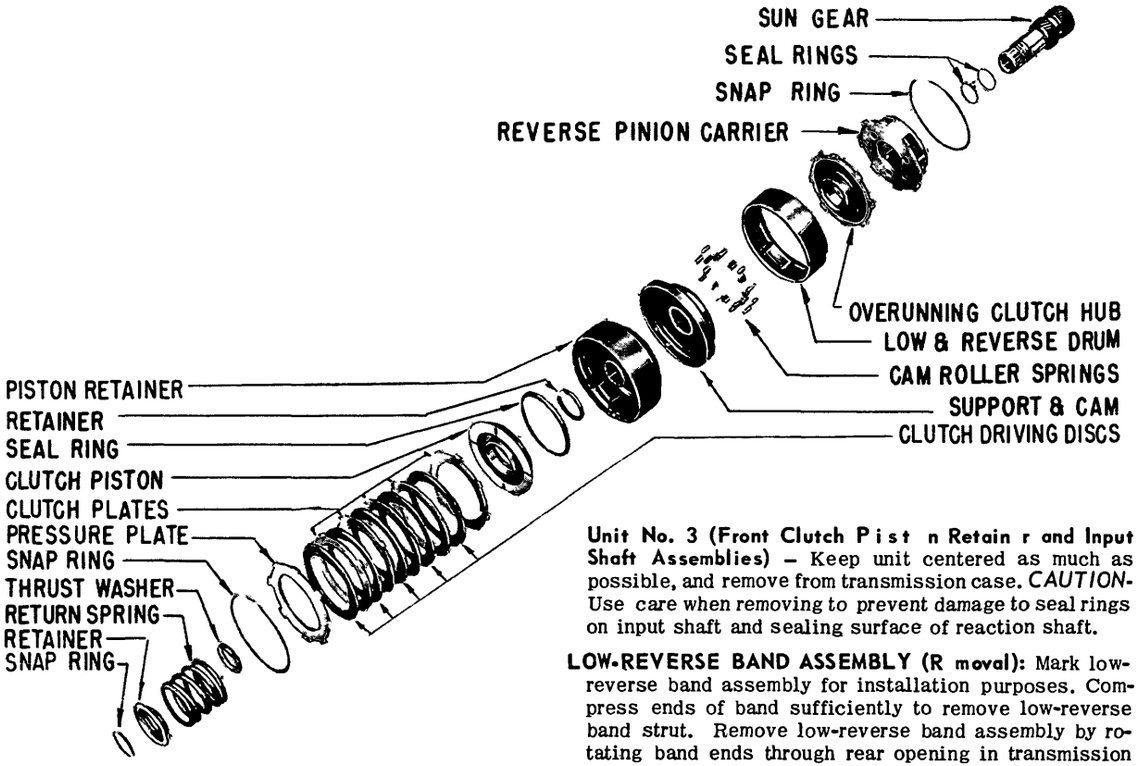
FRONT CLUTCH END CLEARANCE CHECK: Before removal of propeller shaft flange and drum assembly, check end clearance of front clutch piston retainer assembly using dial indicator, Tool C-3339 mounted on case in such a manner as to have dial indicator plunger bearing against rear side of front clutch piston retainer assembly. Pry front clutch forward by inserting screwdriver between front and rear clutch. Remove screwdriver and with dial indicator point contacting edge of front clutch retainer, set dial to zero. Pry clutch assembly rearward against rear clutch, remove screwdriver and take indicator reading. This clearance should be .020-.050". *NOTE - If clearance exceeds the specified limits, particular attention should be paid to the condition of input shaft thrust washer when disassembling transmission.*

HAND BRAKE ASSEMBLY (Removal): Remove transmission flange nut and Belleville washer. Attach puller, C-452 (if necessary) and remove propeller shaft flange and drum assembly. Remove transmission brake support grease shield spring (spring acts as a guide for brake shoes and retains brake support grease shield to transmission extension). Place a rubber band around brake shoes to hold them in position and remove brake

CONTINUED ON NEXT PAGE

TORQUEFLITE (Cont.)

shoe return spring. Remove brake anchor washer and brake shoe guide. Remove both brake shoe assemblies, adjusting sleeve, nut, screw, and brake shoe operating lever link. *(NOTE* - Operating link is marked for installation purposes). Make sure adjusting nut turns freely on screw. Remove the other brake shoe guide from anchor pin. Remove brake support grease shield from extension being careful not to damage neoprene sealing surface at bottom of shield. Slide brake support assembly from rear extension and anchor. Inspect neoprene spacer on back of support plate for deterioration and note the steel sleeve used between neoprene spacer and extension.



EXTENSION HOUSING: Remove speedometer drive pinion and sleeve assembly (damage to nylon gear will result if drive pinion and sleeve assembly is not removed first). Inspect output shaft, rear bearing oil seal, and remove if necessary, using puller, Tool C-748. Remove transmission extension-to-case screws and lockwashers. Install guide studs, Tool C-3283, and remove extension from output shaft support assembly by tapping housing lightly with a soft hammer. Housing may be separated from support by using a pry bar between support screw and housing bracket. Remove gasket.

Inspection: Inspect extension housing for cracks in casting and remove burrs from gasket surfaces. Inspect vent in top of housing and make sure it is free of dirt. Clean output shaft rear bearing and dry with compressed air. Inspect bearing for rough spots. Do not remove from housing unless it is necessary to replace.

GOVERNOR & REAR OIL PUMP HOUSING (Removal): Using a screwdriver, remove governor valve shaft snap ring from weight assembly end. Remove governor valve shaft and valve from governor body assembly. Using pliers, C-3229, remove governor weight assembly snap ring (large) and remove governor weight assembly from body. Using a 5/16" socket, remove governor locating screw from governor support. Remove five rear oil pump-to-output shaft support screws (with Belleville washers). Remove pump housing, gear, and governor assembly from output shaft. Use prussian blue and mark face of pump gears in relation to pump housing. *(CAUTION* - Do not use scribe). Remove oil pump pinion, being careful not to lose ball used to key pinion to output shaft, from output shaft, and mark in same manner as for gears.

Inspection: Inspect pump housing plug for leaks and machined surfaces for nicks and burrs. Inspect gears for scoring or pitting. With gears cleaned and installed in housing (as marked) and using straightedge, Tool C-3335 and feeler gauge, check clearance between pump housing face and face of gears. Clearance should be .001-.0025".

OUTPUT SHAFT SUPPORT (Removal): Remove output shaft support-to-transmission case screw and washer. Slide output shaft rear support assembly and gasket from transmission case. If rear support is stuck to case, it can be loosened by tapping with a soft hammer. Remove guide stud from transmission case.

TRANSMISSION UNIT NO. 2

Inspection: Inspect all oil passages in support for obstructions. Remove pressure take-off plugs (governor and rear clutch supply) and clean passages with compressed air. Check rear oil pump mating surfaces for burrs and score marks. Check for stripped threads in support. Inspect gasket surfaces for burrs and score marks. Inspect inside bearing surface for wear or scoring.

POWER TRAIN UNITS (Removal): Unit No. 1 (Output Shaft, Kickdown Planet Pinion Carrier, and Intermediate Shaft Assemblies) – Remove by sliding unit out rear of transmission case being careful to support unit as much as possible to prevent damage to seal rings on intermediate shaft.

Unit No. 2 (Sun Gear, Reverse Planet Pinion Carrier, Overrunning Clutch, and Rear Clutch Assemblies) – Loosen locknuts on low-reverse and kickdown band adjusting screws, and back adjusting screws out 2 to 3 turns. Remove the three intermediate support locating screws and lockwashers (two outside of case and one inside). *(CAUTION - When removing unit, identify locating hole in intermediate support to correspond with the threaded locating hole inside of case, for installation purposes).* Keep unit centered as much as possible to prevent binding of intermediate support, and remove assembly from transmission case. *CAUTION - Make sure front clutch and sun gear thrust washers remain in position in front of unit.*

Unit No. 3 (Front Clutch Piston Retainer and Input Shaft Assemblies) – Keep unit centered as much as possible, and remove from transmission case. *CAUTION-* Use care when removing to prevent damage to seal rings on input shaft and sealing surface of reaction shaft.

LOW-REVERSE BAND ASSEMBLY (Removal): Mark low-reverse band assembly for installation purposes. Compress ends of band sufficiently to remove low-reverse band strut. Remove low-reverse band assembly by rotating band ends through rear opening in transmission case. Remove low-reverse band anchor from adjusting screw.

KICKDOWN BAND ASSEMBLY (Removal): Compress kickdown band ends sufficiently to remove band strut (note that strut is grooved to act as a guide). Remove kickdown band anchor from adjusting screw. Remove kickdown band assembly by rotating band ends over center support in transmission case, using care not to damage lining on edges of transmission case. *NOTE* - Both bands have bonded lining and no attempt should be made to reline them. Different material is used on kickdown and low-reverse bands.

BAND INSPECTION: Check for wear and bond to metal. If lining is worn to point where grooves are no longer visible, band assemblies must be replaced. Inspect bands for distortion or cracked ends. The low-reverse band is narrower than kickdown band. Mark for proper installation.

LOW-REVERSE & KICKDOWN BAND ADJUSTING SCREWS (Removal): Remove both band adjusting screws locknuts and remove adjusting screws. *CAUTION* -It is very important that adjusting screws fit freely into transmission case. When locknuts are loose, adjusting screws must be finger free. If not, inspect screws and nuts for pulled threads or foreign material in threads.

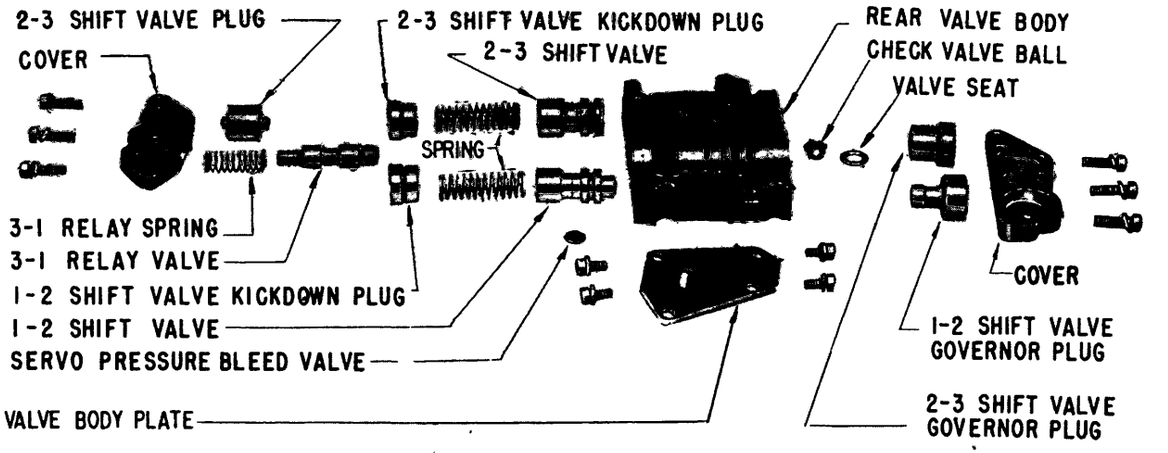
CONTINUED ON NEXT PAGE

TORQUEFLITE (C nt.)

LOW-REVERSE AND KICKDOWN BAND LEVER ASSEMBLIES (R moval): Remove kickdown and low-reverse lever shaft stop plug at rear of transmission case. Using a pair of long nosed pliers, remove kickdown and low-reverse shaft lever spacer (flat). Thread guide stud, Tool C-3288 into shaft, and remove shaft from case. Remove kickdown and low-reverse servo levers.

Inspection: Inspect levers for being cracked or worn and make sure they are free to turn on shaft and have side clearance when installed. Inspect lever shaft for excessive wear.

LOW-REVERSE SERVO (R moval): Lift out low-reverse servo sleeve and install Tool C-3529, on transmission case and compress piston spring retainer. Using a screwdriver, remove low-reverse servo piston spring retainer snap ring. Loosen compression portion of tool and remove. Remove spring retainer, spring, servo piston, and valve assembly.



Inspection: Inspect inside bore of piston sleeve for burrs, scores and wear. Inspect bleeder hole in sleeve and make sure it is free of foreign matter. Inspect lever contact surface on sleeve for excessive wear. Remove and inspect piston seal ring for deterioration and hardness. Inspect seal ring groove for nicks or burrs. Inspect sleeve contacting surface for nicks, burrs and scoring (light scores may be removed with crocus cloth). Inspect servo piston valve for proper installation and operation. Long end of valve should protrude through bottom of piston. Valve should operate freely when compressed by hand. Make sure valve spring snap ring is properly seated in piston. Inspect servo piston return spring, retainer, and snap ring for distortion.

KICKDOWN SERVO (R m val): Install Tool C-3529. Apply pressure on the kickdown piston rod guide, and remove snap ring. Loosen compressing portion of tool and remove from transmission case. Remove piston rod guide, piston spring, and piston rod. Using pliers, Tool C-484, remove the kickdown piston from transmission case. Remove accumulator piston from case.

Inspection: (Kickd wn Piston Assembly) – Inspect riveting of kickdown piston rod. Inspect guide contacting surface for nicks or burrs. Inspect seal ring on guide for wear and make sure it turns freely in groove. Check fit of guide on piston rod. Inspect the three rings (two interlocking) on piston for wear or broken locks. Make sure they turn freely in groove. *(NOTE* - It is not necessary to remove rings unless condition warrants. When replacing new rings, use care to avoid damaging interlocking portion of ring). Inspect piston for light scores and wear. Inspect piston spring and rod guide snap ring for distortion.

Insp ction: (Accumulator Piston Assembly) – Inspect both piston seal rings (one interlocking) for wear or broken locks and make sure they turn freely in grooves. *(NOTE* - It is not necessary to remove rings unless condition warrants). Inspect accumulator piston for nicks, burrs, and excessive wear. Inspect accumulator spring for distortion.

FRONT OIL PUMP (R moval): Remove transmission regulator valve spring retainer, spring, gasket, and valve.

TORQUEFLITE RELIEF VALVE BODY ASSEMBLY

Remove torque converter control valve spring retainer, spring, gasket and valve (these valves can be removed with a mechanical retriever or a piece of welding rod, 5/32" for regulator, and 1/8" for torque converter, inserted in end of valve). Remove the front pump housing-to-transmission case screws and washers (sealing washers used under bolts are aluminum; discard if damaged). Remove oil pump housing assembly from transmission case by tapping with a soft hammer. Mark face of gears in relation with face of pump housing using prussian blue. DO NOT SCRIBE.

► *FRONT PUMP DUST SEAL NOTE:* Do not remove dust seal from housing unless inspection indicates that it is necessary. To remove dust seal, use a brass drift and drive seal out front of housing. To replace, position seal in housing (metal portion of seal down) and use driver, Tool C-3278. Drive seal in until tool bottoms on face of housing.

Inspection: Inspect drive sleeve seal ring contacting surface in housing for wear and scratches. Inspect steel back bronze bushing in hub for scratches or scoring and excessive wear, (bushing and housing is serviced as an assembly). Remove oil pump gears and inspect contacting surfaces for scratches, burrs or grooving. Inspect regulator body casting surface on pump housing face for nicks or burrs. Inspect housing passages and make sure they are free of dirt or other material. Clean and replace oil pump gears in housing noting marks made at disassembly. Using straightedge, Tool C-3335, and feeler gauge, check clearance between housing face and face of gears. Clearance limits are .001-.0025". Measure tip clearance between rotor lobes. Replace rotors if clearance exceeds .010". Measure clearance between outer rotor and pump housing bore. Replace rotors or pump housing if clearance exceeds .010". After checking clearance, lubricate with Automatic Transmission Fluid.

REGULATOR VALVE BODY (Removal): Install guide studs, Tool C-3288, and using two threaded holes provided in valve body, install guide studs and pull regulator valve body off torque converter reaction shaft and remove gasket. *CAUTION - Valve body is aluminum and should be handled with care to avoid damage.*

Inspection: Clean body and valves and dry with compressed air. Inspect reaction shaft seal ring surface in bore for scratches, nicks or burrs. Inspect both valves for free movement in valve body (they should fall in and out of bores when valves and body are dry). Crocus cloth may be used to polish valve (do not round the sharp edges of valve). Check all fluid passages for obstruction and inspect mating surfaces for burrs and distortion. If regulator valve has a slight nick or raised portion on mating surfaces, it may be removed by using a flat surface plate and crocus cloth. Inspect front and rear pump check valve for proper seating on both surfaces. If necessary to remove valve, use a pair of long nosed pliers.

TORQUE CONVERTER REACTION SHAFT (Removal): If inspection indicates necessity of removing torque converter reaction shaft, proceed as follows: Remove reaction shaft seal ring (neoprene). Remove the three transmission case-to-reaction shaft screws and washers. Using Tool C-3531, press reaction shaft out of case.

Inspection: Inspect inside of reaction shaft for burrs and inspect splines on shaft for burrs and wear. Inspect seal ring for deterioration and hardness. Inspect thrust surface for wear and slight scores.

TRANSMISSION CASE (Inspection): Inspect case for cracks, sand holes and stripped threads. Check for burrs on mating surfaces. Blow compressed air through all passages to make sure they are open. Check pressure takeoff plugs for tightness. Using a straightedge, Tool C-3335, inspect valve body mating surfaces on case for any burrs or irregularity in surface. Surface should be smooth and flat. Inspect servo and accumulator bores for any scores or scratches. Light scratches may be removed with crocus cloth. Check regulator valve body mating surface in front of case for any irregularities. *NOTE* - Disregard any scratches which may have been made by torque converter reaction shaft screw lockwashers.

CONTINUED ON NEXT PAGE

TORQUEFLITE (Cont.)

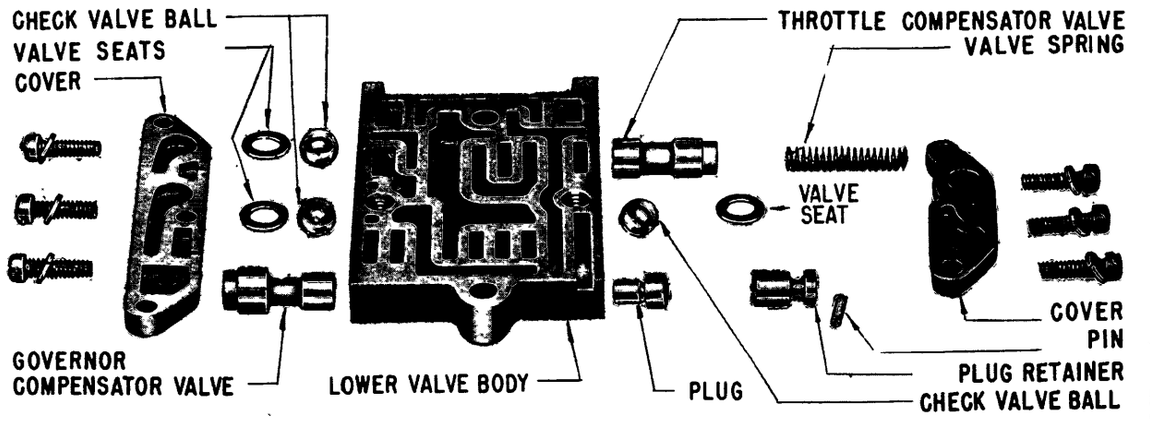
OVERHAUL OF UNITS

VALVE BODY & TRANSFER PLATE DISASSEMBLY: Place valve body and transfer plate assembly in stand, Tool C-3528.

► *CAUTION: Never clamp any portion of this assembly in vise or use force when removing or installing valves and plugs.*

► *CLEANING & INSPECTION NOTE:* After disassembly and each part has been cleaned and inspected, place on clean paper until ready for reassembly.

1) Wash all parts in clean solvent and dry with compressed air. Make sure all passages are free from obstructions. Check for porous castings.



2) Inspect all mating surfaces for burrs, nicks, or grooves. Small ones may be removed with crocus cloth; otherwise damaged parts must be replaced. Using a straightedge, check all mating surfaces for distortion. Using a light, inspect bores in valve body for scoring marks, pits and irregularities. Inspect all springs for distortion and collapsed coils.

3) Inspect all valves and plugs for burrs, nicks, or scores. Small ones may be removed with crocus cloth providing extreme care is used not to round off the sharp edge portion of valve. Check valves and plugs for free operation in bores; they must fall freely in bores when valves, plugs, and bores are clean and dry.

Lower Valve Body (Removal): Remove the two valve body screws from retainer plate located between front and rear valve bodies, and remove plate. Invert valve bodies and remove the two lower valve body screws and lockwashers. Remove lower valve body and plate from transfer plate *(CAUTION - Use extreme care to prevent loss of governor compensator valve plug retaining pin).*

Disassembly - Remove governor compensator valve plug retaining pin, retainer, and compensator plug. Remove the three screws from governor compensator cover (larger cover on valve body). Use care to prevent loss of the two check valve balls and seats, and remove cover. Invert valve body and remove governor compensator valve. While holding throttle compensator valve cover in place (spring loaded), remove the three screws and lockwashers. Use care when removing cover to prevent loss of check valve ball and seat. Remove throttle compensator valve spring and valve. *NOTE* - Inspect ball contacting surface in valve seats and valve body for nicks and burrs. Inspect cover for flatness and porosity.

Reassembly – Place valve body in an upright position and install throttle compensator valve and spring. Make sure spring is properly seated in valve. Place ball and ball seat in position in valve body. Place throttle compensator valve cover in position over spring and body and install three screws and lockwashers. Draw down evenly and tighten. Install governor compensator valve into valve body (small end first). Place two check valve balls and seats in position in valve body, and install governor compensator valve cover, screws and lockwashers. Draw down evenly and tighten. Install governor compensator valve plug (small end first) in valve body, and install plug retainer and pin.

TORQUEFLITE LOWER VALVE BODY ASSEMBLY

Rear Valve Body (Removal): Remove the two rear valve body screws and lockwashers, and remove rear valve body from transfer plate assembly. Remove the servo pressure bleed valve to prevent loss. Invert valve bodies and transfer plate assembly and place on stand, Tool C-3528.

Disassembly – Keeping thumb pressure against kickdown plug cover (spring loaded) remove the three screws and lockwashers. *(CAUTION - When removing cover be careful not to lose internal parts).* Remove cover and take out the following: 1-2 shift valve spring and valve, 3-1 relay valve, 2-3 shift valve spring and valve. Remove the three governor plug cover screws and lockwashers. Use care when removing cover to prevent loss of check valve ball seat and ball. Remove the 1-2 shift valve governor plug from valve body. Remove 2-3 shift valve governor plug from valve body. Rear valve body plate can be removed for cleaning by removing the four screws and lockwashers.

Reassembly – With valve body setting in an upright position, install the 1-2 shift valve (small end first) into valve body. Place the 2-3 shift valve (spring pilot facing out) into position in valve body. Position the 1-2 and 2-3 shift valve springs in valves. Place the 2-3 shift valve kickdown plug (identified by large pilot) over 2-3 shift valve spring. Compress spring sufficiently to seat plug in valve body and secure by placing a thin piece of metal (6" scale) behind plug. Install the 3-1 relay valve (large end first) into valve body and place spring on pilot. Place the 1-2 shift valve kickdown plug over the 1-2 shift valve spring. Position 2-3 shift valve throttle plug in kickdown plug cover. While holding plug in cover, place cover over 3-1 relay valve spring and 1-2 kickdown plug. Compress springs and guide the 1-2 kickdown plug into valve body. Install three cover screws and lockwashers and draw down evenly and tighten. Remove piece of metal or 6" scale. Install rear valve body plate (if removed). Place the 1-2 shift valve governor plug (small end first) in position in valve body. Place the 2-3 shift valve governor plug (small end first) in position in valve body. Install check valve ball and seat. Place governor plug cover in position on valve body and install the three screws and lockwashers. Draw down evenly and tighten.

Front Valve Body (Removal): Remove two front valve body to transfer plate screws and lockwashers and separate front valve body from transfer plate assembly. *(CAUTION – Do not disturb throttle valve stop screw setting).*

Disassembly – Keep thumb pressure against shuttle valve cover (spring loaded) and remove the four screws and lockwashers. Use caution when removing cover to prevent loss of front check valve ball seat and ball. While holding thumb over throttle valve, invert valve body and remove shuttle valve sleeve, plug, stop ring, spring and valve. Remove throttle valve, spring, kickdown valve, and detent plug, (it is not necessary to remove detent plug retaining screw and lockwasher). Remove cotter pin from valve body in outer end of reverse blocker valve. Remove reverse blocker valve plug, blocker valve, and spring. *NOTE* - Normally it is not necessary to remove the throttle valve lever shaft, manual valve lever assembly, or manual valve. However, if condition warrants, proceed as follows: Support throttle lever shaft on block of wood. Using a small punch and hammer with care, remove the throttle valve lever shaft pin (a rubber band may be used to hold manual lever in place while removing pin). Remove any burrs from throttle valve and manual valve lever shafts, and slide them from valve body. Slide throttle valve lever shaft out of manual lever assembly. Using caution to prevent loss of detent ball and spring, slide manual valve lever assembly out of valve body. Using a twisting motion, remove manual valve.

► *FRONT VALVE BODY INSPECTION NOTE:* Inspect manual valve detent ball and make sure it slides freely into valve body. Inspect riveting and wear on manual valve lever pin in lever assembly. Inspect the staking of manual lever and throttle cam to their respective

CONTINUED ON NEXT PAGE

TORQUEFLITE (C nt.)

shafts. Inspect the kickdown valve detent plug to make sure it slides freely on valve. Inspect check valve ball seat in valve body for faulty casting. Inspect manual valve lever needle bearing in valve body *(CAUTION - Do not remove, as body and bearing are serviced as an assembly).*

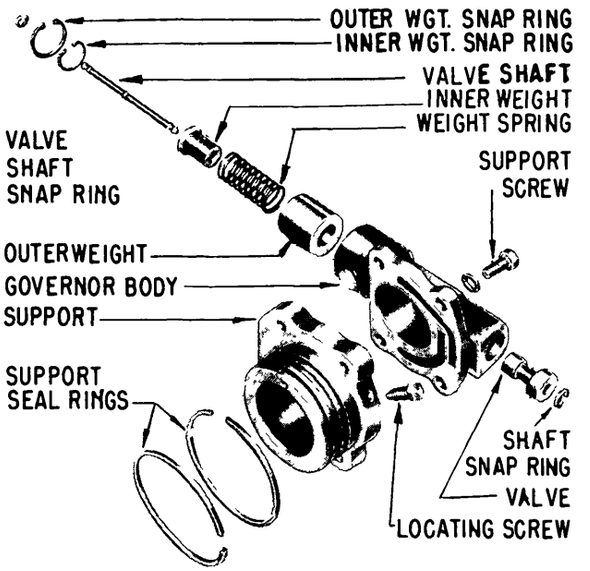
R ass mbly – Place valve body on clean paper in an upright position, and using a twisting motion, install manual valve until it bottoms on paper. Place manual valve lever detent ball spring and ball in position in valve body. While compressing detent ball in position with right index finger, install manual valve control lever by sliding over detent ball and engage pin on lever with manual valve (hold this assembly in position with a rubber band). While holding manual lever assembly in position against valve body, install throttle valve lever assembly with flat portion on end of shaft facing away from valve body to allow maximum travel of lever. While holding levers in position in valve body with rubber band, support throttle lever on wooden block. Install shaft pin using a small punch and hammer. Remove rubber band. With reverse blocker valve spring in position in valve and with slots in valve aligned with pin, install reverse blocker valve in valve body. Install reverse blocker valve plug and compress spring sufficiently to install pin. Lock pin in positi on. Check kickdown detent plug stop screws for being tight, and install detent plug (large inner diameter first) on kickdown valve, and position kickdown valve (detent plug first) into valve body. Install throttle valve spring and throttle valve into valve body. Install shuttle valve and spring (small end of valve first) in valve body. Install shuttle valve stop ring (tangs out) into valve body. Install small end of shuttle valve plug into large end of sleeve, and seat plug properly in sleeve. Install plug and sleeve assembly over shuttle valve spring and into position in valve body. Place front check valve ball and seat in position in valve body. Place shuttle valve cover in position on valve body and install the four screws and lockwashers. Draw down evenly.

VALVE BODIES & TRANSFER PLATE REASSEMBLY: Place valve body transfer plate in an upright position on stand, Tool 3528. Place rear pump suction tube (flange portion up) into counterbore hole in transfer plate. Place steel plate (upper) over pilot on stand, and into position on transfer plate. Install two screws with lockwashers and tighten to secure steel plate to transfer plate.

Front Valv Body: Position front valve body on steel plate (upper) and install two screws and lockwashers in outer end of valve body and draw down finger tight.

Rear Valve Body: Invert transfer plate and replace on stand. With servo pressure bleed valve in place, hold rear valve body up in position against steel plate and install the two outer screws (short) with lockwashers through the transfer plate and into lower valve body. Draw up finger tight.

Lower Valv Body: To prevent loss of governor compensator valve retainer pin, position steel plate (lower) on lower valve body. Place valve body and steel plate into position on transfer plate. Install the two screws (intermediate length) and lockwashers. Tighten the two lower valve body and rear valve body screws to 50-60 inch lbs. Invert valve bodies and transfer plate and replace on stand. Install valve bodies retainer plate and two screws (long) with lockwasher and tighten retainer plate and front body screws to 50-60 inch lbs. Check manual valve to make sure it operates freely.



OUTPUT SHAFT REAR BEARING & SEAL (Removal): Remove rear bearing seal. Using pliers, Tool C-760, remove rear bearing snap ring (note that snap ring has a beveled edge). Inspect ring for distortion. Using driver, Tool C-3275, drive output shaft rear bearing out of rear extension.

Installation: Using driver, Tool C-3204, install bearing in extension making sure it is properly seated. Lubricate with automatic transmission fluid. Using pliers, C-760, install rear bearing snap ring with beveled side out. Make sure snap ring seats properly. Using driver, Tool C-3205, install shaft bearing seal with metal portion of seal facing in until tool bottoms on extension.

GOVERNOR (Disassembly): Using pliers, Tool C-3229, remove snap ring from governor weight assembly (keep thumb pressure against secondary weight when removing snap ring). Remove governor secondary weight and spring. Inspect all parts for burrs and wear. Check secondary weight for free movement in primary weight by placing secondary weight in primary weight without spring. Primary weight should fall free when both parts are dry. Place secondary weight and spring in primary weight, compress spring and install snap ring. Slide governor body and support from rear oil pump housing. Remove the two governor support seal rings. Remove the four governor body-to-support screws and lockwashers and separate body from support. Inspect oil passages and make sure they are free from dirt or other material. Clean passages with compressed air. Inspect governor body for slight scores. Valve should travel freely in governor body.

Reassembly: Lubricate the two governor support seal rings with automatic transmission fluid and install on governor support. Make sure seal rings are free to rotate in grooves. Position governor body on support and install the four screws and lockwashers (do not tighten screws at this time). Slide governor support and body assembly into position in rear pump housing. Compress governor support seal rings with fingers as support enters oil pump housing. DO NOT FORCE.

POWER TRAIN UNITS (Disassembly): Unit No. 1 (Output Shaft, Kickdown Planet Pinion Carrier, and Intermediate Shaft Assemblies) – *NOTE - Unit may be placed in the propeller shaft flange and hand brake drum assembly to aid in disassembly.* Using a screwdriver, remove output shaft drive housing snap ring. Remove reverse annulus gear from output shaft assembly. Remove intermediate shaft and kickdown shaft and kickdown carrier assemblies from output shaft assembly. Remove output shaft thrust washer located inside of housing. Remove kickdown planet pinion carrier assembly from intermediate shaft assembly *(NOTE - The kickdown planet pinion carrier assembly used in this unit is the same as th low-reverse planet pinion carrier assembly used in Unit No. 2. No attempt should be made to interchange thes units).* Remove kickdown carrier thrust washer from

TORQUEFLITE GOVERNOR ASSEMBLY

carrier assembly. Remove sun gear roller thrust washer from intermediate shaft assembly. With a screwdriver, remove kickdown annulus gear snap ring and separate gear from intermediate shaft assembly.

Inspection (Output Shaft): Inspect all bearing and thrust surfaces for scoring or scratches. Blow compressed air through all oil passages: make sure they are open and free of dirt. Inspect the four large and two small interlocking seal rings for excessive wear, broken ends, and make sure they rotate freely in grooves. Intermediate shaft and clutch feed tubes are serviced as an assembly.

Inspection (Kickdown Planet Pinion Carrier): Inspect planet carrier for cracks and pinions for broken or worn gear teeth. Using a feeler gauge, check clearance on individual planet pinion gears (clearance should be .006-.017"). Inspect pinion shafts for fit in carrier and make sure pinions are free to rotate on shafts. Make sure shaft lock pins are installed. Inspect oil holes in carrier to make sure they are open. *(NOTE* - Do not replace carrier unless this inspection indicates it is necessary. The planet pinion carrier and pinions are serviced only as a complete assembly). Inspect kickdown thrust washer for scratches or excessive wear.

Inspection (Reverse and Kickdown Annulus Gears): Inspect for worn, cracked or broken gear teeth. Check contacting surfaces of teeth for indications of binding. This condition will usually be evidenced by a brinelling condition. If "brinelling" is noticed, check thrust washer contacting surfaces and alignment of annulus gear on shaft. (Annulus gear teeth having slight cracks, or what appear to be cracks, should provide sufficient evidence to warrant replacement of gear). While burrs

CONTINUED ON NEXT PAGE

TORQUEFLITE (C nt.)

or slight obstructions on gear teeth can be safely removed with a hone, under no circumstances should broken areas of gear teeth be filed or ground. In this case the annulus gear should be replaced. Wash annulus gear and be sure to remove all metal pick-up from teeth.

Reassembly (Unit No. 1): *(NOTE* - To aid in reassembly, position output shaft in the propeller shaft flange and brake drum assembly for use as a holding fixture). With output shaft in an upright position, lubricate output shaft thrust washer with automatic transmission fluid and place into position in housing. Place kickdown annulus gear in position on intermediate shaft assembly and install snap ring (select fit). Using a feeler gauge, check clearance under kickdown annulus gear snap ring. Hold clearance as close as possible to .000". Snap rings are available in the following two thicknesses: .060-.062" (Part No. 1636357), .064-.066" (Part No. 1636358). *(NOTE* - When checking clearance, support annulus gear on edge of bench so intermediate shaft will seat properly in gear). Make sure snap ring seats properly. Place intermediate shaft assembly in output shaft housing. Lubricate kickdown carrier thrust washer with automatic transmission fluid and place in position in kickdown annulus gear (make sure thrust washer remains in position). Place reverse annular gear in position in housing and install output shaft drive housing snap ring, making sure it seats properly in housing. Lubricate and install sun gear thrust washer (roller type) over intermediate shaft and into position in carrier assembly.

Disassembly: Unit No. 2 (Sun Gear, Reverse Planet Pinion Carrier, Overrun Clutch, and Rear Clutch Piston Retainer Assemblies) – With unit in upright position, remove sun gear and front clutch thrust washer. Using two screwdrivers inserted between clutch and intermediate support, remove rear clutch retainer assembly from sun gear. Remove two clutch neoprene seal rings from sun gear. Remove reverse sun gear from overrun clutch and reverse planet pinion carrier assemblies. Install Tool C-3527, in intermediate support and cam assembly from overrun clutch hub. Using a screwdriver, remove snap ring from low-reverse band drum. Remove overrun clutch hub assembly from low-reverse band drum. Remove overrun clutch cam roller springs and rollers (ten of each) by removing Tool C-3527 from intermediate support and cam assembly *(CAUTION* - Place assembly over bench when removing tool so springs and rollers will not be lost).

Rear Clutch Piston Retainer Disassembly – Using screwdriver, remove snap ring (large) from rear clutch piston retainer assembly. Remove rear clutch pressure plate from retainer assembly. *(NOTE* - Rear clutch plates (steel) are dished and identified by a notch in one of the driving lugs. When removing the steel plates from clutch retainer, note that dished side of these plates is facing out. Check for dished side by using a straightedge across plate). Invert clutch piston retainer assembly and remove clutch plates and driving disc assemblies (five each). Using Tool C-3533, slightly compress the rear clutch piston return spring retainer, being careful not to damage retainer by compressing spring too far. Using pliers Tool C-3301, remove piston return spring snap ring. Release Tool C-3533 and remove clutch return spring retainer and spring from clutch piston retainer assembly (spring retainer may require guiding past snap ring groove as tool is released). Using a twisting motion, remove clutch piston assembly from retainer. Remove rear clutch piston inner and outer seal rings.

Inspection (Clutch Driving Disc & Plate) – Inspect driving discs and plates for evidence of burning, glazing and flaking off of facing material. Check disc by scratching facings with finger nail. If material collects under nail, replace all driving discs. Replace driving discs if splines have become damaged. Inspect the steel clutch plates and pressure surface for evidence of burning, scoring, and damaged driving lugs. Replace if necessary.

Inspection (Piston & Seal Rings) – Inspect seal ring surfaces in piston retainer for nicks and deep scratches. Light scratches will not interfere with sealing of neoprene rings. Inspect inner and outer piston seal rings (neoprene) for deterioration, wear, and hardness. Inspect seal ring groove in piston for nicks or burrs. Inspect inside bore of piston for score marks; if light, remove with crocus cloth; if heavy, replace piston. Inspect piston spring, retainer and snap ring for distortion.

Inspection (Clutch Piston Retainer) – Note ball check in clutch retainer. Make sure ball operates freely. Inspect the band contacting surface for deep scores and burns, especially if the band lining is worn to point where steel band has been contacting rear clutch piston retainer. *(CAUTION – Do not machine the piston retainer in an engine lathe to remove score marks).* Inspect steel clutch plate contacting surfaces for burrs or brinelling. Make sure clutch driving lugs on steel clutch plates travel freely into retainer. Remove any metal pick-up on hub of retainer.

Rear Clutch Piston Retainer Reassembly – Lubricate and install inner piston seal ring on hub of clutch retainer (seal lip must be facing down, and seal must be properly seated in groove). Lubricate and install outer seal ring on clutch piston (lip of seal facing away from flange). Place piston assembly in clutch retainer, and with a twisting motion, seat piston in bottom of retainer. Install piston return spring on hub and position spring retainer snap ring on spring. Using Tool C-3533, compress clutch spring sufficiently to seat the snap ring. Make sure snap ring is properly seated. Remove Tool C-3533. Lubricate all clutch plates and discs with automatic transmission fluid. Assemble by placing one rear clutch steel plate (identified by a notch on one of the lugs) with the dished side facing out, in the clutch retainer, followed by a driving disc. Repeat this procedure until all five discs and five plates have been installed *(CAUTION – All steel driving plates must be installed with dished sides facing same direction for proper travel of clutch pressure plate).* Install rear clutch pressure plate. Select and install snap ring making sure it is seated properly in clutch retainer. Using feeler gauge, check the clearance between snap ring and pressure plate. Clearance limits are as close to .000" as possible. Snap rings are available in the following sizes: .060-.062" (Part No. 1636315); .064-.066" (Part No. 1636316).

Inspection (Reverse Sun Gear Assembly): Inspect gears for cracked or broken teeth. Inspect steel back bronze bushing for scoring or excessive wear. Bushing and reverse sun gear are serviced as an assembly. Inspect intermediate support bearing surface of gear for wear and slight scores. Inspect rear clutch seal ring grooves on gear for nicks or burrs. Inspect inner ring sealing surface in bore of sun gear for grooves or scratches. Inspect thrust area of sun gear for nicks, scratches, or burrs. Inspect neoprene seal rings for deterioration, wear, nicks, or hardness. Inspect front clutch and sun gear thrust washers for scratches or excessive wear.

Inspection (Support & Cam Assembly): Inspect riveting of cam to intermediate support. Inspect cam roller surface for brinelling. Inspect roller spring retaining tabs for being bent or distorted. Inspect bearing surface on hub for scoring. Inspect steel backed bronze bushing in hub for scratches or scoring and excessive wear. Bushing and intermediate support are serviced as an assembly. Inspect overrunning clutch cam rollers for being pitted or scored. Inspect overrunning cam roller springs for distortion. Replace if necessary.

Inspection (Low-Reverse Planet Pinion Carrier): Inspect carrier for cracks and pinion for broken or worn gear teeth. Using a feeler gauge, check end clearance on individual planet pinion gears, clearance should be .006-.017". Inspect pinion shaft for fit in carrier and and make sure pinions are free to rotate on shafts. Make sure shaft lock pins are installed. *(NOTE* - Do not replace carrier assembly unless inspection indicates that it is necessary. The planet carrier and pinions are serviced as an assembly).

Inspection (LO2-Reverse Band Drum): Inspect band contacting surface for deep scratches and burrs, especially if band lining is worn to point where steel band has been contacting drum *(CAUTION - Do not attempt to machine drum in an engine lathe to improve score marks).* Inspect driving lugs inside drum for excessive wear.

Inspection (Overrunning Clutch Hub): Inspect cam roller contacting surface for brinelling. Inspect steel back bronze bushing in hub for scratching or scoring and excessive wear. Bushing and hub are serviced as an assembly. Inspect lubricating hole and make sure it is free from foreign matter by cleaning with compressed air. Inspect reverse drum snap ring for distortion.

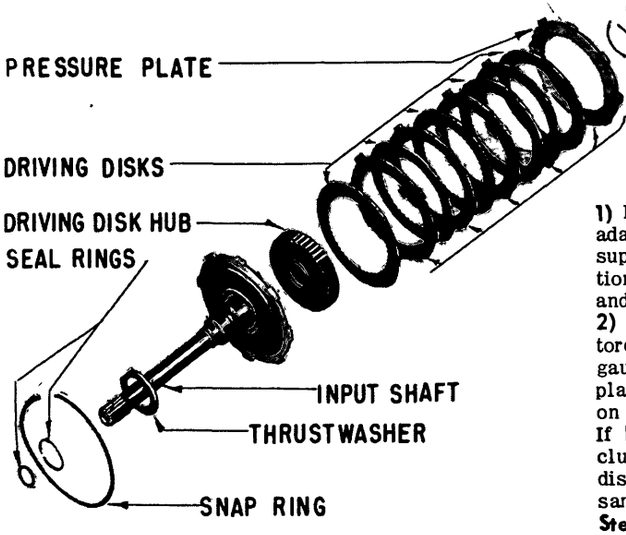
Reassembly (Unit No. 2): Install overrunning clutch hub assembly (hub first) into snap ring side of the low-reverse band drum. Place low-reverse planet pinion carrier assembly in position in low-reverse band drum. With drum supported, select snap ring to give minimum clearance. Snap rings are available in the following thicknesses: .060-.062" (Part No. 1636315); .064-.066" (Part No. 1636316); .068-.070" (Part No. 1636317). Place tool C-3527, in position in intermediate support and cam assembly and install cam springs and rollers. *(CAUTION - Make sure that cam springs and rollers are properly seated against cam; otherwise, damage to springs will result when overrunning clutch hub is installed).* With intermediate support and cam assembly resting on bench, lubricate bushing and install low-reverse band drum assembly over hub. While holding the

CONTINUED ON NEXT PAGE

TORQUEFLITE (C nt.)

two assemblies together, remove Tool C-3527. Lubricate bearing surface on reverse sun gear and install intermediate support and planet pinion carrier assembly. Lubricate the two sun gear rear clutch seal rings (neoprene) with automatic transmission fluid, and install on reverse sun gear. Install rear clutch piston retainer assembly on reverse sun gear. *(CAUTION - To prevent injury, do not place fingers under clutch retainer assembly when installing).* Install front clutch and sun gear thrust washer (Lubriplate may be used to hold thrust washer in position).

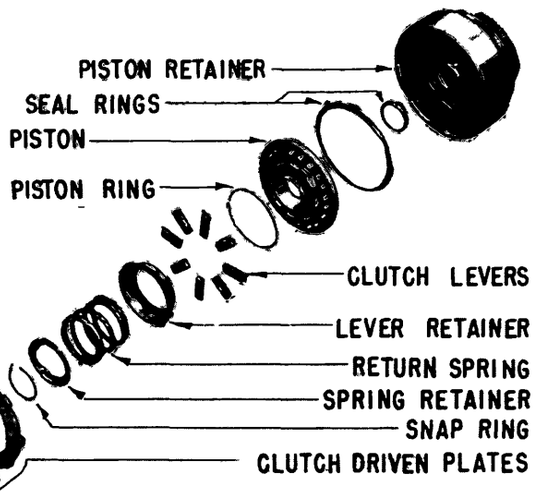
Disass mbly: Unit N . 3 (Input Shaft & Front Clutch Pist n R tain r Ass mbli s) - Remove input shaft fibre thrust washer (select fit). Using a screwdriver, remove front clutch snap ring. Remove input shaft assembly from clutch piston retainer, and mark the top driving disc (select fit) for identification at assembly. Invert front clutch piston retainer, and remove driving discs (five), and clutch plates (four). Remove clutch plate and clutch hub. Install Tool C-3533 and compress front clutch piston return spring retainer. Using pliers, Tool C-3301, remove piston return spring snap ring. Release and remove tool. Remove clutch piston return spring retainer and spring. Remove lever retainer and levers from front clutch piston retainer. Using a twisting motion, remove piston assembly from retainer.



Insp cti n (Input Shaft): Inspect thrust washers for cracks or excessive wear. Inspect front clutch snap ring for distortion. Inspect interlocking seal rings for wear or broken locks. Make sure they turn freely in grooves. *(NOTE* - When replacing rings, use extreme care not to damage interlock portion). Make sure all passages are open by blowing air through them. Check splines and lugs for nicks or burrs. Inspect bearing and thrust surfaces for nicks or scratches. Inspect steel back bronze bushing for scratches, scoring or excessive wear (bushing and input shaft are serviced as an assembly).

Insp cti n (Clutch Driving Discs, Plates, and Hub): Inspect driving discs for evidence of burning or glazing, and flaking off of facing material. Check discs by scratching facings with finger nail; if material collects under nail, replace all driving discs. Replace driving discs if splines have become damaged. Inspect steel clutch plates and pressure plate surface for evidence of burning, scoring, and damaged lugs; replace if necessary. Inspect lever contacting surface on pressure plate for evidence of wear (oil passages in hub are to lubricate clutch plates). Make sure they are free of foreign matter.

Insp cti n (Fr nt Clutch Piston, Seal & Levers): Inspect levers for wear or distortion. Remove and inspect inner and outer piston seal rings (neoprene) for deterioration, wear, and hardness. Inspect seal ring groove in piston for nicks or burrs. Inspect inside portion of piston hub for score marks. If light, remove with crocus cloth, if heavy, replace piston. Inspect lever ring for seating properly in groove on piston. Inspect lever retainer, return spring, spring retainer, and snap ring for distortion.



Insp cti n (Fr nt Clutch R tainer): Make sure check ball operates freely. Inspect seal ring surfaces in hub; if intermediate shaft seal rings have excessively worn or grooved this surface, replace the clutch piston retainer. Remove any metal pick-up on hub of retainer, and inspect seal ring groove for nicks or burrs. Inspect steel clutch plate contacting surfaces for scores or brinelling. Inspect thrust surface on rear of retainer for scratches or scoring. Make sure all clutch feed and lubricating passages are open and free of dirt.

Reassembly (Unit No. 3): Lubricate and install neoprene oil seal ring on hub of clutch retainer (seat seal properly in groove with lip of seal facing down). Lubricate and install outer seal ring on clutch piston with lip of seal facing away from flange. With piston lever ring seated in piston, place piston assembly in clutch retainer, and with a twisting motion, seat piston in bottom of retainer. Place lever retainer in piston and install the lever (eight), making sure they are free and properly seated in slots of piston. Install clutch return spring over hub of clutch retainer, and position spring retainer and snap ring on spring. Using Tool C-3533, compress the clutch return spring sufficiently to seat snap ring with pliers, Tool C-3301. Check to make sure snap ring is properly seated. Remove spring compressing portion of tool. Install pressure plate (smooth side up) in retainer. Install discs and plates by placing one of the driving discs in clutch retainer followed by a steel plate. Repeat this procedure until all five driving plates and four steel plates have been installed.

TRANSMISSION UNIT NO. 3

Front Clutch Pressure Plate Travel Check & Adjustment: To properly control travel of clutch plate assembly, the top driving disc is a selective fit and is available in the following sizes: .060-.063" (Part No. 1636260, Std. Size); .073-.076" (Part No. 1636372); .087-.090" (Part No. 1636373). To select the correct top driving disc, proceed as follows:

1) Remove top driving disc from clutch retainer. Install adaptor, SP-2872 over screw portion of Tool C-3533, and support ends of adaptor on input shaft flange stop portion of clutch retainer. Install spring washer, SP-2881 and plate compressing adaptor SP-2876.

2) Install thrust washer (ball type) SP-100 and nut; torque to 10 inch lbs. Using Tool SP-2873 (checking gauge) check distance between surface of top clutch plate (steel) and end of adaptor SP-2872 which is resting on output shaft flange stop portion of clutch retainer. If **First Step** of checking gauge will slide between top clutch plate (steel) and end of adaptor, use standard disc, Part No. 1636260. If **Second Step** will slide into same position, use disc, Part No. 1636372. If **Third Step** will slide into same position, use disc, Part No. 1636373. *NOTE - If there is excessive clearance between third step of checking gauge and end of adaptor due to wear on disc facings, correct as follows:*

3) Remove adaptor, SP-2872 (checking portion of tool) from clutch retainer assembly. Remove top clutch plate and second disc. Install oversize driving disc, Part No. 1636373 (oversize disc) in second disc position. Reinstall top clutch plate (steel) and checking tool. Recheck clearance as indicated above. *(NOTE* - in the event the first stop on checking gauge will not slide between top clutch plate and tool, disassemble clutch to determine cause. Inspect for dirt, location of levers, distorted or improperly installed plates or tool.

4) Lubricate clutch disc and plate assembly with automatic transmission fluid and position clutch hub in plate and disc assemblies. *(CAUTION - To prevent damage to discs when installing input shaft, make sure hub engages splines in each disc).* Install input shaft assembly in clutch retainer. Select snap ring for minimum clearance and install. Snap rings are available in two thicknesses: .060-.062" (Part No. 1636315); .064-.066" (Part No. 1636316). Make sure snap ring seats properly. Install input shaft thrust washer.

CONTINUED ON NEXT PAGE

TORQUEFLITE (C nt.)

TRANSMISSION REASSEMBLY & INSTALLATION

TORQUE CONVERTER REACTION SHAFT (Installati n): Using sun lamps, heat front of transmission case to approximately 170-190°F. Install guide studs, Tool C-3283, in front face of reaction shaft flange. Lubricate portion of reaction shaft flange (that presses into case) with automatic transmission fluid. Position torque converter reaction shaft into front of transmission case so that guide studs in shaft align with threaded holes in case. Using Tool C-3531, press reaction shaft into place. Remove guide studs and start the three transmission case-to-reaction shaft screws and washers. Draw down evenly and tighten to 10-15 ft. lbs. Coat torque converter reaction shaft seal with automatic transmission fluid, and install on shaft.

REGULATOR VALVE BODY (Installation): Install guide studs, Tool C-3288 in transmission case. Install valve body gasket over guide studs and into position on transmission case. With seal ring (neoprene) in position on reaction shaft, install regulator valve body and valves over guide studs and into position *(CAUTION* - Hold valves in place to prevent damage while installing valve body).

FRONT OIL PUMP (Installation): With inner and outer seals lubricated and pump gears in position in housing (counterbore in pinion gear facing down as identified when removed), place oil pump housing over studs and slide into position. Start five of the screws (with aluminum washers) and draw housing down evenly until it is seated in transmission case. Remove guide studs and install the two remaining screws and washers. Tighten the two long screws and five short screws to 14-16 ft. lbs. *(CAUTION - Improper tightening of these screws may cause pump gears to bind).* Lubricate and install front pump drive sleeve (bearing surface first), and engage the driving lugs of oil pump pinion to determine if oil pump gears turn freely (main body of driving sleeve should be flush with oil pump housing when properly installed). If gears do not turn freely, remove pump and check for foreign matter between pump gears and housing. Install torque converter control valve spring, retainer and gasket. Tighten to 35-40 ft. lbs. Install transmission regulator valve spring, retainer and gasket. Tighten to 45-50 ft. lbs.

ACCUMULATOR PISTON (Installation): Lubricate seal rings and place accumulator piston into position. Compress outer seal ring and tap lightly in transmission case.

KICKDOWN PISTON (Installation): Lubricate piston seal rings and place kickdown piston assembly into position, compress outer ring, and start assembly into case. With piston properly centered so as not to damage rings, tap lightly and bottom piston into case. Place kickdown piston rod assembly in piston and slide piston spring over kickdown piston rod. Install Tool C-3529, for kickdown piston installation. Compress spring sufficiently to install snap ring. Loosen compressing portion of tool and remove from transmission case. Place servo piston sleeve over piston. Make sure sleeve slides freely on piston by working it up and down.

KICKDOWN BAND (Installation): Install kickdown band assembly by rotating band ends over center support in transmission case *(CAUTION - Use care when installing bands so not to damage lining on edges of transmission case).* Install anchor on kickdown band adjusting screw.

LOW-REVERSE BAND (Installation): Install anchor on reverse band adjusting screw. Install band by rotating band ends through rear opening in transmission case.

LOW-REVERSE & KICKDOWN BAND LEVER ASSEMBLIES AND STRUTS (Installation): Place levers in position in case and slide shaft through levers from rear of transmission case. Remove guide stud, Tool C-3288, from threaded end of shaft and install shaft lever spacer (flat) and plug. Tighten plug to 30-35 ft. lbs. Position kickdown band over anchor and compress band sufficiently to install kickdown band strut. Place reverse band into position on anchor and compress band end; and with aid of a screwdriver, install strut.

POWER TRAIN UNITS (Installation): Unit No. 3 (Front Clutch Piston Retainer and Input Shaft Assemblies) - If when transmission was disassembled, the end clearance was found to be incorrect, correction can be made at this time by selection of proper input shaft thrust washer. To accomplish this, use a micrometer and measure thickness of thrust washer which was removed. Select a thicker or thinner washer to give proper clearance *(NOTE - Front clutch end clearance should be .020-.050" with transmission fully assembled).* Thrust washers are available in the following sizes: .115-.117" (Natural color, Part No. 1637669); .097-.099" (Black, Part No. 1638670); .078-.080" (Red, Part No. 1638671). With input shaft thrust washer in position and input shaft seals lubricated, start unit through rear of transmission case. By supporting and keeping unit centered as much as possible, guide through bands and reaction shaft into position.

Unit No. 2 (Sun Gear, Reverse Planet Pinion Carrier, Overrunning Clutch, and Rear Clutch Assemblies) - Start unit through rear of transmission case. Align identified locating hole in intermediate support with threaded locating hole inside of transmission case. By supporting and keeping unit centered as much as possible, guide through bands until it contacts hub on front clutch. While pushing in on assembly, rock sun gear to engage clutch plates of rear clutch on hub of front clutch *(CAUTION* - While rocking sun gear, make sure unit does not bind on bands or in intermediate support. Do not use excessive force when installing this unit so as to prevent damage to clutch discs in rear clutch). Use a drift punch to assist in alignment of intermediate support locating holes. Install the three intermediate support locating screws, lockwashers, and tighten to 25-30 ft. lbs. Use great care when installing the locating screw to prevent loss of lockwasher. Check input shaft and sun gear for turning freely.

Unit N . 1 (Output Shaft, Kickd wn Plan t Pini n Carrier, and Intermediate Shaft Ass mbli s) - Be sure reverse sun gear thrust washer (roller type) is in position in planet pinion carrier assembly. Lubricate seal rings and bearing surface on intermediate shaft, with automatic transmission fluid. Install unit by placing intermediate shaft in sun gear. Keeping unit centered as much as possible and slowly turning output shaft, slide into position (large seal ring on output shaft flush with rear of transmission case). *CAUTION* - Use care when installing to prevent damage to seal rings on intermediate shaft.

OUTPUT SHAFT SUPPORT (Installati n): With guide studs, Tool C-3283 in rear of transmission case, place output shaft support gasket over guide studs and into position on rear of case. Lubricate output shaft seal rings. Install support over shaft and guide studs, and position against transmission case *(CAUTION* - Use care when installing support so not to damage ring sealing surfaces). Install the one (short) output shaft support-to-transmission case screw and lockwasher, and tighten finger tight.

REAR OIL PUMP & GOVERNOR ASSEMBLIES (Installation): Place rear oil pump pinion ball in ball pocket in output shaft. Lubricate rear oul pump drive pinion. Place over output shaft and slide into position aligning key-way in pinion with ball in shaft. *(CAUTION - Pinion was marked at disassembly. Make sure it is installed correctly).* Lubricate rear oil pump gear and position in pump housing. Make sure gear is installed correctly; check marking. Slide rear oil pump and governor assemblies over output shaft and into position against support. *(CAUTION* - There are two extra holes in housing which are used for vents. Make sure no attempt is made to install screws in these holes. Check each threaded hole before installing screws). Install the five oil pump housing-to-output shaft support screws. Draw screws down evenly and tighten to 10-12 ft. lbs. After screws have been tightened, turn output shaft to make sure pump gears are free to rotate. If not, disassemble pump to determine cause.

GOVERNOR WEIGHTS & VALVE ASSEMBLY (Installation): Align locating hole in output shaft to locating screw hole in governor support and install locating screw. Tighten to 5-7 ft. lbs. If governor body had been removed, and installed, tighten the four body screws to 6-8 ft. lbs. Dry governor weight assembly and valve with compressed air, but do not lubricate when assembling. Place governor weight assembly (secondary weight snap ring facing out) into governor body, and using pliers, Tool C-3229, install snap ring, making sure it is properly seated in groove. With the governor valve (small end up) on governor valve shaft, slide shaft into governor body through output shaft and governor weight assembly; at the same time position valve

CONTINUED ON NEXT PAGE

TORQUEFLITE (C nt.)

into body. Install governor valve shaft snap ring (from weight assembly end). Make sure it is properly locked to shaft. After snap ring installation, apply sufficient pressure to both ends of valve shaft to force snap rings to outer portion of snap ring grooves. Check operation of governor weight assembly and valve by turning output shaft. • Both should fall free in governor body.

EXTENSION HOUSING (Installation): Install new extension housing gasket over guide studs and into position against output shaft support. *(CAUTION - Do not use sealing material on gasket).* Place extension over output shaft and guide studs and into position against support *(NOTE* - Propeller shaft flange and drum assembly can be used, if necessary, to draw extension output shaft support). Install extension housing-to-case screws and tighten to 25-30 ft. lbs. Tighten output shaft-to-case screw to 25-30 ft. lbs. (Check output shaft to make sure it turns freely). Install speedometer drive pinion and sleeve assembly in extension housing and tighten to 40-56 ft. lbs.

HAND BRAKE (Installati n): Make sure brake support spacer (neoprene) is in position on back of brake support and spacer sleeve is in center of support. Slide brake support assembly over rear of extension and anchor pin. Make sure spacer sleeve remains in center of support. Install brake support grease shield on extension housing(indent on shield is for correct positioning on extension, also, the shield must be located on extension far enough to permit installation of spring). Place both brake anchor washers on brake shoe anchor and install locking anchor washer. Place both shoe assemblies with adjusting sleeve nut and screw into position on anchor. Make sure brake shoes are between anchor washers. Use rubber bands around shoes to hold them in position. Install operating link. Note that link is marked for correct installation. Install the brake support grease shield spring (opening in spring toward adjusting sleeve). Make sure spring is properly seated in groove. Slide brake shoe return spring behind grease shield spring and hook into position. Install propeller shaft flange and drum assembly. Install shaft flange washer and nut. Tighten to 200 ft. lbs.

►*FRONT CLUTCH END CLEARANCE CAUTION.* Recheck end clearance *(See "Front Clutch End Clearance Check" under "Removal & Inspection of Transmission Units" above).* If clearance not correct (.020-.050"), input shaft washer of proper thickness can be installed by removing the seven screws and lockwashers from extension housing. Install guide studs, Tool C-3233. Remove the one output shaft support-to-transmission case screw and washer, and remove the hand brake assembly, extension, output shaft support, and No. 1 unit as an assembly.

BAND ADJUSTMENT: Rotate hand brake drum in both directions to center bands on retainers prior to making band adjustment. *See "Band Adjustment" above, for adjustment procedure.*

VALVE BODIES & TRANSFER PLATE ASSEMBLY (Installation): Clean mating surfaces of valve body assembly and place into position on transmission case. Install five (short) transfer plate screws, with Belleville washers. Draw down evenly and tighten to 14-16 ft. lbs. Install accumulator spring through transfer plate and position in piston. Install accumulator cover, three screws with Belleville washers and draw down evenly. Place oil strainer in position over rear pump suction tube in transfer plate assembly. Check position of front pump suction tube in elbow (opening in suction tube should be facing oil pan). Slide front pump suction tube into strainer and position elbow on transfer plate. Install the two screws (with Belleville washers), draw down evenly and tighten elbow and accumulator cover screws to 14-16 ft. lbs. Install neutral starter switch and visually check manual valve lever contact with switch.

OIL PAN (Installation): Install pan, using new gasket. Tighten screws evenly to 10-12 ft. lbs. Tighten oil drain plug.

MANUAL CONTROL VALVE LEVER AND CONTROL CABLE ADAPTOR HOUSING (Installation): Install manual control lever (locking screw to rear) on manual valve lever shaft. Position lever so there is 7/32" clearance (without gasket) between bottom of lever and transmission case. Tighten locking screw securely. Place control cable adaptor (with spring lock in position) in lever and install pin. Place manual valve control lever in reverse position and install gasket, control cable housing, and three screws (with Belleville washers). Tighten evenly to 14-16 ft. lbs. Install felt washer, flat washer, and throttle valve lever assembly over shaft. Tighten clamp bolt.

FORDOMATIC, MERCOMATIC & TURBO-DRIVE TRANSMISSION

F rd Pass. Cars, All Models (1956)
Ford Trucks F-100, F-250, F-350, P-350, P-500 (1956)
Continental (1956)
Lincoln (1956)
Mercury (1956)

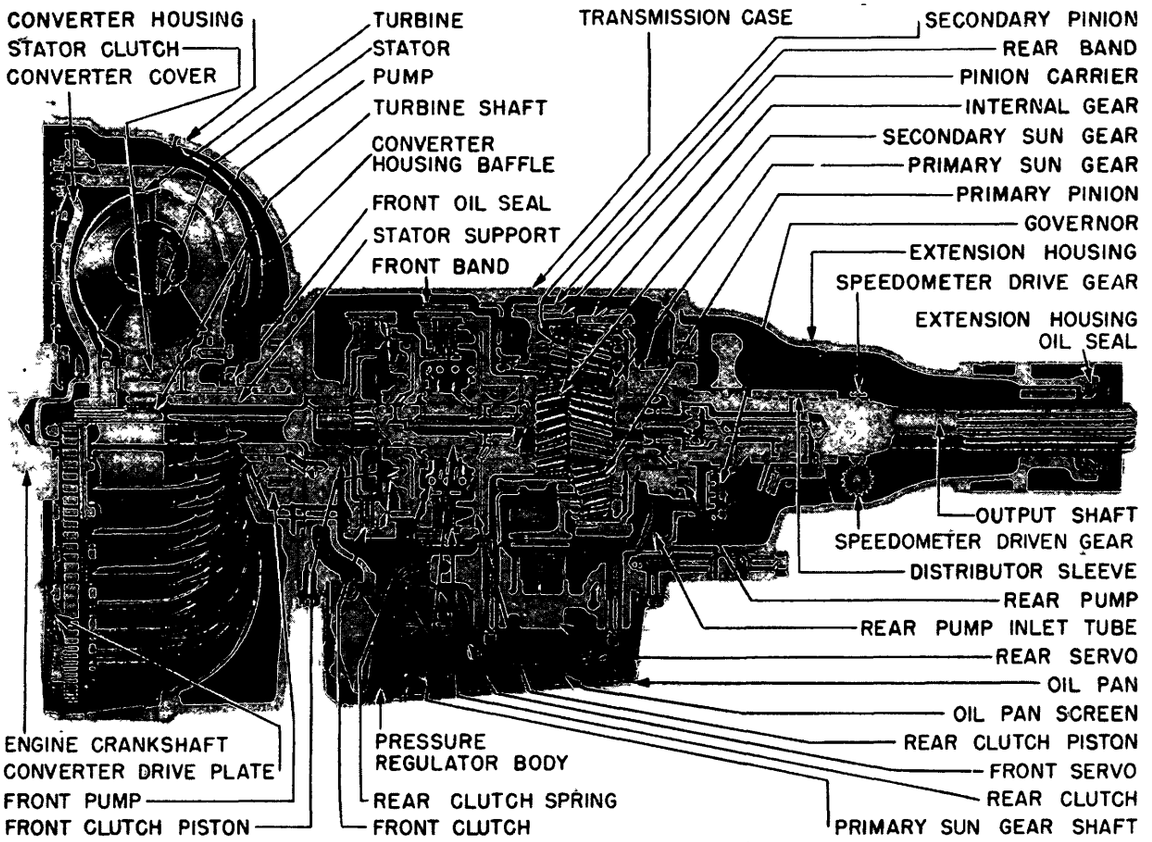
►CHANGES, CAUTIONS, CORRECTIONS

►*1956 FORDOMATIC CONTROL VALVE ASSEMBLY IDENTIFICATION: Three different control valve assemblies used which are identified by a letter located on lower valve body as follows:*

Model	Identification Letter
6 Cyl. Cars & Trucks	"S"
8 Cyl. Cars (272" Eng. & 2-Barrel Carb.)	"S"
8 Cyl. Cars (272" Eng. & 4-Barrel Carb.)	"E"
8 Cyl. Trucks	"E"
8 Cyl. Pass. Cars (292" Eng.)	"E"
Thunderbird & Police Interceptor	"T"

►*PRESSURE TAKE-OFF LOCATION CHANGE (THUNDERBIRD & INTERCEPTOR): These models now have the pressure take-off plug located at left rear of transmission case, just above oil pan.*

►*LOCK-UP CONDITION (BELOW 18 MPH IN INTERMEDIATE RANGE) CORRECTION:* This condition is caused by a cross leakage in the front servo piston. Check the front servo piston carefully for radial cracks that might cause leakage.



►*FORDOMATIC REAR CLUTCH PLATE NOTE:* The driven rear clutch plates can be installed facing either the front or rear of transmission; however, the coned surfaces of the plates must all face the same direction.

►*1956 FORDOMATIC CONVERTER STATOR CLUTCH PRODUCTION CHANGE:* A new 16 sprag stator clutch, Part No. B6A-7940-A, replaces the former 20 sprag clutch. When installing the later type clutch, the flanged edges must face front of transmission.

►*TRANSMISSION FAILURE CAUTION (Cars with Air Cooled Torque Converter):* In the event of band failure or transmission failure where there is a possibility of foreign material circulating in the cooling system, it is recommended that the cooler and lines be back-flushed with automatic transmission fluid and air prior to installation. *CAUTION - Do not use pressure greater than 100 lbs.*

►*1956 FORDOMATIC TORQUE CONVERTER ASSEMBLY PRODUCTION CHANGE & REPLACEMENT PARTS CAUTION (8 CYL. MODELS):* Beginning approximately Jan. 15, 1956 a new water cooled torque converter is being used on 8 cylinder models. A steel impeller housing and a redesigned turbine is used. *NOTE* - The later type turbine, Part No. B6A-7920-A can be used to replace the earlier turbine; however, the earlier turbine, Part No. B5A-7920-A must not be used with the steel type impeller.

►*1956 FORDOMATIC PRESSURE REGULATOR ASSEMBLY PRODUCTION CHANGE (On cars with the new steel impeller):* Pressure Regulator, Part No. B6A-7440-E is used on 8 Cyl. models (except Thunderbird and Interceptor) and is identified by a white colored main regulator spring. Pressure Regulator, Part No. B6A-7440-F is used on Thunderbird & Interceptor, and is identified by a red main regulator spring.

FORDOMATIC & MERCOMATIC TRANSMISSION (SECTIONAL VIEW)

►*1956 FORDOMATIC & MERCOMATIC REGULATOR REPLACEMENT CAUTION (Cars with aluminum type impeller):* The later type regulator used with the steel impeller converter, must not be used on cars having an aluminum impeller housing as serious damage would result. The converter for use with the steel impeller converter can be identified by the omission of the .280" diameter hole under the intake regulator body cover.

►*1956 FORDOMATIC "RAPPING" OR "THUMPING" NOISE CORRECTION (Cars with steel converter):* Correct by installing a low pressure regulator valve, Part No. B6A-77464-A (converter pressure). The new valve can be identified by either a "flat" or "groove" in center land of valve. All transmissions that are equipped with the steel torque converter and have the later type valve installed, are identified by a daub of white paint adjacent to name plate. *CAUTION - Do not attempt to machine the earlier type valve as the short intermediate land would prevent transmission lubricating system from receiving proper amount of lubricant.*

►*1956 FORDOMATIC & MERCOMATIC TRANSMISSION SERVICE REPLACEMENT CASE NOTE:* The transmission case, Part No. B6A-7005-A, used for service replacement has two tapped holes for attachment of fluid cooler lines. When this case is installed on cars not having the fluid cooler, the holes should be plugged with 1/8" pipe plugs.

►*1956 FORDOMATIC STEEL TORQUE CONVERTER UNBALANCE CORRECTION:* This unbalance occurs when converter is filled with fluid and will appear as engine vibration during a standing engine run-up between 900-1000 RPM; 1500-1700 RPM; and 2000 RPM and over. Correct by removing converter and rotating its mounting position 180°.

►*1956 FORDOMATIC & MERCOMATIC REAR CLUTCH PLATE NOTE:* Ford Thunderbird & Interceptor models and all Mercury models have five bronze and five steel clutch plates in rear clutch assembly. A thinner clutch piston is also used with these assemblies which must not be used on models having the four bronze and four steel clutch plate assemblies.

CONTINUED ON NEXT PAGE

FORDOMATIC, MERCOMATIC & TURBO-DRIVE (C nt.)

►*1956 FORDOMATIC TORQUE CONVERTER BOLT INTERFERENCE CORRECTION:* On early transmissions with steel torque converter, interference between converter bolts and starter seal can be eliminated by using the shorter converter bolts, Part No. B6A-7964-B.

►*1956 TURBO-DRIVE & MERCOMATIC THROTTLE CONTROL INNER LEVER ENDPLAY CORRECTION & PRODUCTION CHANGE:* A new inner lever, Part No. B5A-77283-A has been released for service replacement to correct excessive endplay. The lever is stamped with the letter "O" and should be installed with the "O" toward inside of transmission.

►*1956 TURBO-DRIVE & MERCOMATIC PRESSURE TAKE-OFF PLUG LOCATION NOTE:* The take-off hole is located in rear wall of transmission case, and oil pressure is directed from control valve assembly through a hole in bottom gasket surface, near rear of case on name plate side, to the take-off hole. If the 1956 type case is used with a 1955 main control assembly, Part No. PMB-77700-A, B, C, D, it will be necessary to use PMB-77715-D separator plate, or drill a hole in the existing plate comparable to the hole in PMB-77715-D plate.

►*1956 TURBO-DRIVE & MERCOMATIC FRONT SERVO CAUTION:* The front servo is redesigned and the parts are not interchangeable with 1955 parts.

►*1956 MERCOMATIC CONVERTER HUB FAILURE CAUTION:* In case of converter hub driving lug failure, check and make sure the engine-to-converter housing locating dowels are present. If these dowels are missing, the resulting misalignment could cause additional lug failure.

►*1956 MERCOMATIC TORQUE CONVERTER ASSEMBLY PRODUCTION CHANGE:* A new water cooled torque converter having a steel impeller housing and a redesigned turbine are now being used in production. This later torque converter is identified by the omission of openings for air intake, baffles and exhaust.

►*1956 MERCOMATIC "THUMPING" NOISE CORRECTION (Cars with steel converter):* Install Pressure Regulator Assembly, Part No. B6A-77440-F having the later type converter pressure regulator valve. The later type valve is identified by either a machined "flat" or "groove" in the intermediate land.

►*TORQUE CONVERTER REASSEMBLY (STEEL CONVERTER) CAUTION:* When the impeller is attached to converter cover, with the new square head bolts, it is important that the balance marks stamped "O" on cover and etched "O" on impeller housing be in alignment.

►*TRANSMISSION IDENTIFICATION NOTE:* Transmission Model No. and Serial No. on name plate on left side of transmission case must be used to identify individual units for parts replacement etc.

►*STARTING ENGINE BY TOWING OR PUSHING CAR:* Pushing is recommended. Place selector lever in Neutral "N" position. When car reaches 20 MPH speed, turn on ignition, move selector lever to "LO", depress accelerator pedal to half throttle position until engine begins to run. *NOTE–On ice or snow where traction not good, move selector lever to "DR" position to crank engine.*

►*TOWING CAR CAUTIONS: Do not tow at speed greater than 40 MPH and observe following precautions:*

If Transmission Operating Properly–Place selector lever in Neutral "N" position. Car can be towed normally for distances not to exceed 12 miles. **For greater distances, use same procedure as for inoperative transmission.**

If Transmission Inoperative–Tow car with rear wheels lifted off road, or disconnect and remove propeller shaft and protect rear end of transmission from entry of dirt (U-joint Knuckle, Part No. 1M-4841 can be installed and wired in place for this purpose).

DESCRIPTION

Fordomatic, Mercomatic, & Turbo-Drive Automatic Transmissions consist of a hydraulic torque converter and an automatic transmission which provides automatic operation in "DR" range, and additional "LO", "R", & "P" ranges which are controlled manually.

See "Fordomatic, Mercomatic & Turbo-Drive Transmissions" in 1955 Annual Data or later Manual edition.

OPERATION

Torque converter automatically provides a torque multiplication ranging from 2.1-1 (maximum for starting and acceleration) to 1.0-1 (normal driving range with torque converter acting as a fluid coupling). This torque multiplication is supplemented by the planetary gears when selector lever placed in "DR", "LO", and "R" ranges.

Drive Range–Car starts in Intermediate Gear (except when accelerator pedal depressed to floor when car will start in Low Gear) with a gear ratio of 1.467-1 (Ford), 1.46-1 (Lincoln & Mercury), with Front Clutch applied locking the Primary Gear to the Turbine Shaft, and the Front Band applied, holding Secondary Sun Gear stationary. The power flow at this point is from Turbine Shaft through Front Clutch to Primary Pinion, to Secondary Pinion, to Internal Gear, to Output Shaft. As car speed increases (depending on throttle pressure) to a certain point, the Front Band is released and the Rear Clutch is applied, automatically causing transmission to change to direct (1.0-1) drive. The power flow in "High" gear is from the Turbine Shaft through the Front and Rear Clutches to the Planetary Gears which are locked together and rotate as a unit, causing the Output Shaft to rotate at engine speed.

Low Range–Front Clutch applied, locking the Turbine Shaft to Primary Sun Gear, and the Rear Band applied, holding Pinion Carrier stationary. The flow of power is from the Turbine Shaft through the Front Clutch., to Primary Pinions. to Secondary Pinions, to Internal Gear and out the Output Shaft at a ratio of 2.40-1. *See "Fordomatic, Mercomatic & Turbo-Drive Transmissions" in 1955 Annual Data or later Manual dition.*

LUBRICATION

►*FLUID CAPACITY NOTE (Cars with Water Cool d Torque Convert r): The approximate fluid capacity is th same as for air-cooled type.*

►*CAUTION: Transmission oil level should be checked at 1000 mile intervals and should be changed at 15,000 mile intervals.*

Recommended Oil–Automatic Transmission Fluid Type "A" only.

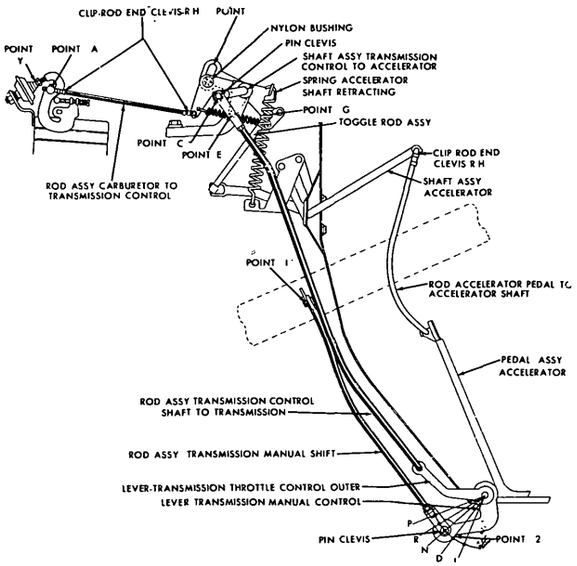
Capacity–Approximate capacities are as follows:
Ford (6 Cyl. Pass. Car & All Trucks)–9 qts.
Ford (8 Cyl. Pass. Cars exc. those listed below)–9½ qts.
Ford (Thunderbird & Police Interceptor)–10½ qts.
Lincoln (All Models)–10 qts.
Mercury (All Models)–10½ qts.

Checking Fluid Level–Apply hand brake, place selector lever in Neutral "N" position, run engine at idle speed for approximately four minutes, then move selector lever to Park "P" position. When engine and transmission have reached normal operating temperature, move selector lever through all positions to assure fluid distribution throughout transmission, return lever to "P" position. Raise engine hood, clean all dirt from around filler cap at right rear corner of engine. Check fluid level on dipstick in filler tube *(CAUTION–* make certain dipstick pushed all the way down in the filler tube when checking fluid level). Add fluid as necessary to bring level up to "F" full mark on dipstick.

Drainage and Refilling–Remove converter housing lower plate and drain converter by removing one drain plug, then rotate the engine 180° and remove the second drain plug. Disconnect filler tube from transmission oil pan to drain fluid from transmission. Tighten converter drain plugs to 7-10 ft. lbs. Tighten filler tube connection. Install 5 quarts of automatic transmission fluid, start engine and allow to idle four minutes. Add 4 qts, of fluid and bring transmission to to operating temperature. Place selector lever in parking (P) position and check oil level. If level is not up to dip stick level mark, add additional fluid as required.

►*CAUTION–Correct fluid level should be determined by dipstick reading rather than actual number of qts. installed.*

LINKAGE ADJUSTMENT



►*THROTTLE LINKAGE ADJUSTMENT NOTE: See CARBURETOR on Car Model pages.*

Manual Linkage Adjustment (All Models): Disconnect upper end of manual shift rod from selector arm. Position selector lever, with the indicator in the quadrant down against its stop in the "DR" position. Place manual lever at transmission in the drive "DR" detent (second from bottom). Rotate manual shift rod clevis until clevis pin fits freely into holes in clevis and selector arm. Lengthen rod assembly 2 complete turns (Ford, All Models), 1 complete turn (Lincoln & Mercury), counter-clockwise. Install clevis pin and check pointer alignment in all positions.

CONTINUED ON NEXT PAGE

FORDOMATIC, MERCOMATIC & TURBO-DRIVE (C nt.)

STARTER NEUTRAL SAFETY SWITCH: *(NOTE–Neutral Safety Switch is located at lower end of steering column (Ford, All Models), on steering column, inside passenger compartment (Lincoln & Mercury).*

TURBO-DRIVE THROTTLE LINKAGE

►*1956 FORD ACCIDENTAL STARTING (Cars with Back-Up Lights):* This condition may occur with ignition switch off and headlight switch on, and is caused by foreign material closing the circuit between back-up light switch and solenoid terminal in neutral safety switch, causing the engine to start. Correct by connecting the longest lead (beyond taped portion of harness) to the neutral safety switch "A" terminal. Connect shorter lead to "B" terminal. When replacing neutral safety switch, connect as indicated above.

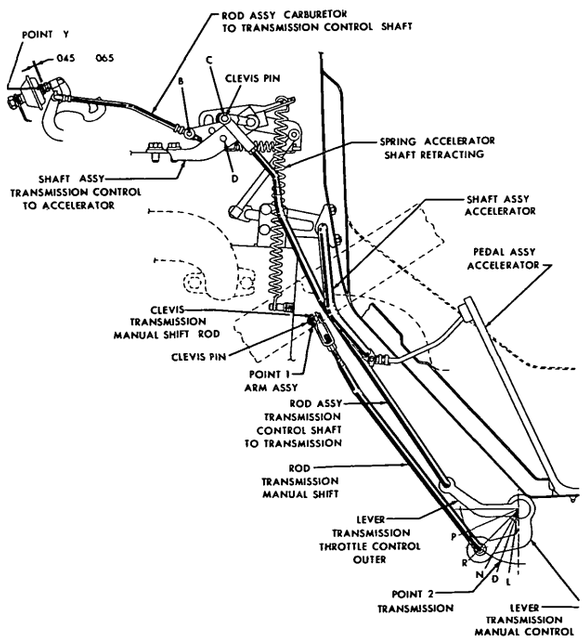
►*1956 LINCOLN SELF-CRANKING & CONTINUOUS OPERATION OF BACK-UP LIGHTS CORRECTION:* Install later type insulator assembly, Part No. FDK-15827-B which is identified by two ridges approximately .020" high on each side, and parallel to brass strip.

BAND ADJUSTMENT

►*Band Adjustment is recommended to be made at 15000 mile intervals when transmission fluid is changed (pan should be removed and cleaned at this time).*

FRONT BAND ADJUSTMENT: Drain fluid from pan using a drain can with a fine mesh screen, remove pan. Remove fluid screen from transmission and loosen the front servo adjusting screw locknut TWO FULL TURNS, using a 9/16" wrench. Using front band adjusting tool No. 7225, insert gauge block between servo piston and adjusting screw and tighten adjusting screw until wrench overruns. Back off adjusting screw exactly ONE COMPLETE TURN and remove gauge block. While holding adjusting screw stationary, tighten locknut clockwise (20-25 ft. lbs.). Install fluid screen and install pan using new gasket. Install the drain plug and refill transmission to "Full" mark using fluid drained from transmission unless fluid being changed. Check fluid level (see LUBRICATION).

►*CAUTION–Severe damage may result if adjusting screw not backed off exactly 1 full turn.*



REAR BAND ADJUSTMENT: Fold back floor mat to expose right side of floor pan and remove access hole cover on right side of transmission floor pan. Using rear band adjusting tool No. 7195, loosen rear band adjusting screw locknut. Using "T" handle of tool No. 7195, tighten rear band adjusting screw until wrench overruns. (If screw was found to be tighter than wrench capacity (10 ft. lbs.), loosen several turns and retighten until wrench overruns). Back off adjusting screw exactly 1½ COMPLETE TURNS. While holding adjusting screw stationary, tighten adjusting screw locknut to 35-40 ft. lbs.

►*CAUTION–Severe damage may result if adjusting screw not backed off exactly 1½ turns.*

TESTING

►*CAUTION: While making the Stall Test never hold the throttle open longer than 5 seconds.*

STALL TEST: The stall test is made in "D", "LO" & "R" ranges to determine if bands or clutches are slipping. Connect a tachometer to engine and set it to read on the "high" scale. Make sure engine is idling properly at normal operating temperatures. Start engine, then firmly apply parking brake and service brake. Place selector lever in "D" range, then press accelerator slowly all the way to the floor without going into "low gear" kickdown. The engine speed should be as indicated in the "Stall Speed Table" below. If engine speed is below minimum limit, tune the engine and repeat test. If engine speed exceeds maximum limit, release accelerator immediately because front band or clutch slippage is evident. To determine whether the front band or front clutch is causing slippage, move lever to "LO" range and repeat the test. If slippage is evident in "LO" range also, the front clutch is slipping. If slippage is found in "DR" range, but not in "LO" or "R" ranges, the front band is causing the the slippage. If engine exceeds the maximum limit with selector lever in "R" range, the rear band or rear clutch is slipping. To determine which of the two is faulty, move selector lever to "LO" range. If slippage is evident in "LO" and "R" ranges, but not in "D" range, the rear band is slipping. When slipping is noted in "R" range but not in "LO" or "D", the rear clutch is causing the slippage.

MERC-O-MATIC THROTTLE LINKAGE

ENGINE STALL SPEEDS

CAR & MODEL	Low Limit	ENGINE RPM	High Limit
Ford 6 Cyl. (223" Eng.)	1380		1580
Ford V8 (272" Eng.)	1460		1660
Ford V8 (292" Eng.)	1440		1740
Ford V8 (312" Eng.)	1590		1790
Continental	1550		1750
Lincoln	1550		1750
Mercury (Exc. Montclair)	1590		1790
Mercury Montclair	1610		1810

SHIFT TESTS: Select a smooth road for the tests. Make test as outlined below and see "Shift Point Table" for correct speed where shifts should occur.

2-3 Upshift (Minimum Throttle): Place selector lever in "DR" range, and starting from a standstill, apply accelerator lightly but steadily.

3-2 Downshift (Minimum Throttle): Permit car to decelerate (from speed attained in above test) until downshift occurs from high to intermediate.

3-2 Downshift (Forced): Reduce car speed below 45 MPH (Ford), 50 MPH (Mercury & Lincoln). Press accelerator pedal to floor. Transmission should shift from high to intermediate. This shift should occur only with car in high gear.

2-3 Upshift (Maximum Throttl): Place selector lever in "DR" range, and starting from a standstill, press accelerator to the floor. Full throttle upshift should occur as indicated.

2-1 Downshift (Forced): With selector lever in "DR" range and car speed below 18 MPH (Ford), 19 MPH (Mercury & Lincoln), quickly press accelerator fully to the floor. This action shifts transmission from high, to intermediate, or low.

1-2 Upshift (Maximum Throttle): With accelerator fully pressed to floor for above test (2-1 Downshift, Forced), transmission should upshift from low to intermediate when car speed indicated in table is reached. The 2-3

CONTINUED ON NEXT PAGE

FORDOMATIC, MERCOMATIC & TURBO-DRIVE (Cont.)

Upshift will occur at same speed as for 2-3 Upshift (Maximum Throttle).

"DR" to "LO" Manual Shift: With car speed between 40-45 MPH (Ford), 45-50 MPH (Mercury & Lincoln), Manually shift selector lever from "DR" to "LO". Instead of shifting to low gear, the transmission should shift from high to intermediate. When car speed is reduced within the range indicated in table, the transmission should shift into low range.

"R" Shift: Bring car to a stop and place selector lever in "R" range. The car should move in reverse direction smoothly, upon light throttle pressure.

OPERATING PRESSURE TEST: Set parking brake firmly and raise rear wheels off floor. Disconnect throttle at outer throttle lever on transmission.

Pressure Gauge Installation: Remove pipe plug in transmission case (located either near throttle lever or at rear of case. See Production Changes above for location), then connect pressure gauge No. 77820 so it can be read from under car.

▷ *1956 LINCOLN PROTRACTOR GAUGE 77270-D MODIFICATION:* To eliminate interference between manual lever and protractor pointer when making an operating pressure test, a small notch can be filed or ground into the pointer arm at point of contact with manual lever so the gauge will read at "zero" (this point will be in upper bend of pointer adjacent to pivot point). The forward end of the pointer arm locating slot can also be opened which will eliminate the necessity of disconnecting throttle control rod at transmission. When using the gauge with this modification, the control rod will enter the locating slot and take the place of the locating pin. It will be necessary to disconnect throttle control rod at upper end in order to set pointer at "zero" reading.

Throttle Lever Protractor Gauge Installation: Position gauge T55L-77270-C (Ford), 77270-C (Mercury) & 77270-D (Lincoln) over throttle lever shaft. Rotate gauge on shaft until gauge pin passes through hole in oil pan flange and contacts bottom machined surface of transmission case. Tighten gauge setscrew to hold gauge firmly on throttle lever shaft. Rotate throttle lever up against its internal stop in transmission, then insert gauge pin through small elongated hole in gauge and hole in throttle lever. Check position of protractor gauge pointer. If pointer is at zero, the throttle mechanism is not distorted. If throttle lever distorted, replace it with a new one.

Pressure Rise Point ("R" Reverse Range): With throttle lever pin through the elongated hole in gauge and hole in throttle lever, advance the throttle lever fully (down). The lever should travel 28° to 33°. Connect a tachometer and set engine idle speed at 600 RPM with selector lever in "R" (reverse) range. Observe pressure at 3° (Ford Cars & Trucks); 0° (Lincoln & Mercury) throttle lever position. The pressure should be 49-62 lbs., (Ford 6 Cyl. Pass. Cars); 51-69 lbs., (V8 Pass. Cars & All Trucks, except Thunderbird & Interceptor); 55-68 lbs., (Thunderbird & Interceptor); 50-63 lbs., (Lincoln & Mercury). From beneath car, advance throttle lever slowly and note angular reading at moment pressure begins to rise (3½-4½°). Continue to advance throttle lever slowly until maximum pressure is indicated on gauge. This pressure should be 173-190 lbs. (Ford 6 Cyl. Pass. Cars); 181-199 lbs., (V8 Pass Cars & All Trucks, except Thunderbird & Interceptor); 194-212 lbs. (Thunderbird & Interceptor); 175-190 lbs., (Lincoln & Mercury). Maximum pressure should occur at 9½° to 12° (Ford Cars & Trucks); 9½° to 11½° (Lincoln & Mercury) throttle lever advance.

Pressure Rise Point ("DR" Drive Range): Move selector lever to "DR" (Drive) range and repeat the above procedure. Maximum pressure should occur at 12° to 15° (All cars except Thunderbird & Interceptor) 14½° to 17½° (Thunderbird & Interceptor) throttle advance. Maximum pressure should be 124-144 lbs., (Ford 6 Cyl. Pass. Cars); 133-153 lbs., (V8 Pass. Cars & All Trucks, except Thunderbird & Interceptor); 130-150 lbs., (Lincoln & Mercury). On Thunderbird & Interceptor the maximum pressure should occur at 14½° to 17½° and be 147-168 lbs.

▷ *NOTE—If pressure regulation is not within above specifications, leave gauges attached (for a recheck after repairs) and adjust pressure as indicated below.*

Throttle Valve Stop Adjustment: This adjustment requires draining transmission and removing oil pan. Use bending tool No. 77763 to bend the throttle valve stop within transmission case as follows:

If pressure Rise Start is Over 4½° (in Reverse Range)—Hold throttle outer lever against its stop, clamp protractor gauge on lever and set to read 0°, then advance lever to maximum travel. Install bending tool over throttle valve stop, bend stop toward valve body to advance the stop position the number of degrees to bring the pressure rise to 4° in "R" range. Check by returning the lever to stop position and reading protractor gauge (reading will indicate change in stop position).

▷ *CAUTION: Do not attempt to correct the stop setting if the pressure rise point is more than 4° out of limits, since extreme bending of the stop can distort valve body plate and result in leakage. Replace stop plate (upper valve body front plate).*

If Pressure Rise Point is Under 3½° (in Reverse Range)—Hold throttle lever against its stop and note protractor gauge reading. Advance throttle lever to maximum travel and place throttle valve stop bending tool over stop. Bend stop away from valve body far enough to bring pressure rise to 4° in "R" range. (For example: If pressure rise point was 2°, the required correction is 2°. To make this correction, bend the stop an estimated amount, then remove tool and move throttle lever against its stop. Subtract previously noted protractor gauge reading from present reading to determine amount of change). Repeat procedure as necessary to bring pressure rise to 4°. Install oil pan and fill transmission with Automatic Transmission Fluid type A.

Ⓒ If manual shift made above speed indicated, transmission will shift from high to intermediate; if made below these speeds, transmission will shift from intermediate to low.

FORDOMATIC, MERCOMATIC & TURBO-DRIVE (C nt.)

AIR PRESSURE TESTS (WITH TRANSMISSION IN CAR): Raise car on hoist and remove transmission oil pan, and control valve assembly Proceed as follows

Front Clutch: Apply pressure to front clutch and governor input passage (see illustration) Listen for dull thud which indicates that clutch is operating Keep air pressure in passage for several seconds to check for leaks in this part of system

G vernor Valve: Remove governor inspection cover Apply air pressure to the same passage as for front clutch (above) Listen for a click and also watch valve snap inward

R ar Clutch: Apply air pressure to rear clutch oil passage (see illustration). Listen for a dull thud to indicate clutch is operating Check for leaks in same manner as for front clutch (above)

R ar Band & Servo: Apply pressure to rear servo oil passage (see illustration), and observe band application

Front Band & Servo: Apply pressure to front servo apply tube (rear tube), and observe band application

►*TESTING NOTE: If servos, bands, clutches, and governor operate with air pressure, then the no drive problems, erratic shift, or no upshift conditions indicate that the control valve assembly is the cause of the trouble. See "Control Valve" in OVERHAUL BELOW.*

TROUBLE SHOOTING & DIAGNOSIS

HIGH UPSHIFT (Intermediate-to-High): Throttle linkage is too short or throttle lever is bent. Valves sticking in governor or improper valve travel (check with air pressure). Governor oil delivery pipe leaking at connections (air pressure will indicate leak). Valve sticking in control valve assembly.

LOW UPSHIFT (Intermediate-to-High): Throttle linkage too long or throttle lever bent. Valves sticking in control valve assembly. Internal leak in control valve assembly (possible loose screws or mating surfaces require lapping).

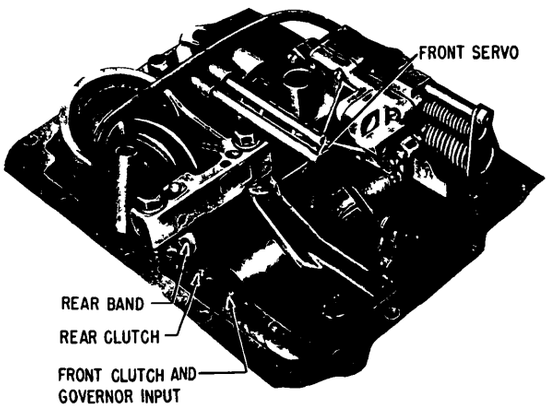
ROUGH UPSHIFT (Intermediate-to-High): Throttle linkage not correct length or throttle lever bent Bands require adjusting to factory specifications Hydraulic operating pressures not correct Valve sticking in control valve assembly Internal leak in control valve assembly (possible loose screws or mating surfaces require lapping)

SLIPS (Light Throttle Upshifts): Throttle linkage too long, or bands out of adjustment

SLIPS (Heavy Throttle Upshifts): Throttle linkage too long or throttle lever bent Bands out of adjustment Hydraulic operating pressure not correct Valves sticking in control valve assembly Internal leak in control valve (possible loose screws or mating surfaces require lapping)

SLIPS (2-3 Upshift): Same possible conditions as for "SLIPS (Heavy Throttle Upshifts)" above

ROUGH 3-2 DOWNSHIFT (Cl sed Throttl): Same possible conditions as for "SLIPS (Heavy Throttle Upshifts)" above



NO FORCE DOWNSHIFT: Throttle linkage too long, or throttle lever bent Accelerator pedal height not correct Valves sticking in control assembly

NO 2-1 KICKDOWN SHIFT: Throttle linkage too short. Throttle lever bent Valves sticking in control valve assembly

SLIPS 3-2 FORCED DOWNSHIFT: Bands out of adjustment

NO 2-3 UPSHIFT: Valve sticking governor (check with air pressure) Governor oil delivery pipe leaking at connections (check with air pressure) Valves sticking in control valve assembly Rear clutch inoperative (check with air pressure)

ROUGH REVERSE START· Engine idle incorrect Throttle linkage not of correct length or throttle lever bent Bands out of adjustment Hydraulic operating pressures not correct Valve sticking in control valve assembly Internal leak in control assembly (possible loose screws or mating surfaces require lapping)

TRANSMISSION TEST POINTS

NO DRIVE IN ANY RANGE: Fluid level incorrect Shift linkage not adjusted correctly Hydraulic pressure not correct A broken or improperly assembled front clutch will cause loss of drive in all positions except Reverse Improperly assembled control valve assembly

LOCKS UP IN REVERSE: Front clutch not releasing (check with air pressure) Shift linkage not adjusted correctly or not operating properly Leak in rear servo apply passage (check with air pressure and make certain servo applies and releases freely without tendency to stick or chatter)

LOCKS UP IN "LO" OR "DR": Rear clutch is applied and not releasing (check with air pressure)

UNABLE TO START ENGINE BY PUSHING: Rear pump inoperative or a defective pressure regulator valve

ROUGH 2-1 FORCED DOWNSHIFT: Rear servo sticking Rear servo accumulator sticking or broken spring Valve in valve body sticking

ROUGH 1-2 UPSHIFT (THROUGH DETENT): Engine idle incorrect Throttle linkage too short. Rear servo accumulator sticking or broken spring Valves in valve body sticking

MINOR REPAIRS (TRANSMISSION IN CAR)

The following transmission units can be removed for repair without removing transmission assembly from car Raise car on hoist for these operations, then drain fluid from transmission and remove oil pan

►*NOTE: For Disassembly & Overhaul of the following units, see OVERHAUL (TRANSMISSION UNITS) below.*

Governor Removal: Remove governor inspection cover from extension housing Rotate the drive shaft to bring governor body in line with inspection hole Remove the two screws that secure governor body to sleeve Remove governor

►*CAUTION· Use care not to drop bolts or governor valve into housing.*

Installation–Lubricate governor valve with transmission fluid and install valve in governor body (*CAUTION*–valve must move freely in body) Install governor body on counterweight with the **side plate forward** (*CAUTION*–fluid passages in governor body and counterweight must be aligned), install governor body attaching screws Install inspection cover with NEW gasket tighten cover screws to 4-6 ft lbs torque.

►**NOTE:** For the following operations, remove transmission fluid level indicator Remove transmission filler tube and drain the fluid into clean container using a fine mesh wire screen for straining (Fluid may be re-used) Then remove transmission oil pan and screen

Front Servo Removal: Loosen lubrication tube from pressure regulator and rear pump and remove (NOTE–If necessary tap tube with soft hammer to remove. *CAUTICN*–Do not bend or distort tube) Loosen control valve body attaching bolts Remove servo attaching bolt and while holding servo strut with fingers, remove servo assembly

Installation–Position servo band forward in case with band ends down Position servo strut with large end indexing with servo actuating lever and small end indexing with band end Rotate band, strut and servo into position, indexing tubes from valve body to servo, and anchor end of band with anchor in case Install attaching bolt, tightening to 30-35 ft lbs Tighten control valve attaching bolts to 8-10 ft lbs Install lubrication tube and adjust servo band See "Front Band Adjustment" Install screen, install oil pan using NEW gasket, tighten oil pan screws to 10-13 ft lbs Connect filler tube Fill transmission to correct level (old fluid can be re-used), recheck fluid level with transmission at operating temperature

Rear Servo Removal: Remove lubrication tube from rear pump and regulator.(*NOTE*–If necessary tap tube with soft hammer to remove) Remove rear pump intake tube Remove front servo (see above) Take out rear servo attaching bolts, hold actuating and anchor struts with the fingers, remove rear servo assembly

Installation–Position servo anchor strut and rotate servo band to engage strut Hold in position with fingers Position actuating lever strut and install

CONTINUED ON NEXT PAGE

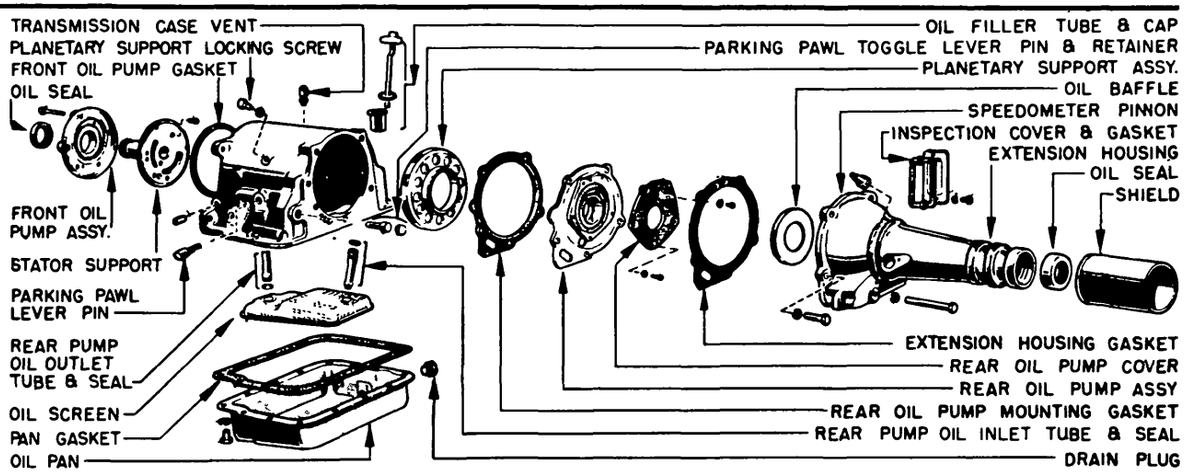
FORDOMATIC, MERCOMATIC & TURBO-DRIVE (C nt.)

servo, install servo attaching bolts(*CAUTION*–Longer attaching bolt must be installed in forward bolt hole), tighten attaching bolts to 40-45 ft. lbs. torque. Install front servo (see above). Install rear pump intake tube and lubrication tube. Adjust rear band (see BAND ADJUSTMENT). Install oil pan with NEW gasket, tighten oil pan screws to 10-13 ft. lbs. Connect filler tube. Fill transmission to correct level (old fluid can be re-used), recheck fluid level with transmission at operating temperature.

C ntrol Valv B dy R m val: Remove two "U" tubes from pressure regulator and control valve body. Loosen front servo attaching bolt three turns. Take out three valve body attaching bolts, lower the valve body and pull it off the servo tubes.

►*CAUTION–Use extreme care when removing valve body to pr v nt damage to body and attached parts.*

Installati n–Align servo tubes with holes in control valve body, position manual lever in neutral, position inner throttle lever between stop and downshift valve and at the same time push the throttle valve in to clear the transmission case **making certain that manual valve ngages actuating pin manual detent lever.** Install control valve body attaching bolts but do not tighten the bolts. Install two "U" tubes in pressure regulator and control valve body. Tighten control valve body attaching bolts to 8-10 ft. lbs. torque. Tighten front servo attaching bolt to 35-40 ft. lbs. torque. Adjust front and rear bands (see BAND ADJUSTMENT). Install oil screen, install oil pan using NEW gaskets, tighten oil pan screws to 10-13 ft. lbs. Connect filler tube. Fill transmission to correct level (old fluid may be re-used) recheck fluid level with transmission at normal operating temperature.



Pressur Regulator R m val: Remove lubrication tube. Remove control pressure tube and compensator tube from valve body and regulator. Remove pressure regulator spring retainer. (*CAUTION*–Maintain pressure on retainer to prevent springs flying out). Remove the control pressure and converter pressure valves. Take out pressure regulator attaching bolts and washers, remove regulator.

►*MAIN OIL PRESSURE REGULATOR VALVE INSTALLATION CAUTION:* If regulator removed to correct transmission "buzzing" noise, examine valve for undersize bleed flats and rotate valve 90° in bore from original position when re-installing it. This should correct the noise.

Installation–Install regulator body and attaching bolts and tighten to 17-22 ft. lbs. Install converter pressure and control pressure valves and make certain valves operate freely in bore, then install valve springs and retainer. Install large control pressure tube, small compensator tube, and lubrication tube. Install oil screen, install oil pan using NEW gaskets, tighten pan screws to 10-13 ft. lbs. Connect filler tube. Fill transmission to correct level (old fluid may be re-used), recheck fluid level with transmission at normal operating temperature.

Manual & Throttle Lever Seal Replacement: Remove control valve body (see above), disconnect manual and throttle linkage rods at transmission levers. Remove nut on inner throttle lever shaft and remove inner throttle lever. Remove outer throttle lever and shaft, remove throttle shaft seal from counterbore in manual lever shaft. Take out cotter pin in each end of parking pawl torsion lever rod and remove the rod, rotate manual lever shaft until detent lever clears detent ball (*CAUTION*–do not allow detent ball to fly out), remove detent ball and spring. Remove manual lever shaft nut, remove detent lever, remove outer manual lever and shaft assembly. Remove manual shaft seal.

Installation–Coat outer diameter of new seal with Permatex No. 3, install seal in case using tool No. 77288. Install outer manual lever and shaft, rotate shaft until manual lever points downward, place detent lever on inner end of shaft, install attaching nut and tighten nut to 35-40 ft. lbs. torque. Place detent spring and ball in hole in case (use piece of thin wall tubing to depress ball and spring), rotate detent lever until detent ball is held in place. Install parking pawl torsion lever rod and cotter pins. Install new throttle shaft seal, outer throttle lever and shaft, inner throttle lever and attaching nut, tighten nut to 25-28 ft. lbs. Connect manual and throttle rods to outer levers. Check linkage for free movement. Install control valve assembly and other parts. *See Control Valve Assembly Installation (above).*

TRANSMISSION CASE & EXTENSION HOUSING ASSEMBLY

TRANSMISSION & CONVERTER REMOVAL
FORD PASS. CARS & TRUCKS (EXCEPT THUNDERBIRD)

►*TRANSMISSION OR CONVERTER REMOVAL NOTE: Transmission and converter can be removed as an assembly, or transmission can be removed separately (without disturbing converter) as follows:*

1) Place car on hoist. On truck models, drain radiator, fold front of floor mat back and remove covers from converter housing access bolt holes. Loosen water inlet and outlet hose clamps at oil cooler and pull hoses off cooler. On all cars and trucks, remove the two upper converter-to-engine bolts and lockwashers then raise vehicle with the hoist.

2) Disconnect oil filler tube at oil pan and drain transmission. Remove converter housing front plates (8 Cyl.) or the access plate (6 Cyl.). Remove one of the converter housing drain plugs. Rotate converter 180°, then remove second drain plug. Drain converter.

►*NOTE: Converter may be drained after it is removed from car.*

3) Disconnect drive shaft at rear axle and remove shaft. On F-250, F-350, P-350 or P-500 trucks, remove the four bolts attaching drive shaft coupling yoke at parking brake assembly.

4) Remove the six flywheel-to-converter drive plate bolts. Position the drive plate horizontally, and install the lower converter housing front plate (8 Cyl.), or wedge the converter from sliding out of housing when transmission is removed.

5) Disconnect starter cable at starter, then disconnect transmission-to-frame ground cable at transmission remove starter. On truck models, remove bolts attaching oil cooler to support brackets, on all models with oil cooler, disconnect oil cooler inlet and outlet hoses at transmission. On truck models, remove oil cooler. On air cooled models, remove converter air duct and linkage dust shield, (cars), or the exhaust duct shield (trucks).

6) Disconnect manual and throttle linkages at transmission. Disconnect speedometer cable at transmission. On Pass. Cars, remove the two engine rear support-to-transmission bolts. Position a transmission jack under transmission and raise it slightly to take weight off crossmember. On trucks, with the transmission jack in place remove the converter housing crossmember bolts. On all vehicles, then remove the two lower converter housing-to-engine bolts.

7) Tilt rear of converter and transmission assembly upward slightly, then move assembly toward rear of vehicle sufficiently to remove the six engine crankshaft flange-to-flywheel attaching bolts. Remove flywheel to provide sufficient clearance, then lower converter and transmission assembly.

CONTINUED ON NEXT PAGE

FORDOMATIC, MERCOMATIC & TURBO-DRIVE (C nt.)

Torque Converter Removal (from Transmission): *See "Torque Converter Overhaul" below.*

THUNDERBIRD

►*NOTE: The converter and transmission assembly cannot be removed with engine in the car. Either the engine can be removed first, or transmission, converter and engine can be removed as an assembly.*

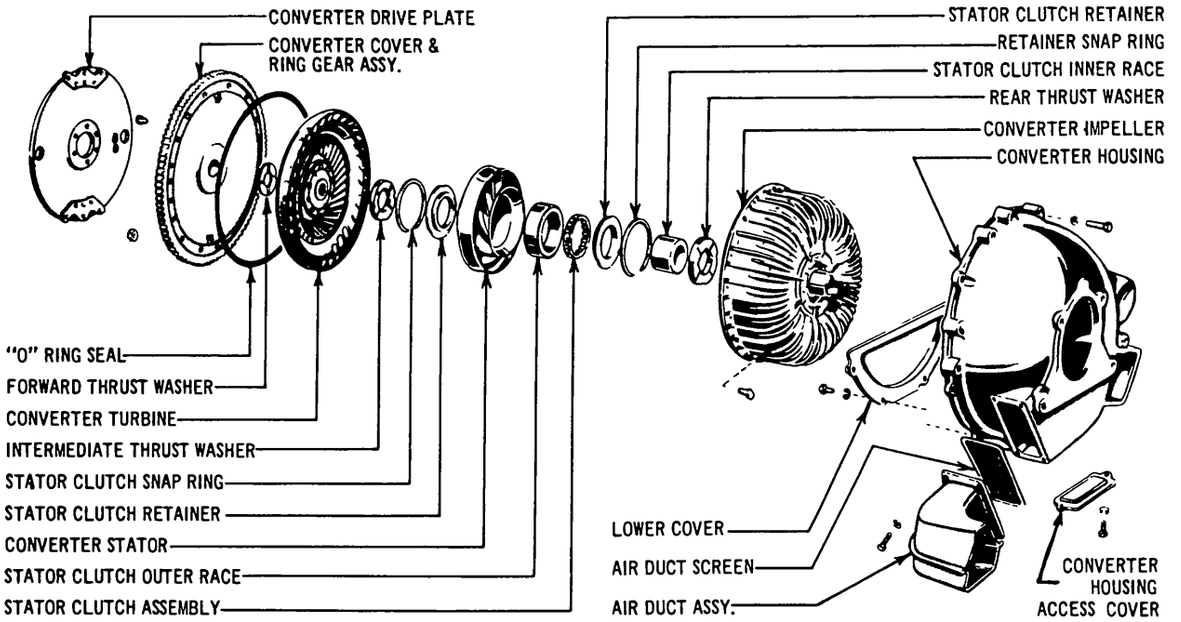
1) Remove engine *(see "Engine Removal" in Ford Special Data).* If converter and transmission have been removed with the engine, they can be removed from the engine by removing the six converter-to-flywheel drive plate bolts, then removing the four converter housing to engine attaching bolts.

2) To remove converter and transmission after the engine has been removed separately, remove the two transmission extension housing-to-rear engine support attaching bolts. Remove speedometer cable at transmission. Disconnect the manual shift control lever at transmission. Move transmission forward and remove forward drive shaft, then remove converter and transmission from car.

Torque Converter Removal (from Transmission): *See "Torque Converter Overhaul" below.*

LINCOLN & MERCURY

1) Remove ground strap from battery. Remove bolts and nuts securing throttle linkage bar bracket to engine and body. Place car on support stands with all four wheels approximately 12" off ground. On Mercury models with single exhaust pipe, remove nuts securing muffler inlet and cross over pipe to exhaust manifolds. Remove manifold outlet pipe from mounting bracket at rear of manifold and move exhaust system away from working area.



2) Disconnect manual linkage and throttle linkage at transmission. Disconnect speedometer cable at extension housing. Disconnect drive shaft at rear universal joint and remove drive shaft from transmission output shaft. On models with water cooled torque converter, remove inlet and outlet hoses at transmission. On models with air cooled torque converter, remove air duct from torque converter housing.

3) Remove splash deflector, and converter housing lower plate. Drain converter by removing one drain plug, then rotate engine 180° and remove second drain plug. Drain fluid from transmission.

4) Remove engine rear mount-to-frame crossmember bolts. Position transmission lift under transmission and raise engine and transmission sufficiently to install support tool. Remove rear engine mount from transmission. On Lincoln, remove the detachable frame crossmember from frame "X" member (the Mercury models have a tubular crossmember with brackets welded to the crossmember). Lower lift under transmission to allow engine to rest on support tool. Reposition transmission lift under transmission assembly and raise lift just enough to relieve weight of transmission on engine.

5) Remove starter and upper converter housing plate with seal. Remove six bolts securing converter to flexible drive plate. Remove the bolts securing converter housing to engine block.

6) Remove transmission and converter assembly by sliding assembly toward rear of car sufficiently to disengage converter housing dowels and converter cover pilot. Secure converter to converter housing to prevent damage to converter. Lower the assembly and remove from under car.

TORQUE CONVERTER ASSEMBLY

Torque Converter Removal (from Transmission): *See "Torque Converter Overhaul" below.*

TRANSMISSION REMOVAL (WITHOUT CONVERTER)

FORD PASS. CARS & TRUCKS

►*NOTE: On most cars and trucks, the transmission can be removed without removing the converter assembly.*

1) Raise vehicle with a hoist and drain fluid from transmission. Disconnect drive shaft at rear axle and remove drive shaft.

2) On trucks, disconnect oil cooler-to-transmission fluid inlet and outlet lines at transmission. Remove bolts holding oil cooler on support brackets, then move cooler to one side.

3) Remove converter air duct from pass. cars, and remove exhaust duct splash shield from trucks.

4) Disconnect manual control and throttle linkage at transmission. Disconnect speedometer cable at extension housing. On pass. cars, remove the two rear support-to-transmission bolts. Position a transmission jack under transmission and raise it slightly to take weight off crossmember. Remove crossmember bolts and crossmember.

5) On all vehicles, with transmission jack in place, remove the four transmission-to-converter housing attaching bolts. On trucks, remove oil cooler from front support bracket. Tilt rear of transmission slightly upward and move assembly toward rear, with a jack, until clear of turbine shaft. Lower assembly and move it from under vehicle.

LINCOLN & MERCURY

1) Place car on support stands with all four wheels approximately 12" off floor. On Mercury models with single exhaust pipe, disconnect muffler pipes at exhaust manifold and the outlet pipe at support bracket, and move complete exhaust system away from work area.

2) Drain fluid from transmission and disconnect manual and throttle linkage at transmission. Disconnect speedometer cable at extension housing. Disconnect drive shaft at rear universal joint and remove drive drive shaft from transmission output shaft.

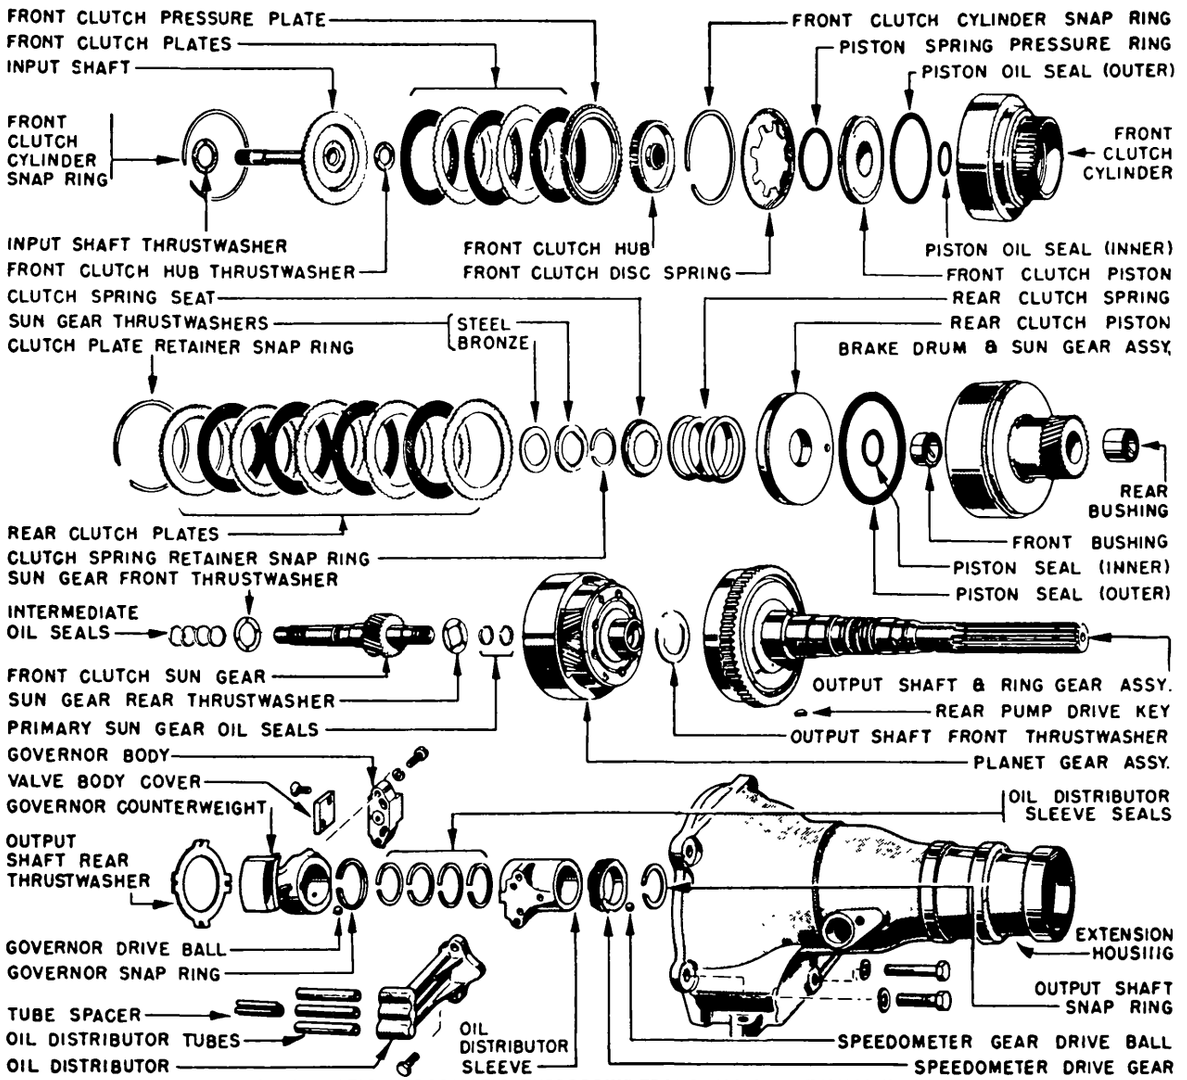
3) Remove rear engine mount to frame crossmember bolts. (Mercury models have a tubular crossmember with brackets welded to crossmember). Position lift under transmission and raise engine and transmission and raise engine and transmission sufficiently to install engine support tool. Remove rear engine mount from transmission. On Lincoln, remove the detachable crossmember from frame "X" member.

4) Lower lift under transmission and allow engine to rest on support tool. Reposition transmission lift to relieve the weight of transmission. Remove four bolts securing transmission to converter housing.

5) Remove transmission by sliding assembly toward rear of car sufficiently to disengage the turbine shaft. Lower the assembly and remove from under car.

CONTINUED ON NEXT PAGE

FORDOMATIC, MERCOMATIC & TURBO-DRIVE (Cont.)



TORQUE CONVERTER OVERHAUL

►*DISASSEMBLY & REASSEMBLY CAUTION: CLEANLINESS IS EXTREMELY IMPORTANT WHEN OPENING UP TRANSMISSION. Thoroughly clean outside of case first, clean each part as removed.*

TORQUE CONVERTER REMOVAL (From Transmission): Grasp converter cover with both hands and pull straight out. *(CAUTION–*To prevent damage to front seals, do not rock assembly from side to side). Remove converter housing attaching bolts and remove housing from transmission.

DISASSEMBLY: Remove converter cover attaching bolts and nuts. Remove cover and "O" ring seal. Remove bronze thrust washer from turbine and remove turbine. Remove stator from pump housing *(CAUTION–Check and locate the balancing marks on cover and stator so they may be replaced in the exact same position).* Remove thrust washer from pump hub and from turbine hub. Remove sprag clutch inner race and remove snap ring retaining outer hub to stator *(CAUTION–Do not burr snap ring groove).* Remove outer hub, sprag assembly, outer race and inner hub as an assembly. Separate hubs and sprag assembly from outer race. Remove snap ring retaining inner hub to stator.

INSPECTION: Inspect converter blades for looseness, and check thrust surfaces for scores and splines for burrs and wear. Inspect seal surfaces and front pump driving lugs for wear. Inspect sprag assembly for worn or broken sprags or broken or distorted spring. Inspect bushings for wear or scoring (if bushings worn, polish bearing surface of journal with crocus cloth to eliminate possibility of wear having been caused by rough bearing surface).

FORDOMATIC, MERCOMATIC, TURBODRIVE TRANSMISSION INTERNAL UNITS

REASSEMBLY: Install stator inner hub and snap ring. Turn assembly over, install outer race in stator. Install sprag assembly in outer race making sure that sprags are pointed in the right direction. Install outer hub and outer hub snap ring. Insert Tool No. 7946, tapered side first, into sprag assembly while rotating tool counter-clockwise to position sprags. Install inner race with spline section up. Guide tool No. 7946 with hand while pushing inner race into position. Check stator for clockwise rotation while holding the inner race. Install new seal in pump hub and install hub in pump. Tighten hub capscrews to 8-10 ft. lbs. Install thrust washer into hub of converter pump and install stator with the word "front" (stamped into face of stator) upward. Install thrust washer in hub of turbine and install turbine. Install bronze thrust washer on turbine hub. Position converter cover on pump housing with new "O" ring seal and properly align balance marks on cover and housing *(CAUTION–Cover and housing must be installed in the same position not d when these parts disassembled).* Install all converter bolts and tighten to 25-28 ft. lbs. in the sequence indicated below. Install converter housing on transmission case and tighten attaching bolts to 40-45 ft. lbs. Install converter assembly and press it firmly into position on turbine shaft. *(CAUTION–Do not "rock" converter assembly while installing it on shaft (will damage oil seals).*

►*COVER BOLT TIGHTENING SEQUENCE (To prevent leaks):* Tighten two nuts directly opposite each other just snug, tighten two nuts 90° from first two similarly, tighten two nuts 45° from first four nuts similarly, Continue this sequence until all nuts have been tightened **just snug,** then torque all nuts in same sequence to 25-28 ft. lbs. torque.

TRANSMISSION DISASSEMBLY

►*DISASSEMBLY & REASSEMBLY CAUTION: CLEANLINESS IS EXTREMELY IMPORTANT WHEN OPENING UP TRANSMISSION. Thoroughly clean outside of case first. CLEAN each part as removed with cleaning fluid or gasoline and dry with air–wiping cloths will leave lint on parts.*

DISASSEMBLY OF TRANSMISSION (Into Major Units): With transmission on bench fixture, (tool No. 7000-C-D recommended for holding transmission), remove all transmission units as follows:

1) Remove pan and gasket and take out fluid screen.
2) Remove pressure regulator spring retainer, regulator springs, control pressure and converter pressure regulator valves.

►*CAUTION: Maintain pressure on retainer to prevent valve springs from flying out.*

3) Loosen pressure regulator and valve body attaching bolts, and remove lubrication tube from pressure

CONTINUED ON NEXT PAGE

FORDOMATIC, MERCOMATIC & TURBO-DRIVE (Cont.)

regulator and rear pump. NOTE—If necessary tap tube with soft hammer. *CAUTION—do not bend or distort tube.*

4) Remove rear pump intake tube, being careful not to bend or distort it.

5) Remove compensator pressure tube (small) and control pressure tube (large) from pressure regulator and valve body. NOTE—If necessary, tap tube with a soft hammer. *CAUTION—do not bend or distort tube.*

6) Remove pressure regulator spring retainer, pressing it inward toward regulator to release. Remove pressure regulator springs, control pressure and converter pressure regulator valve. Remove regulator body attaching bolts and washers and remove body from case. NOTE—After removing regulator body from case, replace valve in body to protect them.

7) Loosen front and rear servo band adjusting screws five turns and loosen front servo attaching bolts three turns. Remove valve body attaching bolts and raise valve body to clear case and disengage valve body to clear case and disengage valve body to servo tubes and remove valve body.

8) Remove front servo apply and release tubes by twisting and pulling tubes. Take out front servo attaching bolt, hold front servo strut with fingers, lift servo out.

9) Remove rear servo attaching bolts and while holding actuating and anchor struts with fingers, lift servo from case *(CAUTION—Do not allow struts to drop into case).*

10) *CHECK TRANSMISSION ENDPLAY before proceeding with disassembly, as follows:* Remove one front pump attaching bolt and mount Dial Indicator & Support Tool No. 77067 in this bolt hole so that contact button rests on end of turbine shaft. Install Extension Housing Seal Replacer Tool No. 7657-D on output shaft to provide support for shaft. Pry front clutch cylinder toward rear of transmission using a large screwdriver, and set dial indicator to zero while maintaining a slight pressure on clutch cylinder. Remove screwdriver and pry units forward (toward front of transmission) by inserting screwdriver between large internal gear and case. Record indicator reading (endplay) for use in step 17 (below). This endplay should be .010-.029". Remove dial indicator and support and remove tool from output shaft.

11) Remove front pump attaching bolts and remove front pump assembly. (NOTE—If pump is tight in case, use soft hammer to loosen pump). Remove pump to case gasket. *CAUTION—Pull pump off shaft carefully to avoid damaging oil seal.*

12) Remove five extension housing-to-transmission bolts (these bolts also hold rear oil pump on case), withdraw extension housing carefully while holding rear pump in place. *CAUTION—Pull housing off output shaft carefully to avoid damaging rear oil seal.*

13) Remove speedometer drive gear snap ring from output shaft and take off the speedometer drive gear. *(CAUTION—Do not lose drive ball).*

14) Remove fluid distributor attaching bolts and slide distributor and tube from transmission. Remove distributor sleeve from output shaft. Carefully remove the four seal rings from the output shaft with the fingers *(CAUTION—use care not to damage these rings).*

15) Remove governor snap ring from shaft and slide governor assembly from output shaft. *(CAUTION—Use care so as not to damage seal rings on output shaft. Do not lose governor drive ball).*

16) Remove rear pump discharge tube using tool 77869 and remove pump from case. Remove extension housing and pump gaskets. Remove rear pump drive key from output shaft. Remove bronze thrust washer from output shaft. (NOTE—Washer may come off with pump). Hold rear drum forward and remove the output shaft.

17) Remove selective thrust washer from rear of pinion carrier. If endplay as recorded in step 10 (above) was not within limits of .010-.029", replace this washer with one of proper thickness to give desired endplay. This washer furnished in following sizes: .063-.061", .069-.067", .076-.074", .083-.081".

18) Remove two seal rings from primary sun gear shaft. *CAUTION—use care not to distort rings.*

19) Remove pinion carrier from case and remove bronze thrust washer.

20) Mark rear band position so that it can be assembled in the same position. Remove band by squeezing ends together and tilting band forward.

21) Remove two center support bolts (on outside of case-one on each side). Press on end of turbine shaft to force clutch units toward rear of transmission and remove center support from case.

22) Remove rear and front clutch assemblies from transmission case as a unit. Install clutch assembly into bench fixture, tool No. IP-77530 and remove thrust washer from front of turbine shaft. Remove the front band from case. Lift front clutch assembly from primary gear shaft. *(CAUTION—Do not rock assembly while lifting to prevent damage to seal rings).*

23) Remove bronze and steel thrust washers from primary sun gear shaft and then remove the front clutch seal rings from primary sun gear shaft. Lift rear clutch assembly from shaft. *(CAUTION—Do not rock assembly while lifting to prevent damage to seal rings).* Remove rear clutch seal rings and thrust washers from shaft.

TRANSMISSION OVERHAUL (TRANSMISSION UNITS)

►*DISASSEMBLY & CLEANING CAUTION:* Handle all parts with care to avoid nicking or burring bearing surfaces and mounting faces. Clean all parts with clean solvent and dry with air. DO NOT use wiping cloths which might deposit lint and interfere with proper operation of transmission. Minor scores or burrs may be removed with crocus cloth. *CAUTION—When polishing valves use extreme care not to round edges of valve lands.*

►*REASSEMBLY CAUTION: Use all new gaskets when assembling or installing units in transmission. Lubricate all internal parts with Automatic Transmission Fluid Type "A" (vaseline may be used to retain gaskets and thrust washers). Tighten all bolts, nuts, and screws to correct torque.*

PRIMARY SUN GEAR SHAFT (Disassembly): Remove rear clutch seal rings by applying pressure on one end and at back of ring forcing ring into groove at these two points. Other end will spring out and free the hook. Remove thrust washer from thrust face of primary gear.

Inspection: Inspect all thrust surfaces and journals for wear or scores. Inspect sun gear for broken, chipped, or worn teeth. Inspect shaft splines and ring grooves for wear or burrs. Check all fluid passages for evidence of leakage and make certain passages are clean and free from obstructions. Check seal rings for wear by installing rings in bore and measuring end gap which should be .002-.009", check rings for free fit in groove (must not bind). If front clutch lubrication valve not operating properly, repair it by installing a new kit.

Reassembly: Install bronze thrust washer against thrust face of primary sun gear, install seal rings in shaft grooves. Seals can be installed in the same manner in which they were removed (see Disassembly above).

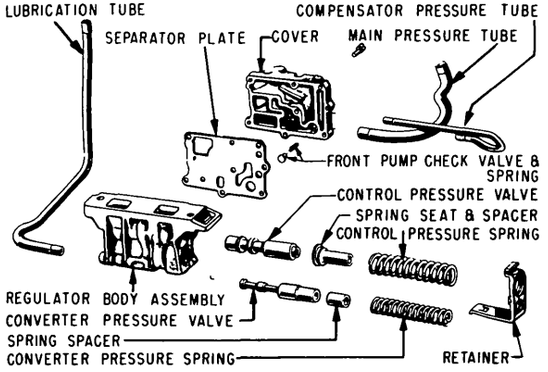
REAR CLUTCH (Disassembly): Using arbor press and tool No. 77515, remove clutch release spring snap ring *(CAUTION—Guide spring retainer while releasing press to prevent retainer interfering with snap ring groove.* Remove retainer, release spring, pressure plate snap ring, and pressure plate. Remove the four bronze and four steel clutch plates (Ford & Mercury), Five bronze and Five steel plates (Lincoln), from the drum. Place splined end of primary sun gear shaft in clutch piston bore, entering it as far as it will go, apply air pressure to hole in end of shaft which will force clutch piston out of cylinder *(CAUTION—Hold* hand over piston to prevent it flying out and being damaged). Remove outer seal ring from groove in piston and inner seal ring from clutch drum. Discard these seals (do not re-use).

Inspection: Inspect drum band surface, the bushing, and thrust surfaces for scores. Remove minor scores with crocus cloth. Replace badly scored parts. Inspect needle bearings for worn or loose rollers. Inspect gear teeth for burrs or wear. Inspect clutch piston bore and piston inner and outer bearing surfaces for scores. Check fluid passages for obstructions, making sure that they are free and clear. Inspect clutch plates for scores, and check plates for fit on clutch hub serrations. Replace all plates that are worn or do not fit properly *(CAUTION—Front clutch plates differ from rear clutch* plates and are not interchangeable). Check coning of the steel plates. Position plates on a flat surface, then check coning with a feeler gauge. Plates are coned to .010" clearance and should be checked on the inside diameter. Inspect clutch pressure plate for scores on clutch plate bearing surface. Replace plate if deeply scored. Check clutch release spring for distortion and discard if badly bent.

Reassembly: Lubricate all parts with Automatic Transmission Fluid Type "A". Install clutch piston inner seal ring in groove in drum. Install a new outer seal ring on piston and install piston in clutch drum. Install four steel and four bronze clutch plates (Ford & Mercury), five steel and five bronze (Lincoln), alternately, starting with a steel plate, convex side up (Ford),

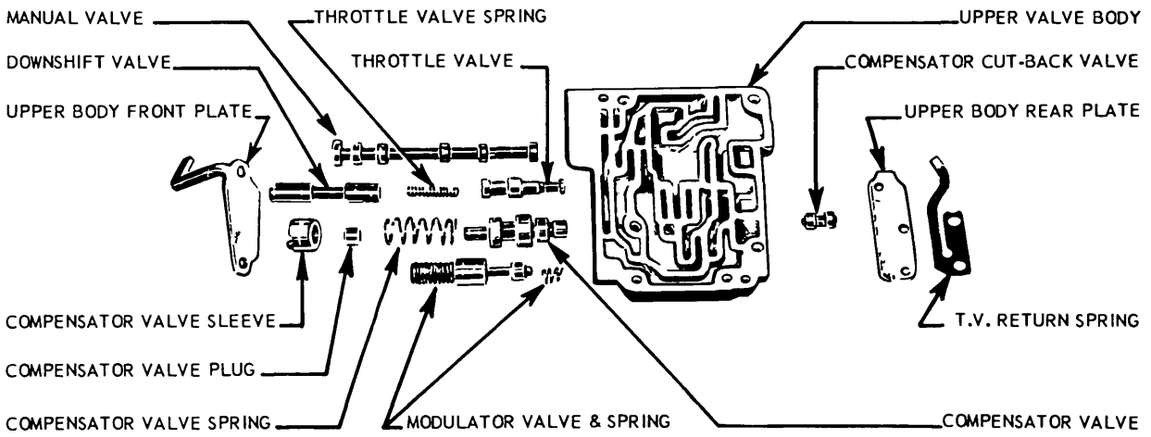
CONTINUED ON NEXT PAGE

FORDOMATIC, MERCOMATIC & TURBO-DRIVE (C nt.)



concave side up (Lincoln & Mercury). Install clutch pressure plate with bearing surface down, and install snap ring. Make sure snap ring is fully seated in groove. Install clutch release spring, then position retainer on spring. Position the clutch assembly in an arbor press using tool No. 77515 positioned on spring retainer, and compress clutch spring. Install snap ring *(CAUTION–While compressing the spring, guide retainer to avoid interference of retainer with snap ring groove. Make sure snap ring is fully seated in groove).*

FRONT CLUTCH: Disassembly–Remove clutch cover snap ring and remove turbine shaft (input shaft) from clutch drum. Remove thrust washer and clutch hub. Remove four bronze and three steel clutch plates and pressure plates. Using arbor press and tool No. 77565 depress clutch release spring and remove snap ring. Release spring pressure, remove clutch release disc spring from drum. Using air pressure and a piece of 3/16" tubing (bend at the end for entry into hole in clutch bore) force clutch piston out of cylinder. *(CAUTION–Hold hand over piston to prevent damage).* Remove piston inner seal from clutch cylinder and remove piston outer seal from groove in piston.



Inspection: See "Rear Clutch Inspection" above and follow the same procedure except that all front clutch plates are flat. *CAUTION–Front and rear clutch plates are not interchangeable.*

►*FRONT CLUTCH ASSEMBLY PRODUCTION CHANGE (ALL TRANSMISSION):* To prevent gear noise or clutch "roll over" during manual shift from "D" to "N", Front Clutch Plate (bronze). Part No. B5A-77519-A is used to replace two of the original four bronze plates. Install one later type plate identified by additional parallel grooves on both sides, next to clutch pressure plate, and the other installed on top of the balance of the plates. These later type plates can be used to correct the above condition in early 1955 transmissions

Reassembly: Install a new piston inner seal ring in clutch cylinder and a new outer seal ring in piston groove. Install piston in clutch housing. *(CAUTION–Make certain that steel bearing ring is in place on piston).* Position release spring in cylinder with **con-**

PRESSURE REGULATOR ASSEMBLY

CONTROL VALVE UPPER BODY ASSY.

cave side up, place spring compressor tool on spring and compress spring in an arbor press to enable installation of snap ring, make sure that snap ring is fully seated in groove. *NOTE–Complete reassembly of front clutch after rear clutch assembly has been installed on primary sun gear shaft as indicated below.*

PRIMARY SUN GEAR SHAFT & CLUTCH (Reassembly): After individual units assembled (Shaft and Front & Rear Clutches), place primary sun gear shaft assembly in bench fixture and install rear clutch assembly on sun gear shaft *(CAUTION–Center seal rings on shaft to prevent breakage as clutch assembly installed).* Install steel and bronze thrust washers on shaft in that order. Install two seal rings in shaft grooves. Install two seal rings in shaft grooves. Install front clutch housing on primary gear shaft while rotating clutch units to mesh rear clutch plates with serrations on clutch hub being careful not to damage seal rings as clutch assembly being installed. Install clutch hub in clutch cylinder with deep counterbore down. Install bronze thrust washer on clutch hub. Install pressure plate in clutch cylinder with bearing surface up then install four bronze and three steel clutch plates alternately, starting with a bronze plate, *(CAUTION–*Lubricate all plates with Automatic Transmission Fluid Type "A" as they are installed. Install turbine shaft in clutch cylinder and install snap ring in groove, making sure that it is fully seated. Install bronze thrust washer on turbine shaft. Assembly is now ready for installation in transmission case. *See "Transmission Reassembly" below.*

FRONT PUMP (Disassembly): Remove pump cover attaching screws and remove cover with stator support. Mark the driven gear with Prussian Blue to assure correct assembly and remove drive and driven gears from pump body. To remove seal from pump body, mount the pump body on transmission case, use tool No. 1175-AB to remove seal

►*CAUTION· Extreme care must be taken not to scratch or mar pump gears or bearing surfaces*

Inspection: Inspect bushing, gear pockets and crescent for scores. Inspect front cover, pump body, gear teeth and stator support splines for burrs. Check pump for evidence of contact between outside diameter of drive gear and crescent. REPLACE PUMP if such contact noted. Check bushing for wear and scoring

Reassembly: Use tool No. 77837 to install new seal in pump body *(CAUTION–*coat outside diameter of seal with Permatex No. 3 before installation to prevent fluid seepage). Install pump driven gear in pump body in accordance with marks made before disassembly, install drive gear. Install pump cover, attaching screws, lockwashers, and tighten cover screws evenly to 1-3 ft. lbs. Check pump for free movement.

REAR PUMP: (Disassembly): Remove screws and lockwashers securing pump cover to pump body and remove cover. Using Prussian Blue, mark pump drive and driven gears to assure correct assembly, and remove gears from body.

►*CAUTION–Handle pump parts with care to avoid scratching or marring*

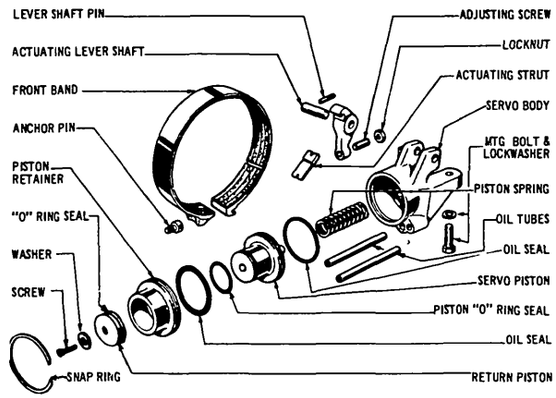
Inspection: Inspect all pump parts for excessive wear, score, or burrs. Check fluid passages for obstructions. Check pump for evidence of contact between outside diameter of drive gear and crescent. REPLACE PUMP if such contact noted. Check bushing for wear or scoring.

Reassembly: Install pump driven gear into pump body, positioning gears as marked on disassembly. Install drive gear into position as marked. Install pump cover, install cover screws with lockwashers, tighten screws evenly to 50-60 inch lbs. (¼"), 20-30 inch lbs.,(10-24 screws). Check pump for free movement of gears.

PRESSURE REGULATOR BODY (Disassembly): Remove valves from body. Take out cover attaching screws, remove cover and separator plate

Inspection: Inspect regulator body and cover mating surfaces. Check fluid passages in body and fluid passages in separator plate for obstructions. Inspect valves and valve bores for scoring and check freedom of valves in valve bores. Check regulator valve springs for distortion. Wash thoroughly in clean solvent and blow dry with air.

Reassembly: Install check valve spring in regulator cover and position valve on spring *(see "Pressure*

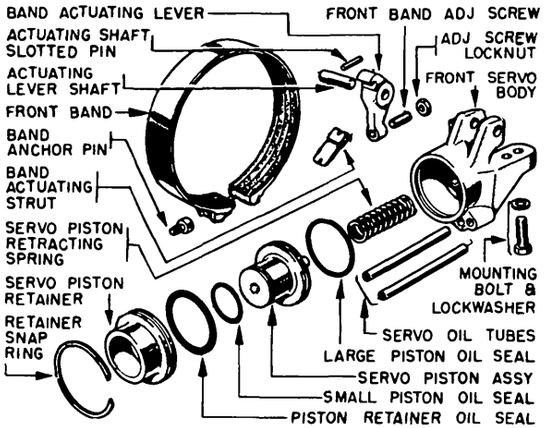


CONTINUED ON NEXT PAGE

FORDOMATIC, MERCOMATIC & TURBO-DRIVE (C nt.)

Valve Installation Caution" below) Position separator plate on regulator cover. Hold regulator and cover together and check for free movement of valve. Place regulator body in position on separator plate and install attaching screws. *NOTE–Do not install valves at this time as they should be installed after regulator assembly is installed in transmission. See "Transmission Reassembly" below.*

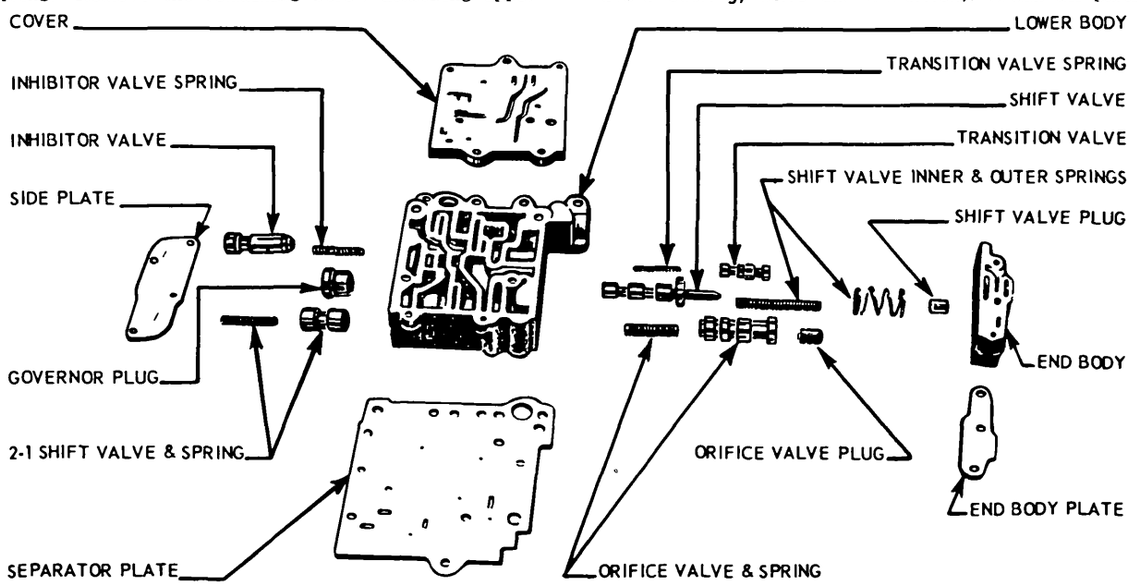
►*MERCOMATIC & TURBO-DRIVE PRESSURE REGULATOR VALVE SPRING & SPACER INSTALLATION CAUTION.* It is extremely important that the spring seat and spacer be installed so that the cupped end fits over the end of the control pressure valve, and the stem fits down through the control pressure spring. Two types of spacers are used in production, one having the small diameter end closed, and the other with the end open. Install either spacer as indicated above.



CONTROL VALVE (Disassembly): During disassembly of the control valve avoid damage to valve parts and keep valve parts clean. Place valve assembly on a clean cloth while performing the disassembly operation. *(NOTE–Do not separate the valve bodies until after valves have been removed).* Remove manual valve and remove one screw attaching separator plate to lower valve body. Remove upper body front plate *(NOTE–The plate is spring loaded. Apply pressure to plate while removing the attaching screws).* Remove compensator spring and plug, remove valve spring and valve. Remove modulator valve retainer, both large and small springs and valve. Remove downshift valve and spring. Remove two screws attaching throttle valve return spring to upper body, then remove spring. Remove the remaining screw attaching upper valve body rear plate to valve body, then remove plate. Remove throttle valve, then the compensator cut back valve. Remove lower body side plate *(apply pressure to plate while removing as it is spring loaded).* Remove the 2-1 shift valve spring and valve, low inhibitor valve and spring, then remove the 2-3 shift valve and governor plug. Remove the end body *(End body is spring loaded. Apply pressure while removing attaching screws).* Remove orifice control valve plug and 2-3 shift valve plug from end body and remove end body plate. Remove 2-3 shift valve outer and inner springs, then remove shift valve. Remove orifice control valve and transition valve and spring. Remove attaching bolts and screws and separate bodies. Remove separator plate from upper body and remove check valve seat, valve and spring from lower body

TURBODRIVE FRONT SERVO & BAND ASSY.

Inspection: *(CAUTION–Handle all parts carefully to avoid scoring, burrs and distortion).* Clean all parts thoroughly in clean solvent and blow dry with air. DO NOT USE CLOTH FOR WIPING PARTS (lint left by a cloth may cause poor valve operation). Inspect all mating surfaces for burrs, scratches, and flatness. Check all passages for obstructions. Inspect all valves and valve bores for scoring and check valves for free movement in bores (valves should slide in bore of own weight). Valves can be polished with crocus cloth.



►*CAUTION–Do not round the sharp edges of valv s and plugs*

FORDOMATIC & MERCOMATIC FRONT SERVO & BAND ASSEMBLY

Reassembly: *(NOTE–Arrange all parts in their correct position. Rotate valves and plugs when inserting them in their bores, to avoid shearing of soft body castings).* Install separator plate on upper body (do not tighten screws). Install check valve spring, valve, and seat in lower body Position lower body on upper body. Install lower body cover and tighten attaching bolts finger tight. Align the valve body attaching bolt holes in the separator plate and lower body. Tighten the four valve body bolts to 4-6 ft. lbs. *(CAUTION–Excessive tightening of these bolts may distort valve bodies, causing valves or plugs to stick).* Install the three lower cover to lower body screws and tighten to 20-30 inch lbs. Install the plate on lower end body and tighten attaching screws. Install orifice control and shift valve plugs in end body. Install transition valve and spring, the orifice control valve and spring, 2-3 shift valve in lower body. Install shift valve inner and outer springs, and install end body on lower body, *(CAUTION–Make sure that inner spring is piloted on shift valve regulator plug).* Install governor plug in lower body Install low inhibitor valve spring in valve, and install spring and valve. Install 2-1 shift valve spring in valve, and install valve and spring Install lower body side plate Install compensator cut-back valve in upper body. Install throttle valve and position upper body rear plate on upper body with the plate between end lands of throttle valve. Install one plate to body screw in hole next to throttle valve Position throt-

CONTINUED ON NEXT PAGE

CONTROL VALVE LOWER BODY ASSY.

FORDOMATIC, MERCOMATIC & TURBO-DRIVE (C nt.)

tle valve return spring on plate, and secure plate in place with the remaining plate to valve body screws. Install compensator valve and spring and downshift spring and valve. Install modulator small spring, valve, spring, and retainer as an assembly. Install the plug in the compensator valve sleeve, castellated end out, and install assembly in body, with smooth end toward body. Install upper body front plate. Install separator plate to lower body screw and install manual valve.

GOVERNOR (Disassembly): Remove governor body side plate attaching screws, remove plate. Remove governor body attaching screws and remove body from counterweight. Remove governor valve from body.

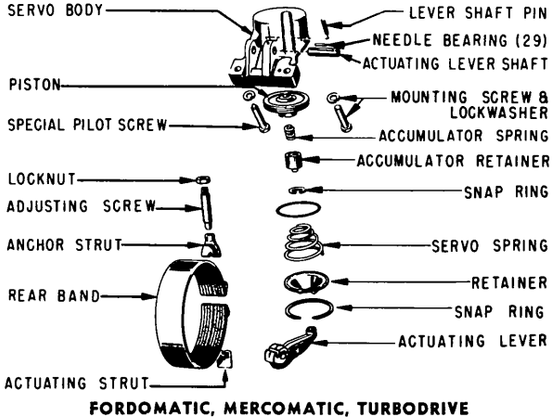
Inspection: Inspect valve and valve bore for scores and check free movement of valve in bore. Inspect all fluid passages for obstructions. Inspect mating surfaces for burrs and distortion

Reassembly: Install governor valve in bore of governor body and install body cover plate and attaching screws Mount governor body on counterweight, making sure that fluid passages line up with passages in counterweight. Install body attaching screws. Tighten body-to-counterweight screws

FRONT SERVO (Disassembly—Ford & Mercury): Remove piston retainer snap ring *(CAUTION—Servo piston is spring loaded. Apply pressure to piston when removing snap ring).* Remove servo piston and retainer from servo body (NOTE—If necessary, tap servo piston guide lightly with soft hammer to remove from servo body). Remove servo spring, and remove retainer from piston and seal from retainer

Disassembly (Linc In): Proceed as with Ford & Mercury (above), then loosen to one half its length the screw that secures servo piston release piston to servo piston stem. Tap screw head with soft hammer until stem is forced from release piston. Separate release piston, piston retainer and piston. Remove seal from release piston. Remove "O" ring seals from piston.

Inspecti n: Inspect servo body for cracks. Inspect piston and piston bore for scores. Check fluid passages for obstructions. Check actuating lever for free movement and inspect for wear. (NOTE—If necessary to replace actuating lever or shaft, remove retaining pin and push shaft out of bracket). Inspect threads in lever and on adjusting screw. Check servo spring and servo band for distortion. Inspect servo band lining for excessive wear and bond to metal band. (NOTE—Band should be replaced if worn to a point where grooves are not evident). Inspect bands for cracks and distortion.



Reassembly (Ford & Mercury): Install new "O" ring seals on piston, and new oil seal on piston retainer. Lubricate seals and install retainer on piston. Position servo spring in servo body. Lubricate and install piston and retainer assembly in servo body. Press retainer into servo body and install snap ring. *(CAUTION—Make sure snap ring is fully seated in groove).* Install adjusting screw and locknut in actuating lever if previously removed. Check operation by applying air pressure to apply hole.

Reassembly (Lincoln): Install new "O" ring seals on piston, and install new seal on piston retainer. Lubricate seals and install retainer on piston. Install new oil seal on release piston and retainer piston and piston retainer. Install new "O" ring seals on piston. Install piston in retainer and move piston to full release position in retainer. Place piston release piston in position, concave side toward stem and press into place. Install screw retaining release piston to piston stem. Complete reassembly in same manner as for Ford & Mercury (above).

REAR SERVO (Disassembly): *(NOTE—Ford & Mercury Rear Servo is smaller in diameter than that used on Lincoln).* With a 1/8" pin punch, remove servo actuating lever shaft retaining pin, and remove shaft and operating lever *(CAUTION—Use care when removing actuating lever to avoid losing needle bearings).* While pressing down on servo spring retainer, remove snap ring (release pressure on retainer slowly). Remove retainer and servo spring Hold hand over piston to prevent damage and force piston from servo body with air pressure. Press down on accumulator piston and hold in this position while removing "cir-clip" type lock ring with lock ring pliers. With lock ring removed, gradually release accumulator piston until all tension has gone from spring. Remove piston seal ring from servo piston.

Inspection: Inspect servo body for cracks, and piston bore for scores. Inspect servo body-to-transmission case mating surface for burrs. Check fluid passages for obstruction and passage plugs for tightness in body. Inspect piston stem for scores. Inspect accumulator bore and piston for scores and wear, and accumulator spring for distortion. Inspect actuating lever, socket, and shaft for scores and wear. Check needle bearings for wear and distortion. Inspect servo spring for distortion. Inspect servo band lining for excessive wear and bond to metal band. (Band should be replaced if worn to point where grooves are not clearly evident). Inspect band and struts for distortion and band ends for wear.

Reassembly: Install new seal ring in servo piston. Install accumulator spring and piston in servo piston and retain with lock ring. Install piston in servo body (lubricate parts to facilitate assembly). Install servo

FORDOMATIC, MERCOMATIC, TURBODRIVE REAR SERVO & BAND ASSEMBLY

spring with small end against servo piston and install retainer. Compress spring and install snap ring, making sure that snap ring is fully seated in groove. Place needle bearings in actuating lever shaft hole. With a pencil, position needle bearings around hole. Lock bearings in place by placing thumb over bearings and rotating clockwise. Install actuating lever with socket in lever bearing on piston stem. Needle bearing retainers at each side of actuating lever shaft hole must be installed with actuating lever. Install actuating lever, aligning the retaining pin holes and bearing retainers, and install pin. Check lever for free movement and then check operation of servo by applying air pressure to apply hole.

DISTRIBUTOR SLEEVE (Inspection): Inspect all passages for obstructions. Inspect sleeve bore for scores or excessive ring wear. Inspect mating surfaces for burrs and flatness. Check fit of fluid tubes. *NOTE*—Make sure spacer is on center tube.

PINION CARRIER (Inspection): Inspect servo band surfaces for scores. Inspect inner bushing for scores. Check free movement of pinions on pins and inspect for worn or broken teeth. Check pinion endplay (.010-.020"). Pinion pins must be a tight fit in carrier. Check all fluid passages. Check journal bushing for scores. *NOTE*—Planet carrier is serviced only as an assembly.

OUTPUT SHAFT (Inspection): Inspect thrust surfaces and journals for scores. Inspect internal gear for broken or worn teeth. Inspect aluminum sleeve for scores and check ring grooves for burrs. Inspect keyway and drive ball socket for wear. Inspect splines for burrs or wear. Inspect external parking gear teeth for damage and speedometer drive gear for burrs

EXTENSION HOUSING (Inspection): Inspect housing for cracks and drive shaft slip yoke bearing surface for scores. Inspect gasket surface for burrs. If inspection reveals it necessary to remove rear seal, use tool No. 1175-AB. (NOTE—Rear seal may be replaced without removing transmission from car). Use tool No. 7657-D and install new seal in extension housing. Remove inspection cover and gasket and check fluid baffle for tight fit in housing.

TRANSMISSION CASE LINKAGE (Disassembly): Remove throttle lever nut and take off inner and outer throttle levers. Remove throttle lever shaft seal from counterbore in manual lever shaft. Remove parking mechanism actuating rod, detent ball and spring. Remove manual lever shaft nut, detent and outer manual lever and shaft. Remove torsion lever retainer clip and take off torsion lever assembly. Disassemble torsion lever assembly by rotating lever while holding spring. Disengage pawl return spring from toggle link pin and remove pin. Remove pawl pin by working pawl fore and aft until pin protrudes from case. Remove toggle pin retainer clip, toggle pin, pawl return spring, spring retainer and link. Remove toggle lever pin by tapping lever toward rear of case, then remove plug, toggle lever pin and lever (NOTE—toggle lever pin is held in place by the plug). Remove manual shaft seal and transmission vent from case.

CONTINUED ON NEXT PAGE

FORDOMATIC, MERCOMATIC & TURBO-DRIVE (Cont.)

Inspection: Inspect each part of parking mechanism for wear, distortion or other damage.

Reassembly: Assemble toggle lever, link, pawl return spring and pawl and install assembly in transmission case. Install toggle lever and pawl pins. Install torsion lever assembly. (NOTE—Use screwdriver to position spring on torsion lever). Install washer and retainer clip. Coat outer diameter of new manual shaft seal with Permatex No. 3 and use Tool 77288 to install seal in case. Install manual lever and shaft in case, mount detent lever and tighten attaching nut to 35-40 ft. lbs. torque. Install detent spring and ball *(NOTE—use a piece of thin tubing to depress ball and spring while rotating detent).* Position ends of parking pawl torsion lever rod in detent lever and torsion lever and secure with cotter pins. Install new seal on throttle lever shaft, install outer throttle lever and shaft in case, install lever on inner end of shaft and tighten attaching nut to 35-40 ft. lbs. Check linkage for free operation without binding.

TRANSMISSION CASE (Inspection): Inspect case for cracks and stripped threads. Inspect all gasket and mating surfaces for burrs. Inspect all bearing surfaces for wear, scores, and burrs.

TRANSMISSION REASSEMBLY

►*REASSEMBLY CAUTION. Use Automatic Transmission Fluid Type "A" only to lubricate parts for assembly. DO NOT use any other form of lubricant. Use all new gaskets and tighten all bolts and screws to correct torque specifications. DO NOT USE FORCE WHEN ASSEMBLING PARTS. If parts do not assemble freely, examine parts for cause of difficulty*

CLUTCH ASSEMBLIES: Install front band in transmission case so that anchor end aligned with anchor in case. Install clutch assemblies into transmission case from the rear *(CAUTION—Do not allow clutches to separate),* while positioning servo band on drum. Hold units together while making installation. Position center support in case, aligning hole in center support with hole in right hand side of case. Install right and left hand center support outer bolts and external tooth lockwashers *(CAUTION—Lockwashers must be installed with the rolled edge toward transmission case to insure tight seal).*

PINION CARRIER & OUTPUT SHAFT: Position rear servo band in transmission case, with the strut ends up. Place anchor end (identified by a depression in center of strut retainer), toward adjusting screw. Install a bronze thrust washer on thrust face inside pinion carrier. To install pinion carrier assembly, position rear band over drum while meshing the planet pinions. Install two seal rings on primary sun gear shaft, and check rings for free movement in grooves. Install selective thrust washer on rear of planet carrier, retaining it in place with the transmission fluid. *(NOTE—If endplay was not within specifications, when checked prior to disassembly, replace washer with one of prop r thickness).* Install output shaft, carefully meshing internal gear with pinions.

REAR PUMP: Position rear pump drive key in keyway on output shaft. Position new front and rear gaskets on pump body, retaining gaskets with transmission fluid. Install thrust washer on pump body with the bronze side up. Align thrust washer tangs with bosses on pump body, then install the rear pump *(CAUTION—Be sure drive key is aligned with keyway in pump drive gear).*

GOVERNOR: Position governor drive ball in the pocket in output shaft. Retain ball with transmission fluid Install governor assembly aligning groove with ball in output shaft. Install governor snap ring. *NOTE—Install governor with the governor body plate toward front of transmission.*

DISTRIBUTOR: Place the four seal rings in distributor sleeve, and check ring gap. Check fit of seal rings in grooves of output shaft. Install distributor sleeve on output shaft, chamfer forward (lubricate parts to aid assembly). Install distributor and tubes on sleeve, making sure passages in sleeve and distributor are aligned. Install attaching bolts and lockwashers. Tighten bolts finger tight. Insert distributor tubes in transmission case, until spacer on center tube is against case, then tighten distributor attaching bolts to 8-10 ft. lbs. Install a new seal on rear pump outlet tube and install tube in transmission case and rear pump body.

EXTENSION HOUSING: Position speedometer drive gear ball in pocket in output shaft, retaining it with fluid Install speedometer drive gear, and gear snap ring. Insert extension housing oil seal replacer and pilot in housing, then install extension housing on transmission case Install attaching bolts and external tooth washers. *(CAUTION—Washers must be installed with rolled edge toward transmission case to insure a tight seal).* Tighten extension housing attaching bolts to 28-30 ft. lbs. Install governor inspection cover and a new gasket on housing.

FRONT PUMP: Position a new front pump gasket in counterbore of transmission case. Install front pump, aligning pump bolt holes with holes in case. Install three of the pump attaching bolts and tighten them to 17-22 ft. lbs.

TRANSMISSION ENDPLAY (Checking): Mount a dial indicator support on front pump bolt hole. Mount dial indicator on support so that contact rests on end of turbine shaft. Use a large screw driver to pry front clutch drum toward rear of transmission. Set dial indicator to zero. Remove screw driver and pry units toward front of transmission case by inserting the screw driver between large internal gear and transmission case. Note indicator reading. Endplay should be .010-.029". Remove indicator and remove tool from extension housing. Install the one remaining front pump attaching bolt and tighten it to 17-22 ft. lbs

FRONT SERVO: Position front band forward in case with band ends up. Position servo strut with the slotted end aligned with servo actuating lever and the small end aligned with band end. Rotate band, strut, and servo into position engaging anchor end of band with anchor end in case. Locate servo on dowel in case, then install attaching bolt (or bolts), tightening them only two or three turns. Install servo tubes

REAR SERVO: Position servo anchor strut, then rotate rear band to engage the strut. Position servo actuating lever strut with a finger, then install servo and attaching bolts. Tighten bolts to 40-45 ft. lbs

PRESSURE REGULATOR BODY: Install pressure regulator body and attaching bolts and tighten bolts to 17-22 ft. lbs. Install control and converter valve guides and springs and install spring retainer. Install a new seal ring on rear pump intake tube, then install tube in case. *NOTE—When installing spring retainer be sure that both tangs attach at the same time*

CONTROL VALVE BODY: Install control valve assembly, using care to align servo tubes with control valve. Align the inner throttle lever between throttle lever stop and downshift valve, and at the same time push the throttle valve in to clear transmission case. *(CAUTION—Align manual valve with actuating pin in the manual detent lever. Do not tighten attaching bolts).* Install the large control pressure tube in valve body and regulator. Install small control pressure compensator tube in valve body and regulator. Install lubrication tube in rear pump and regulator body. Tighten control valve body attaching bolts to 8-10 ft. lbs. Tighten front servo attaching bolts or bolt to 30-35 ft. lbs.

ADJUSTMENT (Front Servo): Loosen front servo adjusting screw locknut, then back nut off three turns. Loosen adjusting screw five complete turns. Using the front band adjusting wrench, tool No. 7225, insert a ¼" spacer between lever and stem, then tighten the screw until ratchet overruns. **Back th adjusting screw one complete turn,** then tighten locknut to 20-25 ft. lbs.

ADJUSTMENT (Rear Serv): Loosen adjusting screw locknut three turns with a ¾" socket of the rear band adjusting wrench. Back off the adjusting screw until free travel is obtained. Using tool No. 7195, tighten adjusting screw until ratchet overruns, then back off the adjusting screw 1½ turns. Hold rear servo adjusting screw stationary, and tighten the locknut to approximately 40 ft. lbs.

FLUID SCREEN & PAN: Position fluid screen over rear pump inlet tube then over front pump inlet tube. Press screen down firmly and install screen retaining clip. In trucks, position the oil cooler to sump discharge tube in case. Place a new gasket on transmission case, then install the pan. Install attaching bolts and lockwashers and tighten to 10-13 ft lbs.

TRANSMISSION & CONVERTER INSTALLATION

FORD PASS. CARS & TRUCKS (EXCEPT THUNDERBIRD & SUNLINER)

1) If converter has been removed from converter housing, position converter in housing, then install converter housing lower cover plate (8 Cyl.), or wedge converter in places (6 Cyl.) to prevent converter slipping out of housing. Rotate converter until drive plate bolt holes are in horizontal position (8 Cyl), or in the vertical position (6 Cyl.). Position flywheel on crankshaft flange, then install attaching bolts

CONTINUED ON NEXT PAGE

FORDOMATIC, MERCOMATIC & TURBO-DRIVE (C nt.)

2) Move converter and transmission assembly forward into position, using care not to damage converter drive plate and converter pilot. Install lower converter housing to engine bolts and tighten them to 40-45 ft lbs. Install crossmember on pass. cars. Lower transmission until extension housing rests on crossmember and install extension housing to crossmember bolts.
3) On trucks, install converter housing to crossmember bolts. On all vehicles position flywheel drive plates, and install drive plate attaching bolts. Tighten drive plate bolts to 28 ft. lbs. Install converter drain plugs and access plates. On trucks, position the oil cooler on support brackets, then install cooler. Connect oil inlet and outlet lines to transmission.
4) Coat universal joint knuckle with transmission fluid, then install drive shaft. Connect speedometer cable at transmission. Connect manual linkage at transmission manual lever. Install converter air duct and the linkage splash shield (pass. cars), exhaust duct shield (trucks).
5) Install starter motor and connect transmission-to-frame ground strap at transmission. Connect fluid filler tube to oil pan. Lower hoist, on trucks, position water inlet and outlet lines on oil cooler. Tighten hose clamps securely. Install the two upper converter housing-to-engine bolts and tighten to 40-45 ft. lbs. Replace covers on converter housing access holes, and floor mat. Fill radiator with water.
6) Fill transmission with Automatic Transmission Fluid Type "A" *(see "Lubrication" above)*. Check transmission and converter assembly for fluid leaks, adjust manual and throttle linkages *(see "Linkage Adjustment" above)*

THUNDERBIRD

►*INSTALLATION NOTE: Converter and transmission assembly must be installed before engine installed in chassis. The converter and transmission assembly can be install d in the chassis separately before engine is installed, or converter, transmission, and engine may be installed together as a unit*
1) To attach converter and transmission to engine before assembly into chassis as a unit, first align converter pilot, housing dowel holes, and drive plate holes. Remove all foreign material from converter pilot bore in crankshaft. Apply a heavy film of lubricant evenly on converter pilot bearing surface. *(CAUTION–Excessive lubricant in pilot bore will prevent proper entry of converter pilot into bore, forcing converter rearward and scoring front pump)*
2) Install pilot studs in two of the converter housing to engine bolt holes. Remove converter housing lower front cover plate. Move converter and transmission forward into position using care not to damage converter drive plate and converter pilot. Install four converter housing to engine bolts, remove pilot studs, then tighten bolts to 40-45 ft. lbs
3) If engine has been removed separate from converter and transmission assembly, mount transmission on a transmission floor jack and position assembly in car. Connect drive shaft to transmission output shaft. Install the two extension housing to rear engine support bolts. Connect speedometer cable and manual linkage at transmission. Install engine lifting sling and lower engine carefully into engine compartment, starting converter pilot into crankshaft. Make sure studs on manifold are aligned with holes in muffler inlet pipe, and dowels in block engage holes in converter housing. Raise car and position jack stands. Install engine front insulator bolt, and right and left hand insulator support bolts. Connect exhaust pipe to manifold and lower car to floor
4) Install two lower converter housing to engine bolts and tighten them to 40-45 ft. lbs. (Tighten bolts slowly and evenly to avoid binding on dowel pins). Install converter housing to engine bolts, and tighten them to 40-45 ft. lbs. Align flywheel and drive plate bolts with converter. Install the six bolts and tighten them to 25-28 ft. lbs. Complete engine installation.

LINCOLN & MERCURY

1) Position transmission and converter assembly under car, raise it into position and move it forward to engage converter pilot with hole in crankshaft *(CAUTION–Guide assembly carefully to avoid damage to flexible drive plate and converter pilot)*.
2) Install converter housing attaching bolts and tighten to 40-45 ft. lbs. Install six bolts securing converter to drive plate and tighten to 25-28 ft. lbs. (On Lincoln, install detachable frame crossmember to "X" member). Install engine rear mount to transmission. Remove engine support tool, lower engine and install rear engine mount to crossmember bolts and remove lift. Connect speedometer cable at extension housing.
3) Connect throttle and transmission manual linkage to transmission levers. Adjust linkage (see "Linkage Adjustment" above). Install converter housing upper plate with new seal. Install starter, converter drain plugs, and place fluid filler tube on pan and tighten filler hex nut to 40-50 ft. lbs.
4) Install converter housing lower plate. On air cooled torque converters install duct on converter housing and deflector between frame and housing. On water cooled torque converters, install inlet and outlet hoses. Install drive shaft (lubricate front universal slip yoke to aid installation). On Mercury models with single exhaust, install exhaust system. Check operation of neutral switch. Install throttle linkage brackets to engine and body using original nuts and bolts. Install battery ground cable. Fill transmission with Automatic Transmission Fluid Type "A" (see "Lubrication" above).

TRANSMISSION OVERHAUL: *See 1955 Annual Data or later Manual edition and note "Changes, Cautions, Corrections" above.*

TRANSMISSION INSTALLATION (WITHOUT CONVERTER)

FORD PASS. CARS & TRUCKS

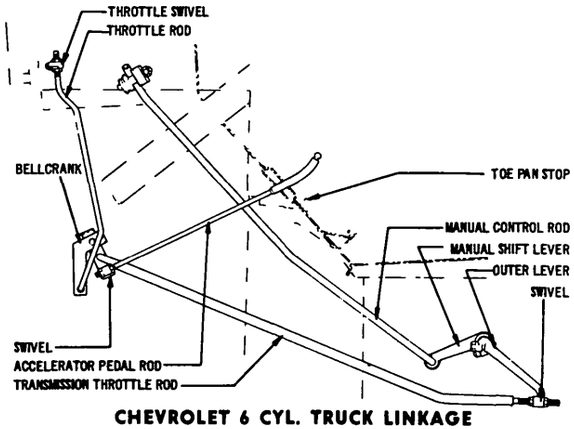
►*NOTE: On Thunderbird and Sunliner it is not possible to remove the transmission (without converter) due to limited clearance.*
1) Install guide pins in the two top transmission to converter housing bolt holes. Mount transmission on jack and position it under vehicle. Rotate engine to position the front pump drive lugs on converter impeller housing in a vertical position. Rotate front pump to position slots in front pump drive gear in a vertical position. Apply lubriplate to seal the surface on the converter impeller cover hub. (If a new transmission is being installed, position a new rubber extension housing duct shield over end of housing)
2) Raise transmission and move it toward front of vehicle *(CAUTION–Be sure to align the turbine shaft splines with turbine hub splines and the converter impeller lugs with slots in front pump drive gear)*
3) On trucks, position the oil cooler front support bracket on case. On all vehicles, install the lower transmission to converter housing attaching bolts. Remove the two guide pins and install the two upper attaching bolts. Tighten bolts to 40-45 ft. lbs.
4) On cars, install the frame crossmember and bolts. Lower transmission onto crossmember and then install engine rear support to transmission bolts. On trucks, position the oil cooler on the support bracket and install attaching bolts. Connect oil cooler to transmission oil lines at transmission. Tighten fittings securely. Install universal joint yoke onto transmission output shaft and connect drive shaft
5) On F-250, F-350 & P-350 trucks, coat universal joint knuckle with transmission fluid. Install the four bolts attaching drive shaft coupling yoke at the parking brake assembly, then connect drive shaft at rear axle. Connect speedometer cable at extension housing.
6) Connect manual linkage and throttle linkage to transmission levers and adjust the linkage (see "Linkage Adjustment" above). Connect fluid filler tube to oil pan and tighten fitting securely. Lower vehicle to floor and fill transmission with Automatic Transmission Fluid Type "A" (see "Lubrication" above).

LINCOLN & MERCURY

1) Install guide pins, tool No. ST-0711 into top transmission to converter housing attaching bolt holes. Mount transmission on lift and position under car. Rotate engine to position front pump drive lugs on converter pump housing in a vertical position. Rotate transmission front pump to position slots in pump drive gear in a vertical position. Apply lubriplate to seal surface on converter pump cover hub.
2) Raise transmission and move toward front of car *(CAUTION–Use care to index turbine shaft splines with turbine hub, and lugs on converter pump with slots in front pump drive gear)*. Install two lower transmission to converter housing attaching bolts. Remove the two guide pins and install two upper attaching bolts and tighten to 40-45 ft. lbs.
3) On 1955 Lincoln, install detachable crossmember in "X" member. Install rear engine mount to transmission
4) Raise engine and transmission sufficiently to remove engine support fixture. Lower unit to crossmember and install rear engine mount to crossmember bolts. Install drive shaft. (Lubricate front universal joint yoke with transmission fluid to aid assembly).
5) Connect speedometer cable at extension housing. Connect manual and throttle linkage to transmission levers. Adjust linkage (see "Linkage Adjustment").
6) On 1955 Mercury with single exhaust system, install exhaust system. Place fluid filler tube in position on pan and tighten filler tube hex nut to 40-50 ft. lbs. Remove support stands and lower car to floor. Fill transmission with Automatic Transmission Fluid Type "A" (see "Lubrication" above). Road test car.

DUAL-RANGE HYDRA-MATIC

Chevrolet Trucks, Series 3100, 3200, 3600, 4000 (1956)
Hudson, Series 40 & 60 (1956)
Nash, Series 40 & 60 (1956)
Oldsmobile, Series 88, (Early 1956)
Pontiac, Series 860 & 870 (Early 1956)
Rambler, Series 5610 (1956)



►CHANGES, CAUTIONS, CORRECTIONS

►*HUDSON, NASH & RAMBLER REAR BEARING RETAINER OIL SEAL INSTALLATION CAUTION:* Two types of oil seals are furnished for service replacement. While the construction of the seals is slightly different, both types must be installed in transmission so the felt portion of seal is toward rear of transmission.

►*1956 HUDSON & NASH JUMPING OUT OF REVERSE CORRECTION:* This condition may be caused by improper manual control linkage adjustment, or back-up light switch (if so equipped). On cars with back-up lights, do not adjust control linkage until switch adjustment is checked. Loosen or disconnect the switch at manual control lever on side of transmission. Operate car in reverse several times to determine condition. If loosening up or disconnecting the back-up light switch corrects the condition, readjust switch to proper spring tension as follows: Place control lever in reverse and adjust switch cable just enough to allow spring to pull switch rod to the contact position.

►*1956 RAMBLER JUMPING OUT OF REVERSE CORRECTION:* This condition may be caused by improper adjustment of back-up light switch (see above), or a binding condition at clevis to throttle valve lever while in a reverse position. If clevis is binding, remove clevis and increase the slot 1/16" by filing both sides. If the condition continues to exist, proceed as follows: Remove transmission side pan. Remove detent plunger retainer and reverse oil delivery pipe *(NOTE* - Place finger over detent plunger while removing it and the oil delivery pipe). Install a 3/16" ball bearing, Part No. G-169067, in detent plunger retainer and replace the spring and plunger (this will increase spring tension holding inside detent control lever in reverse position). Reinstall plunger, retainer plate, and reverse oil delivery pipe. Install side pan and levers. Position shift lever on transmission in "D-3" position and adjust the clevis with steering gear shift operating lever against stop on starter switch housing. Remove clevis pin and **lengthen rod by turning clevis two full turns.** Install Hydra-Matic fluid.

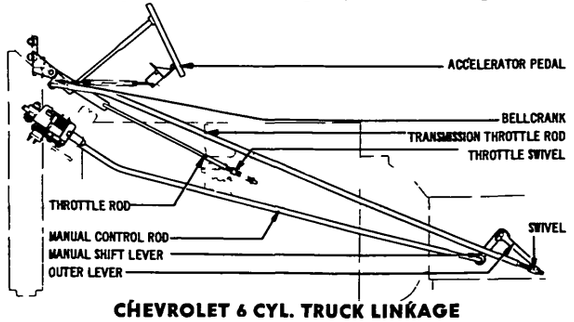
►*1956 RAMBLER 3-4 DELAYED (LIGHT THROTTLE) UPSHIFT (Cars before Serial No. D-331043 having the "E-56" Hydra-Matic Transmission):* Replace accelerator shaft, Part No. 3145969, with Part No. 3149854 on which the throttle valve bellcrank rod lever has been relocated from 7° below center line of shaft to 33° above center line. Replace throttle valve bellcrank adjusting upper rod, Part No. 3146947, with Part No. 3149922 which is a straight rod with a 90° bend on one end. Replace accelerator rod, Part No. 3146821, with Part No. 3149851. Replace accelerator rod clip, Part No. 3131561, with Part No. 3131562. Install accelerator rod, with clip so upper end of rod enters accelerator shaft lever from the rear. Adjust throttle valve linkage (see "Carburetor" on Car Model pages). *NOTE* - The above parts are furnished as a kit, Part No. 3200110, and are also furnished separately.

CHEVROLET 6 CYL. TRUCK LINKAGE (EXCEPT FORWARD CONTROL)

DESCRIPTION

DESCRIPTION: Fluid coupling and hydraulically controlled planetary transmission of same design as used on previous models. *See "Dual-Range Hydra-Matic" in 1955 Annual Data or later Manual edition.*

OPERATION



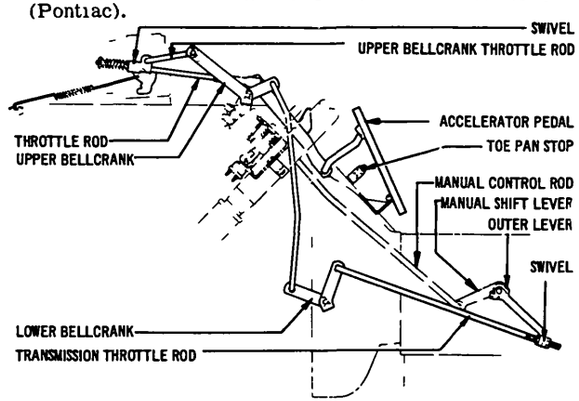
Planetary units and controls operate in same manner as on previous models. *See "Dual-Range Hydra-Matic" in 1955 Annual Data or later Manual edition.*

LUBRICATION

Lubrication Intervals: Check fluid every 1000 miles (Hudson, Nash, Oldsmobile, Rambler). 2000 miles (Pontiac), every day (Chev. Truck). Drain and refill every 25,000 miles.

Oil Level Indicator at Vent Air Cleaner – Clean the mesh type air cleaner (in cap on right top side of transmission case) every 10,000 miles or twice each year.

Checking Fluid Level: Check fluid level with engine warm and idling at slow idle speed (choke valve open, fast idle inoperative). With transmission oil hot, run engine for at least two minutes with selector lever in "N" (Neutral) position (to insure fluid coupling being filled). Check fluid level on dipstick located under hood on right hand side of engine, all cars except Chevrolet truck. On Chevrolet truck the oil filler and dipstick are located under access opening in center floor pan. Add fluid as required to bring level up to "F" mark on dipstick. *NOTE* - Approximately 1½ to 2 pints required to raise level from "L" to "F".



CHEVROLET 6 CYL. TRUCK LINKAGE (FORWARD CONTROL)

►*CAUTION Do not fill above "F" mark on dipstick (may cause foaming when oil is hot).*

Draining & Refilling: Drain oil only when transmission is warm (after normal operation). Remove flywheel housing lower cover (or hand hole cover) turn fluid coupling until drain plug in torus cover points downward. Remove plug and drain coupling. Remove drain plug at rear of transmission oil pan and drain transmission case. Replace both drain plugs and tighten securely. Install 8 qts. (Oldsmobile), 5 qts. (Chev. Truck); 5 to 7 qts. (Hudson, Nash & Rambler), 9½ qts. (Pontiac), of Automatic Transmission Fluid Type "A", bearing an AQ-ATF number on container. Start engine and run it at a speed equivalent to 20 MPH for at least 1½ minutes with selector lever in "N" to fill fluid coupling. Return engine speed to slow idle and recheck transmission fluid level. Add sufficient fluid to bring fluid level up to "F" mark on dipstick.

Fluid Capacity (Refill): 8½ qts. (Chev Truck, without cooler), 9½ qts. (with cooler), 11 qts. (Hudson Hornet & Nash Ambassador), 8½ qts. (Other Hudson & Nash models, and Rambler), 9¾ qts. (Oldsmobile), 9½ qts. (Pontiac).

CHEVROLET V8 TRUCK LINKAGE

LINKAGE ADJUSTMENT

►*THROTTLE LINKAGE ADJUSTMENT NOTE: See CARBURETOR on Car Model pages.*

CHEVROLET TRUCKS

Manual Control Linkage: (All Models)—Move shift control lever from "N" position to first detent that is felt In this position indicator should line up with symbol "1-4" Check control lever in each of the other positions for indicator alignment If adjustment is not satisfactory, proceed as follows: If gearshift control shaft upper support bracket is loose, tighten the clamp screw while holding control lever firmly against stop between "1-3" position and "1-2" While holding lever in "1-3" against the

CONTINUED ON NEXT PAGE

DUAL-RANGE HYDRA-MATIC (C n.inued)

stop which prevents accidental shift into "1-2," loosen gearshift control rod swivel. Make sure transmission outer lever is in the three speed drive position "1-3" (third position from front or rear). With control lever in "1-3" position and held against stop, and with transmission outer lever in the three speed drive position, tighten gearshift control rod swivel.

Neutral Safety Switch Adjustment: Place control lever in "1-4" position. With ignition off, operate starter control. Starter **should not operate.** If it does, check the other positions in the same manner. If starter operates in any position except "N," adjust as follows: Loosen two switch assembly mounting screws. Place selector lever in "N," and with clip over flats on end of shifter shaft, insert pin into mounting bracket of switch and locating plate. Tighten screws to secure switch in this position and remove locating screws.

HUDSON (EXCEPT RAMBLER)

Manual Control Linkage: (All Models)—Place selector lever in "D-3" position and set operating lever against the stop on housing bracket. Remove clevis pin from gear shift control rod at side of transmission case and remove clevis from shift lever. Place transmission lever in "D-3" position and adjust clevis so pin passes freely through hole in clevis and in lever *(NOTE*—Be sure that operating lever is against stop on housing bracket). After adjustment has been completed, lengthen the control rod two full turns and replace clevis and cotter pin.

NASH (EXCEPT RAMBLER)

Manual Control Linkage: (All Models)—Place selector lever in "D-3" position and set lever against stop on starting switch bracket. Remove clevis pin from gear shift control rod at side of transmission case and remove clevis from shift lever. Place transmission shift lever in the "D-3" position and adjust clevis so pin passes freely through hole in clevis and in lever. *(NOTE*—Be sure that operating lever is against stop on housing bracket). After adjustment has been completed, lengthen the control rod two full turns and replace clevis and cotter pin.

OLDSMOBILE

Manual Control Linkage (All Models): Loosen jam nut on shift rod clevis and neutral safety switch. Remove clevis pin from shift rod. Move manual control lever at side of transmission all the way forward into "N" position. Then raise and hold shift lever beyond "N" position against side of opening in jacket. Adjust shift rod clevis so that end of clevis contacts outside diameter of bushing in lower shift lever. Return lower shift lever to "N" position, insert clevis pin through clevis and bushing, assemble cotter pin to clevis pin.

Neutral Safety Switch Adjustment: Set transmission in "N" detent. With switch assembled to steering column and link connected to shift lever, insert .090" pin through switch lever and bracket. Tighten mounting bolt and withdraw .090" pin. Check setting by applying hand brake firmly, placing shift lever in "DR" position, and turning ignition switch to "Start." While holding switch on "Start," slowly move shift lever toward "N" until engine cranks and starts. Without moving shift lever after engine starts, accelerate to determine whether transmission is in gear. If switch properly adjusted transmission will not be in gear and car will not move.

PONTIAC

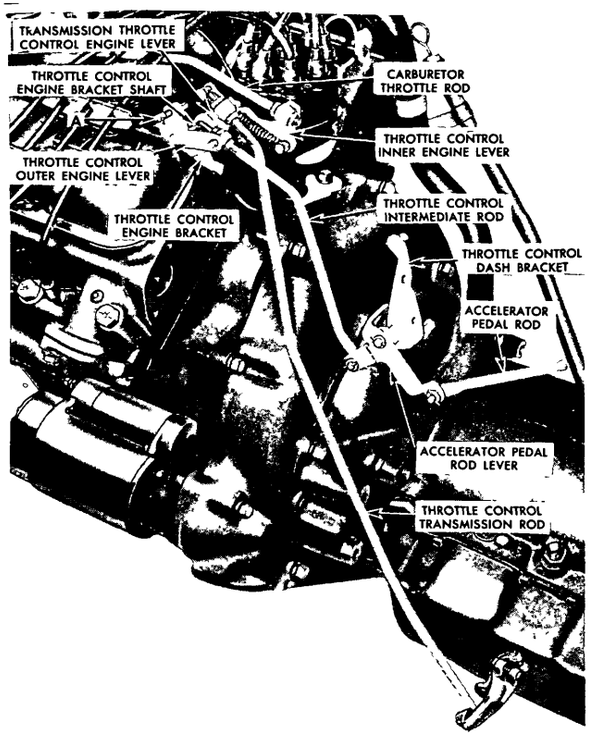
Manual Control Linkage: Place selector lever in "D" (right) position against stop which prevents accidental shift into low range. Loosen both front and rear trunnion locknuts and remove trunnion from transmission outer shift lever. Make sure that transmission outer shift lever is in "D" (right), which is second detent from front. Install trunnion (with locknuts loose) in outer shift lever, tighten front locknut against trunnion finger tight to remove clearance in linkage, tighten front locknut **one** complete turn to lengthen rod. Tighten rear locknut.

Neutral Safety Switch Adjustment: Place selector lever in "D" (left) position. Loosen switch mounting screw and adjust switch bracket to a position where starter will not operate when ignition key is turned to the start position. Place manual control lever in "N" position. Make certain that switch arm does not touch stop on switch bracket. Tighten mounting screw.

RAMBLER

Manual Throttle Linkage: Place selector lever in "D-3" position and set lever against stop on starting switch bracket. Remove clevis pin from gear shift control rod at side of transmission case and remove clevis from shift lever. Place transmission shift lever in "D-3" position and adjust clevis so pin passes freely through hole in clevis and in lever. *(NOTE*—Be sure that operating lever is against stop on housing bracket). After adjustment has been completed, lengthen the control rod two full turns and replace clevis and cotter pin.

BAND ADJUSTMENT



► *OLDSMOBILE & PONTIAC FRONT & REAR BAND ADJUSTMENT CAUTION: Do not adjust bands externally. Internal adjustment must be made in all instances. See procedure below.*

EXTERNAL BAND ADJUSTMENT (Not used on Oldsmobile & Pontiac); Adjusting tools and an accurate tachometer as indicated below, must be used.

► *BAND ADJUSTMENT CAUTION:* Do not attempt to adjust bands externally (without removing oil pan) unless adjusting tool J-2681 (Hudson No. J-2681A) and an accurate tachometer are used. Otherwise, remove oil pan and use special servo gauges.

1) Block front wheels securely and set hand brake firmly to prevent car moving while adjusting. Remove floor mat and adjusting hole cover over adjusting screws on left side of transmission. Run engine until temperature is normal and engine is at normal idle speed. Connect and adjust tachometer for accurate recording of engine speed.

2) Place selector lever in "Dr" position. ("Dr 4"). Adjust carburetor throttle stopscrew so that engine idles at exactly 700 RPM. Adjust front band as follows: Install adjusting tool on front band adjusting screw,

PONTIAC HYDRA-MATIC LINKAGE

loosen adjusting screw locknut (turn long handle while holding short handle stationary). Loosen band adjusting screw (turn short handle) until engine speed increases to 900-1000 RPM *(NOTE* - If no increase in speed is noted when adjusting screw loosened, band has probably been slipping in service. Remove oil pan and inspect band and drum. With pan off, adjust bands as directed in "Adjustment - With Pan Off" below and disregard following steps).

3) Tighten band adjusting screw slowly until engine speed drops to 700 RPM (front drum now stopped). Loosen band adjusting screw until engine speed increases and tighten again slowly until engine speed returns to 700 RPM *(NOTE* - The object in loosening and retightening the screw is to locate exact point at which the band stops the drum from spinning). At this point wait 30 seconds. If engine speed increases, tighten screw 1/10 turn. Wait 30 seconds and if engine speed again increases, tighten screw 1/10 turn more. Repeat this procedure until engine speed remains at 700 RPM for at least 30 seconds.

4) Set counter on tool to 00. While holding locknut stationary with long handle of tool, tighten adjusting screw exactly 7.7 turns (Exc. Chev. Truck); 6.5 turns (Chev. Truck) as indicated on counter. Hold adjusting screw from turning and tighten locknut.

CONTINUED ON NEXT PAGE

DUAL-RANGE HYDRA-MATIC (Continued)

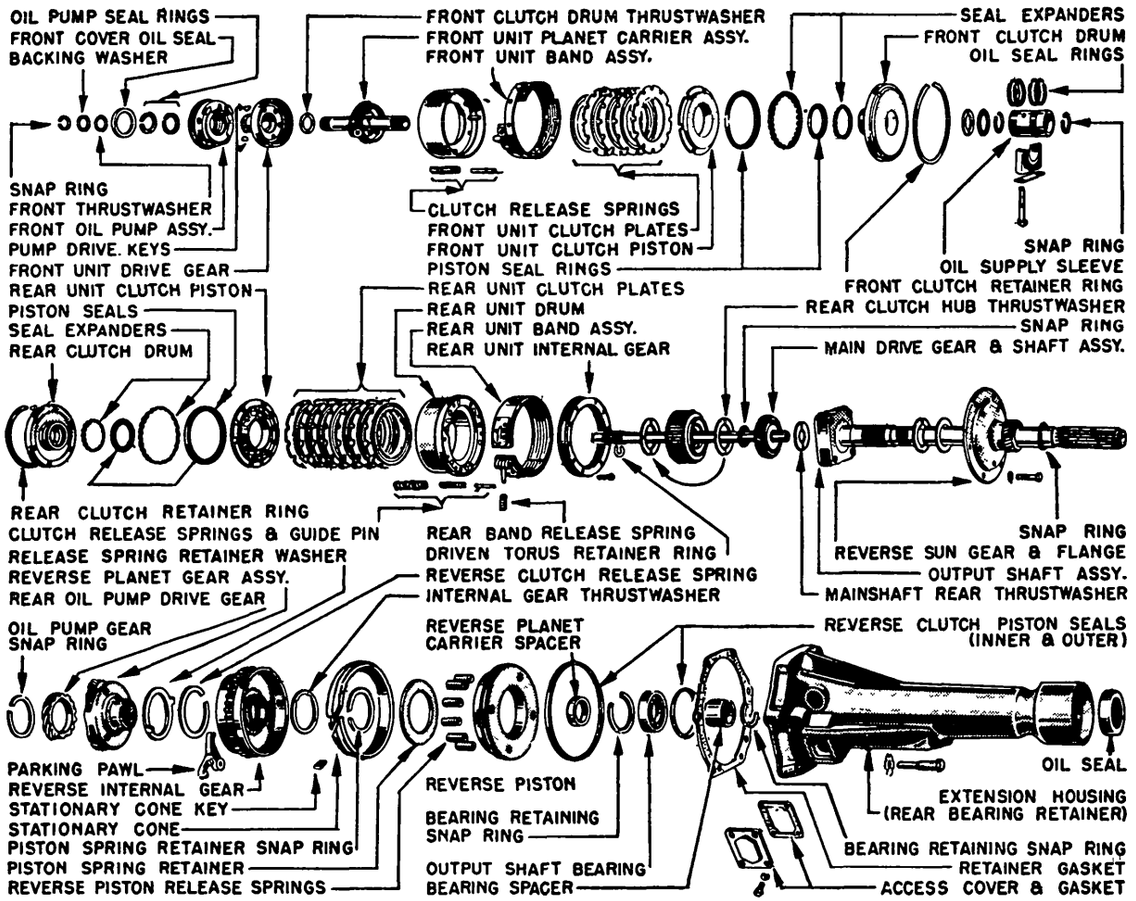
5) Adjust rear band as follows: Install the adjusting tool on rear band adjusting screw and loosen locknut. Loosen band adjusting screw until engine speed increases to 900-1000 RPM *(NOTE* - If no increase in engine speed noted when band adjusting screw loosened, band has probably been slipping in service. Remove oil pan and inspect band and drum. With pan off, adjust bands as directed in "Adjustment - With Pan Off" below, and disregard following steps).

6) Tighten band adjusting screw until engine speed drops to 700 RPM, loosen adjusting screw until engine speed increases, then tighten adjusting screw until engine speed again drops to exactly 700 RPM, wait 30 seconds and if engine speed increases, tighten adjusting screw 1/10 turn. Repeat this procedure until engine speed remains at 700 RPM for at least 30 seconds.

7) Place selector lever in "N" position. Set counter on adjusting tool to 00. Hold locknut stationary, tighten band adjusting screw **exactly 2 turns** as indicated on tool counter. Return selector lever to "Dr" position. Hold band adjusting screw from turning and tighten locknut securely. After both bands adjusted, reset engine to correct idle speed as indicated below.

Idle Speed Setting

Car Model	Idle Speed	Selector Lever
Chev. Truck	425 RPM	"N"
Hudson	490-510 RPM ①	"N"
Nash	450 RPM ②	"N"
Oldsmobile	400 RPM ①	"DR"
Pontiac	450-470 RPM ①	"N"
Rambler	475 RPM ②	"N"



① — Compressor must be running on cars with air conditioning.

② — 500 RPM, with compressor running on cars with air conditioning.

INTERNAL BAND ADJUSTMENT (Use on Oldsmobile and Pontiac at all times, and on other cars when pan r moved for other work): *Use adjusting tools and gauges specified.* Drain transmission oil pan and remove pan. Remove floor mat and floor hole cover over band adjusting screws.

Front Band (Gauge J-1693): Loosen locknut and back off front band adjusting screw approximately 5 turns. Make certain that band is centered on drum. Remove pipe plug from bottom of front servo. Loosen hexagonal headed adjusting screw on gauge by hand until approximately 1/8" of adjusting screw threads are exposed above gauge body. Screw gauge into pipe plug hole in front servo by hand. Tighten hexagonal adjusting screw on gauge by hand until gauge stem is felt to just touch piston in servo, then continue to tighten adjusting screw with a wrench **exactly five full turns** from point where stem first contacted piston. Tighten front band adjusting screw until knurled washer on gauge (at upper end of hexagonal adjusting screw) is just free to turn. Hold band adjusting screw from turning and securely tighten adjusting screw locknut. Loosen gauge adjusting screw at least six turns, remove gauge from servo. Install pipe plug in servo and tighten securely.

Rear Band (Gauge J-5071): With band centered on drum, tighten band adjusting screw until actuating lever contacts face of gauge (gauge positioned on servo with short leg gauge hooked over accumulator body and long leg resting on servo piston stem). *(CAUTION* - If adjusting screw is accidentally turned beyond adjustment, loosen two or three turns and repeat adjustment). Hold band adjusting screw and tighten adjusting screw locknut to 40-50 ft. lbs.

DUAL-RANGE HYDRA-MATIC TRANSMISSION INTERNAL UNITS

TESTING

►***"DUAL-RANGE" HYDRA-MATIC TESTING NOTE:*** **These transmissions have MODULATED PRESSURE and HYDRAULIC REVERSE and following test procedure will apply to all transmissions:**

ROAD TEST: Operate the car over a test route and note performance and shift speeds. Select a test route that will provide for all types of operation: Hilly section to check full-throttle upshifts, slippage, and throttle downshifts; a level section to check closed throttle upshifts; and a quiet section to check for noise. ***See Hydra-Matic Shift Point table for correct shift speeds.***

STALL TEST: Can be used to check engine and transmission performance. Connect accurate electric tachometer to check engine speed. Start engine and warm up engine and transmission to operating temperature. Apply foot brake firmly and set hand brake tight. Set selector lever in "Dr. 4" position. Depress accelerator pedal to the floor and NOTE ENGINE RPM. If engine speed not within limits shown in table, make further tests as indicated below.

►***CAUTION—Use extreme care in making this test and NEVER HOLD THROTTLE OPEN MORE THAN ONE MINUTE (15-20 seconds preferably). If engine speed exceeds maximum figure shown in table, CLOSE THROTTLE IMMEDIATELY to avoid possible damage to transmission.***

If engine speed below minimum—Engine requires tune-up, or front unit is locked up.

CONTINUED ON NEXT PAGE

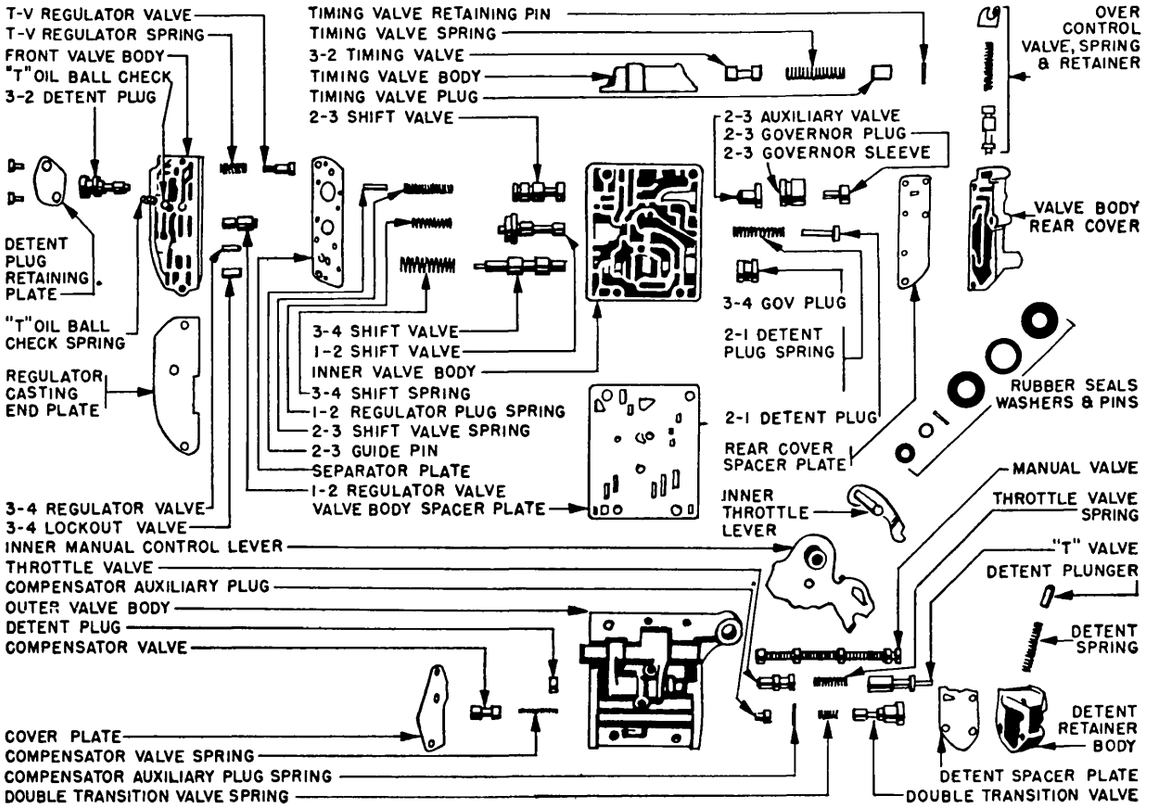
DUAL-RANGE HYDRA-MATIC (C ntinued)

If ngine speed above maximum—Bands are slipping, Torus check valve leaking or missing, or torus members damaged. Localize the trouble by making the following tests before adjusting the bands:

Check to determine which band slipping—Repeat the stall test (above) with selector lever in Revere "R" position. If engine speed still excessive, Front Band or Front and Rear Bands are slipping. If engine speed within limits, Rear Band only is slipping. Adjust bands.

Check for Missing or Leaking Torus Check Valve: Set hand brake lever securely, start engine and run at speed of 20 MPH. for approximately 1½ minutes. Reduce engine speed to normal idle speed, check fluid level and make certain that it is at "Full" mark on dipstick. Shut off engine and allow car to stand for 10 minutes. Recheck fluid level without starting engine. If level has not raised more than ½", torus check valve is operating satisfactorily and slipping bands or damaged torus members are indicated.

STALL TEST LIMITS



Car Mod l	Minimum RPM	Maximum RPM
Chev. Truck	1400	1600
Hudson Hornet	1700	1900
Hudson Wasp	1600	1800
Nash Ambassador	1550	1650
Nash Statesman	1600	1800
Oldsmobile	1750	1875
Pontiac	1800	2000
Rambler	1600	1800

MAIN LINE OIL PRESSURE: *PRESSURE GAUGE NOTE*– It is recommended that a 300 lb. gauge (J-2540-A) be used for making pressure tests.

Ch cking Main Lin Oil Pressure – Connect gauge at main line oil plug hole on top of case between band adjusting screws (accessible by lifting floor mat and removing metal plate over band adjusting screw hole). Make the following tests on the road (or with car up on jacks so that engine can be run to simulate road performance) after engine has been run sufficiently so that engine and transmission are at operatingtemperature.

Idling Oil Pr ssur – With engine running at normal idle speed, note gauge pressure with selector lever in each position. In general, pressure should be equal in "N", "Dr4", "Dr3", and "Lo" (10 lbs. maximum variation), and higher in "R". *See table below for specified pressures.*

Zer Thrott Pressure – With selector lever in "Dr4" position, operate car at speed higher than 30 MPH (Exc. Chev. Truck), 19-22 MPH (Chev. Truck), close throttle, note gauge reading just as car speed drops to 30 MPH (Exc. Chev. Truck), 19-22 MPH (Chev. Truck). *See pressure table.*

DUAL-RANGE HYDRA-MATIC CONTROL VALVE (TYPICAL)

Full Throttle Pressure—With selector lever in "Dr4" position, operate car at approximately 25 MPH (Exc. Chev. Truck), 17 MPH (Chev. Truck), depress accelerator pedal to point where detent resistance is felt but DO NOT go through the detent (this would result in forced 4-3 downshift), note gauge reading just as car speed reaches 30 MPH (Exc. Chev. Truck), 17 MPH (Chev. Truck). *See table below for specified pressures.*

► *SHOP TEST NOTE* If above test being made in the shop (with car on stands), this full throttle position of the control valve can be obtained by disconnecting throttle control rod at lever on side of transmission case and moving lever to the full throttle position (DO NOT move lever through detent), then note gauge reading.

R v rs Pressur – With car standing, place selector lever in "R", apply foot brake firmly to hold car stationary, accelerate engine to half throttle position, note gauge reading. *See table below for specified pressures.*

Main Line Oil Pressures

Car Model	① Idling	Zero Thtl.	Full Thtl.	Rev.
Chev. Truck		60-68	85-93	135 Min.
Hudson	50 ②	60 Min.	80 Min.	125 Min.
Nash	50 ②	60 Min.	80 Min.	125 Min.
Oldsmobile	50 ③	60 Min.	85 Min.	④ 150 Min.
Pontiac	50	64-72	101-109	145-185
Rambler	50	60 Min.	80 Min.	125 Min.

① – Minimum pressure.
② – 60 lbs. maximum in all ranges.
③ – Idling at 400 RPM
④ – Idling at 600 RPM.

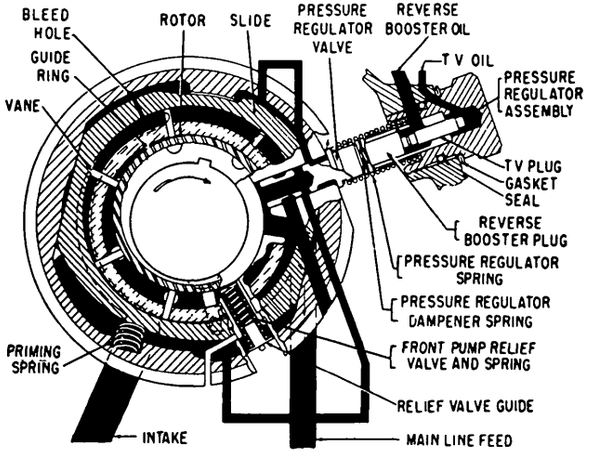
► *CHECKING REAR OIL PUMP* Operation of rear pump alone can be checked by the following procedure (Idling test above will check operation of front pump alone, road test involves both front and rear pumps). Operate car on road in 4th speed (selector lever in "Dr4") at 30-45 MPH, move selector lever to "N", turn ignition "off" (this will stop front pump operating so that all

CONTINUED ON NEXT PAGE

DUAL-RANGE HYDRA-MATIC (Con.inued)

pressure will be supplied by rear pump). Gauge reading should be 60-75 lbs. *(CAUTION - If rear pump not working (no pressure) stop road test immediately).* If low oil pressure indicated when testing both pumps, oil leak in system is indicated. If one pump alone has low pressure, trouble in this pump is indicated.

TESTING HYDRA-MATIC OPERATION WITH AIR PRESSURE: ***Following procedure can be used to check operation before disassembling transmission and can also be used after overhaul to insure proper operation before transmission installed in car.*** Drain transmission, remove oil pan and screen. Remove side cover, control valve assembly, and reverse oil pipe. Use air line fitted with special air nozzle (Tool J-4353-1 etc.) so that air can be applied to oil passage holes on side of transmission case. Use approximately 80 lbs air pressure and make test listed below Refer to illustration for location of test points



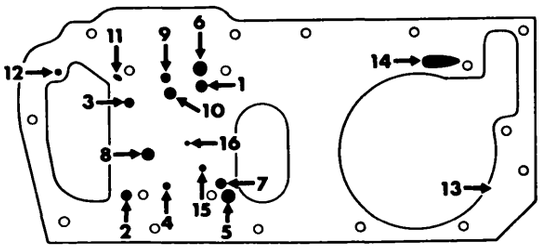
1) Front Clutch. Pressure at this point should actuate front clutch (piston movement will be audible if air applied intermittently, or can be felt if front drum held firmly by hand). *NOTE*—If large amount of air escapes around oil delivery sleeve area, recheck after servos removed to note point of leakage. If oil fog and large amount of air emitted from inside front end of front drum, faulty front clutch seal is indicated. Leakage from any other drilled passages inside case is indication of defective case or oil delivery sleeve.

2) Front Band Apply. Pressure at this point should actuate servo and apply front band. No appreciable air escape should be noted at servo mounting face on case (small amount of leakage at 4-3 valve exhaust hole and also front band release hole is permissible) (front band release hole leakage should only be leakage past ring gap, not blow-by).

3) Front Band Release. Pressure at this point will not actuate servo (piston held in released position by retracting spring) but air escape between servo body and case, or around band release cylinder should only be normal leakage past piston ring gap.

4) Governor Pressure (G1 to 4-3 Valve). Pressure at this point will leak around 4-3 valve retainer wire. No air should be noted between servo body and transmission case or from any other passage (small amount of air from Front Band Apply and Compensator passages).

5) Rear Band Release. Pressure at this point will release rear servo and band with no large escape of air (small amount will escape through piston ring gaps but should not impede normal servo operation) and no appreciable amount of air should escape between servo mounting face and transmission case. No air escape should be noted from any other passage hole (except slight amount at Compensator hole—see item 7).



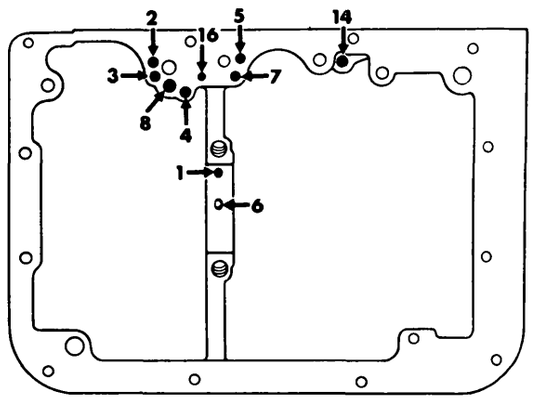
DUAL-RANGE HYDRA-MATIC FRONT PUMP & PRESSURE REGULATOR

6) Rear Clutch. Pressure at this point should actuate rear clutch (piston movement will be audible if air applied intermittently, or can be felt if rear drum held firmly by hand). *NOTE*—If large amount of air escapes around oil delivery sleeve area, recheck after servos removed to note point of leakage. If oil fog and large amount of air emitted from inside rear drum assembly, faulty rear clutch seal or oil delivery sleeve rear ring is indicated Leakage of air from any other passage hole on side of case indicates interconnected passages (defective case) or damaged oil delivery sleeve.

7) Compensator (to Front & Rear Servos). Pressure at this point should actuate rear servo to tighten rear band (band applied by spring) and to actuate front servo to apply band. No appreciable air escape should be noted (other than normal leakage through piston ring gaps) and no air should be noted at any other passage hole on side of case.

8) **Main Line (Pump Feed):** Pressure at this point should be an open blow-by due to fact that main line exhaust valve is in exhaust position

PRESSURE TEST POINTS (SIDE OF TRANSMISSION CASE)



9) Pressure Gauge Hole to Top of Case. Pressure at this point should produce NO evidence of air escape if pressure line plug (on top of case between band adjusting screw) is tight.

10) Exhaust (Port for Valve Body). Pressure at this point should blow freely through to inside of case. Make visual inspection of this hole to see that it is completely open for entire length (***CAUTION***—any obstruction of this hole will cause poor shifting).

11) T.V. Pressure to Regulator. Not necessary to check this passage (this is modulating pressure line to T.V. pressure plug in pressure regulator).

12) Reverse Booster to Pressure Regulator. Not necessary to check this passage (this is booster pressure line to reverse booster plug in regulator).

13) Reverse Pressure. Pressure at this point should actuate reverse cone clutch piston (piston movement should be audible if air applied intermittently, or can be felt if reverse internal gear grasped with the hand). If large amount of air escapes around cone clutch piston, outer and inner oil seal leakage in reverse cone assembly is indicated

PRESSURE TEST POINTS (BOTTOM OF TRANSMISSION CASE)

14) Governor Feed Not necessary to check this passage (directs main line pressure to governor).

15) Line Exhaust Not necessary to check this passage (passage exhausts main line pressure when engine is turned off and car is standing).

16) Low Range (Manual Low Oil). Not necessary to check this passage (passage directs main line pressure oil to fast dump valve in rear servo).

Lockout in "Lo"—4-2 shift, 50-41 MPH

DUAL-RANGE HYDRA-MATIC (Continued)

►*NOTE—Most Hydra-Matic troubles can be corrected by external adjustments and correct oil level. See following table for trouble and possibe causes. See also "HYDRA-MATIC OVERHAUL."*

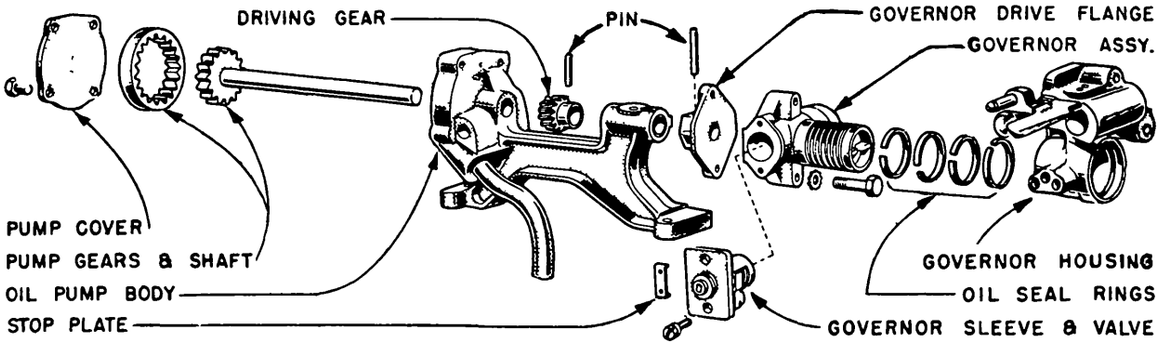
LIGHT THROTTLE SHIFT POINTS HIGH: (With Full Throttle Shift point normal)—Throttle linkage adjusted incorrectly. Adjust throttle linkage and check for worn or loose control rods.

FULL THROTTLE SHIFT POINTS: (Either too high or too low or do not occur)—Governor valves not operating properly, leakage at governor assembly, broken oil rings. Governor ring lands might be worn. Correct by freeing valves, check for warped surfaces. Replace parts as necessary.

NO THROTTLE DOWNSHIFT IN "Dr" RANGE: (From 4th to 3rd above 20 M.P.H.)—Insufficient accelerator travel due to interference of throttle linkage or at floor carpet. Throttle controls improperly adjusted or lever bent or loose on shaft. Spring lock in downshift valve may be missing.

TRANSMISSION DOES NOT RESPOND TO SHIFT LEVER POSITION: Pin which picks up manual valve in valve body is not operating in groove in manual valve. To check, shift selector lever into reverse. If severe clashing results or if lever goes into reverse but car locks up and fails to move backwards, pickup pin is not operating manual valve. Remove side cover and engage pin.

TRANSMISSION FAILS TO DRIVE CAR: Usually caused by failure of one or both bands to be applied. Check for low oil pressure. Front or rear band adjustment incorrect. Manual valve mispositioned, or torus check valve sticking. Front oil pump inoperative. See Oil Pressure Tests.



NO 3RD. OR 4TH. SPEED DRIVE (Drive normally in 1st. & 2nd. Speed): Rear clutch not applying due to: Leakage in line to clutch or in valve body, hole in transmission case to oil delivery sleeve or sleeve passage clogged, oil delivery sleeve incorrectly installed or oil rings broken, clutch oil seal leaking or clutch piston sticking.

SLIPS IN 1ST. 3RD, & REVERSE (Operation normal in 2nd. & 4th. Speed): Front band slipping due to: Leakage in valve body, passages in case, or in servo. Servo pistons sticking. Band incorrectly adjusted. Valves in valve body sticking. Throttle linkage incorrectly adjusted or not operating correctly.

SLIPS IN 1ST. OR 2ND. SPEED (Operation normal in 3rd. 4th., & Reverse): Rear band slipping due to: Leakage in valve body, passages in case, or in servo. Servo piston sticking. Band incorrectly adjusted. Valves in valve body sticking. Throttle linkage incorrectly adjusted or not operating correctly.

SLIPS IN "LO" RANGE (Operation normal in Reverse): Rear band slipping or not operating (see causes in 1st. & 2nd. Speed Slip above).

SLIPS OR CHATTERS ON 3-2 DOWNSHIFT: Rear band slipping or not operating (see causes in 1st. & 2nd. Speed Slip above). Rear servo operation incorrect due to: weak or broken servo springs or accumulator check valve stuck closed. Insufficient compensator pressure due to: Throttle linkage operating incorrectly or compensator valve stuck.

DUAL-RANGE HYDRA-MATIC REAR OIL PUMP & GOVERNOR

THROTTLE DOWNSHIFT FROM 3RD. SPEED DELAYED OR REQUIRES EXCESSIVE THROTTLE OPENING (May not occur until car stopped, usually occurs when transmission cold): Governor or valves in valve body sticking.

CLOSED THROTTLE 3-2 DOWNSHIFT OCCURS AT EXCESSIVELY HIGH SPEED (with severe "clunk"): Rear servo check valve not operatng correctly, accumulator piston rings stuck or broken, valves in valve body sticking, rear clutch piston binding on its pilot, governor operation incorrect, governor oil seal rings broken, or oil leak at governor assembly.

LIGHT THROTTLE DOWNSHIFT TO 3RD. SPEED OCCURS ABOVE 20 MPH. IN DRIVE RANGE (Or transmission "hunts" between 4th. & 3rd. Speeds): Throttle linkage adjustment incorrect or valves in valve body sticking.

UPSHIFTS ERRATIC OR MISSING (Starts in 3rd. or 4th. Speed in "Dr" Range, Starts in 2nd. Speed in "Lo" Range, May shift to 3rd. Speed in "Lo" Range or miss 3rd. Speed in "Dr" Range, May operate only in 2nd. Speed or only in 3rd. & 4th. Speeds in "Dr" Range): Governor valves sticking or valves in valve body sticking.

NO 4TH. SPEED UPSHIFT (2nd. & 3rd. Speed Upshifts normal): Governor valves sticking or valves in valve body sticking.

LIGHT THROTTLE UPSHIFT SPEEDS EXCESSIVELY HIGH (with violent band application when shifting from "N" to "Dr" when car standing): Governor valves sticking or valves in valve body sticking.

TRANSMISSION JUMPS OUT OF REVERSE: Manual control linkage rod adjusted too short.

SHIFT OUT OF REVERSE DIFFICULT: Inside manual cam lever surface rough or detent plunger rough.

ERRATIC RESPONSE TO SHIFT LEVER: Inner manual control valve lever loose on shaft. Replace lever assembly.

HUNTING: Adjust throttle linkage, check valve assembly and clean thoroughly and reface.

ALL SHIFTS ROUGH: Adjust throttle linkage and servo bands. Clean and reface valve assembly. Check transmission passages for leaks. Check oil pressure.

CREEPS FORWARD WHEN IN "R" POSITION: Rear unit not operating correctly. Excessive drag in rear clutch.

NO DRIVE WHEN ENGINE IS FIRST STARTED: Check fluid coupling and front pump. Test oil pressure.

CREEPS EXCESSIVELY IN "Dr": Engine idle speed too high.

CAR WILL NOT BACK UP: (Unless throttle is opened excessively)—Rear band not released due to low oil pressure caused by leakage or compensator valve auxiliary plug pin missing.

BANDS APPLIED VIOLENTLY, ENGINE SPEEDS UP: Low oil pressure or level. Pressure regulating valve sticking. Front pump may not be operating properly or there is a bad oil leak in the system. Check oil pressure and oil level. Free up pressure regulator valve or install new valve.

NO DRIVE IN REVERSE: This condition will occur if front servo exhaust body spacer is installed in reverse. Under this condition oil pressure does not increase when selector lever is placed in Reverse position. Pressure will increase to 150-170 lbs. when transmission shifts from 1 to 2.

SLIPPING IN REVERSE ONLY: Check for Low Oil Pressure in Reverse, Inoperative Front Servo Exhaust Valve, Key missing or defective in stationary cone, Stationary Cone or Cone Clutch Piston worn excessively, Front Servo & Band operation not operating properly, Valve Body Assembly dirty (sticking valves or oil leaks), Stationary cone distorted by handling when disassembled.

SELECTOR LEVER WILL NOT GO INTO REVERSE: Check for: Governor G-1 weight stuck wide open or broken governor ring (separating main lin pressure from G-1 pressure to reverse blocker piston),

CONTINUED ON NEXT PAGE

DUAL-RANGE HYDRA-MATIC (C ntinued)

Governor ring groove or gap clearances incorrect, Governor sleeve defective, Parking Pawl Crank bent, Detent Plunger in inner control lever stuck, Reverse Blocker Piston sticking or piston spring weak or broken.

EXCESSIVE SQUAWK IN REVERSE (May occur when selector lever out of Reverse if reverse unit not fully disengaged): Check for low oil pressure and galling of stationary cone and cone clutch piston. If reverse not fully disengaged also check for: Check Valve in detent plunger retainer in valve body plugged, Reverse Clutch Spring inoperative or weak, High spot or galling of stationary cone and cone clutch piston, cone clutch piston release springs defective or weak, Rear Bearing Dowels too high.

LOW OIL PRESSURE, SLIPPAGE, DELAYED AND ERRATIC UPSHIFTS: These conditions will exist when one or the other of the two ¼" cup shaped plugs are missing from the parking bracket. (CAUTION—These plugs are not service parts and should never be removed). If plugs are loose or missing, replace assembly.

REVERSE CONE ENGAGES WHEN IN DRIVE: This condition can occur when there is excessive leakage into the reverse apply circuit. Check for leakage as follows:

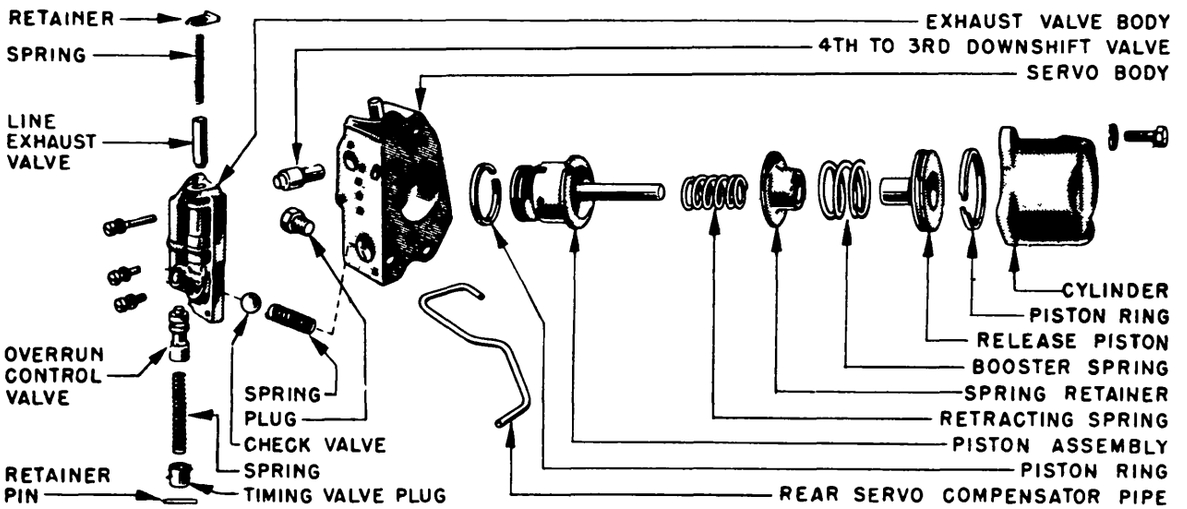
1) Check front servo exhaust valve for proper fit in exhaust body. Clearance should be .002".

2) Inspect detent retainer spacer and valve body surfaces that contact spacer. Replace control valve if necessary.

3) Check Throttle Valve plug in Pressure Regulator for excessive clearance. If greater than .002" replace Regulator plug assembly.

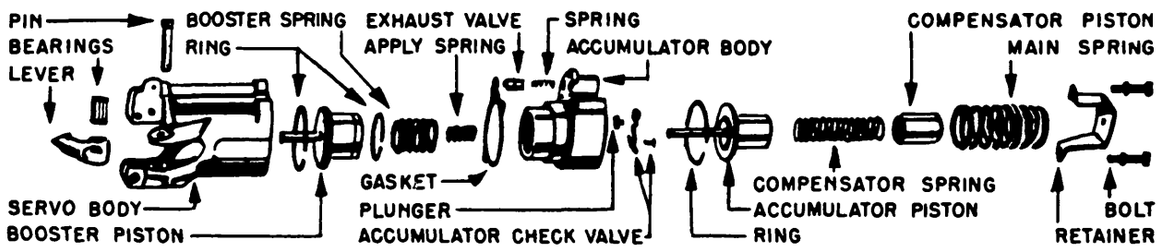
4) Neoprene seal on Pressure Regulator Plug defective. Use extreme caution when installing plug not to damage seal (remove all sharp corners or burrs in transmission case with round hone, place small amount of grease on seal before installing assembly, DO NOT use wrench to start pressure regulator plug in housing).

REMOVAL & INSTALLATION
HUDSON, NASH & RAMBLER



REMOVAL: Raise car and place on jack stands, supporting rear of car at body side sills. Support rear axle assembly with a hydraulic jack. Drain fluid from transmission (see "Draining & Refilling" above) and remove oil pan. Disconnect hand brake cable at bellcrank and brake cable housing at bellcrank bracket. Disconnect speedometer cable and housing at transmission adapter. Disconnect throttle rod and manual control rod assemblies at levers on transmission. Remove rear brake hose bracket from floor pan to prevent damage to hose. Disconnect torque tube from rear bearing retainer; then move rear axle and torque tube assembly to rear and separate by sliding universal joint to rear, off splines of output shaft. Support rear end of engine to take weight off support crossmember. Remove support crossmember, cushion and bracket assembly. Remove plate from flywheel housing and drain fluid from torus cover. Remove throttle control lever from transmission to prevent bending it while removing and replacing transmission. Remove torus cover-to-flywheel attaching bolts and lockwashers (30). Lower engine slightly to remove flywheel housing attaching bolts. Place hydraulic jack, with tool J-2808 under transmission (jack handle toward rear), and lift transmission slightly to take strain off flywheel housing bolts (*CAUTION* - Tool J-2808 must be fastened securely to jack pad to prevent it slipping). Remove flywheel housing attaching bolts, nuts and lockwashers. Remove transmission assembly by moving transmission to rear of car and lower assembly after mainshaft has been withdrawn from crankshaft pilot bushing. *NOTE* - To prevent end of mainshaft striking flywheel-to-crankshaft bolts when lowering transmission, turn flywheel so end of mainshaft will pass between two bolts.

INSTALLATION: Reverse removal procedure and note the following: Guide sleeves of flywheel housing into corresponding holes in rear engine plate and dowels of flywheel in corresponding holes in torus cover. Install flywheel housing attaching bolts, lockwashers and nuts. Install torus cover-to-flywheel bolts with lockwashers and tighten finger tight. Finally tighten as follows: Tighten two bolts adjacent to dowels to 12-15 ft. lbs. Tighten two bolts located 90° from dowels to 12-15 ft. lbs. Tighten all bolts in rotation to 20-25 ft. lbs. Re-tighten all bolts in rotation to 30-35 ft. lbs.



OLDSMOBILE

REMOVAL: Disconnect lower starter cable assembly from junction block, then disconnect purple lead from neutral safety switch, and black lead from main wiring harness. Loosen safety switch mounting bracket. Raise car on two-post hoist and drain transmission (see "Draining & Refilling" above). Remove left engine filler plate and remove starter with cable assembly attached. Remove crankcase ventilator. Support engine with unit-lift, raising it far enough to relieve weight from rear mounts, then remove capscrews from rear mounts-to-flywheel housing. Remove three bolts from each end of crossmember-to-frame and remove crossmember. Remove lower flywheel housing and install rear engine support bar BT-28, with pilots on support screws entering lower housing front attaching screw holes. (*NOTE* - Locate bar forward so it will not inter-

CONTINUED ON NEXT PAGE

DUAL RANGE HYDRA-MATIC FRONT SERVO UNIT (TYPICAL)

DUAL-RANGE HYDRA-MATIC REAR SERVO ASSEMBLY (TYPICAL)

DUAL-RANGE HYDRA-MATIC (Continued)

fere with torus cover when lowering transmission). Remove unit-lift. Disconnect speedometer cable at transmission. Disconnect manual control rod from transmission lever. Remove throttle control rod lever. Disconnect propeller shaft from companion flange and slide rearward away from transmission Remove torus cover-to-flywheel attaching screws (30). Lower engine, not to exceed 1½", enough to permit removal of the two upper bellhousing-to-block capscrews. Again support transmission with unit-lift and secure with chain (if so equipped). Remove two remaining flywheel housing-to-block bolts. Remove transmission assembly toward rear of car, lower it at the same time. *NOTE* - To prevent end of mainshaft striking flywheel-to-crankshaft bolts when lowering transmission, turn flywheel so end of mainshaft passes between two bolts.

INSTALLATION: Reverse removal procedure and note the following Use a new gasket and do not use shellac or sealer. Tighten torus cover-to-flywheel capscrews to 35-40 ft. lbs.

PONTIAC

REMOVAL: Raise car on hoist and drain transmission (see "Draining & Refilling" above). Disconnect filler pipe. Disconnect speedometer cable at transmission. Disconnect propeller shaft at differential flange and slide propeller shaft from transmission output shaft. Loosen exhaust pipe at crossover pipe flange. Remove flywheel housing lower cover. Drain oil from cover by removing pipe plug. Remove throttle control lever (outer) from shaft at side of transmission. Disconnect gear shift control rod assembly from shift lever at transmission. Remove torus-to-flywheel cover attaching bolts (30). Disconnect two rear engine mounting insulators at crossmember. Using Tool J-4732, raise back of engine until rear engine mountings are approximately ¼" above crossmember *(CAUTION - Do not raise engine more than necessary to remove crossmember).* Remove six crossmember-to-frame side rail bolts and remove crossmember by tapping both ends of crossmember down until right end is resting on exhaust pipe. Then tap left end down until it clears frame side rail. Lift right end over exhaust pipe and remove *(NOTE* - Mark crossmembers so left side can be distinguished from right when installing). Lower engine below its normal position so rear flywheel housing upper attaching bolts are accessible with an 18" to 22" socket extension and universal socket. Position special transmission jack under transmission and lift transmission slightly to take strain off rear flywheel housing attaching bolts. Remove six rear housing-to-front flywheel attaching bolts and lockwashers. Remove transmission assembly by moving transmission toward rear of car and at same time lowering assembly to floor.

INSTALLATION: Reverse removal procedure and note the following Position torus cover so that grind marks, punch marks, or blue markings on flywheel dowel and torus cover correspond. To position frame crossmember, raise engine approximately ½" above its normal height. Tap crossmember into place between frame side rails, making sure it is installed in correct position (rear edge of crossmember is cut away slightly along bottom edge to give ample clearance for transmission oil pan).

TRANSMISSION OVERHAUL

OVERHAUL: Disassembly, reassembly and overhaul procedures are the same as for 1955 model transmissions. *See "Dual-Range Hydra-Matic Transmission" in 1955 Annual Data or later Manual edition, and note the "Changes, Cautions, Corrections" above.*

DUAL-COUPLING HYDRA-MATIC

Cadillac (1956)
Nash Ambassador Special V8 (1956)
Hudson Hornet Special V8 (1956)
Oldsmobile (1956) ①
Pontiac (1956) ①

①—Dual-Range Hydra-Matic also used on some models.

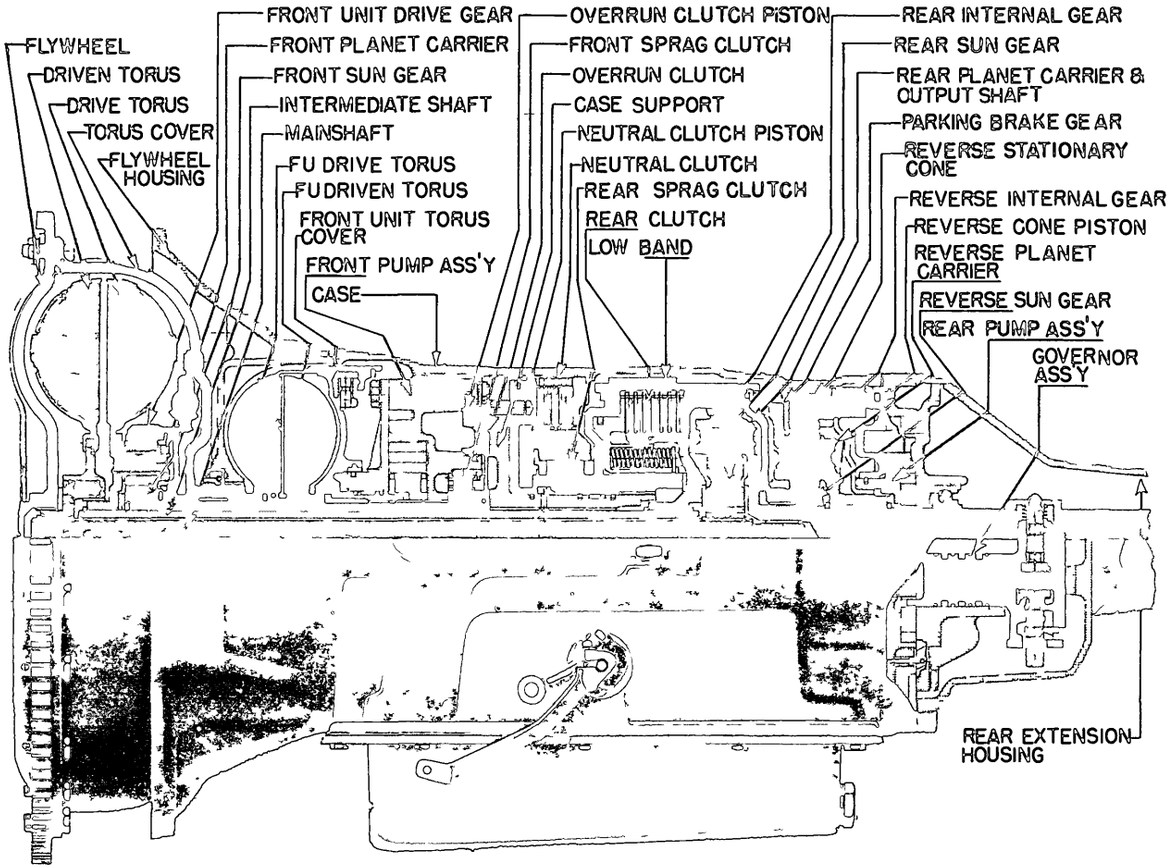
▷CHANGES, CAUTIONS, CORRECTIONS

▷*STARTING ENGINE BY PUSHING CAR:* Move selector lever to "N" (Neutral) position and turn on ignition switch. When car reaches speed of 25 MPH (Exc. Cadillac); 30-35 MPH (Cadillac), move selector lever to either "D" (Drive) position on Cadillac, Hudson, Nash & Pontiac; or to "D" or "S" position on Oldsmobile.

▷*TOWING HYDRA-MATIC DRIVE CARS:* Drive shaft must be removed or car must be towed with the rear wheels off the ground. Damage to transmission will result if these precautions not taken.

▷*TRANSMISSION OIL COOLER NOTE (ALL MODELS):* In the event of serious damage to transmission, the oil cooler should be replaced as it is not possible to properly clean cooler in the field.

▷*TRANSMISSION OIL FOAMING NOTE (ALL MODELS):* This condition may be caused by water leaking into transmission at the oil cooler. Check oil cooler for leaks as follows: Remove cooler and apply air pressure not exceeding 25 lbs., to either of the two cooler water pipes (plug other pipe). Submerge end of oil pipes in water and check for air bubbles in water. If bubbles appear, oil cooler is leaking and must be replaced. Before installing new cooler, remove transmission oil pan and clean thoroughly. Install clean transmission oil.



▷*1956 CADILLAC & PONTIAC TRANSMISSION OIL FILLER PIPE LEAKAGE CORRECTION:* Remove filler pipe and install Service Package, Part No. 861956 as follows: Install new "O" ring seal and new sleeve, tapping sleeve gently into case until snug against "O" ring seal. Lubricate filler pipe and insert into sleeve and through "O" ring seal (it may be necessary to remove pipe and drive sleeve down against seal to properly compress it for a tight fit). Make sure "O" ring seal is not damaged during installation.

▷*TRANSMISSION PRESSURE POINT CHANGE:* On later transmissions, a pipe plug will be found on the right side of the transmission just above and to rear of oil cooler pipe adapter, which will be used for checking Throttle Valve Pressure.

▷*1956 CADILLAC TRANSMISSION "SQUEAK" CORRECTION:* A high shrill squeak, similar to a dry water pump squeak may occur in first and reverse gears, and in "Dr3" under full throttle. Correct by installing thrust washer, Part No. 8616526, between driving torus of front unit coupling and bushing of flywheel.

▷*1956 CADILLAC ERRATIC SHIFT CORRECTION:* See *"Overhaul" below.*

▷*1956 CADILLAC 1-2 OR 2-3 LATE SHIFT CORRECTION:* May be caused by improper throttle valve adjustment, dirt in control valve assembly, or interchanged valve springs. See *"Overhaul" below.*

DUAL-COUPLING HYDRA-MATIC TRANSMISSION (SECTIONAL VIEW)

▷*1956 CADILLAC SLIPPING SHIFT CORRECTION:* If slipping or long drawn out 2-3 shifts cannot be corrected by throttle valve rod adjustment or cleaning control valve and governor, install an inner accumulator spring, Part No. 8617469. See *"Overhaul" below.*

▷*EARLY 1956 CADILLAC GOVERNOR CLICK CORRECTION:* See *"Overhaul" below.*

▷*1956 PONTIAC 285 HORSEPOWER ENGINE TRANSMISSION THROTTLE VALVE CONTROL ROD & LEVER CHANGE:* This correction made to reduce the tendency of bunching the 1-2 and 2-3 shifts, and to improve the 2-3 shift. The later type throttle valve outer lever, Part No. 521523 is identified by its right angle shape (earlier type has a reverse curve). On the later type, the distance between centerline of throttle shaft hole and centerline of hole for throttle rod ball is 2-31/32" (3-7/8" on early type). A new throttle rod, Part No. 522789 is used with the new lever and is identified by a 4-5/32" length from rear ball stud to first bend (earlier rod is 3-1/16" at this location).

▷*1956 PONTIAC 285 HORSEPOWER ENGINE TRANSMISSION SOFT OR SLIPPING 2-3 SHIFT CORRECTION:* If there is a soft or slipping 2-3 shift after installation of the later type throttle valve outer lever and throttle rod (see above), transmission accumulator springs can be changed. See *"Overhaul" below.*

▷*1956 PONTIAC PRODUCTION CHANGE (TO IMPROVE 2-3 SHIFT) AND CENTER BEARING SUPPORT PRODUCTION CHANGE:* See *"Overhaul" below.*

▷*1956 PONTIAC LOW SPEED "CLICKING" NOISE CORRECTION:* See *"Overhaul" below.*

▷*1956 PONTIAC TRANSMISSION LOCKUP CORRECTION (When Shifting From Drive To Reverse):* See *"Overhaul" below.*

DESCRIPTION

The Dual-Coupling Hydra-Matic is a four speed hydraulically controlled planetary type transmission

CONTINUED ON NEXT PAGE

DUAL-COUPLING HYDRA-MATIC (C ntinu d)

which is connected to the engine crankshaft through a fluid coupling, and is composed of the following control assembly, parking assembly, and drive units.

Control Valve Assembly–The control valve assembly consists of four individual assemblies connected to one main assembly Coupling Valve Body Assembly, Shift Valve Body, Reverse Blocker Body, and Manual Control Valve Body Assembly.

Parking Assembly–A pawl actuated by linkage of manual control lever drops into teeth on outer diameter of the reverse planet carrier which is splined to output shaft of transmission and which prevents the output shaft from turning.

Front Unit–Drive parts of the front unit are the controlled fluid coupling, planetary gear set, and front sprag clutch.

Rear Unit–Drive parts of the rear unit are the planetary gear set, multiple disc rear clutch, rear sprag clutch, and the neutral clutch.

Reverse Unit–Drive parts of the reverse unit are the planetary gear set, reverse stationary cone, and reverse apply piston.

Overrun Clutch (Front Unit)–The overrun clutch is a single disc clutch connected to the front sprag clutch and is used to prevent the sun gear from rotating. This unit operates only when overrun braking is required in Dr. 3 range (1st & 3rd speed), Lo range (1st speed), and Reverse.

Lo Band (Rear Unit)–The Lo band is servo operated and is engaged only when transmission is in Lo range. Adjustment of this band is not required.

OPERATION

Transmission operation in each selector lever position is outlined below. In either "D" (Drive) position, operation varies with car speed and operating conditions.

N utral Position: Front unit is in reduction (controlled coupling empty and sprag clutch holding). Rear unit is in neutral (neutral clutch released, rear clutch released and Lo band released). Reverse unit is in neutral (reverse cone clutch released)

Drive Left (Pointer to left of "D" on Cadillac & Pontiac. "Dr" on Oldsmobile. "Dr4" on Nash & Hudson).

First Speed–Front unit is in reduction (controlled coupling empty, sprag clutch holding). Rear unit is in reduction (neutral clutch applied, rear clutch released, sprag clutch holding and Lo band released). Reverse unit is in neutral (reverse cone clutch released). Total reduction is 3.97-1.

Second Speed–Front unit is in direct drive (controlled coupling is filled and sprag clutch released). Rear unit is in reduction (neutral clutch applied, rear clutch released, sprag clutch holding and Lo band released) Reverse unit is in neutral (reverse cone clutch released). Total reduction is 2.55-1.

Third Speed–Front unit is in reduction (controlled coupling empty, sprag clutch holding). Rear unit is in direct drive (neutral clutch applied, rear clutch applied, sprag clutch released and Lo band released). Reverse unit is in neutral (cone clutch released). Total reduction is 1.55-1.

Fourth Spe d–Front unit is in direct drive (controlled coupling is filled, sprag clutch released). Rear unit is in direct drive (neutral clutch applied, rear clutch applied, sprag clutch released and Lo band released). Reverse unit is in neutral (cone clutch released). No reduction 1.00-1.(Direct Drive).

Drive Right (Pointer to right of "D" on Cadillac & Pontiac. "S" on Oldsmobile. "Dr3" Nash & Hudson).

First Speed–Front unit is in reduction (controlled coupling empty, sprag clutch holding, overrun clutch applied). Rear unit is in reduction (neutral clutch applied, rear clutch released, sprag clutch holding and Lo band released). Reverse unit is in neutral (reverse cone clutch released) Total reduction is 3.97-1.

Second Speed–Front unit is in direct drive (controlled coupling filled, sprag clutch released, overrun clutch released). Rear unit is in reduction (neutral clutch applied, rear clutch released, sprag clutch holding and Lo band released). Reverse unit is in neutral (reverse cone clutch released). Total reduction is 2.55-1.

Third Speed–Front unit is in reduction (controlled coupling empty, sprag clutch holding, overrun clutch applied). Rear unit is in direct drive (neutral clutch applied, rear clutch applied, sprag clutch released and Lo band released). Reverse unit is in neutral (reverse cone clutch released). Total reduction is 1.55-1.

Lo Range (All Models):

First Speed–Front unit is in reduction (controlled coupling empty, sprag clutch holding, overrun clutch applied). Rear unit is in reduction (neutral clutch applied, rear clutch released, sprag clutch holding and Lo band applied). Reverse unit is in neutral (reverse cone clutch released). Total reduction is 3.97-1.

Second Speed–Front unit is in direct drive (controlled coupling filled, sprag clutch released, overrun clutch released). Rear unit is in reduction (neutral clutch applied, rear clutch released, sprag clutch holding and Lo band applied). Reverse unit is in neutral (reverse cone clutch released). Total reduction is 2.55-1.

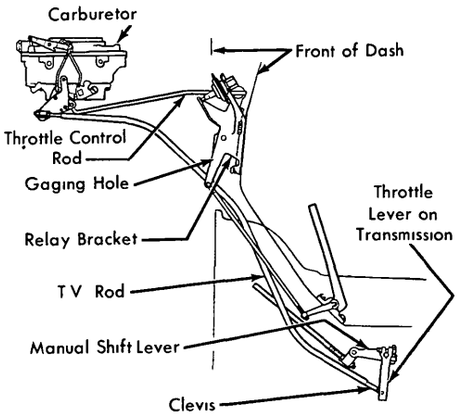
Reverse Range: Front unit is in reduction (controlled coupling empty, sprag clutch holding, overrun clutch applied). Rear unit is acting as reverse idler (neutral clutch released, rear clutch released, sprag clutch released). Reverse unit is in reduction (reverse cone clutch applied). Total reduction is 4.31-1.

LUBRICATION

LUBRICATION INTERVALS: Check fluid level every 1000 miles (Hudson, Nash & Oldsmobile), 2000 miles (Cadillac & Pontiac). Drain & refill every 25,000 miles.

Recommended Lubricant: Use only GM Hydra-Matic Fluid or an Automatic Transmission Fluid Type "A" with "AQ-ATF" embossed on top of fluid container.

CHECKING FLUID LEVEL: With selector lever in "N" or "P" position, run engine at normal idle speed (except Cadillac), approx. 20 MPH (Cadillac), for 1½ minutes and check fluid level on dipstick. With engine still running, add fluid to bring level up to within ¼" of "F" (full) mark on dipstick. *CAUTION–do not fill above "F" mark on dipstick as this will cause foaming when transmission oil is hot.*



►*NOTE Fluid level should be ¼" below "F" mark when cold and at the "F" mark when hot.*

DRAINING & REFILLING: Remove transmission oil pan drain plug and drain plug from flywheel or torus cover (*NOTE*–To gain access to flywheel or torus cover drain plug, remove flywheel housing front cover (Cadillac, Hudson & Nash), flywheel inspection plate (Oldsmobile), flywheel housing lower plate (Pontiac). Allow old fluid to drain completely and then reinstall plugs. *(CAUTION–Care must be taken not to damage flywheel or torus drain plug).* Pour 11 qts. (Oldsmobile), 8 qts. (all others) of Automatic Transmission Fluid Type "A" into transmission through filler tube on right side of transmission (tube is located under hood and also houses the dipstick). Run engine at 800 RPM (Cadillac), normal idle speed (all others) for 1½ minutes with selector lever in "N" (neutral). On Cadillac, reduce engine to idle speed and add fluid as required to bring level up to within ¼" of "F" (full) mark on dipstick.

►*NOTE*–Transmission oil capacity is approximately 12 qts. (Cadillac), 10½ qts. (Hudson & Nash), 11 qts. (Oldsmobile), 9½ qts. (Pontiac).

LINKAGE ADJUSTMENT

►*THROTTLE VALVE LINKAGE ADJUSTMENT NOTE: See "Carburetor" on individual car model pages for throttle valve linkage adjustment.*

CADILLAC MANUAL LINKAGE

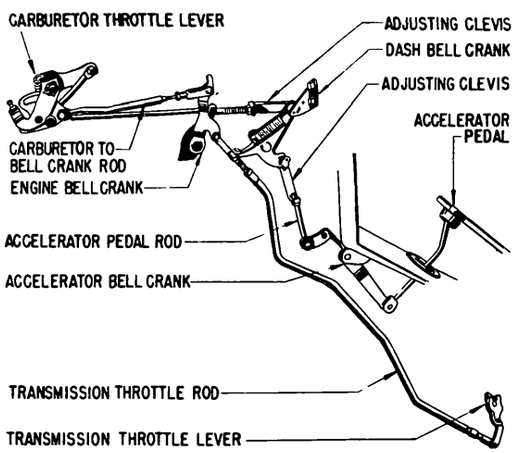
CADILLAC

MANUAL LEVER LINKAGE ADJUSTMENT: Loosen the adjusting nuts on transmission manual rod and back off approximately 1". Place manual lever on transmission fully forward to "P" (Park) position. Place selector lever on steering column in "P" (Park) position Slide clevis of manual lever along manual rod in direction of steering column until all slack in linkage is taken up (*NOTE*–If clevis contacts upper adjusting nut before all slack is taken up, nut should

CONTINUED ON NEXT PAGE

DUAL-COUPLING HYDRA-MATIC (Continu d)

be backed off an additional amount). Tighten lower adjusting nut with fingers against clevis to further remove slack. Bring upper adjusting nut down to contact clevis and tighten with wrench. Check manual selector lever in car. It should be free to enter the "P" (Park) position and the "DR4" stop in the steering column should correspond to the "DR4" detent position in the transmission. Readjust if necessary. Check indicator pointer to see that it indexes to the "DR4" position when selector lever is at the "DR4" stop.



N utral Saf ty Switch Adjustment (Combination Neutral Saf ty Switch, Back-up Light Switch): Located on steering column forward of instrument panel. Loosen attaching screw on switch and position it on jacket so starter is not operative in any position except "N" (Neutral) or "P" (Park).

NASH & HUDSON

MANUAL LEVER LINKAGE ADJUSTMENT: Place selector lever in the "D-3" position and set operating lever against stop on starter switch bracket. Remove clevis pin from gear shift control rod at side of transmission case and remove clevis from shift lever. Place transmission outer shift lever in "D-3" position. Adjust clevis so that clevis pin passes freely through hole in lever with the operating lever against stop on starter switch bracket, then remove clevis and **l ngthen the contr l rod two full turns** and replace clevis and pin.

OLDSMOBILE

MANUAL LEVER LINKAGE ADJUSTMENT: Place transmission manual lever in neutral detent position. Disconnect manual rod from lower shift lever. Hold lower shift lever upward so selector lever is positioned against stop in upper steering column. Adjust manual rod clevis so pin will enter approximately 1/8" into lower shift lever bushing with selector lever against stop. Tighten clevis locknut and connect manual rod to lower shift lever.

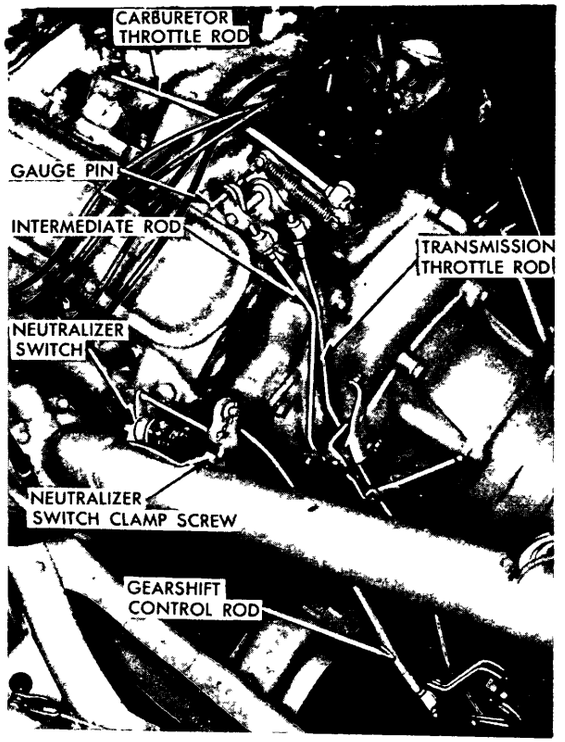
OLDSM BILE MANUAL LINKAGE

Neutral Saf ty Switch Adjustment: Located on steering column forward of instrument panel. Loosen attaching screws on mast jacket, and with selector lever in "N" (neutral) position, position the switch so that a .090" pin can be inserted through hole in switch arm and into hole in face of switch. Tighten switch attaching screws and remove pins. Check to see that starter will operate only in "P" (Park) and "N" (Neutral) positions, and that transmission is not in gear.

PONTIAC

MANUAL LEVER LINKAGE ADJUSTMENT: Place gear shift selector in "Drive Right" position against stop which prevents accidental shift into low range. Loosen both front and rear trunnion lock nuts and remove trunnion from outer shift lever. Make sure that transmission outer shift lever is in "Drive Right" position (third detent from front). Install trunnion with locknuts loose, in outer shift lever. Tighten front locknut against trunnion finger tight to remove clearance in in linkage. Tighten rear locknut against trunnion.

Neutral Safety Switch Adjustment: Located at lower end of steering column in engine compartment. Loosen switch mounting screw and adjust switch bracket to a position where starter will not operate when ignition key is turned to start position. Place manual control lever in "P" (Park) position. Make certain that switch arm does not touch stop on switch bracket. Check to see that engine starts when selector lever is in "P" (Park), or "N" (Neutral) positions. Tighten mounting screw securely.



TESTING

ROAD TEST: Operate car over a test route and note performance and shift speeds. Select a test route that will provide for all types of operation. *See "Dual-Coupling Hydra-Matic" Shift Point Table for correct shift speeds.*

►*1ST SPEED & REVERSE TEST NOTE: See "Stall Test" below.*

2nd Speed Test: With selector lever in "Lo" range, make a full throttle start from a complete stop. The shift to 2nd speed should occur as indicated in "Shift Table" below, accompanied by a drop in engine RPM which then increases in second speed as full throttle opening is maintained. If a definite change from first to second speed is not noticed and engine speed does not drop but increases steadily, a malfunctioning front unit coupling is indicated. When the car is in second speed, permit the car to coast at zero throttle opening. If a definite engine braking effort is noticed, a malfunctioning overrun band is indicated. If transmission slips in second or misses second speed, the front unit coupling is not operating properly. If transmission slips in first and second on coast in "Lo" range, the overrun band is not operating properly.

3rd & 4th Speed Test: Using the "Dr4" (Drive Left) range to obtain 40 MPH, move the selector lever to "Dr3" (Drive Right) range, forcing a downshift to third speed. Decrease car speed by use of the brakes while throttle is maintained in the open position and car speed is above 25 MPH. If engine RPM increases and the transmission has been satisfactory in reverse,

PONTIAC MANUAL LINKAGE

first & second speeds, the rear unit clutch is slipping. If no excessive slip is felt, the rear unit clutch is operating correctly. The operation of the front unit clutch can be checked by bringing the car speed up to 30 MPH in "Dr4" range. With the car coasting in "Dr4" range, manually shift to "Dr3" range. If an immediate shift is felt which results in more braking effect on the car, then the overrun clutch is operating properly. If the manual lever is shifted from "Dr3" to "Dr4" range above 22 MPH with the car coasting and an immediate reduction of braking effort is obtained, then the clutch is releasing properly.

►*1956 PONTIAC STALL TEST CHANGE: Stall testing to be discontinued.*

STALL TEST (EXCEPT 1956 PONTIAC): Use this test to check engine and transmission performance. Connect a tachometer to check engine speed, and bring engine and transmission to operating temperature. Apply foot brake and set hand brake tightly. Place selector lever in "Dr4" position. Depress accelerator pedal to the floor and note engine RPM *(CAUTION—Use extreme care when making this test and DO NOT HOLD THROTTLE OPEN MORE THAN ONE MINUTE, 15-20 seconds preferably. If engine speed exceeds maximum RPM, as noted below, CLOSE THROTTLE IMMEDIATELY to avoid possible damage to transmission). If engine speed not correct make further tests as indicated below.*

CONTINUED ON NEXT PAGE

DUAL-COUPLING HYDRA-MATIC (C ntinued)

If Engine Speed Above Maximum: If engine speed continues above 1825 RPM (Hudson & Nash), 2100 RPM (Cadillac with single carburetor), 2500 RPM (Cadillac with dual carburetor) it indicates that sprags are not holding properly or that there is slippage in the fluid coupling, damaged torus members, or defective front pump.

Check To Determine Which is Slipping—After above test, place selector lever in "R" position and test again. If slippage still occurs, fault is with front unit (or both front and rear units). If slippage does not occur, then all slippage is in the rear unit.

OIL PRESSURE TEST: Connect Oil Pressure Gauge J-2540 (Cadillac), J-2540-A (Hudson & Nash), J-4268-1 (Pontiac) to take-off hole at bottom of rear pump using a hose and fitting. Drive car until transmission oil has reached normal operating temperature.

Zero Throttle Pressure (Hudson, Nash, Pontiac): Check pressure in all ranges. Pressure should be 50 lbs. minimum in all ranges with a maximum variation of 10 lbs., (may be higher in reverse).

Zero Throttle Pressure (Cadillac): With transmission in 4th speed, and car above 20 MPH, oil line pressure should be 60 to 70 lbs.

Drive Right Pressure (Hudson, Nash, Pontiac): With transmission selector lever in "Drive Right" position and car speed at approximately 25 MPH, pressure should be 90-100 lbs. *NOTE*—Pressure at any speed is constant regardless of throttle pressure as throttle valve pressure is not used to modulate line pressure.

Drive Left Pressure (Hudson, Nash, Pontiac): While driving at 25 MPH, move selector lever back to "Drive Left" position so that transmission will shift into 4th speed. Oil pressure should drop to 60-70 lbs., in 4th.

Full Throttle Pressure Test (Cadillac): In any drive range pressure should be at least 20 lbs. higher than zero throttle pressure test reading (see above).

Rear Pump Pressure Test (Cadillac): Drive car at 40-45 MPH in 4th speed, then shift to neutral and turn engine off. Pressure should be at least 60 lbs.

Reverse Pressure Test (Cadillac, Huds n, Nash, P ntiac): Place selector lever in "R" (Reverse) and

DUAL-COUPLING HYDRA-MATIC (C ntinu d)

apply foot brake firmly. Increase engine speed to half throttle. The pressure range under these conditions should be 160-200 lbs. (Cadillac); 145-190 lbs. (Hudson, Nash, Pontiac).

TROUBLE SHOOTING & DIAGNOSIS

FORWARD DRIVE IN NEUTRAL: Manual linkage not adjusted correctly. Neutral clutch not releasing properly. Rear unit clutch not releasing properly. Overrun band not fully released.

REVERSE DRIVE IN NEUTRAL: Stationary cone sticking. Reverse piston not fully released.

NO DRIVE (R sulting in Neutral Condition): Front sprag clutch slipping. Front sprag clutch incorrectly installed. Rear sprag clutch slipping. Rear sprag clutch incorrectly installed. Neutral clutch apply restricted or leaking. Manual linkage incorrectly installed. Manual valve not engaged with valve pin. Low oil pressure.

NO DRIVE (R sulting in Stall Condition): Stationary cone sticking. Reverse piston not fully released. Front sprag clutch broken. Rear sprag clutch broken.

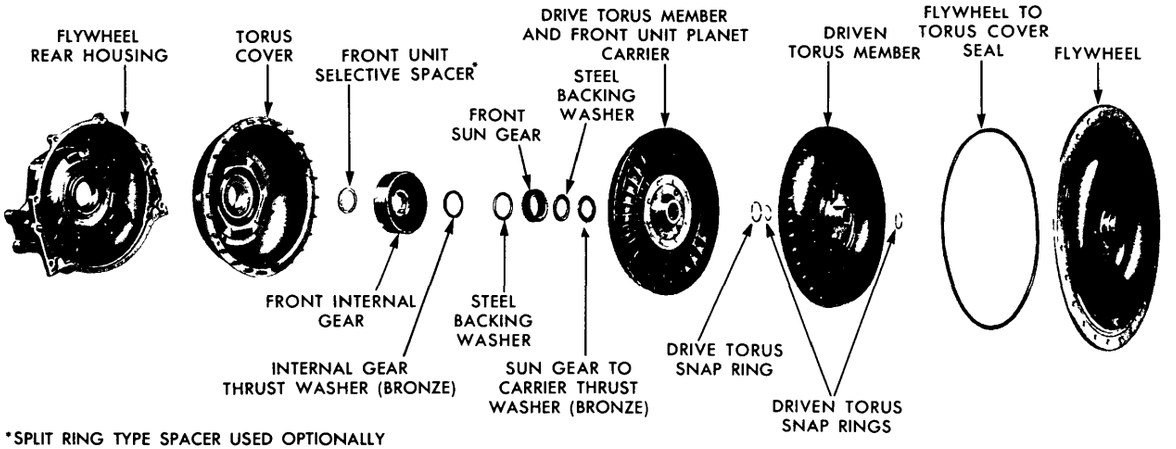
LOCKED-UP CONDITION IN REVERSE RANGE: Neutral clutch not releasing properly. Rear unit clutch not releasing properly. Overrun band not fully released. Rear sprag clutch incorrectly installed.

NEUTRAL CONDITION IN REVERSE RANGE: Reverse piston apply restricted or leakage. Stationary cone key missing.

NO REVERSE (Driv Slips): Reverse piston apply restricted or leaking. Low oil pressure. Manual linkage not adjusted correctly. Manual valve not engaged with valve pin. Front sprag clutch slipping or broken.

SELECTOR LEVER WILL NOT GO INTO REVERSE RANGE: Governor valves sticking or broken govenor oil seal rings. Reverse blocker piston stuck open.

SLIPS IN 1ST & 3RD IN "DR4" RANGE: Front sprag clutch slipping or broken.



SLIPS IN OR MISSES 2ND & 4TH: Front unit coupling cover seals leaking. Front unit coupling cover exhaust valves sticking or missing. Front unit coupling cover feed restriction or leak. Front unit coupling cover signal restriction or leak. Low oil pressure. Coupling valve sticking. Sticking valve or dirt in valve body.

SLIPS IN 1ST & 2ND (All Drive Ranges): Neutral clutch slipping or burned. Neutral clutch apply restricted or leaking. Incorrect number of clutch plates. Rear sprag clutch slipping or broken. Low oil pressure.

SLIPS IN 3RD & 4TH (In Both "Dr4" & "Dr3"): Rear clutch unit slipping or burned. Rear unit clutch apply restricted or leaking. Incorrect number of clutch plates.

SLIPS IN 3RD (In "Dr3" on C ast): Overrun clutch slipping or burned. Overrun clutch apply restricted or leaking. Sticking valve or dirt in valve body.

SLIPS IN 1ST & 2ND (In "L " on C ast): Servo apply restricted or leaking. Overrun clutch not anchored to case or broken. Servo piston binding in case or in servo and accumulator body. Overrun band facing worn or loose.

*SPLIT RING TYPE SPACER USED OPTIONALLY

DUAL-COUPLING HYDRA-MATIC FLYWHEEL REAR HOUSING & TORUS ASSEMBLY

SLIPS IN 1ST (In all Drive Ranges): Front sprag clutch slipping or broken. Front sprag clutch incorrectly installed. Rear sprag clutch slipping or broken. Rear sprag clutch incorrectly installed. Neutral clutch slipping or burned. Neutral clutch apply restricted or leaking. Incorrect number of neutral clutch plates.

NO UPSHIFTS: Governor valves sticking. Broken governor oil seal rings. Sticking valve or dirt in valve body.

MISSES 2ND SPEED: Amplifier valve sticking. Transition valve sticking. Sticking valve or dirt in valve body.

MISSES 3RD SPEED: Transition valve sticking. Sticking valve or dirt in valve body.

ROUGH 2-3 UPSHIFT: Trimmer valve stuck. Accumulator piston stuck. Accumulator gasket broken or leaking. Restricted or leaking oil passages. Broken accumulator spring. Broken or leaking accumulator piston oil seal ring.

LOCKS UP IN 3RD & 4TH: Rear sprag clutch broken.

LOCKS UP IN 2ND & 4TH: Front sprag clutch broken.

UPSHIFTS HIGH: Governor valves sticking. Leaking or restricted main line feed to governor. Broken governor oil seal rings.

UPSHIFTS LOW: Governor valves sticking. Broken governor oil seal rings. Sticking valve or dirt in valve body.

REMOVAL & INSTALLATION

CADILLAC

REMOVAL: Place car on jack stands with all four wheels approximately 12" above floor.

1) Disconnect propeller shaft at the rear universal joint flange and remove shaft with front universal joint and yoke. Disconnect battery and remove starter.

2) Remove flywheel housing front cover and drain transmission at oil pan and flywheel *(see "Draining & Refilling" above).* Remove hoses from oil cooler and plug hose ends to prevent coolant leaking and entry of dirt *(CAUTION–Exercise care when removing hoses to prevent burns).*

3) Remove four nuts attaching flywheel drive plate to flywheel and torus cover assembly. Place a jack or other suitable device under rear of engine oil pan, using a wood block if necessary to prevent damage to oil pan. Remove transmission fluid filler tube from transmission case, being careful to first clean dirt from around flange at transmission.

4) Disconnect throttle rod and manual shift rod from levers on side of transmission. Remove throttle control and manual control levers from shafts. Disconnect speedometer cable from extension housing. Place transmission jack under transmission and raise it just enough to take strain off rear engine support. Disconnect engine rear support at transmission extension housing. Remove bracket cross member that carries support.

5) Pull back carpet in front compartment at center of floor pan and remove two upper flywheel housing screws, through openings in floor pan. From below car, remove four screws holding flywheel housing to engine crankcase.

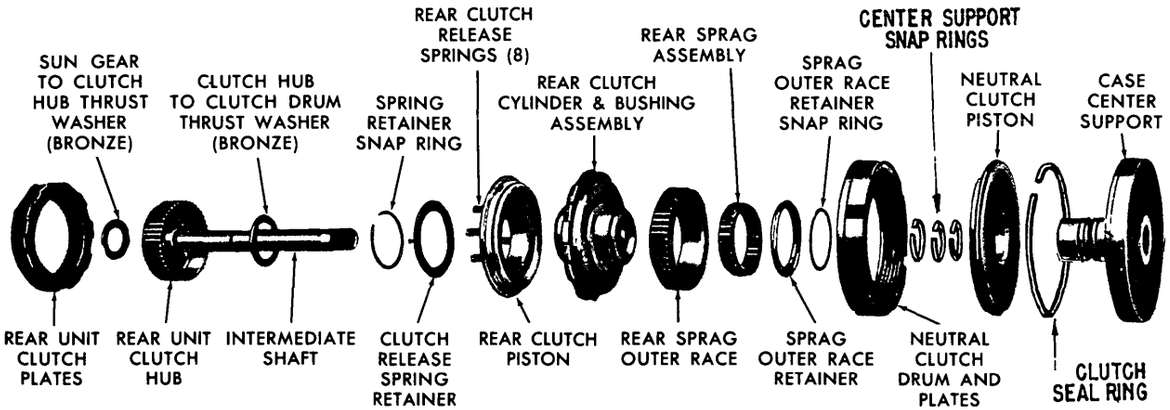
6) Remove transmission and flywheel housing as a unit by moving back toward rear of car, disengaging flywheel housing from dowels locating it to engine crankcase. Tilt transmission and at the same time lower it to floor.

INSTALLATION: *NOTE–Before installing transmission, make sure that engine crankshaft-to-drive plate bolts are properly torqued to 75-80 ft. lbs.*

1) Slide transmission under car and raise into position carefully with a transmission jack, making sure that flywheel drive plate fits over four of the torus cover bolts and that dowel pins in crankcase enter holes in flywheel housing without cocking.

2) Install the screws holding flywheel housing to crankcase and tighten screws securely. Tighten flywheel and oil pan drain plugs.

CONTINUED ON NEXT PAGE



DUAL-COUPLING HYDRA-MATIC (Continued)

3) Install four nuts attaching flywheel drive plate to flywheel and torus cover assembly and tighten to 15-25 ft. lbs.
4) Install flywheel housing front cover. Lift engine and transmission to about one inch above its normal height, using a jack with wooden block under the engine (when transmission jack is of sufficient capacity to lift weight of entire engine). Install bracket that carries engine rear support, lower engine and connect support.
5) Install front universal joint and sliding yoke with propeller shaft on transmission output shaft and connect rear universal joint, using new lock plates. Connect speedometer cable. Install throttle and manual levers, making sure serrations in lever line up with serrations on their respective shafts and are tightened securely. Adjust manual linkage *(see "Linkage Adjustment" above).*
6) Install starter motor. Connect hoses to oil cooler and tighten securely. Lower car to floor and connect battery. Fill transmission. *(see "Draining & Refilling" above).* Adjust throttle control and throttle valve linkage *(see "Carburetor" on car model pages).*

HUDSON & NASH

REMOVAL: Raise car sufficiently on car stands, supporting rear of car at side sills. Support rear axle with a hydraulic jack.
1) Drain flywheel and transmission oil pan *(see "Draining & Refilling"* above). Remove oil filler tube from oil pan. Disconnect oil cooler tubes at right side of transmission.
2) Disconnect hand brake cable at bell crank brake cable housing at bell crank bracket. Remove brake hose bracket from floor pan to prevent damage to hose. Disconnect speedometer cable and housing at transmission adapter.
3) Disconnect throttle rod assembly from throttle lever at transmission and bellcrank at bell housing. Disconnect manual control rod from lever at transmission.
4) Disconnect torque tube from rear bearing retainer, then move rear axle and torque tube assembly to the rear and separate by sliding universal joint to rear off splines of output shaft.
5) Support rear of engine to remove weight from rear engine support cross member. Remove plate from flywheel housing and remove six nuts retaining flywheel and torus assembly to engine flex plate, Place a hydraulic jack, with Tool J-6130 under transmission. Disconnect flywheel housing-to-engine attaching bolts.
6) Disconnect the cross member from rear engine supports and from body side sills. With jack handle toward rear of car, raise the jack slightly to remove strain or bind from bolts fastened to flex plate. Move transmission assembly to rear and lower assembly after six bolts have been withdrawn from engine flex plate.

INSTALLATION: Line up crankshaft flex plate in relation to the six bolts on transmission torus cover.
1) Lift transmission into place with a hydraulic floor jack and align transmission to engage bolts in flex plate. Install the six nuts and tighten to 25-30 ft. lbs.
2) Install flywheel housing-to-engine bolts. Install cross member and connect torque tube to rear transmission housing. Replace speedometer cable, and manual and throttle valve linkage. Connect oil cooler tubes and replace oil filler tube.
3) Connect brake hose bracket. Install lower flywheel housing-to-engine cover. Remove engine support. Complete installation by reversing procedure. Fill Transmission *(see "Draining & Refilling" above).* Adjust manual and throttle linkage *(see "Linkage Adjustment" above).*

CENTER BEARING SUPPORT, NEUTRAL CLUTCH, & REAR UNIT CLUTCH (TYPICAL)

OLDSMOBILE

REMOVAL: 1) Disconnect battery and remove transmission oil filler tube. Raise car with all four wheels off floor. Drain transmission and flywheel *(see "Draining & Refilling" above).* Disconnect speedometer cable at transmission.
2) Disconnect manual and throttle valve linkage and remove both levers from side of transmission. Remove crankcase breather outlet tube. Remove propeller shaft, and on cars with dual exhaust, remove left hand exhaust pipe. Remove starter motor.
3) Support transmission with unit lift and adapter (that will accomodate this transmission). Raise engine enough to relieve weight from rear engine mounts. Remove engine mount-to-cross member bolts. Remove cross bar to frame attaching bolts, then remove cross member.
4) Remove lower flywheel housing. Remove torus oil drain plug and drain torus. Reinstall plug and tighten to 6-7 ft. lbs.
5) Install engine support bar, Tool BT-28, with support screw pilots seated into lower flywheel housing front attaching screw holes. *(NOTE–Locate support bar forward on frame so it will not interfere when lowering transmission).* Lower unit lift until it is free of transmission oil pan.
6) Lower engine (using support bar adjusting screws) NOT TO EXCEED 1½" to permit removal of the two upper bell housing-to-block bolts. Disconnect oil cooler hoses from lines and cap lines immediately to prevent entrance of foreign material.
7) Remove the four flex plate-to-flywheel attaching nuts and remove the flywheel housing-to-block bolts. Move transmission rearward approximately 3/4" to clear dowels (3/8" standard thread holes are provided adjacent to dowels for installing bolts to push flywheel housing off dowels). Lower transmission from car.

INSTALLATION: Reverse the removal procedure and note the following: Torque flex plate-to-flywheel attaching nuts to 20-25 ft. lbs. Torque oil pan drain plug to 35-45 ft. lbs. Torque throttle lever to 10-12 ft. lbs.

PONTIAC

REMOVAL: 1) Drain cooling system and remove transmission oil level indicator. Drain transmission oil pan (torus assembly can be drained at same time or it can be drained after transmission removed).
2) Disconnect rear universal joint from differential companion flange and slide propeller shaft from transmission output shaft. Disconnect speedometer cable from driven gear.
3) Remove flywheel housing bottom cover and crankcase ventilator outlet filter. If car is equipped with dual exhaust system, the right hand exhaust pipe must be removed (it is not necessary to disturb the exhaust system on cars with single exhaust).
4) Disconnect rear engine insulators from rear engine support cross member. Using Engine Fixture J-4732, raise rear of engine until insulators are about 1/2" above cross member *(CAUTION–Do not raise engine more than necessary to remove cross member).*
5) Loosen transmission filler pipe to cylinder head clamp. Remove transmission throttle control lever and disconnect manual control rod from transmission lever. Remove engine rear support cross member.
6) Remove nuts from six torus cover and flywheel-to-flex plate attaching bolts. Disconnect water hoses from oil cooler. Push transmission filler pipe upward out of transmission.
7) Lower engine about 1½" below its normal position and position special automatic transmission jack under transmission and raise transmission slightly to

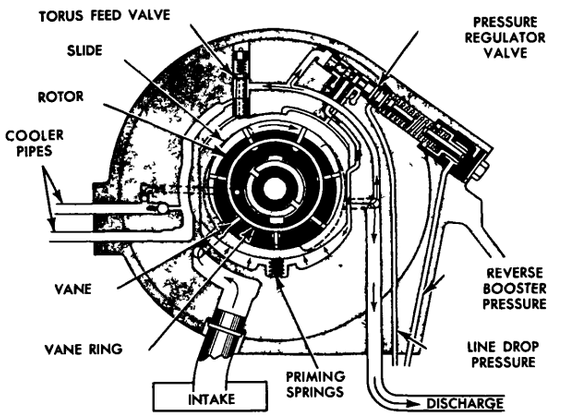
CONTINUED ON NEXT PAGE

DUAL-COUPLING HYDRA-MATIC (C ntinu d)

take load off rear flywheel housing attaching screws. Using 18" to 22" socket extension, remove screws attaching flywheel housing. Work transmission rearward to disengage dowels from front flywheel housing, then lower transmission from car.

►*FLYWHEEL & TORUS COVER ASSEMBLY PRODUCTION CHANGE:* A new torus cover using 12 attaching bolts will be used with a new flywheel having 12 bolt holes. Service replacement parts numbers will remain the same and both early and late types will be interchangeable. When using a 24 bolt type cover on a 12 hole flywheel, it is necessary to remove the 12 alternate bolts.

INSTALLATION: 1) With transmission on special automatic transmission jack, raise it under car until engine flex plate and transmission flywheel and torus cover are at the same level. Rotate torus cover until dowels in cover and flywheel are aligned with holes in flex plate (torus cover and flex plate can be fastened at either of two positions). Move transmission into position engaging flywheel dowels into flex plate and rear flywheel housing dowels into front flywheel housing.



2) Install rear flywheel housing attaching screws (NOTE—Check to see that flywheel and torus cover are free to move back and forth slightly. If pilot on flywheel entered end of crankshaft properly, some movement should be possible). Remove special transmission jack.

3) Raise engine (using Support Fixture J-4732) until transmission touches floor pan. Install engine rear support cross member and install bolts, lockwashers, and nuts and tighten securely. Lower engine into position and fasten insulators to cross member.

4) Install nuts retaining flex plate to flywheel plate torus cover and tighten to 20 ft. lbs. torque. Install crankcase ventilator outlet filter and flywheel housing bottom cover. Slide filler piper into place in transmission (*see "1956 Cadillac & Pontiac Transmission Oil Filler Pipe Leakage Correction" above*). Make sure shoulder on filler pipe is seated against sleeve which extends out of transmission case.

5) Connect cooler hoses to cooler water inlet and outlet pipes. On cars with dual exhaust, replace right hand exhaust pipe. Connect manual shift control rod to lever on transmission case and install transmission throttle control lever. Connect speedometer cable to driven gear. Install propeller shaft and lower car to floor.

6) Fasten transmission filler pipe clamp to cylinder head after making sure pipe is fully seated in transmission. Fill engine cooling system. Fill transmission with automatic transmission fluid (*see "Draining & Refilling" above*). Adjust transmission throttle valve and manual control linkage (*see "Linkage Adjustment" above*).

FR NT PUMP & REGULATOR VALVE (TYPICAL)

TRANSMISSION OVERHAUL

►CHANGES, CAUTIONS, CORRECTIONS

►*TRANSMISSION PISTON SEALS (AND COMPONENT PARTS) PRODUCTION CHANGE:* Metal seal rings have been replaced by composition rubber seals at the following indicated points. Rubber type seals are not interchangeable with metal seals as the grooves in hubs and pistons have been redesigned and have a "step" to accomodate the seal lip (Reverse Clutch seal grooves for early and late types are similar and can be identified as noted below).

Overrun Clutch—In conjunction with the new seals, a new front pump assembly and overrun clutch piston assembly is used.

Reverse Clutch—A new clutch piston and rear pump assembly are used to accomodate the new seals. The ring grooves in early and late type reverse clutch pistons are similar and can be identified by a .040" chamfer (for rubber seals), and a .180" chamfer (for metal seals) on the inside diameter of the piston. *NOTE—Rubber and metal seals are not interchangeable.*

Neutral Clutch—A new neutral clutch piston and case center bearing support are used with the rubber seal rings. Grooves in piston are "stepped" for the rubber type seals. Also required is a new neutral clutch drum. (*CAUTION*—Clutch parts must be of the same type). If a late type front pump having the step type groove for rubber seals is installed in an early transmission, the late type overrun clutch piston and rubber type seal must be used. If a late type center bearing support is installed on an early transmission it is necessary to install a late type neutral clutch drum as well as the new piston and seals. *NOTE*—The later type neutral clutch drum can be identified by a small notch in rear face of drum, and the reinforcing bosses in rear face have been eliminated.

►*1956 CADILLAC 1-2 OR 2-3 LATE SHIFT CORRECTION:* This condition may be caused by improper throttle valve rod adjustment. If readjustment of valve rod does not correct the condition, check to see that the amplifier valve and the 1-2 & 2-3 shift valves are clean and free.

►*1956 CADILLAC ERRATIC SHIFT CORRECTION (Single Carburetor Cars before Engine No. 034367, Series 60S & 62; Engine No. 038764, Series 75 & 86):* If cleaning the governor or control valve assembly and properly adjusting the throttle valve control rod does not correct the condition, install kit, Part No. 3630753, containing an accumulator body, trimmer valve, manual valve body assembly, and carburetor throttle lever adapter plate. *NOTE*—Cars equipped with transmission beginning with Serial No. C56-32200 or CA56-2539 do not require the kit as the latest parts have been installed in production. Whenever the kit is installed, the Throttle Valve Rod Adjustment should be changed from **three** turns to **four** turns and a daub of paint added to carburetor end of rod for identification.

►*EARLY 1956 CADILLAC GOVERNOR "CLICK" CORRECTION:* A kit, Part No. 8616949 containing a bumper plate and orifice plug for the coupling valve, and an "O" ring seal for front pump intake pipe is available to aid in eliminating a low speed governor click on early cars. Install the orifice plug in the oil hole adjacent to the coupling valve in coupling valve body (this hole is located in the depression in coupling valve body, next to coupling valve). The bumper plate should be installed between coupling valve body and coupling valve front end plate. This correction is not required on transmission after Serial Nos. CE-7630 and A-3651.

►*1956 CADILLAC REVERSE INTERNAL GEAR PRODUCTION CHANGE:* A new reverse internal gear, Part No. 8616843, and reverse carrier assembly, Part No. 8616845 are used in production beginning with Transmission Serial No. C56-2100, A56-1002, and CE56-1003. When replacement of either part is necessary on transmissions before the above serial numbers, both carrier and internal gear must be installed. The early and late type parts are not interchangeable except as an assembly.

►*1956 PONTIAC PRODUCTION CHANGE (TO IMPROVE 2-3 SHIFT), AND CASE CENTER BEARING SUPPORT REPLACEMENT NOTE:* On later cars, the clutch apply passage in case center support has been enlarged to obtain an improved 2-3 shift. Whenever the center support is removed, the rear clutch apply oil passage located in the wide groove between the two seal rings on support hub should be checked (this passage is drilled at right angles to the oil hole in groove and it will be necessary to bend a piece of wire having a diameter of .068" to check the hole diameter). If the wire will not enter passage, the center support is the early type and should be replaced.

►*1956 PONTIAC REAR SPRAG OUTER RACE AND REAR CLUTCH CYLINDER AND BUSHING ASSEMBLY PRODUCTION CHANGE & SERVICE REPLACEMENT CAUTION:* A pilot bushing has been added to the rear clutch cylinder and bushing assembly and a new rear sprag outer race and bronze rear sprag outer race retainer is used. *CAUTION*—The early type retainer must not be used with the later type outer race. The later type retainer, however, can be used with the early type outer race.

►*1956 PONTIAC (285 HP ENGINE) SOFT OR SLIPPING 2-3 SHIFT CORRECTION:* If there is a soft or slipping

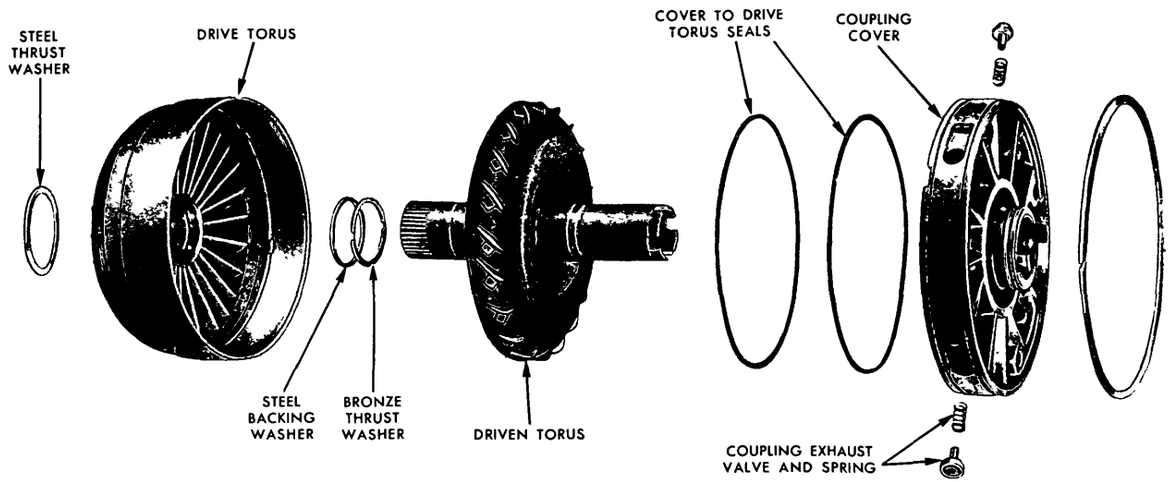
CONTINUED ON NEXT PAGE

DUAL-COUPLING HYDRA-MATIC (Continu d)

2-3 shift after installation of the new throttle valve outer lever and throttle rod (see below), it may be improved by replacing the three accumulator springs with two accumulator springs, Part Nos. 8616833 and 8616834. *(NOTE–These springs are not used in production and should not be used except to correct a soft 2-3 shift).* If the above modification is made to a transmission the letter "A" should be stamped in front of the "P" in the transmission serial number.

►*1956 PONTIAC (285 HP ENGINE) TRANSMISSION THROTTLE VALVE CONTROL ROD & LEVER CHANGE (To Reduce Tendency of Bunching the 1-2 and 2-3 Shifts, and to Improve the 2-3 Shift):* The later type throttle valve outer lever, Part No. 521523 is identified by its right angle shape (early type has a reverse curve). The distance between centerline of throttle shaft hole and centerline of hole for throttle rod ball stud is 3-31/32" (3-7/8" on early type lever). A new throttle rod, Part No. 522789 is used with the new lever, and is identified by a 4-5/32" length from rear ball stud to first bend (early rod is 2-1/16" at this location).

►*1956 PONTIAC CONTROL VALVE ASSEMBLY PRODUCTION CHANGES:* Various changes made in production as follows:



Overrun Clutch Valve Body (First Change)–The original one-piece coupling valve has been replaced by two separate valves (Coupling Signal Valve & Coupling Valve) operating in the same valve bore.

Overrun Clutch Valve Body (Second Change)–Beginning with Transmission Serial No. P56-170202, two coupling valve springs are used and the plug diameter has been increased. *NOTE–When the second type Overrun Clutch Valve Body is installed in place of the first type, the second type Shift Valve Body must also be installed.*

Shift Valve Body (First Change)–The Governor Boost Valve has been modified and an orifice has been added in the passage carrying governor boost oil to end of coupling valve. Governor boost pressure exhaust has been changed to exhaust directly to outside of valve through slot in valve body (slot is located directly over governor boost valve and identifies the later Shift Valve Body). *NOTE–When the later type Shift Valve Body is installed on early cars, the later type spacer plate must also be used.*

Shift Valve Body (Second Change)–Beginning with Transmission Serial No. P56-170202, a spring has been added in front of Governor Boost Valve which improves operation of the valve and assists in preventing 1-2 delayed shifts with cold oil. *NOTE–If the second type Shift Valve Body is installed on an assembly having the first type Overrun Clutch Valve Body, the spring must be removed from Governor Boost Valve so that proper pressure is obtained to operate the early type coupling valves.*

►*1956 PONTIAC LOW SPEED "CLICKING" NOISE CORRECTION:* Install Transmission Control Valve Body Repair Kit, Part No. 8616949 which consists of an orificed plug and a bumper plate. Orifice plug should be installed in governor boost passage in Overrun Clutch Valve Body. Remove end plate and install plug in passage located in depression to the left of coupling valve. Install bumper plate under the front plate of Overrun Clutch Valve Body so coupling valve will strike it instead of plate.

DUAL-COUPLING HYDRA-MATIC FRONT UNIT COUPLING (TYPICAL)

►*1956 PONTIAC TRANSMISSION LOCKUP CORRECTION (When shifting from drive to reverse):* Remove control valve assembly and check for nicks or burrs on the passage lands of transmission case. Remove nicks or burrs by stoning. Check spacer plate and replace if it has been damaged.

TRANSMISSION UNIT REMOVAL (TRANSMISSION IN CAR)

►*REMOVAL OF TRANSMISSION UNITS NOTE: The following transmission units may be removed without removing transmission assembly fron car. Note the following points and see "Disassembly" below, for removal procedure.*

MAIN CONTROL VALVE BODY (ALL MODELS): Remove in usual manner after removal of oil pan.

EXTENSION HOUSING (HUDSON, NASH & PONTIAC): *OLDSMOBILE NOTE*–While the extension housing cannot be removed from transmission, it can be moved rearward far enough to gain access to the following indicated units that would normally require extension housing removal.

GOVERNOR ASSEMBLY (EXCEPT CADILLAC): Remove extension housing. See Oldsmobile Note above.

REAR OIL PUMP (HUDSON, NASH & PONTIAC): On Oldsmobile, the rear oil pump can be moved rearward and rotated sufficiently to remove parking brake pawl bolt.

REVERSE PARTS (HUDSON, NASH & PONTIAC): After removing rear extension housing, reverse parts can be removed.

PARKING BRAKE LINKAGE (ALL MODELS): On Oldsmobile, see "Rear Oil Pump" above.

INSIDE DETENT & THROTTLE LEVERS: Requires removal of outside throttle control and manual levers and also of oil pan, oil screen and intake pipes.

REAR SEAL IN EXTENSION HOUSING (EXCEPT CADILLAC): On Pontiac, the slide hammer used for seal removal must be inserted through shaft tunnel in frame. When installing the seal, use an extension on the installing tool so it can be used through frame shaft tunnel.

ACCUMULATOR & SERVO (ALL MODELS): Can be removed without disturbing the main control valve assembly.

TRANSMISSION DISASSEMBLY

►*TRANSMISSION DISASSEMBLY NOTE: Instructions below cover removal of sub-assemblies from transmission case. See "OVERHAUL OF UNITS" for disassembly, inspection, and reassembly of these sub-assemblies.*

OIL COOLER, TORUS ASSEMBLY & FLYWHEEL REAR HOUSING: Disconnect oil cooler pipes from transmission cooler adapter plate, remove two bottom extension housing attaching screws and remove oil cooler.

1) Mark flywheel and torus cover so flywheel can be reinstalled in same position and remove torus cover to flywheel attaching nuts and remove flywheel. Remove and discard the "O" ring seal from flywheel.

2) Remove snap ring retaining driven torus to mainshaft, and remove driven torus member with check valve and spring. *NOTE*–If torus member sticks, tap end of mainshaft with soft hammer and at same time pull out torus member.

3) Remove inner snap ring locating driven torus member to mainshaft. Remove snap ring retaining drive torus member to intermediate shaft, and remove drive torus member. *CAUTION–Do not attempt to remove torus cover and driving torus member together.*

4) Remove front unit sun gear to drive torus hub bronze thrust washer and steel backing washer. Re-

CONTINUED ON NEXT PAGE

DUAL-COUPLING HYDRA-MATIC (Continued)

move front unit sun gear from shaft of front unit coupling driven torus member. Remove sun gear to internal gear steel backing washer. Leave staked bronze thrust washer in internal gear. Remove internal gear.

5) Remove torus cover assembly *(CAUTION–*Do not attempt to remove torus cover by pulling or pushing in a rough manner as this may result in a damaged oil seal. Work hub of torus cover back through oil seal, pulling torus cover out with even pressure).

6) Remove selective spacer washer from front unit drive torus hub (spacer may have remained in internal gear). Spacer may be either a solid or split ring.

7) Install Front Seal Protector J-6119 to protect front oil seal and bushing when removing flywheel housing. Remove flywheel housing from front of transmission case. *NOTE–*On Pontiac models, leave engine insulators attached to flywheel housing.

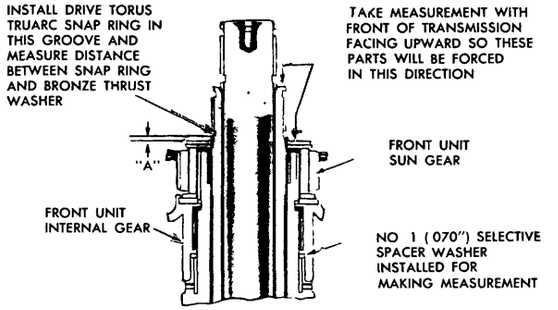
►*1956 PONTIAC FLYWHEEL HOUSING BUSHING NOTE:* Inspect flywheel housing bushing for grooves running between the four normal staking marks in bushing and the circular lubrication channel. This condition is caused by over-staking of the bushing, and if found the flywheel housing assembly should be replaced.

8) Remove Front Seal Protector and remove housing-to-case "O" ring seal.

MAINSHAFT ENDPLAY CHECK: *NOTE–Check and record the mainshaft endplay as it is necessary for the selection of proper selective washer at reassembly.*

1) Install collar of Endplay Checking Fixture J-6127 on intermediate shaft and secure in position by installing snap ring on mainshaft. Install Dial Indicator Support J-6126 and a dial indicator.

2) Move mainshaft back and forth th check endplay of mainshaft. Record the amount of endplay.



►*NOTE:* In order to find the actual endplay of the rear unit, it will be necessary to measure endplay of sun gear on mainshaft after transmission has been disassembled. This dimension must then be subtracted from mainshaft endplay to determine proper selective washer to be used.

3) Remove dial indicator and endplay checking fixture.

FRONT UNIT ENDPLAY CLEARANCE: *(NOTE–This measurement must be made with transmission in vertical position with front end upward).* **1)** Install a No. 1 (.0695–.0705") selective spacer washer over front unit driven torus hub in place of the washer removed at disassembly *(NOTE–The No. 1 washer must be used for gauging purposes).* Install front unit internal gear over front unit driven torus shaft against spacer washer.

2) Install bronze thrust washer and steel backing washer in front unit internal gear (steel washer has splines which engage splines of driven torus shaft). Install front unit sun gear and install steel and bronze thrust washers over intermediate shaft against sun gear. Install drive torus Truarc snap ring in groove on intermediate shaft nearest to bronze thrust washer.

3) Push intermediate shaft and sun gear firmly to rear of transmission to make sure all end play is taken up. Push snap ring down against bottom of groove

MAINSHAFT ENDPLAY CHECK PROCEDURE

and very carefully measure clearance between snap ring and bronze thrust washer using a set of feeler gauges. *CAUTION–Feeler gauge must be flat against the thrust washer to obtain an accurate reading.*

4) Compare measurement with feeler gauge with spacer washer chart (below) to determine the correct selective spacer washer to use. (For example: If measurement is found to be .067", a number "6" selective spacer washer should be used when transmission is reassembled). Check number on original spacer which was removed from transmission. It should be the same as the number found on the chart. If not, a new spacer washer must be used at reassembly. Record identification number of required spacer for use at reassembly.

Selective Spacer Washer Chart

Spacer No.	Dimension "A" ①	Thickness
1	.024-.031"	.0695-.0705"
2	.032-.039"	.077-.079"
3	.040-.047"	.085-.087"
4	.048-.055"	.093-.095"
5	.056-.063"	.101-.103"
6	.064-.071"	.109-.111"
7	.072-.079"	.117-.119"
8	.080-.087"	.125-.127"
9	.088-.095"	.133-.135"
10	.096-.103"	.141-.143"
11	.104-.111"	.149-.151"
12	.112-.119"	.157-.159"
13	.120-.127"	.165-.167"
14	.128-.135"	.173-.175"

① - See feeler gauge (Dim. "A") in illustration.

5) Remove Truarc snap ring, sun gear with bronze and steel thrust washers, internal gear with bronze and steel thrust washers, and .070" selective space washer.

FRONT UNIT COUPLING, PRESSURE REGULATOR & COOLER ADAPTER: 1) Rotate transmission to horizontal position with oil pan upward. Remove front coupling assembly from transmission case. Remove pressure regulator assembly from side of transmission.

2) Remove oil cooler adapter, with gasket, from side of transmission case. Remove two oil cooler sleeves and seals by pulling from case.

OIL PAN, OIL SCREWS & INTAKE PIPES: Remove oil pan and gasket. Remove screw holding front pump intake pipe clamp and remove pipe and clamp from pump screen. Remove "O" ring seal from pump. Remove oil screen and rear pump intake pipe and "O" ring seal.

CONTROL VALVE, SERVO & ACCUMULATOR: Remove screws holding servo and accumulator assembly to case *(NOTE–Servo piston is spring loaded),* and remove servo and accumulator assembly and servo spring. Remove five remaining control valve assembly screws and remove control valve assembly. *CAUTION –Do not drop manual control valve.*

FRONT PUMP & OVERRUN CLUTCH: 1) Remove front pump locking screw and lockwasher located under control valve assembly.

►*FRONT PUMP LOCK SCREW PRODUCTION CHANGE:* Lock washer has been eliminated and a new "washer head" screw is being used in production. Whenever a lock screw is found with a lockwasher, replace it with the later type screw, Part No. 8617869.

►*FRONT PUMP CLEARANCE CAUTION:* When front pump is removed, check clearance between pump bushing and front unit driven torus shaft. This clearance must not exceed .003", using a 1/2" wide feeler. If a .004" feeler can be inserted, the front unit driven torus member and the front pump should be replaced. If the inner sprag race is not the late type which can be identified by an "O" or "S" in the recess in tang end, it should be replaced.

2) Remove the two front pump cover-to-body screws and the three front pump-to-case support attaching screws. Install two Slide Hammers J-6125 into two opposite cover-to-body screw holes in front pump and remove front pump assembly from case. *NOTE–*Front sprag inner race may stick in pump. Be careful not to drop it when pump is removed.

3) Remove overrun clutch release spring and front sprag inner race if it did not come out with pump. Remove clutch overrun plate and clutch thrust washer. Install Rear Unit Clutch Retainer J-6135 with set screw end toward front and lock securely.

CENTER BEARING SUPPORT, NEUTRAL CLUTCH & REAR UNIT ASSEMBLY: 1) Remove speedometer driven gear from rear extension housing. Remove large snap ring retaining center bearing support. Position transmission horizontally, bottom side up.

2) Remove extension housing and gasket. If housing sticks, tap lightly with a soft hammer. Remove governor assembly by pulling governor out of rear housing (Governor drive key may not remain with governor).

3) Remove breather pipe clamp screw from rear of transmission case and carefully pry breather pipe out of pump body. Remove rear pump locating screw (located to right of pump cover, facing pump, and is inset into pump body). Remove pump attaching screw (This screw is located to left of governor bore and is the center screw of the three in that area).

4) Remove rear bearing snap ring from output shaft. If necessary, remove two opposite rear pump cover screws and install Slide Hammers J-6125 and remove rear pump, and reverse clutch piston assembly and gasket. Remove special tools.

5) Remove large wave-type reverse piston release spring, reverse internal gear and tang-type reverse clutch release spring *(NOTE–*Tangs on reverse clutch release spring point outward toward rear of transmission.

CONTINUED ON NEXT PAGE

DUAL-COUPLING HYDRA-MATIC (C ntinu d)

6) Remove reserse planet carrier outer snap ring from output shaft. Remove reverse stationary cone (take care to prevent binding), and remove cone key from case. Remove reverse planet carrier while lifting up on output shaft.

7) Remove center bearing support locking screw from side of transmission case. Remove center bearing support, neutral clutch and rear unit as an assembly by sliding complete assembly toward front of transmission. If assembly is tight in case, use Slide Hammers J-6125 with adapters, to insert into center bearing support and pull entire assembly forward. Remove entire assembly and position into Clutch Unit Holding Fixture J-6116, with output shaft down.

PARKING BRAKE ASSEMBLY, OVERRUN BAND, NEUTRAL CLUTCH DRUM STATIONARY STOP KEY AND INSIDE DETENT AND THROTTLE CONTROL ASSEMBLY: 1) Remove stationary stop key from case. Unhook overrun band end from anchor inside of case and rotate band to horizontal position with band ends facing rear of case. Remove band through front of case.

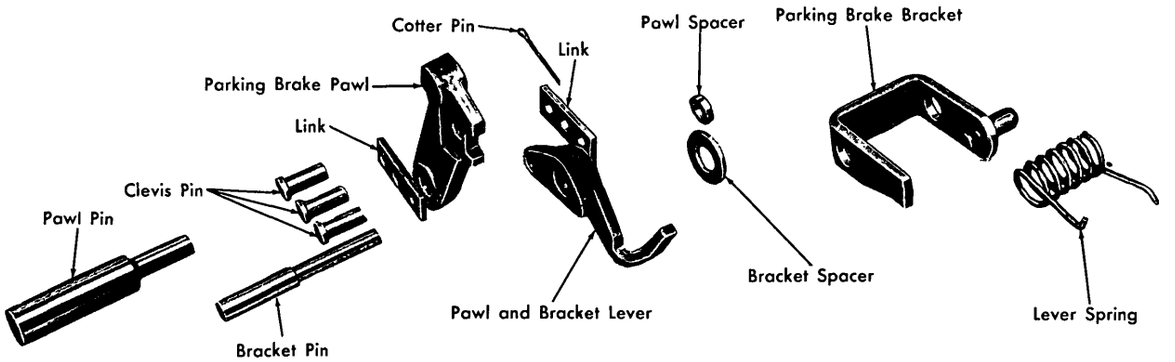
2) Remove inside detent control and inside throttle control lever assembly as follows: Remove snap ring retaining detent control lever to case. Remove lever assembly and outer and inner washers. Remove "O" ring seal from case counterbore.

3) Disconnect parking brake lever spring and remove bracket and spring. Install 3/8" bolt into parking brake pawl pin and remove pin and spacer. Remove spacer, lever and pawl as an assembly.

OVERHAUL OF UNITS

PRESSURE REGULATOR: Disassembly–Remove pressure regulator valve stop pin from reverse booster plug and remove booster plug from regulator plug. Remove "O" ring seal from pressure regulator plug.

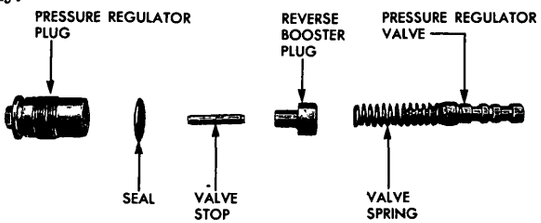
Insp ction: Inspect all passages for dirt or metal chips and all parts for burrs or other damage. Burrs can be removed with crocus cloth and oil. Replace all damaged parts.



Reassembly: Install new "O" ring seal and reverse disassembly procedure.

FRONT PUMP: Disassembly–1) Remove front sprag inner race if still in pump and remove pump cover from body. Remove retaining pin, torus feed valve, spring and retainer.

2) Remove front pump rotor along with top vane ring. Remove 7 vanes and bottom vane ring (vanes may remain in rotor). Remove slide by pushing slide toward priming springs, then lift out of body at opposite end. Note position. Remove inner and outer priming springs.

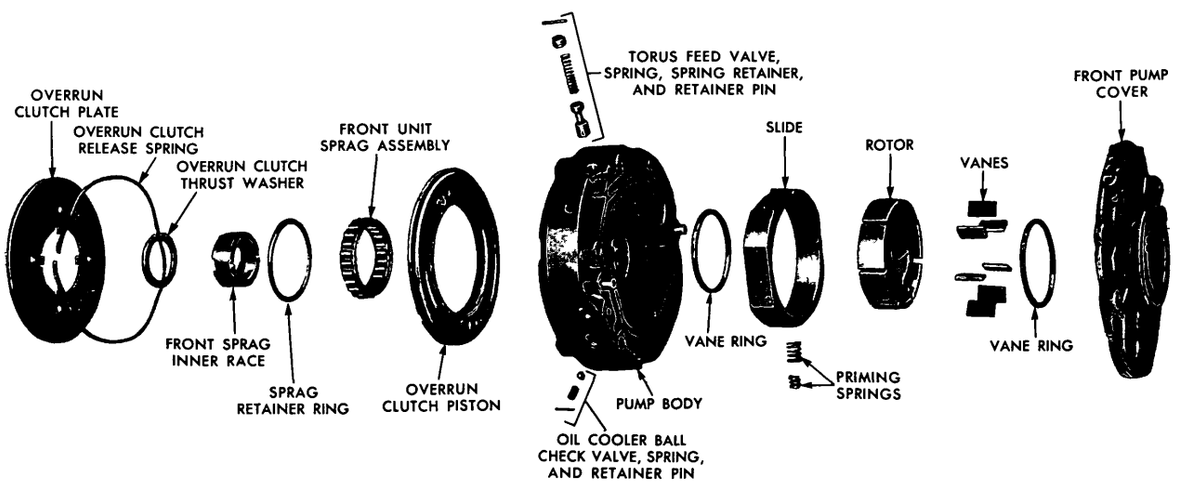


3) Turn pump body over and remove spiral type snap ring retaining front sprag to pump body and remove sprag assembly. *(NOTE*–If outer sprag is damaged, the oil pump assembly must be replaced). Mark overrun clutch piston and pump body for proper reassembly, and remove clutch piston from pump body. If piston sticks, use a soft hammer and tap around outer rear edge of pump body.

4) Remove interlocking oil seal ring from front pump cover.

DUAL-COUPLING HYDRA-MATIC PARKING BRAKE ASSEMBLY

Inspection: Using a small diameter wire, inspect all passages for dirt or restrictions. Check slide for excessive wear or scoring and make sure that it moves freely in pump body. Check freeness of vanes in rotor slots (pump vanes will have a tendency to show a polished surface on the side bearing against the front pump slide, if not excessive, this is a normal condition). Check torus slide valve priming springs for free movement in bores. Check bushing for scores or flaking (a normal wear can be noticed on bushing surface which if not excessive is a normal condition). Examine pump body and pump cover slide surface contacts for smoothness. Clean all parts thoroughly before assembly.



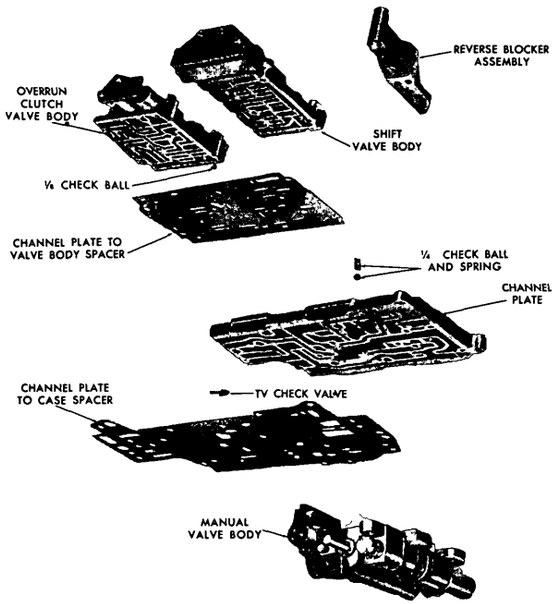
PRESSURE REGULATOR VALVE

►*FRONT SPRAG CLUTCH FAILURE CORRECTION:* In the event of front sprag clutch failure it is recommended that in all cases the following parts should be replaced: Front Pump, Front Sprag Assembly, Front Sprag Inner Race, Front Unit Driven Torus Member Assembly. Inspect all other adjacent parts and replace where needed.

Reassembly: 1) Check location mark on pump body and overrun clutch piston, align and install piston into pump body (insert one side of oil seal ring and position in cavity). At same time, work around ring, compressing and seating it in pump cavity. Do not force clutch piston into cavity. If sticking occurs, dowels and holes are not correctly aligned.

2) Install sprag assembly into rear body with rim of sprag facing up, and check rotation of sprag by inserting inner race. Then remove inner race. Install spiral type snap ring retaining sprag assembly to body. Install interlocking oil seal ring on front pump cover.

FRONT PUMP AND OVERRUN CLUTCH ASSEMBLY (TYPICAL)



CONTINUED ON NEXT PAGE

DUAL-COUPLING HYDRA-MATIC (C ntinu d)

3) Insert inner and outer priming springs in pump body. Position pump slide into pump body toward priming spring. Compress priming springs with slide and drop slide into cavity of pump.

4) Insert bottom vane ring, locating it concentrically with slide bore. Install rotor with drive slots up and install 7 vanes in rotor slots (make certain vanes fit between bottom vane ring and slide). *NOTE*–Check edges of vanes for wear pattern. One edge of vane will be polished full length. This edge should face the slide.

5) Install top vane ring on rotor, centering it between vanes. Install torus feed valve, spring, retainer and retainer pin. Make sure that valve moves freely. Check for free rotation of rotor and that all parts in pump are positioned correctly. Install check valve ball, spring and retaining pin and install cover to pump body. *NOTE*–Leave two opposite cover screws out for later insertion of slide hammers.

C NTR L VALVE ASSEMBLY (TYPICAL)

CONTROL VALVE: The control valve assembly consists of four individual assemblies connected to one main body. In the disassembly and reassembly, each individual part should be disassembled and reassembled separately to avoid confusion of component parts.

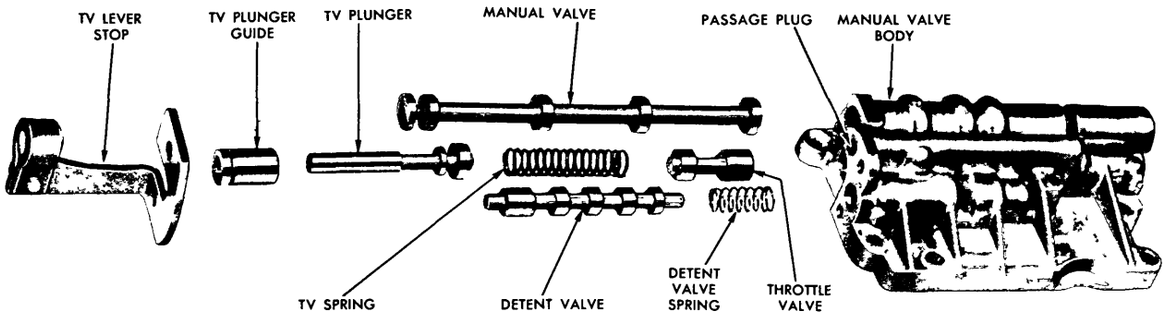
C upling Valv B dy: Rem val & Disassembly– Remove coupling valve body making sure not to lose transition check ball. *(NOTE*–Support valve assembly to prevent damage to channel plate case spacer). Remove coupling valve rear end plate being careful of limit valve spring tension. Remove inner and outer limit valve springs, coupling valve spring and plug, and limit valve and washer. Remove coupling valve front plate and remove transition valve and spring, coupling valve (some assemblies may have two separate valves within the one bore) and overrun control valve. *See "Pontiac Control Valve Assembly Production Changes" above.*

►*INSPECTION NOTE: See "Control Valve Inspection" below.*

Reassembly & Installation–Insert overrun clutch valve into large bore in body. Insert transition valve and spring into valve body. Install coupling valve (two valves and additional valve springs may be used on some cars). Install coupling valve front end plate and install coupling valve spring, or springs. Install limit valve and washer and inner and outer limit valve springs. Position coupling valve plug on spring and install coupling valve rear end plate *(NOTE*–Make certain limit valve springs are aligned properly after tightening screws). Install coupling valve body to channel plate using petrolatum to hold transition ball check in place.

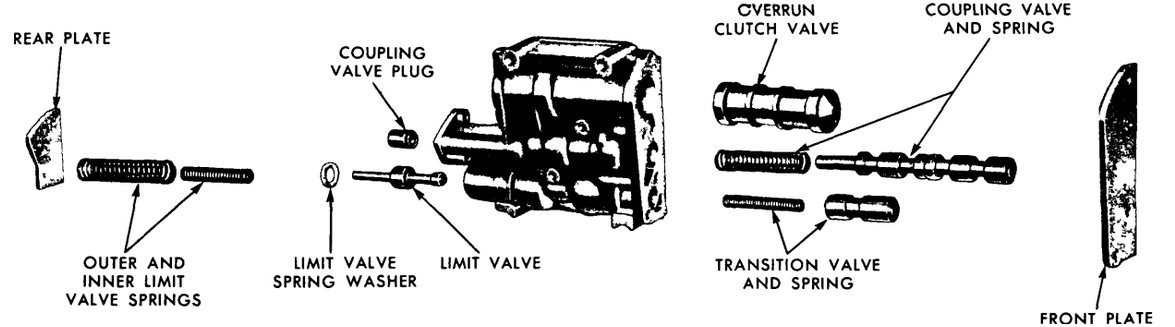
Shift Valve Body: Removal & Disassembly–*(NOTE–See Production changes above).* Remove shift valve body. If coupling valve body has been removed, remove spacer plate *(NOTE*–When removing plate, be sure not to lose check ball and spring). Remove shift valve body end plate, 3-4 governor valve, 2-3 governor valve and amplifier valve. Remove regulator valve body plate and body *(NOTE*–Be careful when removing plate because a great amount of spring load is present on plate). Remove 3-4 throttle valve regulator valve and 2-3 throttle valve regulator valve. Remove regulator valve body cover. Remove the throttle valve (inner) and shift valve (outer) springs and remove 2-3 shift valve. Remove the 3-4 throttle valve regulator valve spring and remove 3-4 shift valve.

►*INSPECTION NOTE: See "Control Valve Inspection" below.*



Reassembly & Installation–Install 2-3 shift valve and 2-3 throttle valve (inner) and shift valve (outer) springs. Install 3-4 shift valve and 3-4 throttle valve regulator valve spring. Install regulator valve body cover. Install 3-4 throttle valve regulator valve, and 2-3 throttle valve regulator valve. Position regulator valve body on on shift valve body as follows: Insert two attaching screws in regulator valve body plate and position on regulator valve body. Install regulator valve body to shift valve body and install remaining screws. Install 3-4 governor valve and 2-3 governor valve. Install amplifier valve. Install shift valve body end plate. Install shift valve body assembly to control valve assembly. If outer separator plate has been removed, be sure to install check ball and spring to channel body before installing outer separator plate and shift valve body.

Reverse Blocker Body: Removal & Disassembly–Remove reverse blocker body from manual valve body. Remove hairpin clip retaining detent plunger and remove detent plunger and spring from body. Remove reverse blocker retaining pin (pin is peened and requires filing to remove). Remove reverse blocker spring and piston.



►*INSPECTION NOTE–See "Control Valve Inspection" below.*

Reassembly & Installation–Install reverse blocker piston and spring into body. Install reverse blocker

CONTINUED ON NEXT PAGE

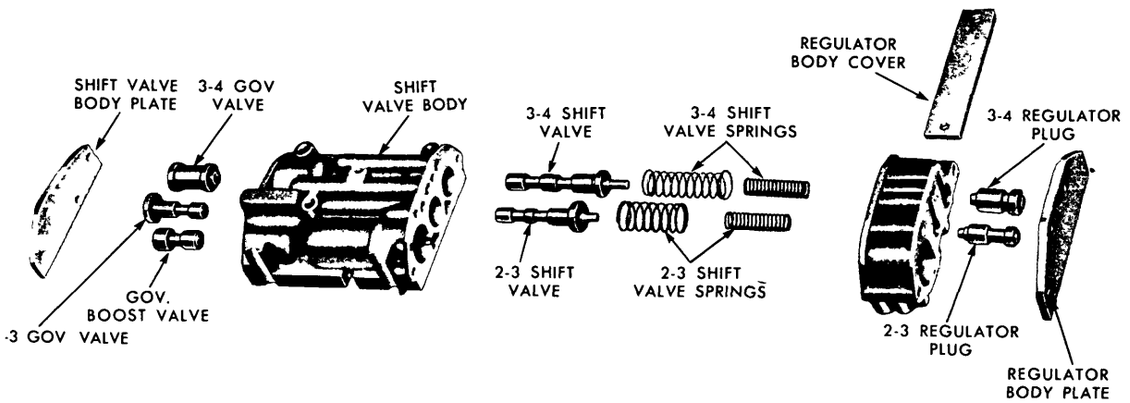
DUAL-COUPLING HYDRA-MATIC MANUAL VALVE BODY (TYPICAL)

FIRST TYPE OVERRUN CLUTCH VALVE BODY (TYPICAL)

DUAL-COUPLING HYDRA-MATIC (C ntinu d)

retaining pin and peen in place. Install detent plunger and spring. Install hairpin clip to retain detent plunger and install reverse blocker body to manual valve body.

Manual Valve Body: Removal & Disassembly–Remove reverse blocker body from manual valve body if not already done. Remove manual valve body from channel body. Remove manual valve. Remove throttle valve lever stop from body and remove throttle valve plunger and guide. Remove detent valve, pressure drop signal valve and spring. Remove throttle valve spring and throttle valve. Remove throttle valve plug retainer pin and remove plug.



►*INSPECTION NOTE–See "Control Valve Inspection" below.*

Reassembly & Installation–Install throttle valve plug and retainer pin. Swedge over edge of retainer pin hole to keep pin in place. Install throttle valve, making sure valve is seated against plug and install throttle valve spring. Install throttle valve plunger guide on throttle valve plunger and install unit. Install pressure drop signal valve spring and valve, lining up spring to be sure it is fully positioned on bottom of bore. Install detent valve. Install throttle valve lever stop on manual valve body and install manual valve body to channel body. Install reverse blocker to manual valve body and install manual valve.

C ntrol Valve Inspection: Clean all parts thoroughly and do not allow valves to bump together, as this may cause nicks and burrs. Inspect all valves carefully to make sure they are free from dirt and are not damaged in any respect. If burrs are present, they should be removed with a fine stone or crocus cloth and light oil. All valves and plugs should be tested in their individual bores to make certain that free movement can be obtained. All valves should fall free of their own weight with a slight tapping action on the body. The manual valve is the only valve which may be serviced separately. If other valves are defective or damaged beyond repair, an individual assembly should be installed.

►*CONTROL VALVE ASSEMBLY NOTE:* If all the individual assemblies were removed at one time, proceed as follows: Position channel body separator plate on channel body. Install manual valve to channel body and install reverse blocker body to manual valve body, positioning one dowel pin. Install ball check and and spring in channel body (ball first, then spring). Install and align separator plate on channel body. Install shift valve body on channel body. Install coupling valve on channel body using petrolatum to hold transition ball check in place. Install manual valve in manual valve body.

FRONT UNIT COUPLING: Disassembly–*(CAUTION–The front unit coupling is balanced at the factory and any change in positioning of the cover will affect the balance. On early transmissions without an indexing point on driving torus shell, punch marks should be made on both cover and shell in line with the snap ring gap (using a very fine punch). On later transmissions the No. 1 exhaust valve is lined up with the snap ring gap and mark on driving torus cover).*

FIRST TYPE SHIFT VALVE BODY (TYPICAL)

1) Remove steel thrust washer from recess at front of front unit drive torus if it did not come off with flywheel housing. Install front unit coupling assembly into Clutch Holding Fixture J-6116 with splined shaft down.

2) Remove large snap ring retaining coupling cover to drive torus shell (make sure that all parts are marked for correct reassembly). Install two Coupling Valve Retainers J-6122 to hold exhaust valve in position when removing cover.

3) Remove coupling cover from coupling using Front Unit Coupling Cover Remover J-6121 as follows: Place cross piece of remover on end of torus shaft with end of shaft indexed in counterbore on underside of tool. Screw stud at end of each leg into holes in coupling cover until they bottom (nuts on studs should be backed off so they will not contact cross piece). Insert long stud of tool J-6121 through coupling and cross piece. Index bottom end with hole in holding fixture so it cannot turn. Install washer and nut on upper end and tighten securely. Tighten nuts on four studs evenly and only a small amount at a time to pull cover out of unit.

4) Remove tool J-6121 and remove coupling cover from unit. Hold fingers over valve so they will not be ejected and remove Coupling Valve Retainers and exhaust valves and springs from cover. Remove rubber seal rings from outer diameter of cover.

5) Remove driven torus member by pulling up on shaft, and remove steel and bronze thrust washers *(NOTE-* It may be necessary to cut the bronze thrust washer). Remove drive torus member from holding fixture.

Inspection: Check for burrs and scratches. Remove burrs with crocus cloth and oil.

Reassembly: 1) Install driving torus into Rear Unit Holding Fixture J-6116. Install interlocking oil seal rings to hub and shaft of driven torus member. Install bronze and steel thrust washers into driving torus member, install one interlocking oil seal ring on driven torus member and install driven torus member into driving torus member.

2) Install two springs and exhaust valves in coupling cover and hold in place, using Front Unit Coupling Valve Retainers J-6122. Install two oil seal rings on cover hub. Install two square rubber ring seals on coupling cover, making sure that seals are square in their respective grooves and apply petrolatum to circumference of seals.

3) Install studs from Front Unit Coupling Cover Remover J-6121, into coupling cover and position cover in driving torus member, lining up marks made during disassembly *(CAUTION–*Cover must be inserted evenly to prevent cocking in drive torus member and damaging seals).

4) Install large snap ring retaining coupling cover to driving torus member. Remove studs from coupling cover and remove coupling assembly from fixture.

ACCUMULATOR & SERVO ASSEMBLY: Disass mbly– Remove servo apply piston from assembly. Remove two opposite accumulator cover screws and install Accumulator Cover Remover & Installer J-6124. Remove remaining three cover to accumulator body attaching screws. Using extreme care remove cover, gasket and special tool. Discard gasket and remove accumulator piston assembly. Remove accumulator spring (more than one spring may be found at this location. See Production Changes & Corrections above). Remove pin retaining trimmer valve assembly in accumulator body. Remove plug, trimmer valve and spring.

Inspection: Inspect servo piston assembly for damaged oil seal ring, scores or burrs in ring land grooves. Inspect accumulator spring for collapsed or distorted coils. *(NOTE–*Slight wear "bright spots" on side of spring are permissable). Inspect accumulator body for restricted passages, scores or burrs. Inspect servo piston assembly for distorted pin, damaged oil seal ring lands or broken oil seal ring.

Reassembly: *(NOTE–Various changes have been made in the number of springs used under piston. See Production Changes & Corrections above).* Install trimmer valve spring, valve and plug in accumulator body. Install pin retaining trimmer valve assembly. Install accumulator spring (or springs) in accumulator body and install piston on outer accumulator spring. Align new gasket to accumulator cover and install Accumulator Cover Remover & Installer J-6124. Compress accumulator spring and install piston into body, making certain that aluminum piston ring is not binding to cause possible breakage. Install three screws retaining

CONTINUED ON NEXT PAGE

DUAL-COUPLING HYDRA-MATIC (C ntinued)

accumulator cover to body. Remove tool and install remaining screws. Tighten all attaching screws. Install servo piston into body.

REAR PUMP: Disassembly–1) Remove vent pipe from rear pump body by carefully prying out of bore with screwdriver. Remove reserse piston from back of rear pump and remove oil seal ring. Remove rear pump cover by tapping pump body with plastic hammer.

2) Remove governor drive key from driven gear in rear pump. Mark top of drive and driven gears to insure correct reassembly, and then remove gears. Remove snap ring retaining rear bearing to rear pump body and remove rear bearing.

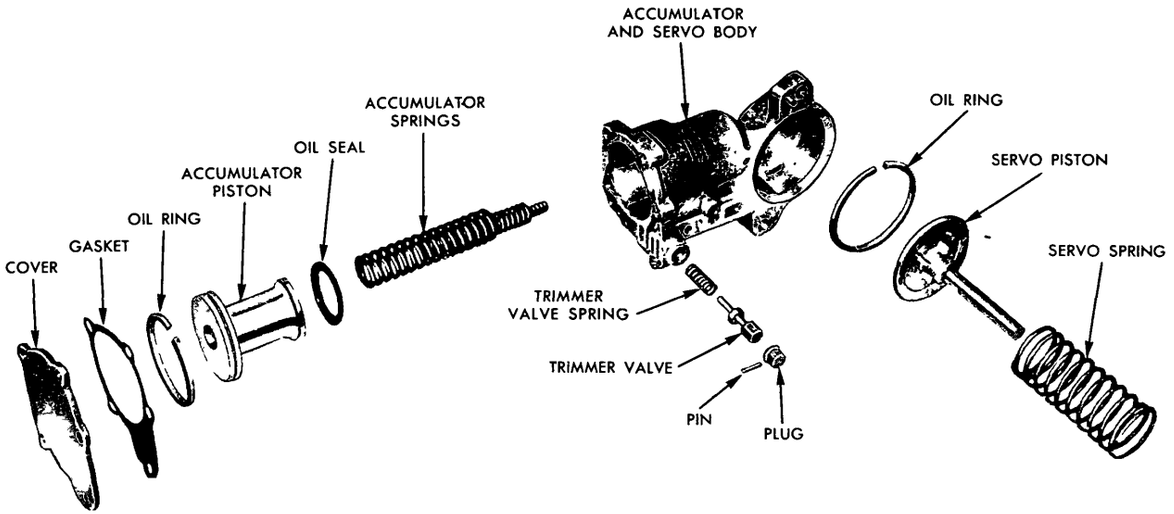
3) Remove reverse piston inner oil seal ring from pump body hub.

Inspection: Inspect all parts to make sure they are free of dirt, burrs, scoring or other damage. Remove burrs with crocus cloth and oil. Check oil seal ring grooves. Make sure vent pipe is not damaged and is free from restrictions.

Reassembly: 1) Install rear pump bearing into pump body and install snap ring retaining rear bearing. Install pump gears, noting the locating marks made at disassembly.

2) Install governor drive key into driven gear, making certain key is properly seated. Install pump cover to body, positioning governor hole over drive gear in pump, indexing properly with dowels.

3) Install reverse servo piston in back of rear pump as follows: Install oil seal rings on pump body hub and on reverse piston. Insert piston into bore of rear pump, positioning on top of dowels. Compress large oil seal ring on piston with fingers at one end of gap. After the end is seated in the cavity, gradually work oil seal around, at the same time applying light pressure, forcing piston into cavity.



GOVERNOR: Disassembly–Remove four oil seal rings and remove cover. Remove end cover plate retaining G-2 valve assembly. Remove valve and bushing assembly and remove valve from bushing.

Inspecti n: Inspect all parts to make sure they are free from dirt, burrs and other damage. Remove burrs with crocus cloth and oil. Test all valves in their respective bores for free movement. Inspect governor ring lands and oil seal rings for freedom in grooves. If lands are damaged or worn, replace complete governor assembly.

R assembly: Insert G-2 governor valve into bushing and install assembly in governor body. Install cover plate retaining G-2 valve assembly, making sure dowel in cover plate enters recess in governor body and governor valve bushing. Install governor cover to body. Install four oil seal rings in grooves which do not contain oil holes.

TORUS CHECK VALVE (Main Drive): Disassembly–Remove cotter key retaining check valve in fluid coupling driven torus member, and remove torus check valve and spring.

Insp ction: Inspect parts for nicks, burrs and for collapsed spring.

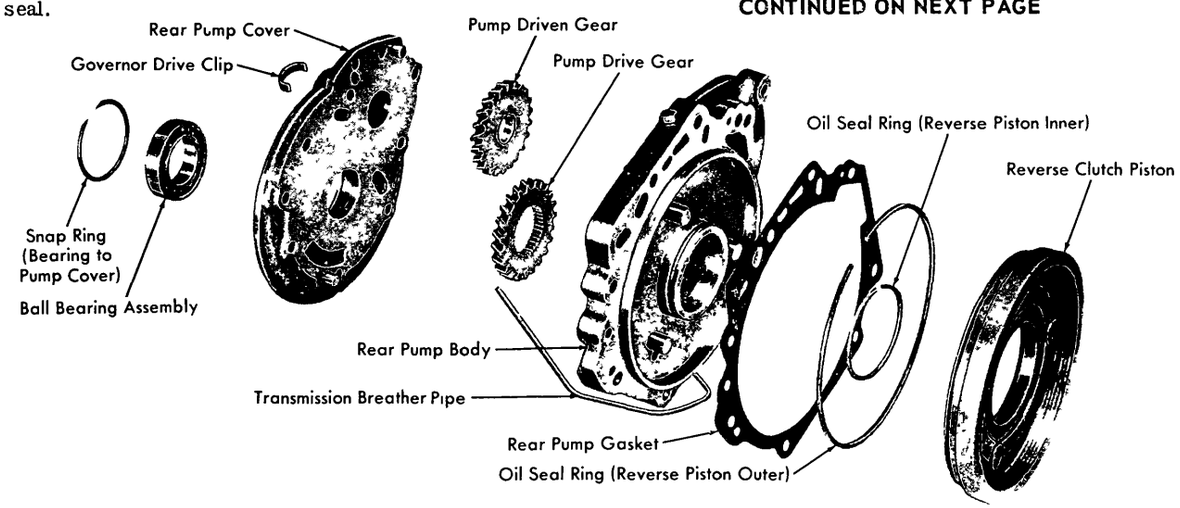
SERVO & ACCUMULATOR ASSEMBLY (TYPICAL)

Reassembly: Install spring into check valve and install check valve and spring into driven torus member. Make sure spring seats properly and valve fits evenly. Install cotter key retaining check valve and spring. Make sure check valve can move freely.

PARKING BRAKE: Disassembly–Remove cotter pin retaining three clevis pins and parking brake links and separate pins, links, parking pawl and pawl lever.

Inspection: Inspect parking pawl for cracks or signs of unusual wear. Check pawl pivot pin and linkage for wear.

Reassembly: Assemble parking brake links, clevis pins, pawl and pawl lever and insert cotter pin.



INSIDE CONTROL LEVER: Disassembly–Remove pin retaining throttle control shaft to inside detent control shaft and separate levers, washers and "O" ring oil seal.

Inspection: Check fit of inside throttle control shaft in shaft of inside detent control shaft. If shaft binds, is excessively worn, or if splines are damaged, replace the defective parts.

Reassembly: Install new "O" ring seal, washers, and throttle control shaft in manual control hub and insert retaining pin.

CENTER BEARING SUPPORT, NEUTRAL CLUTCH & REAR UNIT: Disassembly–1) Remove Rear Unit Clutch Retainer J-6135 *(CAUTION–Be sure to back off screw far enough to prevent damage to machined surface at front of intermediate shaft).* Remove hook-type oil seal ring from intermediate shaft by pushing one end toward center of shaft and other way from shaft. Remove case support and neutral clutch piston assembly.

CONTINUED ON NEXT PAGE

DUAL-COUPLING HYDRA-MATIC REAR PUMP ASSEMBLY

DUAL-COUPLING HYDRA-MATIC (Continued)

►*PONTIAC CENTER BEARING SUPPORT NOTE: See "1956 Pontiac Production Change (To improve 2-3 shift) and Case Center Bearing Support Replacement Note" above.*

►*SEAL PRODUCTION CHANGE NOTE: See "Transmission Seal Production Changes" above.*

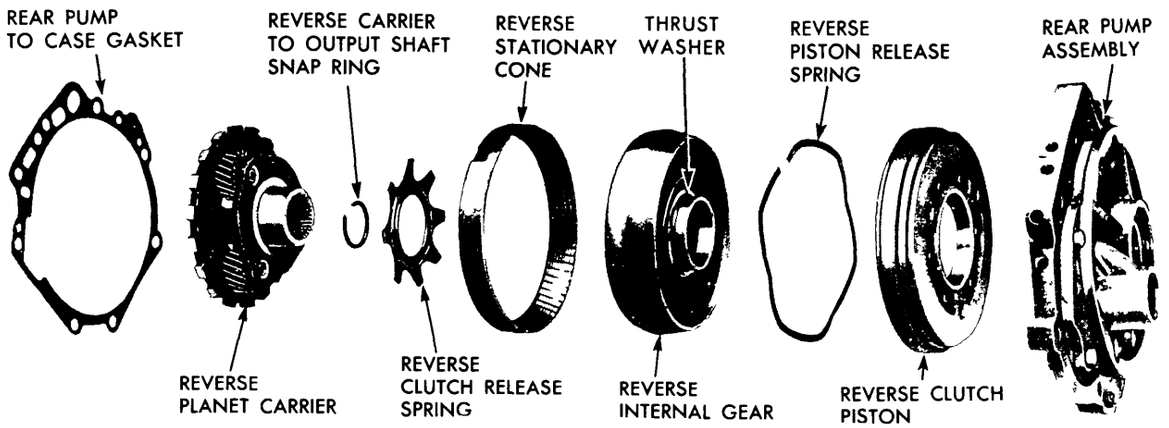
2) Remove oil seal rings from support hub and remove neutral clutch piston. Turn support over and bump on bench to remove piston (*NOTE*–On late type assemblies with rubber lip seals, remove seals from piston hub and hub of support. Leave rings in place on piston and support of early type.

3) Remove neutral clutch drum assembly which contains five composition clutch plates, four steel clutch plates and five release springs. Remove large snap ring from rear drum assembly with screwdriver.

4) Remove rear clutch cylinder and sprag assembly by lifting over intermediate shaft. Remove intermediate shaft and clutch hub, along with front clutch hub washer from rear unit assembly. (*NOTE*–Intermediate shaft and clutch hub may be disassembled if parts replacement necessary). Remove clutch hub front thrust washer from clutch hub.

5) Remove mainshaft assembly and rear unit sun gear from rear unit. Remove clutch hub thrust washer from sun gear.

►*REAR UNIT SUN GEAR CAUTION: Make sure the sun gear is marked properly for reassembly. On later type units, a drill mark is made on rear side of gear. Early type gears were not marked and it is very important that a mark be placed on the rear side to indicate side of gear facing rear of transmission.*



6) Remove seven steel clutch plates and seven composition plates. Remove bronze thrust washer from rear unit carrier. Remove rear unit drum and output shaft assembly from holding fixture and set on bench with output shaft end up.

7) Remove large snap ring holding reverse drive flange to rear unit drum. Lift output shaft and reverse drive flange assembly out of rear unit drum.

8) If parts replacement is necessary, mark internal gear so it can be installed with the same side up. Remove internal gear and rear unit clutch backing plate from rear unit drum assembly together by tapping backing plate with soft hammer. Remove reverse planet carrier locating snap ring from output shaft and remove reverse drive flange and sun gear assembly from output shaft. Remove selective washer from reverse drive flange assembly or output shaft.

9) Remove spiral snap ring from rear unit sprag outer race, using small needle nose pliers or small screw driver. Insert tool into small hole in end of spiral ring and pull upward. Remove outer race, sprag and retainer by rotating counterclockwise and pulling upward (*NOTE–Do not attempt to disassemble sprag assembly).* Remove rear unit sprag retainer and sprag from neutral clutch hub.

10) Disassemble rear unit clutch piston assembly as follows: Place cylinder and piston assembly over tool J-6129 with spring end up. Set spring compressor J-4670 on top of spring retainer and start nut on stud of J-6129. (*NOTE*–On models of J-4670 without hole in center, drill at 7/16" hole so J-6129 can be inserted through it). Turn nut down to compress clutch springs until snap ring is free. Remove snap ring and compressor tool and release spring retainer from rear clutch springs. Remove eight clutch release springs. Remove rear clutch piston from cylinder by rapping piston end of cylinder assembly on wood block. Remove seals from piston and hub.

DUAL-COUPLING HYDRA-MATIC REVERSE ASSEMBLY

►*1956 PONTIAC NEUTRAL CLUTCH CAUTION:* On transmissions below serial number P-15234, neutral clutch should be checked to see if it has a 5/32-3/16" chamfer on inside leading edge of drum. If chamfer is less than 5/32", drum must be replaced.

Inspection: **1)** Inspect center bearing support for burrs, damaged oil seal grooves, worn or damaged bushing or damaged threads. Check to see that all passages are open and are not interconnected, using either a fine wire or air pressure.

2) Inspect neutral clutch piston for scoring, burrs, or damaged oil seal groove. On early type remove oil ring from neutral piston groove, insert it in bore in center bearing support and square it up. Check ring gap with feeler gauge. Gap should be .002-.007". If a new ring is installed, gap must be checked and ends of ring must be filed, if necessary to provide proper gap (*NOTE*–In early production, the neutral clutch piston was sealed by an inner and outer ring. In later production, rubber lip seals are used in place of rings and a corresponding groove is used in piston and hub. When new parts are installed (center bearing support, piston or seals), they all must be of the same type, (See Production Change above). If the late type center bearing support is used to replace the early type, late type piston and rubber lip seals must also be used. A redesigned neutral clutch drum must be used with the late type piston and center bearing support. (The late type drum is notched for identification).

3) Inspect five composition faced neutral clutch drive plates for damaged surfaces or worn teeth. Plates should be flat and have four equally spaced grooves across facing on each side. (*NOTE*–Undamaged clutch drive plates can be reused and durability increased by slotting, later plates are slotted in production. Cut four radial, equally spaced, sharp edged grooves on each side of cork facing on drive plate. Grooves must be 1/8-5/32" wide and .020" deep. Grooves on one face should be spaced between grooves on other face. Use a square cornered mill file to cut the grooves). If flakes of facing material can be removed by scratching surfaced with thumb nail, plate should be replaced. Discoloration is not an indication of failure. Inspect release springs to see that they have eight equally spaced waves 1/8" deep.

4) Inspect four neutral clutch driven plates (steel) for scored surfaces or damaged lugs. Also make sure they have six equally spaced waves (approx. .010" deep). Inspect neutral clutch drum for scored or damaged surfaces. Clutch drums used with neutral clutch piston which have metal seal rings should have a 5/32" chamfer at front inner edge to insure proper clutch action. Inspect spiral snap ring for distortion or damage. Inspect rear unit sprag assembly for damaged shoulder, broken springs, or scored sprags. Inspect rear unit sprag outer race for damaged splines or scored sprag race.

5) Inspect rear clutch cylinder and bushing assembly for scoring, burrs, or damaged lugs. See that snap ring and oil seal grooves are clean and smooth. Inspect drilled passage in cylinder with wire and compressed air to see that they are unobstructed. Inspect rear unit clutch piston for scores, burrs, or damaged seal groove. Inspect either rear clutch release springs for distortion or collapsed coils. Spring should be 1.58" long, .440" in diameter and have 14 coils. Inspect spring retainer for cracks or damage. Six raised spots on retainer keep snap ring in place. Inspect rear unit clutch cylinder-to-clutch hub thrust washer.

6) Inspect intermediate shaft and rear unit clutch hub. Clutch hub and shaft can be separated if either needs replacement. Inspect rear unit sun gear-to-clutch hub bronze thrust washer. Inspect seven rear unit composition faced clutch drive plates for damaged surfaces. Plates should be flat. Check in same manner as for neutral clutch plates. Inspect seven driven plates (steel) for scored surfaces or damaged lugs. Driven

CONTINUED ON NEXT PAGE

DUAL-COUPLING HYDRA-MATIC (C ntinued)

plates must have six equally spaced waves (approx. .010" deep).

7) Inspect main shaft and rear unit sun gear for damaged splines, teeth or bearing surfaces. Gear and shaft can be separated for replacement if necessary. If shaft, only is to be replaced, put old gear on new shaft with same side toward front.

8) Measure endplay of rear unit sun gear on mainshaft and determine correct selective washer to use in rear unit as follows: Clamp sun gear and mainshaft assembly in Holding Fixture J-6116 using "C" clamp and dial indicator. Be sure gear is firmly clamped on both sides so it cannot give. Set dial indicator to contact end of mainshaft. Move mainshaft straight up and down to measure endplay and record endplay. Subtract this endplay from the mainshaft endplay recorded before transmission was disassembled. The difference will be the actual endplay of the rear unit and should be .004-.018". If endplay is outside the limits of .004-.018", select the reverse drive flange-to-rear unit planet carrier thrust washer which will give the proper endplay. Selective washers are furnished in the following nine sizes and are stamped with an identification number:

Id ntificati n N .	Siz	Identification No.	Size
1	.055-.059"	6	.080-.084"
2	.060-.064"	7	.085-.089"
3	.065-.069"	8	.090-.094"
4	.070-.074"	9	.095-.099"
5	.075-.079"		

9) Inspect rear unit internal gear for tooth damage *(NOTE*–Internal gear and clutch backing plate can be separated from drum if replacement is necessary). If drum or backing plate is replaced, the gear should be reinstalled with the same side toward the front (the edges of the gear teeth are chamfered on the side which goes against the backing plate). Inspect output shaft to rear unit sun gear bronze thrust washer. Inspect output shaft for damaged pinions, splines, bearing surfaces or speedometer gear teeth.

10) Inspect reverse drive flange and sun gear assembly *(NOTE*–Reverse drive flange and sun gear are serviced as an assembly and should not be separated). Inspect rear unit selective washer for wear and damage.

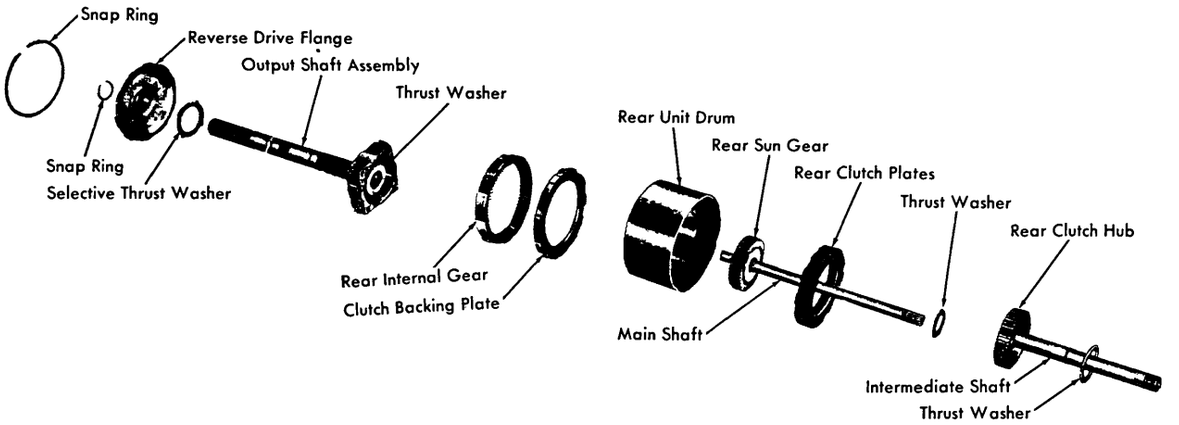
R ass mbly: **1)** Holding reverse drive flange and sun gear in left hand with drive flange up, install proper selective washer *(as determined by rear unit endplay check, see "Inspection" above)* in recess of drive flange with locating lugs indexed in flange. Use petrolatum to hold washer in place. Still holding reverse drive flange and sun gear in left hand, insert output shaft through the assembly until carrier bottoms on selective thrust washer. Hold unit tightly together and place on bench on carrier end. Install reverse planet carrier front ring on output shaft.

2) Insert Reverse Drive Flange Retainer J-6120 between snap ring and flange snug against rear unit carrier to prevent selective washer from dropping out of position *(NOTE*–When the selective washer used between reverse drive flange and planet carrier is at or near the upper limit of thickness, Retainer Tool J-6120 cannot be inserted between snap ring and flange. In this case, it is not necessary to use the retainer since there is not enough clearance to allow the thrust washer to drop out of place. Set rear unit drum on bench with long undercuts on lugs upward (or with internal gear up if it was not removed). Install clutch backing plate with flat surface down if it was removed (it may be necessary to tap plate into place with a soft hammer).

3) Install rear unit internal gear with mark upward (drill mark in rear face of gear or mark made at disassembly) if it was removed (gear teeth are beveled on side which goes against backing plate). Position gear against clutch backing plate. Install output shaft and reverse drive flange assembly into rear unit drum and secure with large snap ring. Set rear unit assembly into Holding Fixture J-6116 with shaft end down. As unit is lowered into fixture, lift up on drum and remove Drive Flange Retainer *(CAUTION–Do not lift on output shaft after retainer is removed).* Position thrust washer in counterbore of output shaft and retain with petrolatum.

4) Apply Hydra-Matic Oil to faces of seven drive and seven driven plates and alternately install them in rear unit drum. Start with a drive (composition) plate and finish with a driven (steel) plate. Install all drive plates with same side upward. Assemble driven plates with lugs in rear unit drum slots so notches in lugs are all in line *(NOTE*–Indexing the notches will nest the plates together so waves are all in the same direction, and with no gaps between plates). Install mainshaft and sun gear assembly into output shaft in rear unit, meshing sun gear with planet pinions of output shaft.

5) Assemble rear unit clutch hub to rear end of intermediate shaft if it was removed (open side of hub toward front of shaft. End with longest spline and longest machined surface will be toward rear). Install two bronze thrust washers on rear unit clutch hub, one on each side and retain with petrolatum. Install intermediate shaft and rear unit clutch hub and thrust washers into rear drum *(NOTE*–Pick up clutch drive plates by rotating intermediate shaft). Do not drive or force rear unit clutch hub into rear unit drum.



6) Assemble rear clutch piston into rear clutch cylinder as follows: Install new inner seal on hub of clutch cylinder with lip down. Install new outer seal on piston with lip facing away from spring bore side. Install piston into cylinder using flat edge of screwdriver to start seal into cylinder. Install eight clutch release springs into bores in piston. Place spring retainers on springs with tangs facing upward. Compress springs using tool J-4670-B and J-6129. Install snap ring which holds release spring retainer. Remove compressor tools.

7) Install rear unit sprag assembly in rear unit outer race with shoulder side of sprag on counterbored side of outer race. Install sprag and outer race of rear unit inner race (push sprag part way down through outer race then rotate sprag counterclockwise to assemble). Install rear unit sprag retainer in outer race with large outer diameter upward. Push retainer down to expose snap ring groove. Install spiral snap ring on rear unit clutch hub. Install rear unit cylinder and sprag assembly into rear clutch drum with sprag side up. Secure cylinder and sprag assembly into rear clutch drum with large snap ring.

8) Install neutral clutch drum on rear unit with driven clutch plate lug slots upward. Apply Hydra-Matic Oil to five clutch drive plates (composition) and four driven plates (steel). Install plates alternately using a release spring between steel plates (start with a composition plate, release spring, then steel plate, and end up with composition plate and spring).

9) Install seal on second type neutral clutch piston with lip side facing side with dowel holes, or install ring on first type. Install seal on hub of second type center bearing support with lip facing bottom of piston cavity, or install oil ring on first type center bearing support. Install neutral clutch piston into center bearing support aligning notch in edge of piston with lockscrew hole in side of center bearing support. This alignment assures that dowels will enter dowel holes (seal or piston ring can be installed by compressing with fingers). Install two oil rings in grooves of center bearing support hub. Center rings around hub and install center bearing support assembly into neutral clutch drum in rear unit using care not to damage bushing when lowering support over intermediate shaft. If properly centered, oil rings

CONTINUED ON NEXT PAGE

REAR UNIT DRUM, MAINSHAFT, & OUTPUT SHAFT ASSEMBLY (TYPICAL)

DUAL-COUPLING HYDRA-MATIC (C ntinu d)

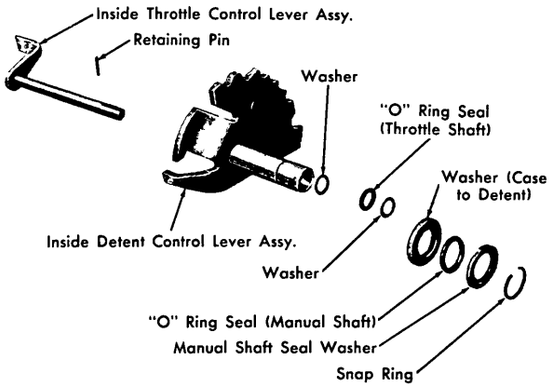
on support hub will be compressed by taper on hub of rear clutch cylinder. Install hook type oil seal ring on intermediate shaft.

FLYWHEEL HOUSING SEAL INSTALLATION: Start seal into bore in flywheel housing with lip facing toward bushing *(NOTE–Do not use sealer).* Drive seal into place using Flywheel Housing Oil Seal Installer J-6118. Stake housing against seal in three places.

TRANSMISSION REASSEMBLY

PARKING BRAKE ASSEMBLY, OVERRUN BAND, NEUTRAL CLUTCH DRUM STATIONARY STOP KEY AND INSIDE DETENT AND THROTTLE CONTROL ASSEMBLY: 1) Install overrun band through front of case with the band ends facing rearward in a horizontal position (anchor support hole should face right hand side). When band is approximately halfway through transmission case, with band still horizontal, rotate band so that ends are in cavity in case above anchor pin and rotate band into position. Position band end on anchor in case.

2) Place parking brake pivot shaft spacer in recess in case. Position parking brake pawl and lever assembly in case with upper lever on pivot in case. Locate parking pawl at pivot shaft hole and insert parking pawl pivot shaft through case, pawl and spacer until end of shaft is flush with rear of case. Slide spacer washer onto pivot shaft against parking brake lever. Position parking brake lever spring in bracket with long end toward rear. Slide bracket and spring assembly onto pivot shaft with end of spring under parking brake lever. Hook other end of spring over pin at front of bracket.



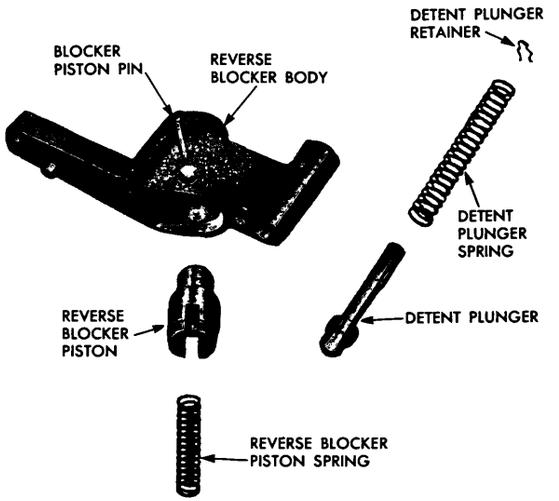
3) With throttle and detent levers assembled, place spacer washer over detent shaft against detent lever. Insert lever and shaft assembly through hole in case from inside with parking brake tang below pin in parking brake bracket. Install "O" ring seal and special washer which fits into bore on outside of case over detent lever shaft. Install snap ring to retain seal and washer.

4) Install neutral clutch stop key in case using petrolatum to hold it in place. Position rounded side toward front to provide lead for guiding neutral clutch drum over key.

CENTER BEARING SUPPORT, NEUTRAL CLUTCH & REAR UNIT ASSEMBLY: 1) Install rear unit, neutral clutch, and center bearing support assembly into case as follows: Insert output shaft end of assembly part way into front of case and then rest rear unit drum on case, while holding intermediate shaft. Rotate neutral clutch drum until groove for neutral clutch key is up.

2) Holding neutral clutch drum in this position, rotate center bearing support so that set screw hole in support is aligned with the second clutch plate slot counterclockwise from key slot in neutral clutch drum.

3) With parts aligned, slide assembly into case, engaging neutral clutch drum key with slot in clutch drum. Alignment can be checked by looking through lockscrew hole in side of case and observing that clutch plate slot in neutral clutch drum is aligned with set screw hole. This will properly align both the setscrew hole



INNER CONTROL LEVER ASSEMBLY

in support and locking key groove in neutral clutch drum. When properly installed, snap ring groove in case will be visible at front edge of case support. *NOTE–* If unit fits tightly in case, assembly may be aided by pulling on output shaft. Also make sure low band does not cock on rear unit drum and hold unit.

4) Make sure case support locking screw hole is aligned and install snap ring which positions center bearing support in case. Tap snap ring as necessary with screwdriver and hammer to make sure it seats fully in groove. *(NOTE–*If necessary to align center bearing support after installation, install Slide Hammers J-6125 to act as handles). Install center bearing support locking screw from outside of transmission case.

REVERSE ASSEMBLY, REAR PUMP & GOVERNOR: 1) Install reverse planet carrier on output shaft, aligning splines and pinions. Install reverse planet carrier to to output shaft snap ring. Install reverse stationary cone key in case with rounded side toward rear and retain with petrolatum. Install stationary cone key making certain that cone aligns with key. If cone sticks, tap gently with plastic hammer until seated.

REVERSE BL CKER ASSEMBLY

2) Install reverse clutch release spring on carrier. Tangs should be positioned away from carrier. Install reverse internal gear on carrier. Position reverse internal gear-to-pump hub thrust washer against internal gear. Install reverse clutch piston release spring over internal gear against shoulder in case and stationary cone.

3) Install new gasket on rear pump, and install the reverse piston and rear pump as an assembly into case aligning splines of pump drive gear and output shaft by rotating shaft. Install locking screw and rear pump-to-case attaching screw. Tighten attaching screw to 25 ft. lbs. and locating screw to approximately 6-8 ft. lbs.

4) Remove Rear Unit Clutch Retainer J-6135 from intermediate shaft. Install rear bearing over output shaft into pump cover. *(NOTE–*If rear bearing is tight on shaft, it will be necessary to tap bearing into place using Rear Bearing Installer J-6133. While tapping bearing into place hold a block of wood aginst front of the mainshaft to hold output shaft to rear until groove for snap ring can be seen behind the rear bearing). If bearing is a slip fit on output shaft install snap ring on shaft against bearing, then pull shaft rearward and push snap ring into groove.

5) Install rear bearing snap rings on output shaft, if not previously installed, and in rear pump cover. Check mainshaft endplay as follows: Install Dial Indicator Support J-6126. Install collar of Endplay Checking Fixture J-6127 and secure in position by installing Truarc snap ring on mainshaft. Attach fixture to collar by threading collar securely into fixture. Install dial indicator. Move mainshaft back and forth to check endplay of mainshaft. Be sure to get free mainshaft endplay. Forcing mainshaft will not give accurate reading. Subtract endplay of rear unit sun gear on mainshaft from mainshaft endplay. Difference will be actual endplay of rear unit and should be .004-.018". If outside these limits it will be necessary to remove and disassemble the clutch unit so that correct selective washer can be installed between rear unit planet carrier and the reverse drive flange. *See "Center Bearing Support, N utral Clutch & Rear Unit" under "Disassembly & R - assembly of Units" above.*

6) Remove endplay checking tool. Install governor into rear pump as follows: Align snap rings so gaps will be upward when governor sleeve is aligned with drive key. Compress rings by hand and work governor into bore in rear pump. Rock governor back and forth to engage drive key. Check to see that governor turns when output shaft is turned.

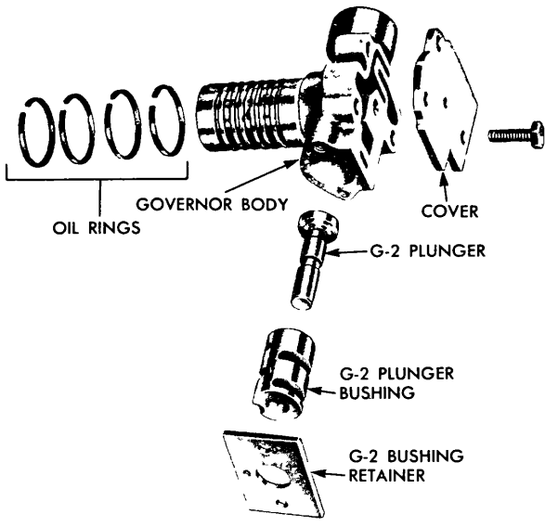
7) Install new extension housing gasket on rear pump with petrolatum, and install extension housing on case with six attaching screws and washers. Tighten to 25 ft. lbs. torque. Leave out bottom two screws which are used to fasten oil cooler. Install speedometer driven gear in extension housing. Insert vent pipe into hole in top of rear pump and clamp pipe to case.

8) If rear oil seal was removed, coat new seal with Permatex and drive seal into housing using seal Installer J-5154-A. Felt portion of seal must be toward rear. Seal should be driven in until it bottoms in housing.

CONTINUED ON NEXT PAGE

DUAL-COUPLING HYDRA-MATIC (C ntinu d)

FRONT PUMP & OVERRUN CLUTCH: 1) Install front pump and overrun clutch plate assembly over intermediate shaft and at the same time align intake pipe holes in front pump and case. These should be indexed properly before any attempt is made to install pump into transmission.



2) Install front pump into transmission case and tighten the three front pump-to-center bearing support bolts, then back off 1/4 turn. Apply air in the neutral clutch hole of transmission case to position center bearing support against snap ring. With air still applied, tighten case to front pump lock screw to 22-27 ft. lbs. Tighten pump-to-center bearing support screws to 25-30 ft. lbs.

►*FRONT PUMP LOCK SCREW PRODUCTION CHANGE:* Lock washer has been eliminated and a new "Washer Head" screw is being used in production. Whenever a lock screw is found with a lockwasher, replace it with the later type screw, Part No. 8617869.

FRONT UNIT COUPLING, PRESSURE REGULATOR & COOLER ADAPTER: 1) Make sure seals are in place on ends of oil cooler sleeves and insert sleeves in case with seal end first. Place oil cooler adapter with gasket on case over oil cooler sleeves, install two attaching screws with copper washers, and tighten securely.

2) With spring in place on regulator valve install valve and spring into case. Install pressure regulator plug assembly and tighten to 5 ft. lbs. *CAUTION–Overtightening of pressure regulator may push pump away from side of case causing an oil leak between passages in pump and case.*

3) Install front unit coupling cover first (with transmission vertical, and front end up), into transmission case. Rock drive torus shell to make sure drive hub engages front pump rotor and rock driven torus shaft to make sure lugs on shaft engages front unit sprag inner race. Driven torus shaft should turn clockwise freely, but should not turn counterclockwise as viewed from front.

GOVERNOR ASSEMBLY

CONTROL VALVE, SERVO & ACCUMULATOR: 1) Rotate transmission to horizontal position. Attach control valve assembly to transmission with five attaching screws, leaving out screw which will position front pump intake pipe retainer. *(NOTE–*The four outer screws have star washers and the center two have flat washers). Position detent lever so it will engage detent plunger and manual valve.

2) Install new front pump "O" ring seal in intake pipe at front of case. Install servo and accumulator assembly and servo spring. Install front intake pipe into case and secure with clip and valve body attaching screw.

3) Install rear pump "O" ring seal on rear pump intake pipe. Install oil screen on front pump intake pipe. Install rear pump intake pipe into screen and case. Install oil pan with new gasket and tighten attaching screws securely.

FLYWHEEL REAR HOUSING, TORUS ASSEMBLY & OIL COOLER: 1) Remove transmission from holding fixture and position on bench in a horizontal position, with pan down. Install steel thrust washer in recess in front unit drive torus shell. Position Flywheel Housing Bushing and Seal Protector J-6119 over intermediate shaft.

2) Install rear flywheel housing-to-case "O" ring seal on flywheel housing. Install rear flywheel housing on case and attach with six screws. Tighten securely. Remove Bushing and Seal Protector.

3) Install proper selective washer on drive shaft of front unit as determined when checking front unit end clearance at disassembly. Install torus cover and push cover on evenly, without rocking, to prevent damage to seal and bushing.

4) Install internal gear assembly into cover, indexing with torus cover and front unit drive torus hub. Install bronze thrust washer then steel backing washer in internal gear. Steel backing washer must be indexed with splines of front unit drive torus shaft.

5) Install sun gear over front unit driven torus shaft, chamfered side first. Install steel backing washer and bronze thrust washer against sun gear. Install drive torus member on intermediate shaft indexing front unit planet carrier with sun gear and internal gear. Secure drive torus to intermediate shaft with Truarc snap ring.

6) Install driven torus rear Truarc snap ring on mainshaft. Install driven torus front Truarc snap ring on mainshaft to secure torus member.

7) Install flywheel "O" ring seal on flywheel and position flywheel against torus cover, indexing with dowels (flywheel can be installed in only one position since dowels are of different sizes). Install and tighten flywheel-to-torus cover nuts leaving the nuts off bolts required for attaching flywheel and torus cover to flex plate *NOTE–24 attaching bolts used in early production. 12 bolts in later production. When using a 24 bolt cover on a 12 bolt flywheel, remove the 12 alternate bolts. A 24 bolt flywheel can be used on a 12 bolt cover without any changes).* Tighten nuts to 20 ft. lbs.

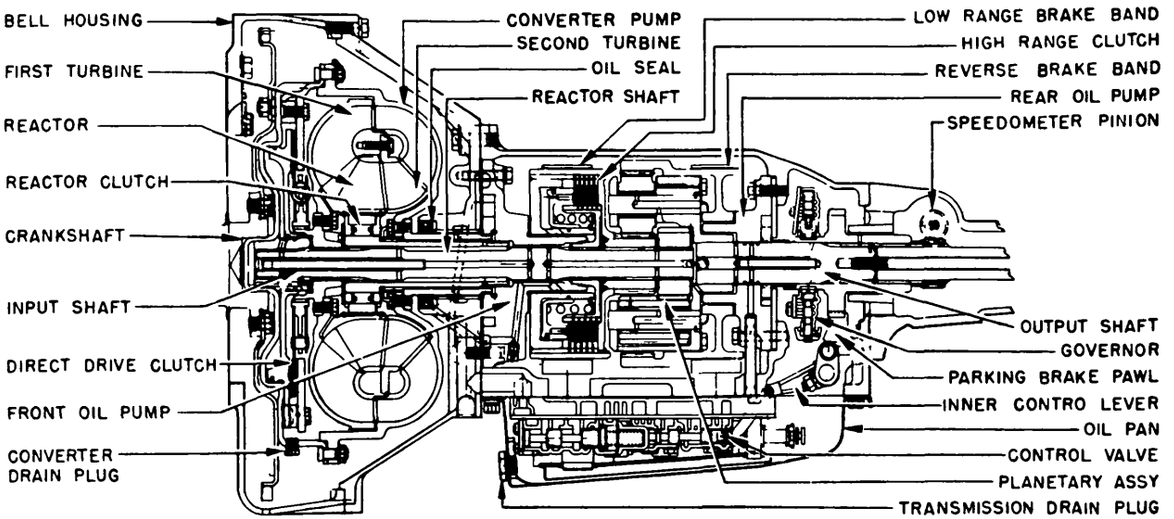
8) Place oil cooler in position against bottom of rear extension housing and install attaching screws. Connect oil cooler pipes to adapter on side of transmission case.

PACKARD TWIN ULTRAMATIC

Huds n, Hornet V8 (1956)
Nash, Ambassador V8 (1956)
Packard, All Models (1956)
Studebaker, Golden Hawk (1956)

►CHANGES, CAUTIONS, CORRECTIONS

►*1956 HUDSON & NASH ULTRAMATIC REAR CIL PUMP PROD. CHANGE·* A new rear pump driver, Part No. 6489292, which pilots in both the rear pump rotor and on the planetary shaft (to prevent brinnelling of the shaft) was used in production starting with transmission serial No P-6492. *NOTE* - The brinnelling marks found on the planetary shaft will not affect its operation. It is therefore not necessary to change the rear planetary assembly when the new driver is installed as it will prevent contact of the rotor drive lugs and shaft.



►*1956 ULTRAMATIC CONTROL VALVE BODY AIR LEAKAGE CORRECTION* This condition can cause erratic shifting and a high pitch whine from either or both oil pumps Correct as follows Lap the mating surfaces using crocus cloth laid on a surface plate or plate glass. When installing control valve assembly in transmission, tighten the bolts as indicated in "Transmission Reassembly" in 1955 Annual Data or later Manual edition.

►*1956 STUDEBAKER ULTRAMATIC LOW RANGE BRAKE PRODUCTION CHANGES* Starting with Transmission Serial No. S-2463, the inner spring was eliminated and a new separator plate, Part No 6489478 entered production. This change was made to overcome possible occurrences of engine "flare-up" or "runaway" during transmission upshift from low range converter to high range converter. To correct this condition on cars before Serial No S-2463, install the later type separator

►*1956 STUDEBAKER ULTRAMATIC HARSH BAND APPLICATION (On Transmission between Serial Nos. S-2463 and S-4028)* If this condition is apparent on transmissions between these serial numbers, install the low range brake inner spring, Part No. 470183).

►*LATE 1956 STUDEBAKER ULTRAMATIC LCW RANGE PRODUCTION CHANGE* Beginning with Transmission Serial No. S-4028, the inner low range brake spring was reinstated, and is used with the later type separator plate. See Production Changes above

►*1956 STUDEBAKER ULTRAMATIC TRANSMISSION FRONT FUMF CHECKING CAUTION* In cases where the high range clutch burns out prematurely, or there is an engine "runaway" on low range converter to high range converter upshift, check the front pump for restrictions, as follows Place complete pump assembly in a shallow pan with pump plate upward. Use a small funnel with the end reworked to fit the high range oil circuit hole of the pump plate (this hole is the fourth hole to left of pump plate screw having the five closely spaced holes adjacent to it. The other plate screw has only two closely spaced holes adjacent to it). Using automatic transmission fluid (temp 65° to 75°F), pour enough fluid in funnel to fill the high range passage in the pump. Allow fluid to drain down to a level slightly above the funnel spout. At this time, pour an additional ½ pint of fluid in the funnel and observe the time required for fluid to reach the predetermined level. If more than 2 minutes and 15 seconds is required for the level to come up, the passage is restricted and the pump should be replaced.

TWIN ULTRAMATIC DRIVE SECTIONAL VIEW

►*1956 STUDEBAKER ULTRAMATIC DIRECT CLUTCH PRESSURE PLATE ASSEMBLY PRODUCTION CHANGE* Flat washers, No 338405 are being installed under the heads of the direct clutch pressure plate bolts to prevent steel shavings (caused by bolt head digging into pressure plate) from falling into transmission. Install these washers at this location whenever work is performed on the direct clutch pressure plate assembly.

►*1956 STUDEBAKER ULTRAMATIC CONVERTER PUMP SHAFT AND TRANSMISSION FRONT PUMP ROTOR PRODUCTION CHANGE* Beginning with Transmission Serial No S-2463, a new converter pump shaft, (with splines controlled to provide an improved spline fit), and a new front pump rotor (with 40 splines instead of 20) were used. (*NOTE* - The early pump shaft had 40 splines, however, only 20 were used as the rotor had only 20 splines). When necessary to replace the early type front pump or a converter pump shaft, use Rotor Assembly and Pump Shaft Kit, Part No. 6484523, or Pump Assembly and Pump Shaft Kit, Part No. 6484524. On cars prior to Transmission Serial No. S-2463, use Converter, Part No. 6479085 when replacing only the converter.

►**TOWING TWIN ULTRAMATIC TRANSMISSION CARS:** Cars can be towed with selector lever in Neutral "N" position providing the Twin Ultramatic unit is not damaged and oil level in unit is normal. **Do not tow car at a speed gr ater than 30 MPH., or for any great distance.** If selector lever cannot be placed in Neutral, or if transmission oil level low, disconnect drive shaft at rear end and securely fasten to frame so it cannot move to the rear (*CAUTION*–Rearward movement will allow front end to slip off transmission main shaft splines and drop down).

►**STARTING ENGINE BY PUSHING CAR:** If this procedure required for Twin Ultramatic Cars, place selector lever in Neutral "N" position and turn on ignition. When car has attained a speed of 25 MPH., move selector lever to LEFT HAND "D" position. Engine will then crank.

DESCRIPTION

Twin Ultramatic Transmission is the same general design as used on 1955 Models. *See 1955 Annual Data or later Manual edition.*

►*1956 PACKARD ELECTRIC FUSH-BUTTON CONTROL NOTE* This unit is standard equipment on Packard Carribean and optional equipment on other Packard models. *See "Packard Twin Ultramatic "Push-Button" Control" for service procedures and wiring diagram.*

The torque converter assembly automatically provides a torque multiplication ranging from approximately 2-1/3 to 1 (for starting and heavy loads) to a 1 to 1 ratio (for steady driving and light loads) and is locked out by the Direct Speed Clutch at speeds above 15 MPH in High Range operation under normal driving conditions (can be "Kicked down" at car speeds under 60 MPH). Planetary unit is manually controlled and provides definite gear ratios (in addition to the varying ratios of the Torque Converter) depending on selector lever position. This control is effected through the hydraulic control system by means of oil pressure supplied by front and rear oil pumps in transmission case.

CONTINUED ON NEXT PAGE

TWIN ULTRAMATIC (C nt.)

LUBRICATION

Check transmission fluid level every 1000 miles and add fluid as required to maintain level at FULL mark on dipstick. Drain and replace fluid at 25,000 mile intervals.

►*CAUTION: Fluid must only be checked at normal op rating temperatures after 1 minute operation at 800 RPM with selector lever in "N" position.*

Ch cking Fluid L vel—With fluid at normal operating temperature, place selector lever in "N" position, idle engine at 800 RPM to fill system, then run engine at low idle while level is being checked, using dipstick in engine compartment on left side.

►*NOTE:* If fluid level doubtful due to bent or distorted dipstick tube, check actual fluid level in transmission as follows: Place car on level floor and allow engine to run at idle speed for five minutes in "N" (Neutral). Place a pan under rear of transmission and remove plug in rear of transmission case. If no oil runs out of opening, add oil until it begins to run out, install plug, then ADD ONE QT. If oil does run out when plug removed at rear of transmission, allow to drain to level of hole, then ADD ONE QT.

Draining & R filling—Remove flywheel housing lower cover and turn flywheel to bring a converter drain plug to the bottom. Place a container under converter and transmission oil pan and then loosen but do not remove converter drain plug. Rotate flywheel to bring the other drain plug to the bottom and remove this drain plug and also the oil pan drain plug and drain fluid. Remove oil filler tube, oil pan, and strainer and thoroughly clean and dry these parts (use compressed air to dry). Reinstall strainer, pan, and tube using new gaskets. Reinstall and tighten converter and oil pan drain plugs (make sure that the drain plug previously loosened is also tightened securely). Install flywheel housing lower cover and tighten retaining screws to 15-18 ft. lbs. (1954 cars), 25-30 ft. lbs. (1955 cars). Pour seven qts. of Automatic Transmission Fluid Type A through filler tube in engine compartment. Start engine and allow to run at HIGH IDLE speed for five minutes with transmission selector lever in "N" (Neutral) position. Bring engine to slow idle speed and add approximately two to three qts. of fluid, and then continue to add only enough to bring level to FULL mark on dipstick.

►*CAUTION: Determine amount of fluid installed by mark on dipstick rather than by number of qts. installed.*

Recommend d Fluid—Packard Twin Ultramatic Transmission Fluid or any Automatic Transmission Fluid Type "A" having an AQ-ATF number and symbol embossed on the container.

LINKAGE ADJUSTMENT

►*THROTTLE LINKAGE ADJUSTMENT NOTE: See "Throttle Linkage" under "Carburetor" on Car Model pages.*

HUDSON & NASH

S l ctor C ntr l Linkage Adjustm nt (Hudson & Nash V8): Place selector lever in "R" (Reverse). Disconnect transmission control lever from control rod at rear of transmission. Move transmission control lever to rear as far as it will go (do not force lever as it may bend stop plate within transmission). Adjust clevis on transmission control rod so that clevis pin fits freely in hole of clevis and transmission lever. Replace cotter key and tighten locknuts on control rod. *NOTE*—If necessary to align selector lever point on steering column, place selector lever in "N" (Neutral) position (noting position of pointer). Remove shroud from jacket tube by removing retaining screw at lower end of shroud and sliding shroud downward and turning upper end toward the right. Lift out of jacket tube. Hold pointer shaft with pliers and move pointer toward right or left on shaft to line it up directly under center of letter "N".

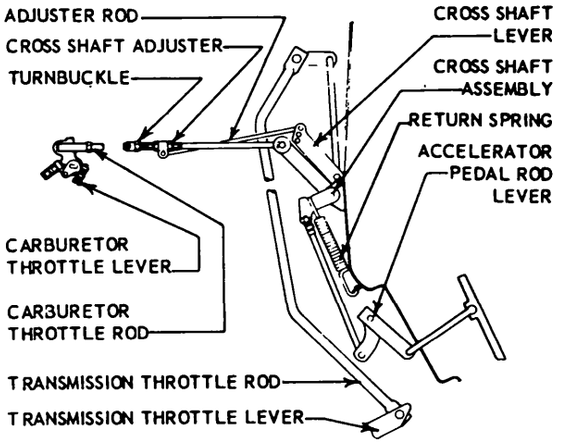
Neutral Safety Switch Adjustment: Adjust switch so starter is operative only in "N" and "P" position.

PACKARD

Selector Control Linkage Adjustment (All Packard): Disconnect forward end of transmission control rod at bellcrank (attached to frame side rail). Pull control rod to its full forward limit which will place the control manual valve in the reverse position. Pull lever at lower end of selector shaft downward to its full limit of travel so it contacts stop on lever bracket. Adjust turnbuckle in lower lever to bellcrank link so that the forward end of the control rod will enter bellcrank, and secure in this position.

Neutral Safety Switch Adjustment: Adjust switch so starter is operative only in "N" and "P" position.

STUDEBAKER GOLDENHAWK



Selector Control Linkage Adjustment: Disconnect clevis from forward end of control rod at bellcrank. Pull transmission rod to its full forward limit of travel by means of the bellcrank which will place manual valve in the reverse position. Pull control rod down to its full limit of travel. Adjust the clevis so the pin will freely enter clevis and bellcrank arm. Tighten clevis locknut and install cotter pin.

Neutral Safety Switch Adjustment: Switch is located at lower end of steering post jacket. Remove hand control-to-switch rod. Loosen screws attaching switch to jacket. Align pin hole in switch lever with corresponding hole in switch body. Install pin through holes to maintain alignment. Tighten attaching screws and install hand control-to-switch rod.

BAND ADJUSTMENT

►*ADJUSTMENT NOTE:* Adjusting screw and locknut for each band are located on left side of transmission case (Low Range Band), right side (Reverse Band). Both bands are adjusted alike as follows:

Adjustm nt: Loosen locknut on band adjusting screw and use a torque wrench to tighten adjusting screw (clockwise) to 20 ft. lbs. torque, then **back ff adjusting scr w 1-3/4 turns.** Tighten locknut.

PACKARD THROTTLE LINKAGE

TROUBLE SHOOTING & DIAGNOSIS

CAR FAILS TO MOVE (Under conditions indicat d below):

1) Car fails to move regardless of selector lever positi n.
(a) Insufficient oil or clogged inlet screen.
(b) Converter valve stuck or pump valve stuck.
(c) Selector control linkage disconnected.
(d) Transmission output shaft broken loose from planetary cage.
(e) Parking gear lever broken which may allow pawl to remain engaged in parking gear.
(f) Low and reverse bands adjusted too tight.
(g) Bushings or bearings seized in the transmission. Noise may or may not be present.

2) Car fails to move in "D" (Drive) range with select r lever in the gear starting position.
(a) Insufficient oil or clogged inlet screen. Loss of pressure to apply side of low range brake.
(b) Selector control linkage disconnected or out of adjustment.
(c) Low range brake band strut out of position or low range brake band badly worn.

3) Car fails to move in "D" (Drive) range with select r lever in high range clutch start position.
(a) Rubber lip seal on high range clutch piston out of position causing piston to leak.
(b) Shift regulator valve stuck or clutch plates worn or burned.
(c) Selector control linkage disconnected or out of adjustment.

4) Car fails to move with selector lever in "L" (L w) position.
(a) Selector control linkage disconnected or out of adjustment.
(b) Worn low range band or band strut out of position.
(c) Low range brake piston jammed or insufficient oil supply to apply side of low range brake.

5) Car fails t m v with s l ct r l v r in "R" (R v rs) p siti n.
(a) Selector control linkage disconnected or out of adjustment.

CONTINUED ON NEXT PAGE

TWIN ULTRAMATIC (C nt.)

(b) Worn reverse brake band or strut out of position.
(c) Manual valve stop inside transmission not adjusted properly allowing the manual valve to over-travel.
(d) Lack of oil to apply side of reverse brake piston caused by a stuck reverse shuttle valve.
( ) Reverse brake piston stuck in housing.

6) Excessive slippage in all driving ranges.
(a) Insufficient oil or low front pump pressure due to sticking pump valve.
(b) Low front oil pump pressure due to ball plugs being out of low range and reverse brake housings, or worn or badly scored pump rotors.
(c) Low oil pressure to the converter caused by a stuck converter valve.

7) Excessive drag in "D" (Drive) range using high range clutch start. Also drags in reverse but is all right on "L" (Low) range.
(a) Low range brake band too tight, or low range brake piston stuck and holding brake partly applied.
(b) Transfer tube to release side of low range brake out of position.

8) Excessive drag in both "D" (Drive) ranges. All right in "R" (Reverse) range.
(a) Reverse brake band too tight, or reverse brake piston stuck holding brake partly applied.

9) Car creeps forward in "N" (Neutral).
(a) Low range brake band too tight, or High range clutch plates sticking on splines.
(b) High range clutch piston rubber lip seal out of position causing piston to stick and partly engage clutch.
(c) Low range brake piston stuck holding brake partly applied.

10) Car creeps excessively in any driving range with the ngine idling.
(a) Engine idling too fast.

11) Car creeps forward when selector lever is in "R" (Reverse).
(a) Manual valve linkage out of adjustment.

12) Car does not move with the selector lever in "R" (Reverse) position.
(a) Reverse shuttle valve stuck preventing the oil above the reverse brake piston from venting.
(b) Reverse brake band strut out of position.

13) Chatter when starting in "D" (Drive) range using high clutch start.
(a) Low range band dragging, or reverse band dragging.
(b) Worn, burned, or distorted high range clutch plates. Could also be caused by sticking plates or piston.

14) Chatter when starting in "L" (Low) range.
(a) Low range brake band out of adjustment, or reverse range band dragging.
(b) Sticking high range clutch plates or pistons.

15) Chatter when starting in "R" (Reverse) range.
(a) Reverse brake band out of adjustment, or low range band dragging.
(b) Reverse drum (ring gear) bushing badly worn.

16) Driv Clutch fails t ngag .
(a) Sticking high speed governor valve, low speed governor valve or direct shift valve. Could also be caused by direct shift throttle valve sticking.
(b) Direct drive clutch piston sticking.

17) Direct drive clutch "hangs on" or fails to release on deceleration.
(a) Sticking direct shift valve or low speed governor valve.

18) Direct drive clutch engages late and disengages early.
(a) Direct shift valve spring "cocked" in valve bore.
(b) Direct shift throttle valve sticking open.

19) Direct drive clutch slips.
(a) Excessive slippage in direct drive clutch circuit.
(b) Sticking converter valve resulting in high converter pressure while in direct drive.

20) Transmission remains in low range using gear start "D" (Drive) position. Will not upshift from low range converter to high range converter.
(a) Sticking low-high shift valve or sticking governor valves.
(b) Sticking throttle valve.

21) Incorrect front oil pump pressure.
(a) Low oil level or sticking pump valve.
(b) Ball plugs missing in reverse brake housing.
(c) Sticking pump check valves, or incorrect valve spring. Sticking modulator valve.

22) Incorrect high range clutch pressure.
(a) Sticking shift regulator valve, or sticking low-high shift valve. Incorrect pump pressure.

23) Incorrect low range brake top pressure.
(a) Ball plug missing in low range brake housing.
(b) Sticking low-high shift valve, or incorrect pump pressure.
(c) Threaded plug missing in low range brake housing.

24) Incorrect converter "IN" pressure.
(a) Incorrect front pump pressure.
(b) Sticking converter valve.
(c) Loss of pressure in the converter circuit caused by loose or worn bushings.

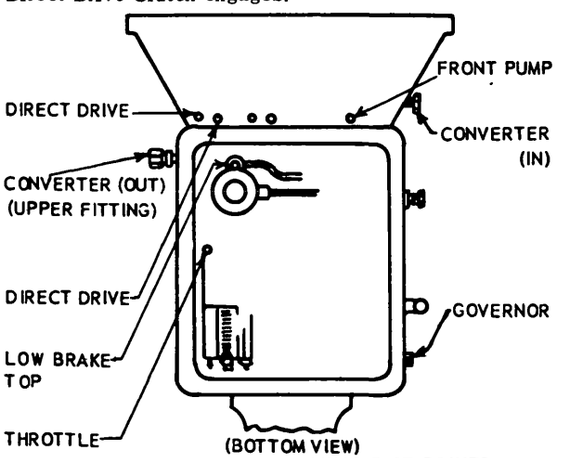
25) Incorrect direct drive clutch pressure.
(a) Sticking low or high speed governor valves.
(b) Worn or leaking direct drive clutch piston rings.
(c) Loss of pressure through direct drive clutch circuit caused by loose or worn bushings.

26) Incorrect governor pressure.
(a) Sticking low or high speed governor valves.
(b) Governor plate not properly installed.

27) Incorrect throttle pressure.
(a) Throttle pressure adjusting screw not properly set.
(b) Throttle linkage not properly set or is binding.
(c) Throttle valve sticking.

HYDRAULIC PRESSURE TESTS

►*NOTE:* Before making following tests, check fluid level in transmission. Road test car by driving under conditions simulating heavy traffic and highway operation (frequent stops and starts, low speed, medium speed, and accelerating). If transmission does not operate satisfactorily after engine and transmission thoroughly warmed up, make hydraulic tests as outlined below.



►*SPECIAL HYDRAULIC TESTING TOOL NOTE:* For Nash & Hudson, use Tool Set J-5975. For Packard models, use Tool Set PU-300, and Pan Adapter PK-23. These tool sets are comprised of gauges, fittings, flexible tubing, and special pan adapters.

TEST GAUGE INSTALLATION (HUDSON & NASH): Fold floor mat away from left side of front seat to uncover floor hole cover. Remove cover and insert flexible pressure gauge lines supplied with Tool J-5875 to the transmission. Remove plug in transmission and connect line fitting to correct passage for desired hydraulic test (see Test Plug Location in illustration).

TEST GAUGE INSTALLATION (PACKARD): Remove flexible tubing from left hand fresh air duct and thread gauges through the fresh air grille, out of air duct and down to transmission. Attach hoses to desired points on transmission (see Test Plug Location in illustration).

FRONT PUMP PRESSURE: Connect gauge to front pump test point at front of transmission case (left side). On all models, operate engine at 400 RPM. Normal oil pressure should be 80-95 lbs. (1954 Packard). 80-110 lbs. (Others), with selector lever in all positions.

With Selector Lever in •D Range—Drive car at 15-20 MPH. Maximum pressure should be 150-160 lbs. (1954 Packard). 150-170 lbs. (Others), at full throttle before Direct Drive Clutch engages.

TWIN ULTRAMATIC HYDRAULIC TEST POINTS

With Selector Lever in D• Rang —Maximum pressure should be 140-150 lbs. (1954 Packard). 80-120 lbs. (1955 Packard). 140-160 lbs. (Nash & Hudson), at full throttle before Direct Drive Clutch engages.

With Selector Lever in L Range (1955 Packard): Drive car at 25 MPH. Pressure should be 120-130 lbs., at full throttle.

HIGH RANGE CLUTCH PRESSURE: *(NOTE—Leave gauge connected for "Front Pump Pressure" test above).* Connect another gauge to high range clutch pressure point at front of transmission (right side). In the following tests, High Range Clutch Pressure should be the same or not more than 10 lbs. under Front Pump Pressure.

With Selector Lever in •D Range: Operate engine at 400 RPM. High Range Clutch Pressure should be 75-90 lbs. (1954 Packard). 70-100 lbs. (1955 Packard). 70-110 lbs. (Hudson & Nash). Front Pump Pressure should be 80-95 lbs. (1954 Packard). 80-110 lbs. (Others).

CONTINUED ON NEXT PAGE

TWIN ULTRAMATIC (C nt.)

With S l ctor Lever in "D Range: Drive car at 15-20 MPH (Converter Drive). High Range Clutch Pressure should be 145-155 lbs. (1954 Packard). 145-165 lbs. (Others). Front Pump Pressure should be 150-160 lbs. (1954 Packard). 150-170 lbs. (Others).

With Sel ct r Lev r in D• Range: Operate engine at 400 RPM. High Range Clutch Pressure should be at Zero pressure. Front Pump Pressure should be 80-95 lbs. (1954 Packard). 80-110 lbs. (Others).

With Selector L ver in D• Range: Drive car at 20 MPH (Direct Drive) with a steady throttle. High Range Clutch Pressure should be 55-65 lbs. (All Models).

LOW BRAKE TOP PRESSURE: *(NOTE–The pressure point for this test and for Throttle Pressure is located on the control valve assembly. A special oil pan adapt r is used and a special procedure is required. Connections for both tests should be made at the same time. S e "Low Brake Top Pressure & Throttle Pressure Test Connection Note" below).* Pressure should be the same or not more than 10 lbs. under Front Pump Pressure.

With Sel ctor L v r in "D Range: Operate engine at 400 RPM. Low Brake Top Pressure should be 75-90 lbs. (1954 Packard). 70-100 lbs. (Others). Front Pump Pressure should be 80-95 lbs. (1954 Packard). 80-110 (Others).

With S l ctor L ver in D• Range: Operate engine at 400 RPM. Low Brake Top Pressure should be at Zero pressure. Front Pump Pressure should be 80-95 lbs. (1954 Packard). 80-110 lbs. (Others).

With Selector L ver in D Range: Immediately after upshift, Low Brake Top Pressure should be 40-65 lbs. (All Models). Front Pump Pressure should be 50-70 lbs. (All Models).

CONVERTER "IN" PRESSURE: Connect gauge to converter "in" test point at left side of converter housing.

With Sel ctor L ver in D• Range: Operate engine at 400 RPM. Pressure should be 60-70 lbs. (1954 Packard). 30-50 lbs. (Others).

With Sel ctor L v r in D• Range: Drive car at 15 MPH., (before Direct Drive). Pressure should be 70-80 lbs. (1954 Packard). 55-80 lbs. (Others).

With S lector L v r in D• Range: Drive car at a speed to engage Direct Speed Clutch. Pressure should be 15-25 lbs. (All Models) with Direct Drive engaged.

With Select r L v r in D• Range: In "kickdown" position, converter pressure should be 70-80 lbs. (1954 Packard). 70-85 lbs. (Others).

CONVERTER "OUT" PRESSURE: To check converter "out" pressure a special tee connection is required (install and braze a 1/8" nipple into one end of the 1/8" tee). Remove upper oil cooler tube adapter from side of bell housing. Install oil cooler tube adapter in the tee and reconnect cooler tube. Connect gauge to tee connection.

With S l ctor Lever in D• Range: Drive car at 15-18 MPH. In "Converter Drive" pressure should be 30-40 lbs. (1954 Packard). 25-40 lbs. (Others). In "Direct Drive" pressure should be 10-20 lbs. (All Models).

DIRECT DRIVE PRESSURE: Connect gauge to direct drive test point at front of transmission (right side), and another gauge to front pump test point at front of transmission (left side). Direct drive pressure should be the same or not more than 10 lbs. under front pump pressure.

With Selector Lever in D• Range: Drive car at 15-18 MPH. Front Pump Pressure should be at Zero pressure (All Models), before Direct Drive Clutch engagement. Front Pump Pressure should be 80-95 lbs. (1954 Packard). 70-100 lbs. (Others). After Direct Drive Clutch engagement, pressure should be 55-65 lbs. (All Models). After "kickdown", Direct Drive Pressure should be at Zero pressure. Front Pump Pressure should be 140-160 lbs. (All Models).

GOVERNOR PRESSURE: Connect gauge to governor pressure test point on left side of transmission case (rear). Pressures should be as follows:

1954 Packard, Hudson & Nash–15-20 lbs. at 13 MPH. 30-35 lbs. at 28 MPH. 55-65 lbs. at 56 MPH.

1955 Packard–15-18 lbs. at 13 MPH. 35-40 lbs. at 28 MPH. 62-69 lbs. at 56 MPH.

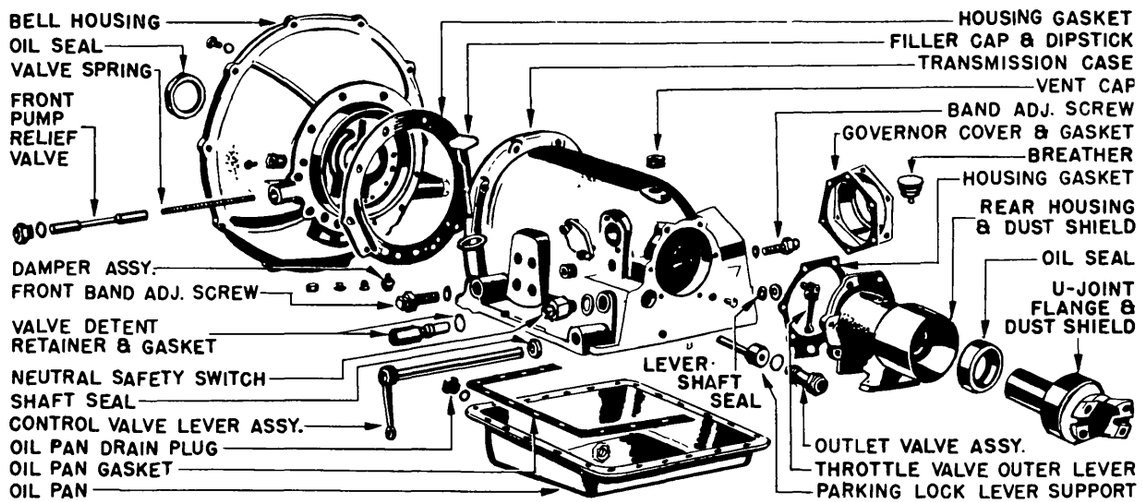
THROTTLE PRESSURE: *(NOTE–The pressure point for this test and for Low Brake Top Pressure is located on the control valve assembly. A special pan adapter is used and a special procedure is required. Connections for both tests should be made at the same time. See "Low Brake Top Pressure & Throttle Pressure Test Connection Note" below).* Operate engine at 400 RPM. Throttle pressure should be 20-25 lbs. (1954 Packard). 23-26 lbs. (Others). At Full Throttle, pressure should be 65-72 lbs. In "kickdown" (before downshift), pressure should be 80-95 lbs. (All Models).

Throttle Pressure Adjustment: Before adjusting throttle pressure, check all of the throttle linkage adjustments (see "Throttle Linkage Adjustment" above). The throttle pressure adjusting screw can be reached from the right side of the transmission case with the Oil Pan Adapter, PK-23 (Packard), or Oil Pan Adapter, J-5975 (Nash & Hudson) in place as described in "Low Brake Top Pressure & Throttle Pressure Test Connection Note" below. Use two wrenches through opening. Loosen locknut and turn adjusting screw to obtain correct throttle pressure (see "Throttle Pressure" above). Be sure to recheck throttle pressure after locknut is tightened.

►*LOW BRAKE TOP PRESSURE & THROTTLE PRESSURE TEST CONNECTION NOTE:* These two connections are located on the throttle control valve assembly within the transmission oil pan. Drain transmission fluid and remove transmission oil pan and screen. Install special test pan adapter, PK-23 (Packard), J-5975 (Nash & Hudson), with the adapter tube on the left side and toward front of car. Thread two of the gauge hoses through elbow tube on the adapter. Remove the 1/8" pipe plug from bottom of low brake housing and install a 1/8" elbow. Connect gauge hose. Remove 1/8" pipe plug from throttle valve body, install a 1/8" elbow and connect other gauge hose. On Packard, install the two oil suction tube extensions to suction tubes, install oil pan and gasket and replace transmission fluid.

TRANSMISSION REMOVAL

HUDSON & NASH



►*NOTE: The transmission and converter are removed from the chassis as an assembly.*

1) Raise car on lift or raise car at both ends and support it with jack stands under side sills. Drain fluid from transmission and converter assembly *(see "Draining & Refilling" above).*

2) Disconnect torque tube and propeller shaft from transmission. Disconnect throttle valve linkage and selector control linkage at transmission. Disconnect speedometer cable and cooler lines at transmission.

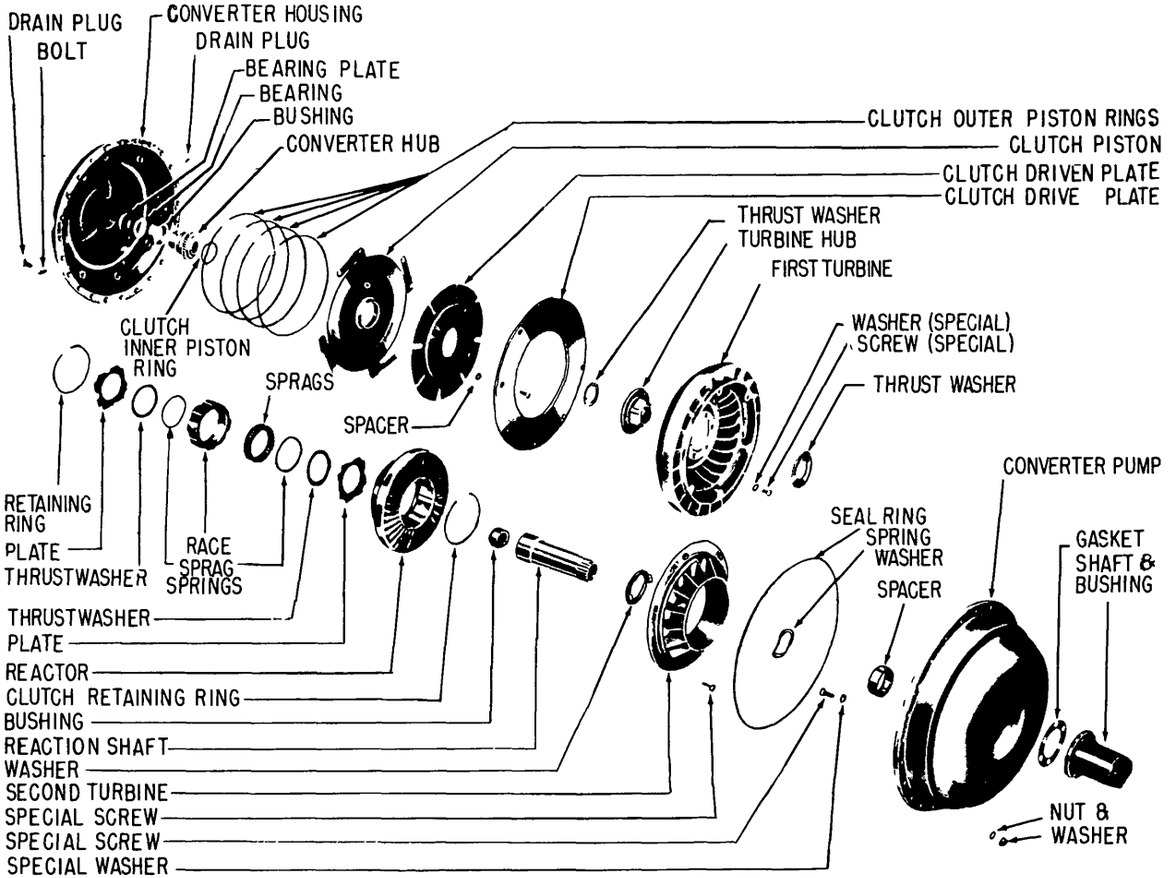
3) Support engine at rear using a support beam across frame channels or with a large block and hydraulic

CONTINUED ON NEXT PAGE

TWIN ULTRAMATIC TRANSMISSION CASE ASSEMBLY

TWIN ULTRAMATIC (C nt.)

jack under rear end of engine oil pan. Raise engine and transmission just enough to take load off rear support under transmission rear housing. Remove the insulator to support nuts and washers and then remove the support to cross member bolts and remove support.
4) Place a transmission lift under transmission with the lift adapter properly positioned around oil pan. Pick up transmission load by slightly raising the lift.
5) Remove direct drive clutch housing to flywheel retaining nuts and slide converter assembly toward transmission. Remove the bell housing to flywheel capscrews and then move transmission rearward until the direct drive housing is clear of the flywheel. Wire converter assembly to bell housing so that it cannot accidentally slide off the input shaft.
6) Lower transmission lift and pull it from under car. Transfer transmission assembly to a reconditioning stand.



PACKARD

►*NOTE: Transmission and converter are removed from chassis as an assembly.*

1) Raise car on lift or raise car at both ends and support with jack stands under side sills. *(CAUTION– Do not place jack or other lifting device under rear load arms or any other part of Torsion Level Suspension assembly).*
2) Disconnect propeller shaft at both ends and remove shaft. Disconnect throttle valve linkage and selector control linkage at transmission. Disconnect speedometer cable and cooler lines at transmission.
3) Support engine at rear using a support beam across frame channels or with a large block under rear of engine oil pan and a hydraulic jack. Raise engine and transmission just enough to take the load off rear support under transmission rear housing. Remove insulator to support nuts and washers and then remove the support to "X" member bolts and remove the support.
4) Place a transmission lift under transmission with lift adapter properly positioned around the oil pan. Pick up the transmission load by slightly raising the lift. Remove direct drive clutch housing to flywheel retaining nuts and slide converter assembly toward transmission.
5) Remove the bell housing to flywheel housing capscrews and then move transmission rearward until the direct drive clutch housing is clear of flywheel. Wire the converter assembly to bell housing so it cannot accidentally slide off input shaft.
6) Lower transmission lift and pull it from under the car.

STUDEBAKER GOLDENHAWK

1) Remove cable from positive battery terminal. Raise car on hoist to provide working clearance and remove left exhaust pipe. Disconnect wires from starter motor. Remove flywheel housing lower cover retaining capscrews and remove lower cover.
2) Rotate engine flywheel until one converter drain plug is at bottom and loosen, but do not remove the drain plug. Rotate flywheel 180° and remove other drain plug. Remove transmission drain plug. Replace and tighten all plugs after converter and transmission drained.
3) Disconnect front propeller shaft at transmission companion flange and tie to right side of frame out of the way. Disconnect throttle valve and manual valve linkage at transmission. Disconnect selector to bellcrank linkage by removing the cotter pin from clevis at bellcrank. Remove bolts and nuts holding bellcrank to transmission bracket, and to frame bracket and remove bellcrank. Disconnect speedometer cable and transmission cooler lines. Remove dipstick tube.
4) Support engine at rear using a support beam across frame channels or with a large block under rear end of engine oil pan and a hydraulic jack. Raise engine and transmission enough to take load off rear engine support cross member under the transmission rear housing. Remove cross member retaining bolts and slide cross member to rear.
5) Remove body front pillar support cross member. Place transmission jack under transmission with saddle adapter J-6316, properly positioned around oil pan. Take up transmission load slightly by raising jack. Remove direct drive clutch housing-to-flywheel retaining nuts and slide converter assembly toward transmission. Remove bell housing-to-flywhe el housing capscrews and then move transmission rearward until direct drive clutch housing is clear of flywheel. Wire converter assembly to bellhousing so that it cannot slide off the input shaft.
6) Lower transmission on jack and pull jack and transmission from under car. Remove bellcrank bracket from transmission. Remove converter and place on bench.

TWIN ULTRAMATIC TORQUE CONVERTER ASSEMBLY

TRANSMISSION INSTALLATION

HUDSON & NASH

1) Wire converter assembly to bell housing to prevent it from slipping off input shaft while moving transmission. Install transmission on lift or jack. Place under car and raise it until pilot at front of direct drive clutch housing is in a line with bore in crank-

CONTINUED ON NEXT PAGE

TWIN ULTRAMATIC (C nt.)

shaft. Move transmission forward so that pilot enters crankshaft while at the same time the four studs on clutch housing enter holes in flywheel. Start two of the converter to flywheel retaining nuts and remove wire holding converter to bell housing.
2) Raise transmission until pilot around top of bell housing flange is right to top of flywheel housing. Install the lower flywheel housing cover and starting motor. Install all bell housing to flywheel housing retaining bolts and tighten to 25-30 ft. lbs. Install the other two converter to flywheel nuts and tighten to 25-30 ft. lbs.
3) Attach rear cross member to the engine supports and side sills. Connect torque tube and universal joint to rear transmission housing and output shaft. Remove the support from under engine and lower the jack from under transmission.

PACKARD

1) Wire converter assembly to bell housing to prevent it from slipping off input shaft while moving transmission. Using a jack or other lifting device, place transmission under car and raise it until the pilot on front of direct drive clutch housing is in direct line with bore in crankshaft. Move transmission forward so pilot enters the crankshaft while at the same time the four studs on clutch housing enter holes in flywheel. Start two of the converter to flywheel retaining nuts and remove wire holding converter to bell housing.
2) Raise transmission until the pilot around top of bell housing flange is tight to the top. The dowel in the flywheel housing positions the bell housing properly in relation to flywheel housing. Install all bell housing to flywheel housing retaining bolts and tighten to 25-30 ft. lbs. Install the two remaining converter to flywheel retaining nuts and tighten to 25-30 ft. lbs.
3) Assemble flywheel housing lower cover to flywheel housing and tighten the bolts to 15-18 ft. lbs. Attach rear support to "X" members. Lower transmission lift and the jack supporting the engine and then install transmission rear housing insulator to support nuts and washers. Remove jack from under engine and the lift from under transmission.

STUDEBAKER GOLDENHAWK

1) Install converter on input shaft of transmission and wire to bell housing to prevent it sliding off during installation. Place transmission on jack and adapter. Install bellcrank bracket on transmission. Move transmission under car and raise until pilot on front of direct drive clutch housing is in line with bore in crankshaft. Move transmission forward so that pilot enters hole in crankshaft while at same time, the four studs on converter housing enter holes in flywheel. Start two of the converter-to-flywheel retaining nuts and remove wire holding converter to transmission.
3) Install all bellhousing-to-flywheel housing retaining capscrews and tighten to 25-30 ft. lbs. Install two remaining converter-to-flywheel retaining nuts and tighten all retaining nuts to 25-30 ft. lbs. Install oil filler tube on transmission and connect speedometer cable and cooler lines to transmission.
4) Install body front pillar support cross member and install engine support cross member. Lower engine and transmission and install rear engine support nuts and washers. Lower transmission jack and remove from car.
5) Connect front propeller shaft to transmission companion flange. Position selector bellcrank on transmission bracket and on frame bracket and install retaining nuts and bolts. Connect selector and throttle control linkage to transmission levers. Assemble flywheel front cover to flywheel housing and install capscrews. Tighten to 25-30 ft. lbs. Install left exhaust pipe. Lower car and fill transmission with Automatic Transmission Fluid. Adjust manual and throttle control linkage.

TRANSMISSION OVERHAUL

OVERHAUL: Procedures are the same as for 1955 Models. *See 1955 Annual Data or later Manual edition and see "Changes, Cautions, Corrections" above.*

PUSH BUTTON CONTROL

Clipper (1956), Optional
Packard, Exc. Carribean (1956), Optional
Packard Carribean (1956), Standard

►CHANGES, CAUTIONS, CORRECTIONS

►*1956 ELECTRIC PUSH BUTTON CONTROL PRODUCTION CHANGE:* In later production, the Battery Relay is eliminated (see wiring diagrams).

►*MOVING CAR WITH ENGINE NOT RUNNING CAUTION:* With ignition off, transmission will be in "Park" position and rear wheels will be locked (Transmission goes into "Park" automatically when ignition turned off). To move car without starting engine, turn ignition ON, press "N" button, **leave ignition on while moving car.**

DESCRIPTION

A "Six Button" control panel mounted on the steering column controls a reversible type motor and gear assembly which is mounted on the transmission and connected to the manual valve lever shaft. When a control panel button is depressed, the electric motor on the transmission automatically positions the manual valve in the transmission to the selected position. When ignition switch is turned off, transmission will automatically be in "Park" position and rear wheels will be locked. The engine cannot be started until "N" or "P" button is depressed.

ADJUSTMENT

The only adjustment required on the unit is the "Anti-hunt" feature. A rapid series of clicks, as the unit completes a shift will indicate necessity of adjustment. Adjusting screw located in end of actuator housing.

Adjustment: Back off armature thrust screw (small center screw) several turns (unit should hunt in any one of several positions). If hunting does not occur back off the outer adjusting screw (large) slightly and tap side of motor with a soft hammer while moving from "R" to "P" and "P" to "R". Continue to back out adjusting screw until hunting occurs. Gradually tighten the outer adjusting screw ¼ turn at a time until unit no longer hunts *(NOTE - Do not allow motor to hunt for long periods as it will become hot enough to affect the adjustment).* As proper adjustment is neared, unit will not hunt continuously out will make several oscillations at one or more positions. This is the proper adjustment on the bench. If unit is on the transmission, the proper adjustment is ¼ turn beyond point where unit does not oscillate. *(CAUTION - Do not over-adjust as an unnecessary load will be placed on the motor).* Lock jam nut firmly. Adjust armature endplay by screwing the center screw in until it is firmly against shaft, **then back screw out one full turn.**

TROUBLE SHOOTING

FAILURE TO START: With ignition on, connect test lamp between terminal No. 3 (red lead) of starter relay and ground. If lamp does not light, the lead from push button, or push button contact is open. Connect test lamp to No. 2 terminal (brown lead) and operate starter switch. If lamp does not light, the ignition switch or lead from ignition switch to relay is open. Connect test lamp to No. 1 terminal (brown lead) and operate starter switch. If lamp does not light, the relay is defective. If lamp lights, the starter switch or its lead is defective.

FAILURE OF BACK-UP LIGHTS: Check lamps and line fuse. Connect test lamp from dark green lead to ground and press "R" button. If lamp does not light, the dark green lead has an open circuit, loose connection or a poor contact in push button. If lamp lights, the wiring to back-up lights or their sockets is at fault.

FAILURE TO SHIFT TO "R", "N", OR "P": Pressure switch is open. Pull orange wires with Douglas terminals from pressure switch mounted on side of transmission near actuator. Connect these together (protect from ground). If the actuator performs normally, replace the pressure switch. If there is an open circuit in the orange lead, inspect for open or broken lead. This is most likely to occur at the cable connector near driver's side of firewall. Be certain that all terminals are pushed into the connector. Use a small screw driver to force any exposed brass terminal ends into place.

FAILURE TO SHIFT TO "H", "L" OR "D": Check the red wire with a white tracer. If there is an open circuit in this wire, check in the same manner as for orange wire (above).

OVERHAUL

PUSH BUTTON CONTROL UNIT & WIRING HARNESS:

Removal – Disconnect connector at rear side of firewall *(CAUTION - Mark location of wire terminals to insure installation in same location),* and remove wires and terminals from connector by pressing in on lip of the terminal with a small screwdriver and pulling wire and terminal through the connector. Remove all wires and terminals. Disconnect dark green, red, and black wires at steering column from individual bullet type connectors. Remove the four bolts clamping control housing to column and remove the two halves. Guide wires into lower openings in column and carefully pull them (one at a time) through the column.

Installation: Install wires through opening in steering column one at a time after lubricating each wire with lubriplate. A piece of stove pipe wire can be used to pull the individual wires through steering column and out through the opening. Be extremely careful when installing the halves of the switch housing on steering column so as not to pinch the wires when the four bolts are tightened. Install the wires in the connector at the same locations from which they were removed. Make sure the open side of the crimp on the connector terminal is next to the wide flat in the connector (the crimp section of the terminal is the part that crimps over the insulated part of the wire). Push the connector on the firewall connector. Connect the dark green, red, and black wires (at steering column) to their individual bullet type connectors. *NOTE* – To remove wires from the front half of the fire wall connector, release the terminal lock by inserting a small thin-bladed screw driver into connector and press down on lock while pulling on the wire. Make sure that wires are marked for installation in the same location in connector.

TRANSMISSION SHIFT ACTUATOR UNIT: Removal – 1) Disconnect tan and yellow leads from parking relay (this will prevent automatic shifting to "Park" when ignition is turned off). Turn on ignition and press the "R" button (this will position sector with the setscrew pointing downward). Turn off ignition. *(NOTE* - If setscrew cannot be positioned downward because of faulty wiring, or other causes, it will be necessary to remove the shift control motor and turn worm gear shaft with a suitable tool). *(CAUTION - When removing the motor, be careful and not allow the worm shaft to come out with the motor as the brake plates and thrust ball bearings will fall out of place).*

2) Remove wiring harness connector from forward side of firewall and disconnect leads from motor reversing relay. Disconnect green lead, orange lead, and red with white tracer lead from battery relay (if early production); from circuit breaker (if later production). Disconnect the two wires from pressure switch on side of transmission.

3) Remove plate from lower side of actuator gear housing. Loosen setscrew locknut and remove setscrew. Disconnect the front universal joint. Jack up rear of engine and remove transmission tail shaft and housing. Disconnect speedometer cable. Using a pry bar or jack, move rear of engine to the right as far as possible. Remove the capscrew holding actuator unit to side of transmission and slide assembly outward off valve lever shaft.

Disassembly & Inspection: Motor – Remove two through bolts and tap motor housing to free it from casting. Withdraw motor housing with care to prevent the slip joint coupling at end of motor shaft from sliding the worm gear shaft out of the gear box. Inspect inside of motor for signs of overheating such as excessive discoloration of the insulation or heavy deposits of varnish on metallic parts. Inspect brushes and commutator for wear and discoloration. Clean commutator and clean brushes as necessary. Connect an ammeter and voltmeter to the green and brown motor leads to measure amperage draw of right field coil. Repeat test on left coil by connecting green and grey motor leads. Replace field coils if draw is not within specifications or if they test grounded (see "Motor Test Specifications" below). Inspect armature for signs of open coils or damage *(NOTE - Do not test for shorts on growler as connections in the armature will cause it to show shorts on the usual growler test).*

Gear Box Unit – 1) Remove external cover plate. Fit the armature and its coupling on worm gear shaft and rotate shaft by hand. The shaft should turn freely and smoothly except at each end of segment stroke. A torque in excess of two inch-pounds or a feeling of stickiness is abnormal and the cause should be corrected. *(CAUTION - Do not turn armature far enough to allow contact fingers to leave end of contact segment).*

2) Inspect electrical switch assembly for signs of excessive wear or damage to contact fingers. Check for looseness of contact fingers and make sure insulation on wires is in good condition. If necessary to disassemble switch, remove screws retaining contact finger assembly. Fingers should be smooth and clean and all have the same shape. All fingers should be properly aligned in their slots.

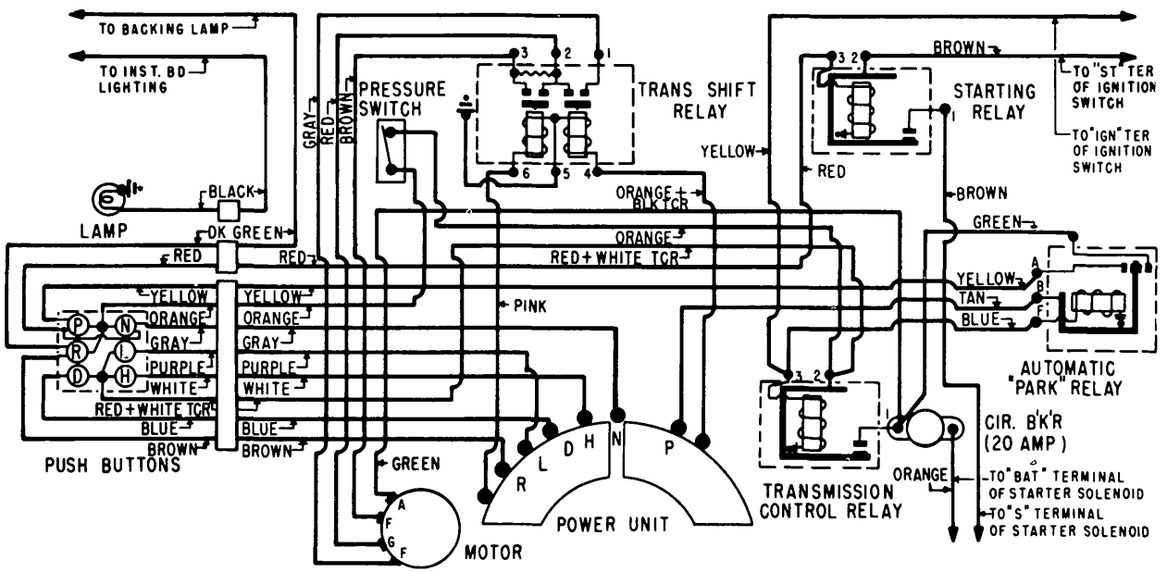
3) To remove contact segment, remove snap ring and slide segment from shaft. The surface of outer rim of

CONTINUED ON NEXT PAGE

PUSH BUTTON CONTROL (C nt.)

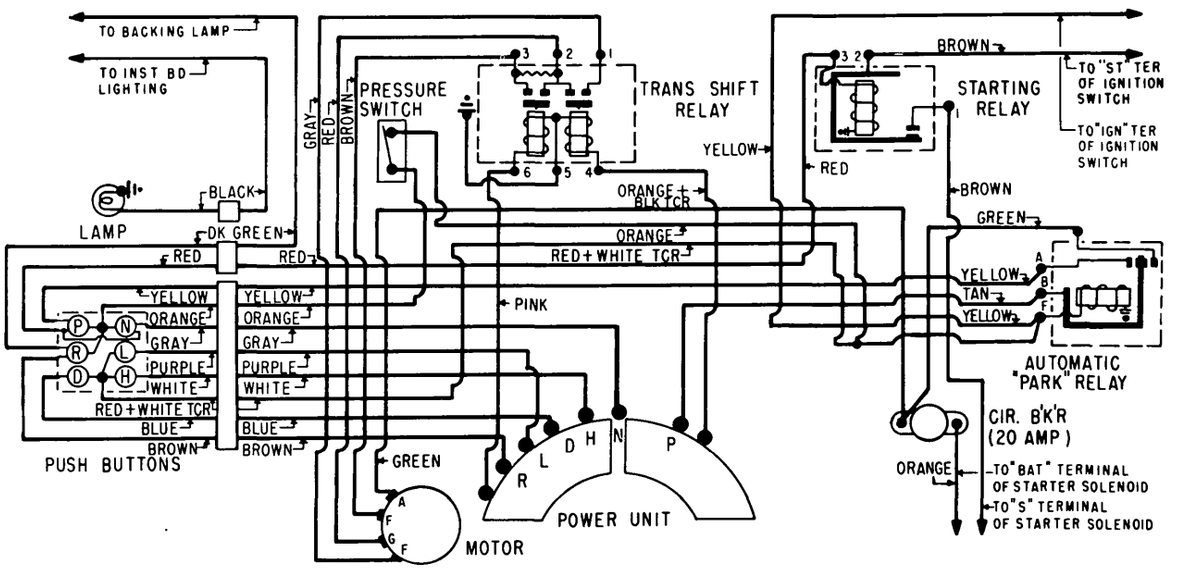
contacts should be smooth and clean. The gap between segments should not exceed .078" and the radius of segment corners should not exceed .040".

4) Remove base plate with or without switch installed. If contact plate has been removed the sector gear will be left in the housing and can be inspected in the assembled position. The worm and sector should be coated with lubricant. There should be at least .010" backlash at worm. Turn sector gear to the right which should cause free motion against the spring. Rotation of the worm shaft should cause a limited motion of the fibre brake plate. Remove sector gear and wash in solvent.



5) Remove worm shaft slowly being careful not to cause any damage to coupling end. This will allow the various components of "anti-hunt" system and worm to be removed. Wash parts in solvent. Inspect fibre brake plate for abnormal wear or scuffing. Examine the notch for broken ears or edges. Check for a free sliding fit on worm shaft. Place fibre in a cup of clean SAE 20 oil to allow to soak until ready for reassembly.

6) Inspect the steel brake washers. These should have a smooth polished surface. The internal lug should be free of burrs and the whole unit should slide freely on the worm shaft. Inspect worm, ball thrust bearing, thrust plates, and spring for wear or damage.



Reassembly & Testing: Brake Assembly – Loosen jam nut and back out the outer adjusting screw at end of worm shaft until the end is about even with inside of housing. Insert the worm shaft partly into left bearing of casting. As the end is gradually moved into place, install the various components in the following order: Place spacer on shaft with its narrow diameter next to casting wall. Remove brake plate from oil and shake off excess oil. Place plate on shaft with notched end engaged on boss of casting. Install one of the 1/16" steel brake discs or two 1/32" discs on worm shaft so that lug engages keyway. Install the worm and its key. Slide thrust ball bearing, consisting of ball assembly between two thrust plates, in position on shaft. Place spring and its thrust washer on shaft and slide shaft into position.

Motor Unit – Place gasket in position on commutator end head. Install brushes in their holders and insert armature into commutator end bearing. Release brushes and inspect to see that they seat properly on commutator. Place commutator end head in position on frame. With gasket in place on shoulder of gear housing, move motor into position engaging first the armature coupling with worm shaft, then locating pin in the motor frame with slot in casting. Install through bolts and tighten securely. As the bolts are tightened, strike motor frame several sharp blows with a soft hammer to align motor and bearings.

Motor Testing – Screw armature thrust screw firmly against shaft, then back out one full turn. Do not screw the outer adjustment screw in as this will place tension on the brake. Connect motor for a no load test with an ammeter in series between green lead and a 12 volt battery, and ground brown and red leads. Connect a voltmeter from green lead to ground. The motor should operate clockwise at the drive end and its current and speed should be within specifications. Change hookup so that grey and red leads are grounded. The motor should turn counter-clockwise and be within specifications. If motor does not operate according to specifications it indicates faulty fields, armature, brushes, hookup, or drag on armature.

TWIN ULTRAMATIC PUSH BUTTON CONTROL WIRING DIAGRAM (FIRST TYPE)

TWIN ULTRAMATIC PUSH BUTTON CONTROL WIRING DIAGRAM (LATER TYPE)

Motor Test Specifications
(Auto-Lite EPR-4001)

Field Coil Draw – 3.5-3.8 amps. at 10 volts (each coil) at 70° F.

No Load Draw – 12.0 volts, 45 amps., 1020 RPM (Min.).

Test with sector gear removed and with brake adjustment backed off to relieve tension. Test in both directions.

Stall Test – 12.0 volts, 65 amps. (Max.), 23 Oz. Ft. Torque (Min).

Motor Lubrication – Soak armature shaft bearings and felts in SAE 10 motor oil at overhaul. Pack gear chamber with 1½ ozs. clutch lubricant. Coat sector shaft and bearing with clutch lubricant.

CONTINUED ON NEXT PAGE

PUSH BUTTON CONTROL (C nt.)

Switch Assembly – Install sector gear with notched end of hub up and with approximate center of gear engaged with the worm. Rotate worm shaft to check for freedom of movement. Lubricate worm and sector gears with 1½ ozs. clutch lubricant. Install base plate and its gasket, holding it in place with the two topmost screws. Check for proper engagement with locating dowel pin. Use care to insure a good gasket seal. Mount contact segment on hub and lock in place with the snap ring. Carefully install contact finger assembly by inserting three screws through assembly. Slide assembly toward contact sector until contact fingers touch the sector. Cautiously align screws with holes and hold firmly while screws are tightened. Inspect carefully that the contact fingers are all lying across contact rim and that none have slipped out of place. Carefully tuck each wire under contact assembly so that none will rub against back of contact finger or be pinched by cover. Mount cover plate and gasket and tighten all screws evenly and securely. Make sure grommet fits into cover plate properly, and that base plate is correctly located on the dowel pins and that gasket is in place. Connect wires to connector and in correct positions.

Installation: Be sure actuator is in reverse position. Connect the leads as indicated in wiring diagrams, except leave the tan lead disconnected from parking relay. Turn on ignition and press the "R" button. Turn off ignition. Manually turn transmission shifter valve to the reverse position. Slide actuator unit into position and tighten the dog point screw. Be careful to set this screw as tightly as possible. Remove jam nut as necessary to secure full purchase on setscrew slot. When tight, lock securely with jam nut. Fasten inspection plate and gasket firmly in place. Engage the mounting stud with actuator and install mounting nuts. Before tightening the mounting nuts, turn on ignition and press "D" button. Rotate the actuator by hand until the center of "D" detent is felt then tighten and lock mounting nuts. Connect tan lead to parking relay. Check operation of actuator by pressing the various buttons at random, paying particular attention to any signs of laboring or hunting. Check angular adjustment of actuator by starting engine and operating at a fast idle. With the brake on press the various buttons and feel for correct shift. Shift "L", "H", "D", "H", "L". A distinct shift should be felt when actuator is correctly located with respect to detent.

Transmission Shift Relay Test Specifications
(Auto-Lite No. RAD-4004)

Contacts Close – 3.0-6.0 volts. Seals at 8.0 volts (max.).
Contacts Open – 1.0 volts (min.).
Resistor – .5-.6 ohms. (resistance of windings).

Pressure Switch Test Specifications
(Auto-Lite No. 14176A)

Contacts Open – 10 lbs. ± 2 lbs. per sq. in.

STUDEBAKER FLIGHTOMATIC

Stud baker Champion (1956)
Stud baker Commander (1956)
Studebaker President (1956)

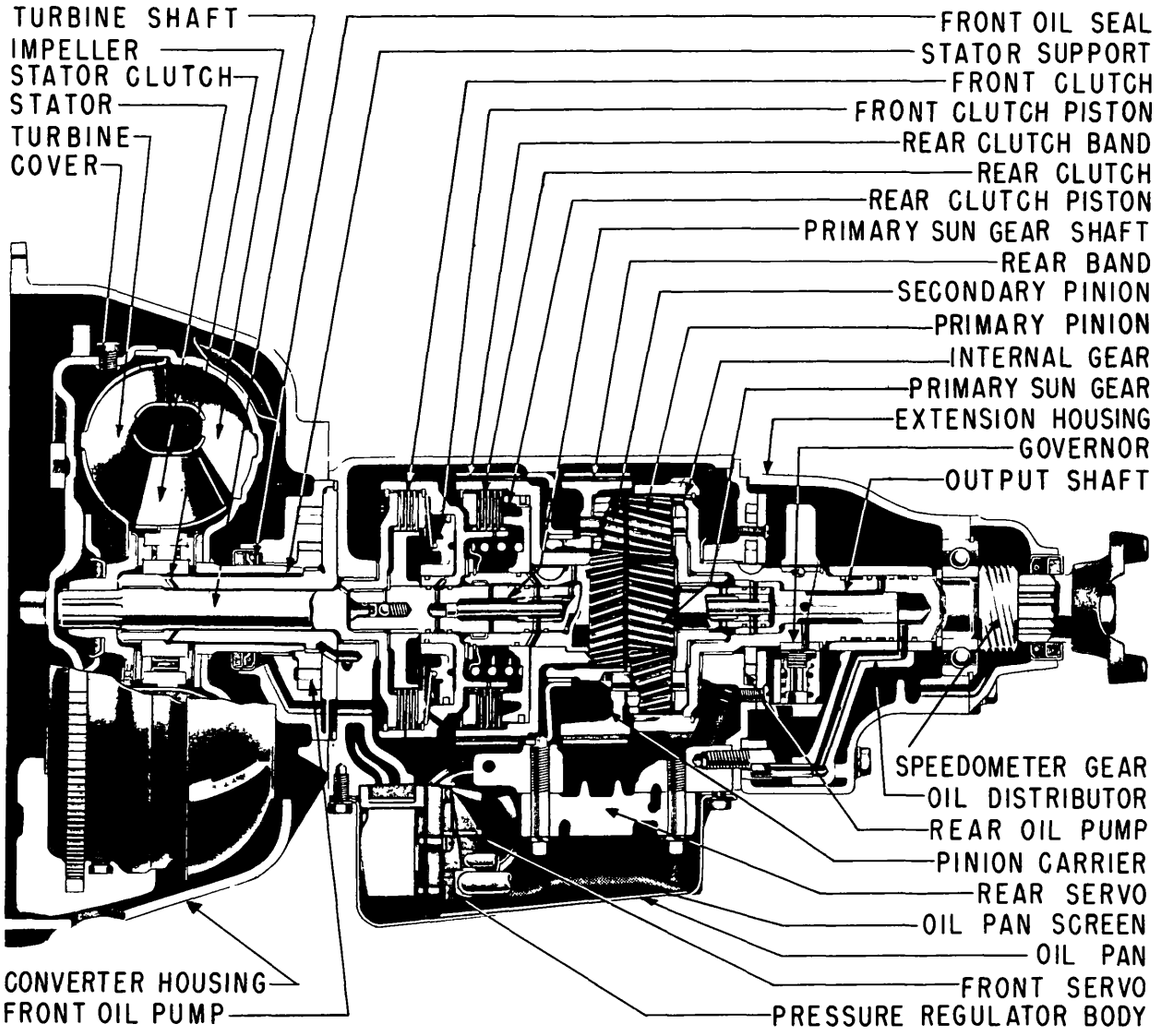
►CHANGES, CAUTIONS, CORRECTIONS

►*STARTING ENGINE BY PUSHING CAR:* Move selector lever to "N" (Neutral) position. When car speed reaches 20 MPH, turn the ignition switch on and move transmission selector lever to the "L" (Low) position. It is recommended that the car be pushed to start it rather than be towed.

►*TOWING CAR CAUTION:* Car can be towed for very short distances with the transmission selector lever in the "N" position. Prolonged towing will result in damage to the transmission unless the drive shaft is disconnected or the rear wheels are off the ground.

►*INTERMEDIATE GEAR START (COMMANDER & PRESIDENT MODELS) PRODUCTION CHANGE:* Beginning with Transmission Serial Nos. 19001 (Commander); 24001 (President), the control valve assembly has been modified to provide an intermediate gear start (rather than a "low" gear start) in all throttle positions. *NOTE–Transmissions prior to the above serial numbers having the letter "B" as a suffix to the serial number, have the modification made to the control valve assembly.*

►*LOW SPEED GEAR NOISE & IMPROVED SHIFT IN "D" RANGE CORRECTION (COMMANDER & PRESIDENT):* The control valve assembly can be modified to correct this condition and also to provide an intermediate gear start on transmissions prior to Nos. 19001 (Commander); 24001 (President), or transmissions not having the letter "B" suffix or transmission serial number. *See "Control Valve Disassembly & Reassembly" below.*



►*TORQUE CONVERTER ASSEMBLY PRODUCTION CHANGE & SERVICE REPLACEMENT NOTE (CHAMPION MODELS):* A new converter assembly, Part No. 1541550, identified by a daub of orange paint, and a Serial Number 1001CD, and up, is being used in production and for service replacement. Stall speeds, with the later type converter are reduced to 1400-1500 RPM.

►*FRONT CLUTCH FRICTION DISC PARTIAL PRODUCTION CHANGE & SERVICE REPLACEMENT CAUTION:* Sintered metal type (copper base) friction discs are being used in partial production and may be released for service replacement. Composition and sintered type discs are interchangeable in complete sets only and must not be mixed in the same clutch assembly.

►*FRONT SERVO SPRING NOTE:* A front servo spring having closed coils and a flat ground seating surface at one end (other end is not closed or flat ground, but has an abrasive cut-off) is being used in partial production. While this spring may appear to be broken, it is entirely serviceable and is interchangeable with the original type spring.

DESCRIPTION

Flightomatic transmission consists of a hydraulic torque converter and a hydraulically controlled automatic 3-speed planetary type transmission which provides automatic operation in "D" (Drive) range, and additional "Lo" (Low), "R" (Reverse), and "P" (Park) ranges which are controlled manually. In "D" position, the car starts in low gear (on all Champion Models, and on Commander & President models having transmissions prior to serial numbers 19001 (Commander); 24001 (President), progressing to intermediate and high. On later model Commander & President, the car starts in intermediate and progresses to high, as speed increases. *See "Intermediate Gear Start" Production Change above.*

STUDEBAKER FLIGHTOMATIC TRANSMISSION (SECTIONAL VIEW)

LUBRICATION

►*CAUTION: Check fluid level at 1000 mile intervals. Drain and refill at 15,000 mile intervals, using Automatic Transmission Fluid Type "A".*

Capacity–9 qts. (approximately).

Checking Fluid Level–Place transmission selector lever in "P" (Park) position and operate engine for approximately four minutes, or until engine and transmission have reached normal operating temperature. Roll up the floor mat from right side until oil level inspection hole cover in floor pan is accessible, and remove cover. Clean all dirt and foreign material from around transmission fluid dipstick. Apply the parking brake and foot brake and move selector lever slowly from "P" position to "R" position and then back to "D" position. Remove dipstick and wipe clean, then install it in transmission and **turn cl ckwise t th lock p sition.** Remove dipstick and check fluid level.

CONTINUED ON NEXT PAGE

STUDEBAKER FLIGHTOMATIC (C ntinu d)

Add fluid through dipstick hole to raise level to the "F" mark on dipstick. *NOTE*–The amount of fluid required to raise the level from "L" mark on dipstick to "F" mark is approximately 1½ pints.

Draining & Refilling–Place transmission selector lever in "P" (Park) position and operate engine for approximately four minutes, or until engine and transmission are at normal operating temperature. Stop engine and raise car on hoist. Remove transmission dipstick *(see "Checking Fluid Level" above)*. Remove transmission drain plug. Rotate the converter until one of the drain plugs is visible through hole in converter housing, remove drain plug and quickly rotate converter 180°, and remove the other converter drain plug. After fluid has drained from transmission and converter, install transmission drain plug using a new gasket, and the two converter drain plugs. Lower the car to floor and install three quarts of Automatic Transmission Fluid Type "A" through dipstick hole. Apply parking brake and foot brake; start the engine and operate it with the selector lever in "N" (Neutral) position. Slowly pour four additional quarts of fluid into transmission. Move selector lever through all ranges. Check oil level on dipstick *(see "Checking Fluid Level" above)*. Add sufficient oil to bring level up to "F" mark on dipstick.

LINKAGE ADJUSTMENT

Throttle Linkage Adjustment: *See CARBURETOR on Car Model Pages.*

Manual Linkage Adjustment: Disconnect shift lever-to-transmission manual valve lever rod at transmission manual valve lever by removing the ball joint assembly. Place selector lever in "D" (Drive) position and place the manual lever on transmission in the "D" (Drive) position (this is center of manual valve lever travel). Adjust the shift lever-to-manual valve lever rod until the ball joint stud will slip freely through the hole in the manual valve lever. Install ball joint stud locknut and lock to rod.

BAND ADJUSTMENT

Front Band: Remove transmission oil pan, gasket and screen. Loosen the front servo adjusting screw locknut two full turns with a 9/16" wrench. Check the adjusting nut for free rotation in the actuating lever and free the adjusting screw if necessary. Install the gauge block of the adjusting tool (J-5880) between the servo piston rod and the adjusting screw. Place the Front Band Adjusting Tool J-5880, on the adjusting screw and tighten until the tool overruns. **Back off the adjusting screw one full turn,** and tighten locknut to 20-25 ft. lbs. Place the screen over the rear pump inlet first then over the front pump inlet, and install the screen retaining clip. Position a new oil pan gasket on transmission oil pan flange and hold it in place with petroleum jelly. Align oil pan on transmission flange and install capscrews and lockwashers. Tighten to 10-13 ft. lbs. Install drain plug and fill transmission *(see "Lubrication" above)*.

Rear Band: Roll up floor mat from the right side until the oil level inspection hole cover in the floor is visible, and remove the cover. Clean dirt and all foreign material from around rear band adjusting screw and locknut, and oil the adjusting screw threads. Using Rear Band Adjusting Tool J-5883, tighten the screw until wrench overruns, **back off adjusting screw 1½ turns,** and tighten the locknut to approximately 35-40 ft. lbs. torque. *CAUTION–It is very important the adjusting screw be backed off 1½ turns to avoid damage to band and servo.*

TESTING

STALL TEST: Connect tachometer to the engine and place it where it can be easily read from the drivers seat. Set the hand brake and start the engine. Place selector lever in "D" (Drive) position, apply service brakes and operate the engine at full throttle. Note tachometer reading. Repeat this procedure with selector lever in "L" and "R" positions. *(CAUTION–Do not operate the engine at high speed while the selector lever is in one of the driving ranges, with the rear wheels held stationary, for more than 10 seconds at a time or for a total time greater than one minute in any half-hour period).* Normal stall speeds are 1500-1600 RPM (Champion with first type converter. See "Production Change" above); 1400-1500 (Champion with later type converter. See "Production Change" above). 1550-1650 (Commander). 1750-1850 (President). If stall speed is greater than normal, slippage in transmission is indicated. If stall speed is between 900-1000 RPM (if engine is normal) slippage is indicated in torque converter stator free wheel unit.

ROAD TEST: A thorough test must be made to determine the shift speeds and transmission performance. The initial application of the various bands and clutches should be checked in all driving ranges by stopping the car and moving the selector lever to "D", "L" & "R" ranges. A driving test should be made in the "D" range to check the shift speeds. *See Shift Speeds below.*

FLIGHTOMATIC SHIFT SPEEDS

Light Throttle Upshift

Shift	Champion	①Comm. & Pres.	②Comm. & Pres.

2-1	4-7	4-7	

① - Cars with "Low" gear start.
② - Cars with "Intermediate" gear start.

FLUID PRESSURE TESTS: Fluid pressure tests should be made to ascertain whether or not the pressure regulator system is functioning correctly and to determine if there is fluid leakage in the clutch circuits. Remove the 1/8" pipe plug located near throttle lever and manual lever, and install pressure gauge hose (pressure gauge should be in drivers compartment). Connect a tachometer to engine and position it so it can be read from drivers compartment. Make the following tests:

1) Idle Pressure Test–With engine and transmission at normal operating temperature, and with engine at normal idle speed, move selector lever to the "D", "L", & "R" positions. The pressure gauge should read approximately 50-80 lbs. in all ranges. If pressure is low in any one range, a fluid leak in that range circuit is indicated. If pressure is high, the throttle linkage should be checked and adjusted (see "Carburetor" on Car Model pages).

2) Pressure Regulation Ch ck–Move selector lever to "D" range and firmly set hand brake and foot brake. Run engine at 1000 RPM and read the pressure gauge Pressure should be approximately 80-85 lbs. If the pressure is less, it indicates the throttle valve linkage is too long and must be readjusted. If pressure is greater, it indicates throttle valve linkage is too short and must be readjusted.

3) Stall Pressure Test–Firmly set hand brake and foot brake and operate engine at full kickdown position. Move selector lever to "D", "L" & "R" ranges and read the pressure. The pressure in "D" & "L" positions should be 130-175 lbs.; and in the "R" range, 170-190 lbs. If pressure is less or greater than the above pressures, malfunctioning of throttle valve, modulator valve, compensator valve, or pressure regulator assembly is indicated, and it will be necessary to remove and clean the control valve assembly and pressure regulator valve assembly.

AIR PRESSURE TEST (With Transmissi n in Car): Raise car on hoist and remove transmission oil pan and control valve assembly. Proceed as follows:

Front Clutch: Apply pressure to front clutch and governor input passage (case rear flange). Listen for dull thud which indicates that clutch is operating. Keep air pressure in passage for several seconds to check for leaks in this part of the system.

Governor Valve: Remove governor inspection cover. Apply air pressure to the same passage as for front clutch (above). Listen for a click and also watch valve snap inward.

Rear Clutch; Apply air pressure to rear clutch oil passage (case rear flange). Listen for a dull thud to indicate clutch is operating. Check for leaks in same manner as for front clutch (above).

Rear Band & Servo: Apply pressure to rear servo oil passage (case rear flange), observe band application.

Front Band & Servo: Apply pressure to front servo apply tube (rear tube), and observe band application.

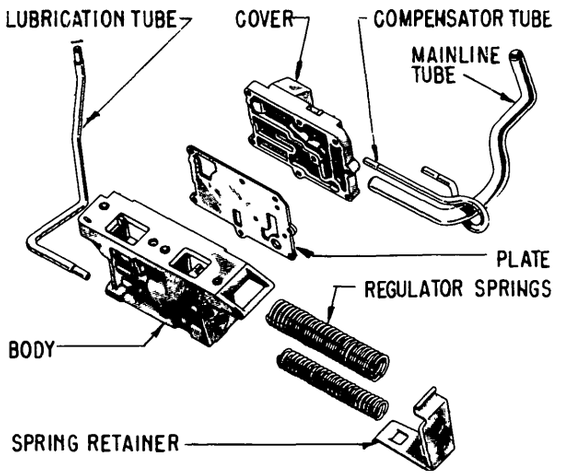
►*TESTING NOTE: If servos, bands, clutches and governor operate with air pressure, then the no drive problems, erratic shift, or no upshift conditions indicate that the control valve assembly is the cause of the trouble. See "Control Valve" below.*

CONTINUED ON NEXT PAGE

STUDEBAKER FLIGHTOMATIC (C ntinu d)

TROUBLE SHOOTING

INITIAL ENGAGEMENT TOO ROUGH: Idle speed may be too high. Control pressure may be too high caused by improper throttle valve linkage or dirt in control valve assembly or regulator valve assembly. Check throttle valve stop and reset if necessary.



INITIAL ENGAGEMENT DELAYED: Check fluid level. Adjust rear band as it may be loose. Control pressure may be too low at idle speed. Clean control valve assembly and pressure regulator assembly. Check front pump for wear. Check fluid circuits for leaks and correct as necessary.

INOPERATIVE IN ALL RANGES: Check fluid level. Manual linkage may be disconnected. No control pressure which may be caused by trouble at front pump. Check rear band adjustment. Check rear servo action with air pressure. Inspect and clean control valve assembly. Check engine stall speed, as converter may not be operating properly.

NO DRIVE IN "D" OR "L" POSITION: Check fluid level. Manual linkage may be disconnected. Control pressure may be low. Adjust throttle valve linkage. Clean control valve and pressure regulator valve assemblies. Check front clutch action with air pressure. Check rear servo and band with air pressure. Check transition valve in control valve assembly as it may be stuck.

NO DRIVE IN "R" POSITION: Check fluid level. Check and adjust manual linkage. Control pressure may be low. Check and adjust throttle valve linkage, and clean control valve and regulator valve assemblies. Check rear clutch action with air pressure. Check rear servo action with air pressure. Check transition valve in control valve assembly.

LOCKS UP IN "D" POSITION: Rear clutch or front band may be applied. Clean control valve and governor valve assemblies. Check rear clutch and front band and servo for mechanical failures.

FLIGHTOMATIC REGULATOR VALVE

LOCKS UP IN "D" POSITION (2ND GEAR): Check rear band and servo, and rear clutch for mechanical failure.

LOCKS UP IN "D" POSITION (3RD GEAR): Front or rear band may be applied. Check bands and servo for mechanical failure. Clean control valve assembly.

LOCKS UP IN "R" POSITION: Check front clutch and band and front band servo for mechanical failure. Clean control valve assembly.

SLIPS IN "D" OR "L" POSITION: Check fluid level. Control pressure may be low. Check throttle valve linkage. Clean control valve and pressure regulator valve assemblies. Rear servo travel may be limited; check for mechanical failure of band or servo. Check front clutch for mechanical failure. Rear pump check valve may be stuck open.

SLIPS IN "R" POSITION: Check fluid level. Check and adjust throttle control linkage. Clean control valve and regulator valve assemblies. Check rear servo for limited travel. Check front clutch for mechanical failure as it may be slipping. Rear pump check valve may be stuck open.

1-2 UPSHIFT ROUGH: Check and correct throttle control linkage as control pressure may be too high. Clean and adjust bands. Governor valve may be stuck.

1-2 UPSHIFT SLIPS: Check and adjust throttle control as control pressure may be too high. Adjust bands. Check for stuck governor valve. Check front servo piston for limited travel with air pressure. Check for fluid leakage.

NO 1-2 UPSHIFT: Check for stuck governor valve or 1-2 shift valve.

1-2 UPSHIFT TOO EARLY: Check for stuck governor valve.

1-2 UPSHIFT TOO LATE: Check for stuck governor valve or leak in governor circuit. Check and adjust throttle control linkage. Clean control valve assembly.

2-3 UPSHIFT ROUGH: Control pressure may be too high; adjust throttle control linkage and clean control valve assembly. Adjust front band. Check for stuck governor valve.

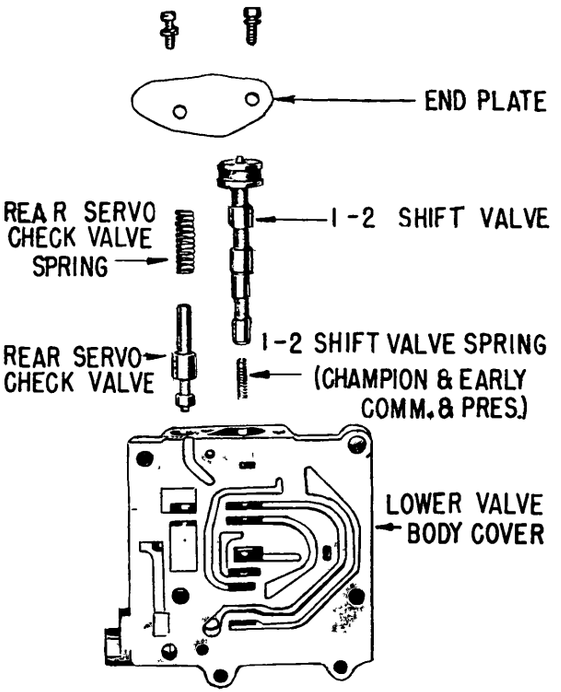
2-3 UPSHIFT SLIPS: Control pressure may be too low; adjust throttle control linkage and clean control valve assembly. Adjust front band. Check for internal leaks and for stuck governor valve.

NO UPSHIFT 2-3: Governor valve or 2-3 shift valve may be stuck.

2-3 UPSHIFT EARLY: Check for stuck governor valve.

2-3 UPSHIFT LATE: Check for stuck governor valve or leak in governor circuit. Adjust throttle control linkage.

3-2 DOWNSHIFT ROUGH (CLOSED THROTTLE): Adjust throttle control linkage. Orifice control valve stuck.



3-2 KICKDOWN (EARLY): Adjust throttle control linkage.

NO KICKDOWN: Adjust throttle control linkage.

2-1 DOWNSHIFT ROUGH (CLOSED THROTTLE): Adjust throttle control linkage. Rear servo check valve may be stuck.

WILL NOT START BY PUSHING: Rear pump not operating. Pressure regulator valve may be stuck.

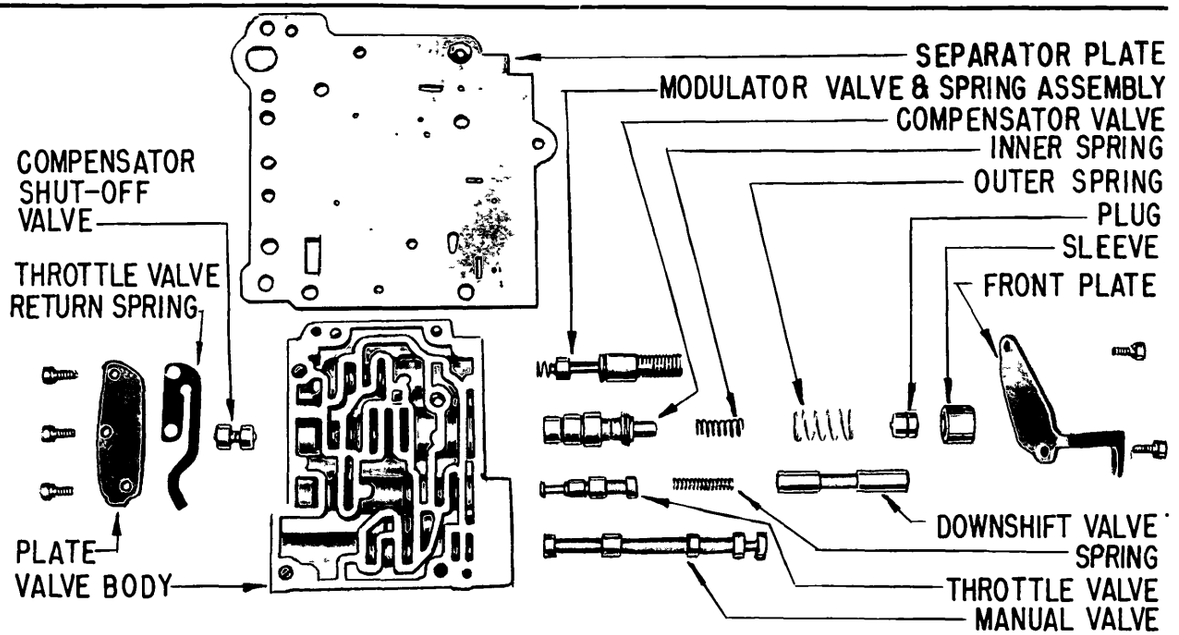
NO PARK POSITION: Adjust throttle control linkage. Check for damaged internal linkage or pawl.

FLIGHTOMATIC LOWER VALVE BODY COVER

TRANSMISSION REMOVAL & INSTALLATION

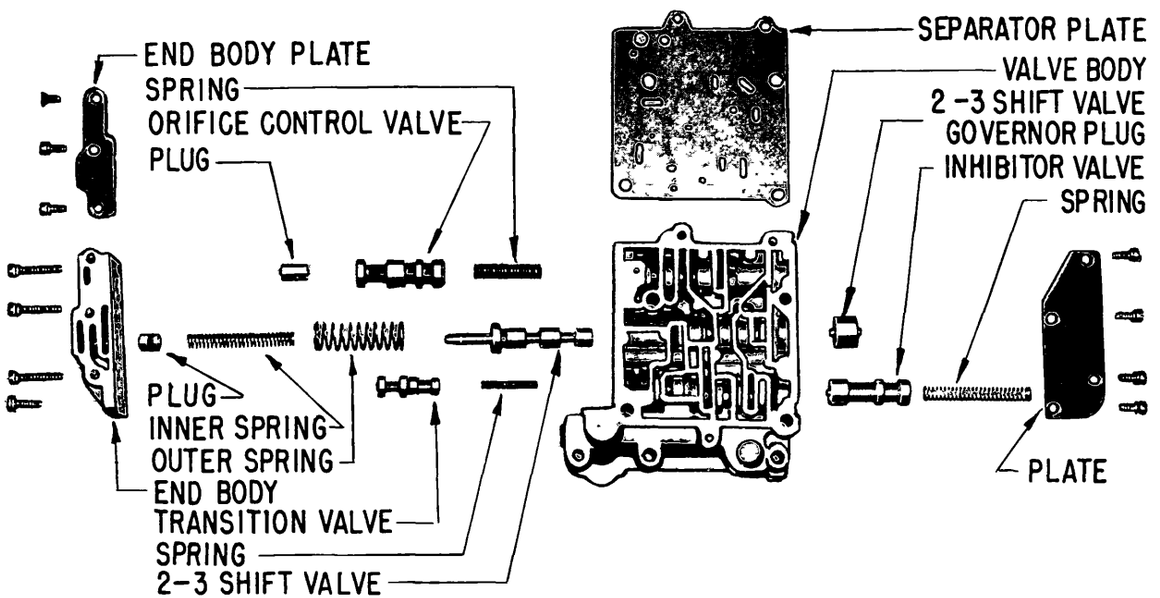
REMOVAL: Raise car on hoist, and remove transmission drain plug and converter drain plug. On coupe and hardtop models, remove body front pillar support crossmember. On cars with dual exhaust system, remove the left hand exhaust system. Remove complete propeller shaft assembly. Disconnect shift lever-to-transmission manual valve lever rod from manual valve lever. Disconnect bellcrank-to-throttle valve lever rod at throttle valve lever. Remove speedometer cable retaining screw and remove pinion and cable. Place transmission lift with the saddle as far forward in the tracks as possible, in position on transmission oil pan flange and align saddle on oil pan flange. Remove the four transmission-to-converter bell housing capscrews. Install transmission-to-converter housing guide pins, Tool J-4284, into upper capscrew holes. Remove transmission assembly by sliding it rearward on saddle out of converter bell housing and converter.

INSTALLATION: Position front pump drive tangs on converter hub in horizontal position. Using a thin screwdriver, position the front pump external tooth gear drive lugs in vertical position. Install transmission-to-converter housing guide pins, Tool J-4284 (if they were removed). Raise transmission to proper height and angle and carefully slide transmission assembly into torque converter and bell housing, using the pilot studs



CONTINUED ON NEXT PAGE

STUDEBAKER FLIGHTOMATIC (C ntinued)



as guides. Do not force transmission into converter by using transmission retaining screws to draw transmission into position, as this may damage converter or front pump. Make sure transmission fits snugly against converter bell housing. When transmission is in contact with bell housing, install the two lower transmission to-bell housing retainer capscrew and lockwashers. Remove guide pins and install remaining capscrews and lockwashers. Tighten capscrews to 40-45 ft. lbs. Remove transmission hoist and saddle. Install speedometer pinion and cable and install retaining screw. Install shift lever-to-transmission manual valve lever rod. Install bellcrank-to-transmission throttle valve lever rod. On coupes and hardtops, install the body front pillar support cross-member. On cars with dual exhaust, install left exhaust pipe. Install propeller shaft assembly. Fill transmission to proper level (see "Draining & Refilling" above).

TORQUE CONVERTER REMOVAL & INSTALLATION

REMOVAL: Remove transmission (see above), and starter. Disconnect tail pipe support and remove the "U" bolt from exhaust pipe support at converter housing. Disconnect rear exhaust pipe from front exhaust pipe and pull muffler and pipe assembly rearward. Move assembly to one side out of the way. Using a suitable support for engine (support must be shaped to support weight of engine at oil pan flanges and not under oil pan) and a hydraulic jack, remove rear insulator studs and raise engine just enough to have a separation between insulators and crossmember. Remove rear engine support crossmember. Remove converter bell housing-to-engine capscrews and remove bell housing, being careful not to damage dowels or distort converter blower. Lower rear of engine, being careful not to pull off water outlet hose (if additional clearance is required) drain cooling system and disconnect water outlet hose). Remove capscrews and washer holding converter assembly to the crankshaft-to-converter drive plate, and remove converter assembly.

FLIGHTOMATIC LOWER VALVE BODY

FLIGHTOMATIC UPPER VALVE BODY

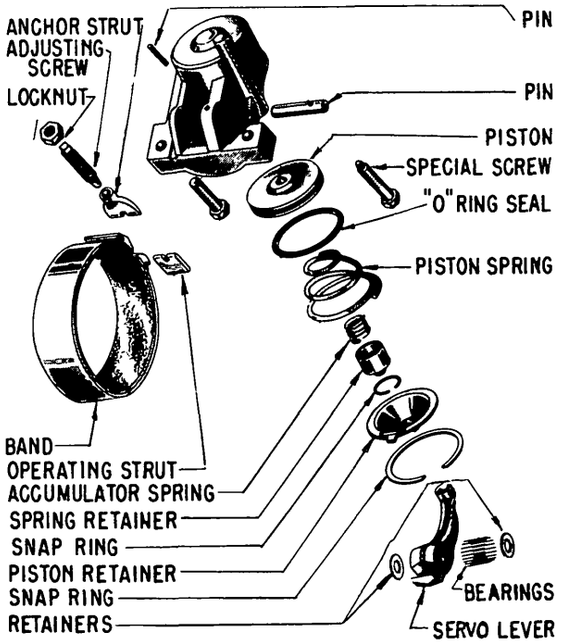
INSTALLATION: Install converter assembly on the crankshaft-to-converter drive plate and loosely install retaining screws and lockwashers. Clean engine rear plate and mating surface on bell housing and install bell housing, taking care not to damage dowels or converter blower. Be sure bell housing is installed on dowels. Install bell housing retaining capscrews and tighten to 23-28 ft. lbs. If engine has been lowered, raise it to normal position. Position converter aligning tool, J-6310, into bore of bell housing and over pump drive fingers on torque converter assembly. Install the two upper transmission capscrews to hold aligning flange in position, and rotate converter assembly through two complete revolutions to center the torque converter assembly. Tighten converter-to-drive plate capscrews to 23-28 ft. lbs. Remove aligning tool. Install rear engine support crossmember. Install exhaust pipe, muffler and tail pipe assembly, making sure that proper alignment exists between assembly and the supports. Install transmission (see above), and starter.

TRANSMISSION OVERHAUL

TRANSMISSION OVERHAUL: Transmission overhaul procedures are the same as for Fordomatic, Mercomatic & Turbo-Drive transmissions. *See "Fordomatic, Mercomatic, & Turbo-Drive Transmissions" Ov rhaul beginning on Page 422.*

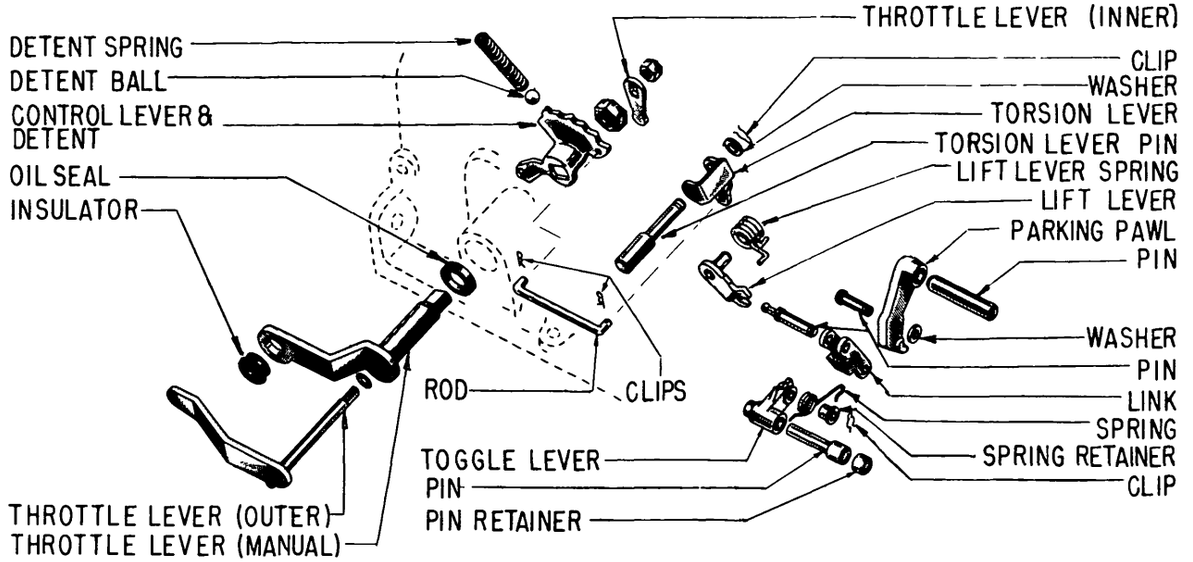
CONTINUED ON NEXT PAGE

STUDEBAKER FLIGHTOMATIC (Continued)



CONTROL VALVE DISASSEMBLY & REASSEMBLY

LOW SPEED GEAR NOISE & IMPROVED SHIFT IN "D" RANGE CORRECTION (COMMANDER & PRESIDENT MODELS): The control valve can be modified, as directed below, and also to provide an intermediate gear start, on transmissions prior to Transmission Serial Nos. 19001 (Commander); 24001 (President), or transmissions not having the letter "B" suffix on serial number. To modify the control valve assembly, install Shift Valve Spring Kit, Part No. 1541549 as follows:

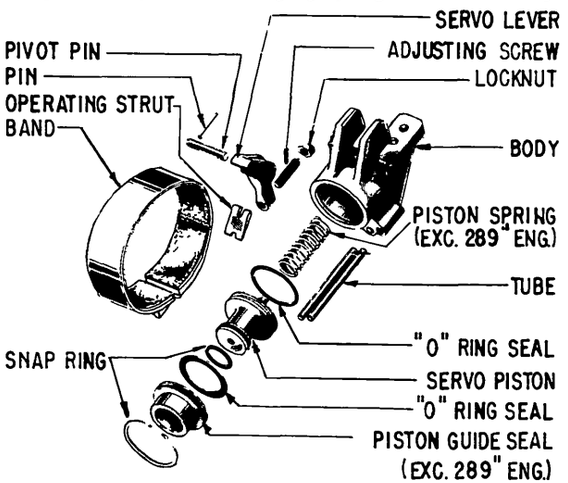


1) Remove control valve assembly from transmission case. Remove the two screws from lower valve body cover end plate and remove end plate. Remove the 1-2 shift valve and shift valve spring. Discard spring.

2) Install the 1-2 shift valve in its bore in lower valve body cover. Install the conical spring from kit on the 1-2 shift valve with small end of spring piloting on stop shoulder of valve. Hold conical spring in shift valve bore with a piece of .020" feeler stock 1/2" wide, being certain that conical spring is completely in valve bore. Install end plate and end plate screws and tighten finger tight. Remove feeler stock by sliding from under end plate and tighten end plate screws securely.

3) Remove screws from end body assembly on lower valve body assembly and remove end body assembly.

FLIGHTOMATIC REAR SERVO & BAND ASSEMBLY



FLIGHTOMATIC TRANSMISSION INNER CONTROL LEVER ASSEMBLY

Remove the 2-3 shift valve inner and outer springs. Discard the springs. Install the 2-3 shift valve springs from kit on the 2-3 shift valve (springs from kit are shorter than springs removed from valve body).

4) Install the end body assembly on lower valve body, being certain the 2-3 shift valve inner spring enters shift valve plug bore. Install and tighten screws. Install control valve assembly on transmission.

►*CONTROL VALVE DISASSEMBLY NOTE:* Each valve body of the assembly should be disassembled, cleaned and inspected, and reassembled at one time to reduce the possibility of interchanging springs in the assembly.

FLIGHT MATIC FR NT SERVO & BAND ASSEMBLY

Clean all parts in solvent and dry with compressed air. Inspect all valves for burrs, scores or scratches. Check fluid passages for obstructions. Inspect mating surfaces for nicks and burrs. Check springs for distortion.

DISASSEMBLY: (Upper Valve Body)—Remove four capscrews and lockwashers that attach lower valve body cover to control valve assembly. Invert assembly and remove the screw attaching separator plate to lower valve body. Remove upper valve body and separator plate. Remove the two separator plate attaching screws and remove separator plate (note that one of the screws is countersunk). Remove throttle valve return spring screws and remove spring. Remove the remaining screw and rear plate. Remove compensator cut-off valve and remove manual valve. Remove front plate retaining screws and lockwashers, and remove plate. Remove downshift valve, throttle valve spring and throttle valve. Remove compensator valve sleeve, valve plug, valve inner and outer springs and the compensator valve. Remove modulator valve and spring assembly. *NOTE*—Do not separate modulator valve and spring assembly.

Reassembly: After cleaning and inspection install modulator valve and spring assembly, compensator valve, inner and outer springs, valve plug and sleeve; throttle valve, valve spring, and downshift valve in their respective bores and install front plate and attaching screws. Tighten screws to 20-30 inch lbs. Install compensator cut-off valve in its bore and install rear plate and screw. *NOTE*—When installing rear plate the throttle valve must protrude from the valve body to provide clearance for the stop on the rear plate. Po-

STUDEBAKER FLIGHTOMATIC (Continued)

sition throttle valve return spring on rear plate and install screws. Tighten screws to 20-30 inch lbs. Position separator plate on upper valve body and install the screw. Tighten screws to 20-30 inch lbs. Install manual valve in its bore.

DISASSEMBLY: (Lower Valve Body)–Remove rear pump check valve seat, valve and spring. Remove screws and washers attaching cover to lower valve body and remove cover. Remove separator plate. Remove retainer facer screws and lock washers and remove the side plate. Remove inhibitor valve spring and valve, and 2-3 shift valve governor plug from their respective bores. Remove the four remaining screws and lockwashers and remove the end body. Remove transition valve and spring, 2-3 shift valve inner and outer springs and 2-3 shift valve, and orifice control valve and spring. Remove the 2-3 shift valve plug and the orifice control valve plug from the end body. Remove retaining screws and remove end body plates

Reassembly· Position end body plate on end body and install retaining screws and lockwashers. Tighten screws 20-30 inch lbs. Install orifice control valve plug and the 2-3 shift valve plug in their respective bores. Install orifice control valve spring and valve, the 2-3 shift valve and inner and outer springs, the transition valve spring and valve in their respective bores Position the end body on lower valve body and install retaining screws and lockwashers. Tighten screws to 20-30 inch lbs. Install the 2-3 shift valve governor plug, and the inhibitor valve and spring in their respective bores. Position side plate on lower valve body and install retaining screws and lockwashers. Tighten to 20-30 inch lbs. Install rear pump check valve spring, valve, and seat.

DISASSEMBLY: (Lower Valve Body Cover)–Remove end plate retaining screws and lockwashers and remove end plate. Remove rear servo check valve spring and check valve from its bore. Remove the 1-2 shift valve and spring from its bore. *NOTE*–Models with "intermediate gear start" (later Commander & President models, and early Commander & President having a modified control valve assembly) have the 1-2 shift valve spring, which is conical, installed between end plate and valve. All Champion models, and early Commander & President models have the spring located at opposite end of valve.

Reassembly: After cleaning and inspection, install the 1-2 shift valve and spring (see "Disassembly" above for spring location), and the rear servo check valve and spring in their respective bores. Position end plate on lower valve body cover and install retaining screws and lockwashers. Tighten screws to 20-30 inch lbs.

►*CONTROL VALVE REASSEMBLY NOTE*· Position the upper valve body and separator plate on lower valve body and install retaining screw and lockwasher, do not tighten screw. Position separator plate and lower valve body cover on lower valve body and install retaining screws and lockwashers, do not tighten screws. Install four capscrews and lockwashers that attach lower valve cover to control valve assembly. Tighten capscrew to 4-6 ft. lbs. Tighten all retaining screws to 20-30 inch lbs.

AIR CONDITIONING SERVICE CAUTIONS

HANDLING FREON: Though considered the safest and best refrigerant for use in Air Conditioning systems, the following precautions must be observed to avoid serious accidents or damage to the system.

Drum: 1) Do not leave drum uncapped (metal cap furnished with drum is for protection of valve and safety plug). It should be replaced after each use of drum.
2) Do not carry drum in passenger compartment of car. Place drum in luggage compartment or, if in an open truck, cover drum to protect it from radiant sun heat. If precaution not taken, resultant increase in pressure may cause safety plug to release or drum to burst.
3) When charging system, do not subject drum to high heat. Use water no warmer than 125°F (Hot rags will suffice). *Never place drum on radiator, stove, or use torches for heating during charging.* Keep drums upright.
4) Never permit a drum to be dropped or strike another drum violently.
5) Do not fill drum completely (when filling one drum from another). Leave space above liquid for expansion.

P rsonal: 1) Do not discharge Freon into room with exposed flame because concentrations of this gas in contact with open flame will produce a toxic gas.
2) Do not expose eyes to liquid, *USE GLASSES OR GOGGLES. Liquid Freon will freeze anything with which it comes in contact.* If Freon should strike eyeballs, splash water to area of eye to gradually get temperature above freezing point, apply a few drops of sterile mineral oil to eyes as an irrigator. If irritation continues, wash eyes with a weak solution of boric acid. *DO NOT RUB EYES. See an eye specialist at once.*
3) Do not inhale large quantities of Freon vapor as it will act an an anesthetic.
4) If Freon comes in contact with skin, injury should be treated for frostbite.

HANDLING REFRIGERANT LINES: 1) Keep refrigerant lines dry and clean. Whenever a connection or joint is broken, clean all dirt from joint or connection.
2) Parts from stock are capped and dehydrated. Caps should only be removed just prior to installation. Lines removed from system to be used again, should be capped immediately, to prevent dirt and moisture from entering lines.
3) Lines should be free of kinks, and should be carefully stored to avoid crushing or bending.
4) Proper size wrenches should be used when tightening fittings. Always use two wrenches to prevent twisting copper tubing.
5) Tubing that is left free to vibrate will harden and crystallize the area of the tubing at flare sections so that it may become brittle and break.
6) When using paint drying lamps, ovens, steam cleaners, or other heat producing devices, avoid heating any part of system. If sufficient heat applied, pressure will increase to a point where some part of system will rupture.
7) When undercoating, use care to see that undercoating does not plug evaporator drain. Do not coat air conditioning joints and connections.
8) Keep gauge set and lines free of moisture.
9) Compressor lubricant container must not be left open longer than necessary as the special oil is moisture free and will absorb moisture from air if left uncapped.

AIR CONDITIONING LEAK TESTS

LEAK TESTING CONFINED AREAS: For leak testing confined areas, such as sections of evaporator and condenser, a torch or flame type detector must be used. Two types are available. One type uses anhydrous methyl alcohol, under pressure, for producing the testing flame. The cylinder is refillable, and must be preheated to pressurize cylinder. The other type uses propane gas, under pressure, to produce the testing flame. The cylinder is replaceable and comes already pressurized, making it unnecessary to pre-heat cylinder in order to produce testing flame. Instructions for use of the detectors are furnished with the detector.

Leak Testing: With flame adjusted, explore for leaks by moving end of hose or sampling tube around all points where a leak may be. Especially check around bottom of connections, since Freon is heavier than air and will be more apparent at bottom of fitting. Color of flame will turn to a yellow-green when a small leak is detected. Large leaks will be indicated by a change in color to bright or brilliant blue or purple. When hose or tube is moved away from leak, flame will clear to an almost colorless pale-blue or green. *CAUTION*–Do not use lighted detector in any place where combustible or explosive gases, dust or vapors may be present. Do not breathe fumes and black smoke that are produced if leak is a big one. Before leak testing, be sure car is thoroughly aired (particularly if Freon tank used or if system opened for any reason) and moved to a Freon-free area in order that false readings may be prevented.

PIN-POINTING LEAKS: There are a number of fittings and places throughout the air conditioning unit where a leak detector solution or detergent may be used to pin-point leaks. Apply solution to suspected area with with swab that is attached to bottle cap. Bubbles will will form, within seconds, if there is a leak.

AIR CONDITIONING TROUBLE SHOOTING

►*CAUTION: Do not disconnect refrigerant lines, replace parts, or attempt adjustments without complete instructions. See "Air Conditioning Service Cautions".*

POOR COOLING: 1) Blowers Not Operating–Fuse blown or faulty circuit breaker; switch in "Off" position; defective switch; switch resistors or blower rheostats inoperative; broken wire or loose connections; blower motor defective; blower fans or motor improperly installed.
2) Restricted Air Flow–Filters clogged; dirt or other obstructions in air ducts; evaporator fins or coils clogged or restricted with frost or ice.
3) Refrigerant Flow to Cooling Coils or Fins Incorrect–Expansion valve improperly adjusted or defective; power element or temperature bulb does not contact pressure line properly; restriction in liquid line between receiver and cooling coils or fins; power element or temperature bulb discharged; insufficient refrigerant; by-pass valve, thermostatic switch or solenoid (if so equipped) not properly set or inoperative; modulator valve (if so equipped) defective; break in any part of closed refrigeration system.
4) Refrigerant Not Condensing Properly–Air flow through condenser, restricted, high engine operating temperatures; air or excess refrigerant in system; restriction in high pressure side of compressor and condenser.
5) Clutch (If So Equipped) Does Not Engage–Defective coil or relay; clutch plate lining worn or saturated with oil causing slippage; air conditioning "On" switch defective; thermostat inoperative; clutch adjustment incorrect.
6) C mpressor - Belts not adjusted properly, worn, or broken; operating above normal pressures; valves faulty; service valves not fully open.
7) El ctrical–Loose connections or broken wires between electrical units, blown fuses or faulty circuit breakers.

TOO COLD: 1) Clutch (If So Equipped) Does Not Disengage–Thermostat inoperative; relay stuck closed; air conditioning "On" switch inoperative.
2) Blower Speed Cannot be Reduced–Defective blower switch.

VIBRATION–NOISE: 1) Blowers–Loose on shaft; striking housing; foreign material; motor bearings or mounts loose or worn.
2) Compressor–Mounting brackets loose; loose internal parts; insufficient oil; too much refrigerant.
3) Air Flow–Foreign material in air system; small slits or openings in ducts.

INCORRECT OPERATING PRESSURE: 1) Excessive Pressure on High Pressure Side–Air or excess refrigerant in system; air flow through condenser core restricted; kinks or restrictions in line on high pressure side; high engine temperature; shut-off valve on high pressure side of compressor not fully open; insufficient air flow through cooling coil; defective expansion valve or incorrect adjustment.
2) Insufficient Pressure on High Pressure Side–Shortage of refrigerant; defective expansion valve or incorrect adjustment; leaky or broken compressor valves.
3) Excessive Pressure on Low Pressure Side–Power element or temperature bulb not making correct contact with pressure line; expansion valve needle stuck open or leaking.
4) Insufficient Pressure on Low Pressure Side–Restriction in lines, shortage of refrigerant; expansion valve needle stuck shut; expansion valve not open far enough, plugged, or defective; dehydrator-filter (strainer-drier) plugged; power element or temperature bulb charge lost or line plugged; compressor valves faulty; blower fans inoperative; temperature control thermostat does not cut out; moisture or freeze-up.

HUDSON & NASH

Hudson (1956)
Nash (1956)
Rambler (1956)

►CHANGES & CORRECTIONS

►*FREON-12 CHARGE CHANGE:* New specifications require that 3 lbs. (Rambler), 3½ lbs. (Others) maximum be charged into system. Two ounces of anhydrous methanol for each lb. of Freon is still required. *NOTE* - Above specifications supersede 3½ & 4 lb. charge previously required.

►*CONDENSATION LEAKS & SPILL-OVER CORRECTION (Rambler).* Effective at car serial number D-329995 a shedder, Part No. 3149919, has been incorporated to an existing baffle on the evaporator retainer backplate. This shedder prevents any condensation held between evaporator fins from being spilled out through forced hot air opening when applying brakes. Part Nos. for service installation are as follows (Shedder) 3149919, (Wire Clip) 3108634, (Two Tinnerman Speed Nuts) 3131-524. Kit No. including all above components is 3209503. Three 1/8" holes must be drilled in the evaporator aluminum endplate at 45° angle toward the shroud. Purpose of holes is to allow water to drain off into shroud.

DESCRIPTION: Similar in design and operation to previous models. *See "Nash & Hudson" in 1955 Annual Data or later Manual edition.*

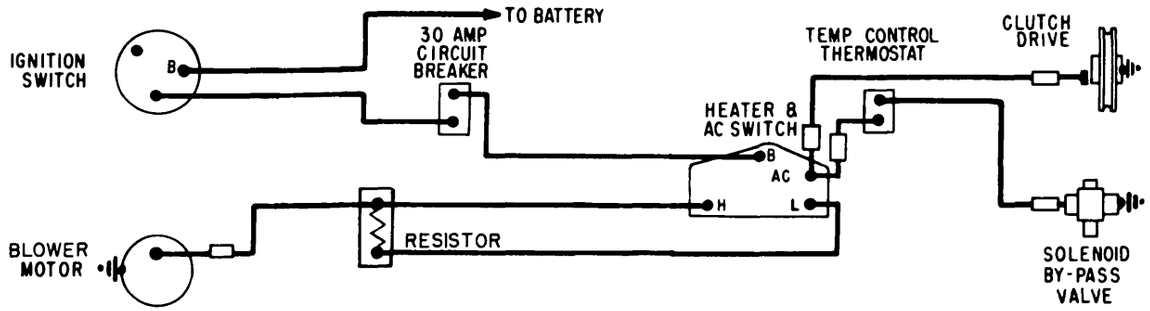
PRECAUTIONS: *Before disconnecting any part of air conditioning system or lines, see "Air Conditioning Service Cautions".*

MAINTENANCE & INSPECTION: *See "Nash All Weather Eye" in 1954 Annual Data or "Nash & Hudson" in later Manual edition.*

ADJUSTMENTS: Compressor Belt - The idler shaft or power steering pump (if so equipped) is adjustable by a slotted link to engine. Some models require that compressor mounting bracket be adjusted in addition to idler shaft. Belts require a tight adjustment. Reduce "flex" to a minimum.

Magnetic Clutch: Shims are available (.010" thick) to adjust air gap between clutch plate and pulley to .010-.040". Clutch plates have three adjusting screws and locknuts to accomplish this adjustment. Torque clutch plate capscrew to 18-22 ft. lbs. and lock in place with lock plate.

COMPRESSOR REMOVAL & INSTALLATION (T Work on Engine): *See "Nash All Weather Eye" in 1954 Annual Data or later Manual edition.*



TROUBLE SHOOTING: *See "Air Conditioning Trouble Shooting".*

LEAK TESTING: *See "Leak Testing Air Conditioning System".*

CHECKING, ADDING REFRIGERANT & ADDING OIL TO COMPRESSOR: *See "Nash All Weather Eye" in 1954 Annual Data or "Nash & Hudson" in later Manual edition.*

CAPACITY: *See "Freon-12 Charge Change" above.*

►*OTHER "NASH-HUDSON" AIR CONDITIONING DATA: See "Nash All Weather Eye" in 1954 Annual Data or "Hudson & Nash" in later Manual edition.*

HUDSON, NASH & RAMBLER AIR CONDITIONING CONTROL DIAGRAM

CHRYSLER, DESOTO, DODGE PLYMOUTH "AIRTEMP"

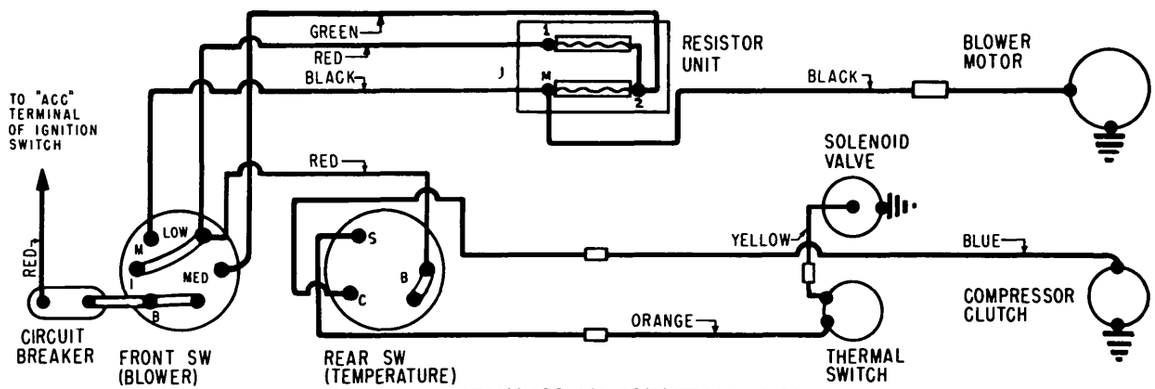
Chrysler & Imperial (1956)
DeSoto (1956)
Dodge V8 (1956)
Plymouth (1956)

DESCRIPTION & OPERATION: Compression process cycle type, now using Freon-12 or Genetron-12 as a refrigerant. Similar in design and operation to previous models. *See "Airtemp" Air Conditioning in 1953 Annual Data or later Manual edition*

Design Changes: *See "Airtemp" in 1954-55 Annual Data or later Manual edition*

PRECAUTIONS: *Before disconnecting any part of air conditioning equipment or lines, see "Air Conditioning Service Cautions".*

ADJUSTMENTS: Compressor Belt - Adjust as follows
Chrysler, Imperial, DeSoto, Plymouth - Adjust tension of **each** compressor belt so that a pull of 9-12 lbs. at center of longest span will provide a 1/4" deflection at that point.
Dodge - Adjust compressor drive belt tension to 15 ft. lbs. with Tools C-3379 and C-3005. Generator mounting bolts must be loosened and tension held to 15 ft. lbs. when bolts are retightened.



Fast Idle Device (If Equipped): Back off round adjusting nut on diaphragm shaft away from pawl. Start engine, attach tachometer, and with transmission control lever in "Neutral" position and engine at operating temperature, adjust engine idle to 475-500 RPM. Turn blower control switch to first position, and temperature control switch to second position. Adjust round adjusting nut on fast idle diaphragm shaft to increase engine RPM to 700-800 RPM. With hand brake on, move transmission control lever to "Drive" range and then back to neutral. Readjust fast idle if necessary. Lock round nut with hex nut.

Expansion Valve: No adjustment. Replace as necessary.

Magnetic Clutch (Warner - Used on some Chrysler Models With Copeland Compressor): Clearance between field coil housing and driven member should be a minimum of .010 015". When clearance is less than specified, it is probably due to misalignment of coil assembly, or from pulley being cocked on compressor shaft. Align pulley and/or coil assembly, and recheck for proper clearance.

Magnetic Clutch (Tecumseh Compressor): Measure gap between drive plate electromagnet and drive plate. Air gap should measure .025"-.035". To adjust,turn screws located in center of three hexagon headed nuts on front face of drive plate. Adjust all three screws to obtain

CONTINUED ON NEXT PAGE

DES T , DODGE, PLYMOUTH STANDARD AIR CONDITIONING CONTROL DIAGRAM

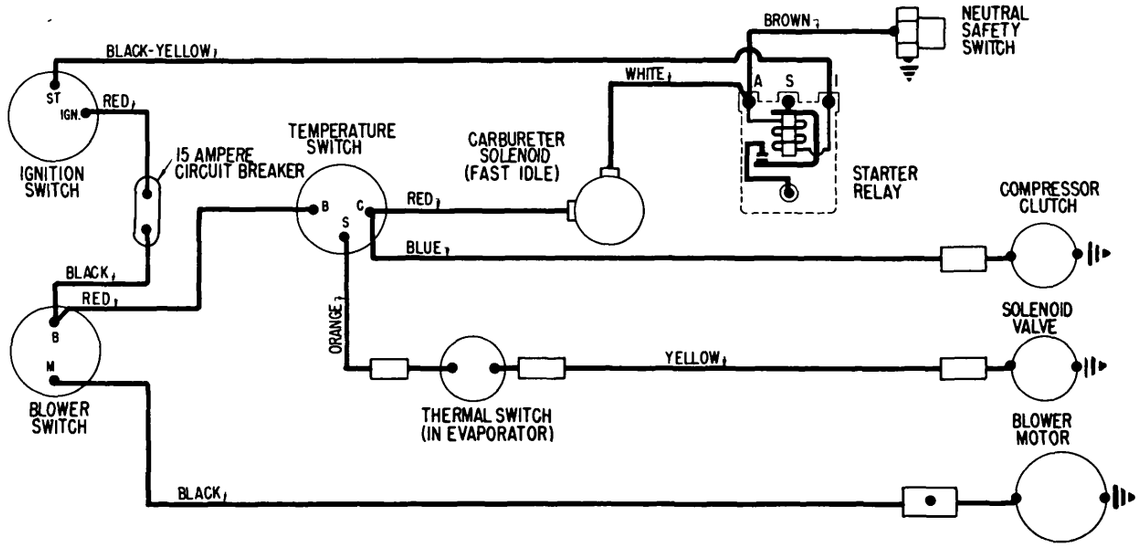
"AIRTEMP" (C ntinued)

evenly spaced air gap, Measure air gap with long feeler that will reach into gap at hub.

COMPRESSOR REMOVAL (To Work on Engine): *(NOTE–* Split muffler bracket as required with hacksaw). Start engine, operate at fast idle until compressor is warm. Remove valve stem protective caps from discharge and suction service valves. Close both valves (clockwise) with Tool C-3361. Loosen port caps on both service valves about two turns to gradually release Freon gas pressure from compressor. Loosen oil filler plug a few turns. Remove drive belts and belt tension adjusting strap from compressor. Disconnect magnetic clutch electrical lead (if so equipped). Disconnect discharge tube flared connection at discharge (lower) muffler and cap tube nut and male connector. Remove Allen screws from suction service valve. Remove upper muffler bracket-to-compressor attaching bolt and gently lay the suction valve, muffler and tube assembly to one side. Do not bend vibration eliminator excessively or it may become damaged. Cover suction port in compressor and suction valve with masking tape. Remove compressor-to-mounting bracket and support bracket bolts, remove compressor.

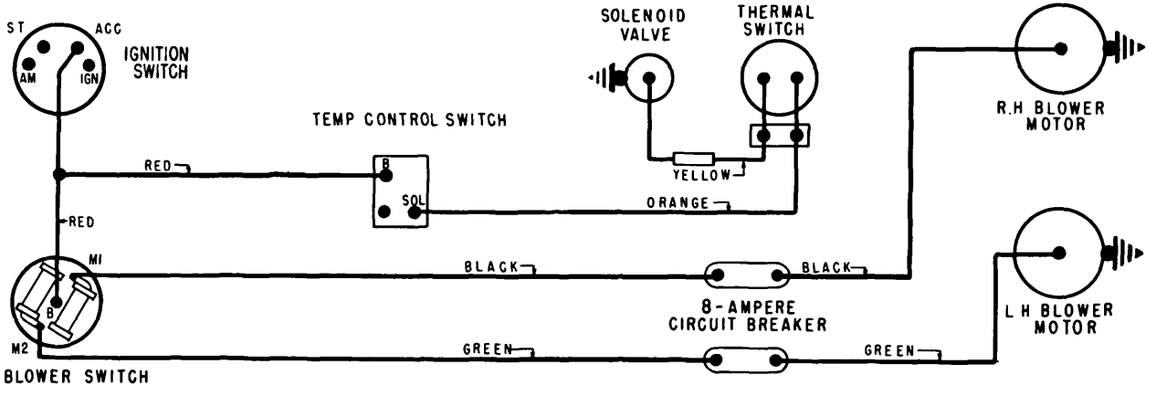
COMPRESSOR INSTALLATION: **1)** Place compressor on mounting bracket and start bolts, tightening them finger tight. Remove masking tape from suction service valve and compressor port, being sure surfaces are clean. Coat a new suction service valve gasket with refrigerant oil and place over valve port. Install suction service valve and tighten Allen screws to 15-20 ft. lbs. Install muffler bracket bolt and tighten bolt to 15-20 ft. lbs. Tighten compressor mounting bracket-to-compressor and support bracket attaching bolts to 20-25 ft. lbs.

2) Remove caps from discharge tube nut and muffler connector. Insert new copper washer and connect flared connection, tightening securely. Install compressor drive belts and belt tension adjusting strap. Adjust belts (see ADJUSTMENTS above). Install magnetic clutch electrical lead (if so equipped).



3) Install manifold gauge set (Tool C-3354). First remove valve stem protective caps from compressor discharge and suction service valves. Using Tool C-3361, make sure both valves are completely back-seated (counter-clockwise). Remove protective caps from discharge and suction service port caps. Install 4-ft. test hose from 600 lb. gauge fitting to discharge service valve port fitting. Install other 4-ft. test hose from 300 lb. gauge fitting to suction service valve port fitting. Turn both handles of manifold gauge clockwise as far as they will go. Crack suction service valve open (counter-clockwise) and tighten oil filler plug. Crack suction gauge hand valve f r an instant to purge air from compressor and suction tube. Close suction gauge hand valve and open discharge service valve (counter-clockwise) slightly. Crack discharge gauge hand valve f r an instant to purge air from discharge side of compressor. Rotate both gauge set hand valves (clockwise) until they are fully seated. Rotate both discharge and suction service valve stems until they are fully back-seated.

4) Start engine and turn blower and temperature controls to "High" and "Cold". Operate engine for 5 minutes, stop engine, and test for leaks. Test system for operation. If satisfactory, remove gauge set and replace protective caps.



TROUBLE SHOOTING: *See "Air Conditioning Trouble Shooting".*

LEAK TESTING: *See "Leak Testing Air Conditioning System".*

CHECKING, ADDING OIL TO COMPRESSOR OR ADDING PARTIAL CHARGE OF REFRIGERANT: *See "Airtemp" in 1955 Annual Data or later Manual edition. NOTE* - Oil level in Chrysler & DeSoto Compressors should be 3/4-7/8", and in Dodge & Plymouth Compressors 3/4-1".

CHRYSLER & DESOTO DELUXE AIR CONDITIONING CONTROL DIAGRAM

DODGE DELUXE AIR CONDITIONING CONTR L DIAGRAM

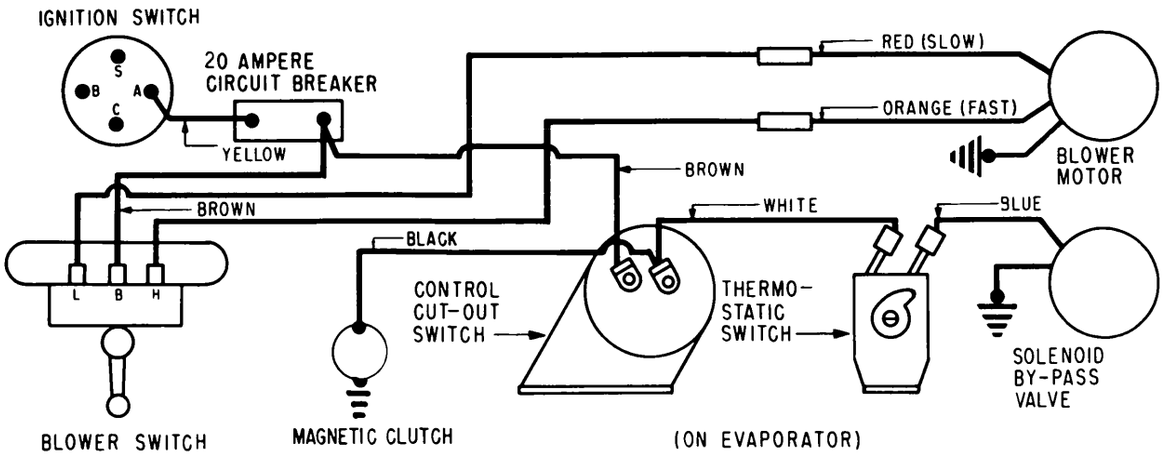
FORD "SELECTAIRE"

Ford V8 (1956)

►CHANGES, CAUTIONS, CORRECTIONS

►*ENGINE OVERHEATING CORRECTION:* **1956 Cars With 1956 Air Conditioning Unit Installed -** Discharge system, remove upper air deflector, grille, and parking lights. Locate and weld or braze the two upper (FDS-19157-A) mounting brackets and two lower (FDS-19158-A) mounting brackets to condenser flanges so short legs of brackets are upward and in position so that mounting bolts can be inserted through flange and bracket holes for mounting to radiator and side deflector flange. Clean welded area thoroughly with wire brush and paint with air dry enamel. Install modified condenser with four bolts, flatwashers, and lockwashers. After installation of other parts evacuate, recharge, pressure test and test system for leaks.

1956 Cars With 1955 Air Conditioning Unit Installed - Remove upper air deflector, grille, and parking lights. Cut two 1 3/8" spacers from a ½" steel pipe for use between condenser and radiator at lower mounting holes. To secure condenser, use two 5/16"-24 x 2" bolts, four 5/16" x 1" O D thick flatwashers and two 5/16" lockwashers. Disregard center mounting bolts and use existing bolts for upper mounting holes. Center bolts should be used to mount radiator only. Install parking lights, grille, and upper air deflector.



►*CLUTCH ASSEMBLY INSTALLATION CAUTION.* When installing clutch assembly to compressor shaft, special self-locking capscrew with nylon insert in threads, 5/16"-24 x 1", Part No. 358606-S, and a flatwasher, Part No. 358605-S, must be used, otherwise retention of clutch assembly to shaft cannot be assured. Torque to 18-22 ft. lbs.

►*GASKET PRODUCTION CHANGE:* Copper gaskets previously used at all connections were discontinued during 1956 production. Once a connection is opened, or a leak developes, copper gaskets must be used to prevent leaks. Overtightening to stop leaks should not be attempted.

DESCRIPTION: Similar in design and operation to previous model. Evaporator unit and allied parts are mounted on dash. System uses Freon-12 as refrigerant. For functioning of various components of the system, see *"Ford, Lincoln, Mercury" in 1955 Annual Data or "Ford SelectAire" in later Manual edition, and note the following design changes:*

►*DESIGN CHANGES·* Magnetic clutch is used (disconnect pulleys discontinued), electrical control similar to previous model except that wire has been added from control cutout switch to supply battery current to magnetic clutch, dehydrator and receiver are combined into a single unit with no shut-off valves at the receiver (pump-down of the system is no longer possible), Freon capacity is 4½ lbs., 1956 Compressors are not interchangeable with 1955 Compressors due to tapered shaft designed to accommodate the magnetic clutch, oil separator is used with factory installed systems.

►*OIL SEPARATOR RELOCATION CAUTION·* Oil Separator is located in low pressure side of refrigerant circuit between evaporator and low pressure service valve. Whenever a refrigerant line is broken for compressor service, it will be necessary to discharge entire system of refrigerant.

FORD AIR CONDITIONING CONTROL DIAGRAM

PRECAUTIONS: *Before disconnecting any part of air conditioning equipment or lines, see "Air Conditioning Service Cautions".*

ADJUSTMENTS: Loosen generator-to-bracket bolt. Pull out generator so there is approximately ½" deflection midway between water pump and compressor pulleys with normal thumb pressure.

Control Cable Adjustments: Air Duct Valve - Set the temperature control lever at its extreme left position. With lever in this position, adjust cable leading to right air duct valve so that valve is in the completely closed position (maximum counter-clockwise).

Louvre–Adjust evaporator louvre cable so that the louvres are completely closed when the temperature control lever is in center position (directly under the dot) If evaporator unit has been removed, it will be easier to adjust cable at the evaporator end before installing the evaporator. Only a slight adjustment of the louvre cable is possible at the control unit.

Heater Thermostat–With temperature control lever at the center position, adjust heater thermostat cable until heater thermostat is in the closed position (thermostat lever all the way to right).

Evaporator Thermostatic Switch Adjustment: *(NOTE -* The switch is adjusted at time of installation and generally requires no further adjustment. However, in very dry climates such as the Death Valley area, the switch can be set to its very lowest temperature position. In higher humidity areas, set switch at index lines to prevent evaporator from icing and clogging air passages. Factory setting of control is at scribe mark on control, representing a temperature setting of 28°F. Control may be adjusted to maintain an evaporator temperature of 24-45°F. The thermostatic switch operating differential is 6°F. at any one setting). To adjust control, remove glove box to gain access to the adjusting screw. Turn thermostatic switch adjusting screw clockwise to lower temperature and counter-clockwise to raise it.

COMPRESSOR REMOVAL (To Work in Engine): Isolate compressor by turning both high and low pressure service valves to extreme clockwise position, then loosen cap on high pressure service valve gauge port, and allow gas to escape until compressor and attaching hoses are relieved of refrigerant pressure. *(CAUTION–* Loosen cap a small amount only, and do not remove it until pressure is completely relieved) Raise car on hoist or jacks and remove splash pan. From underneath car, remove generator adjusting bracket bolt. Loosen generator-to-compressor mounting bolts, swing generator inward, and disengage the two belts from generator and compressor pulleys. Disconnect generator leads, remove generator mounting bolts and remove generator from car. Remove generator-to-cylinder block bolt and compressor-to-lower bracket bolt. Lower car and complete operation in engine compartment. Disconnect high and low pressure hoses from compressor. Remove compressor mounting bolts. Loosen angle bracket bolt and remove compressor from engine.

COMPRESSOR INSTALLATION: Reverse removal procedure. Adjust compressor belts (see ADJUSTMENTS above). Connect high and low pressure hoses *(NOTE–* Be sure to replace metal gaskets in hose connections). Evacuate compressor and attaching hoses (see "Evacuating Compressor & Adding Partial Charge of Refrigerant" below).

TROUBLE SHOOTING: *See "Air Conditioning Trouble Shooting".*

LEAK TESTING: *See "Leak Testing Air Conditioning System".*

CHECKING, ADDING OIL TO COMPRESSOR, EVACUATING & ADDING PARTIAL CHARGE OF REFRIGERANT: *See "Ford, Lincoln, Mercury" in 1955 Annual Data or "Ford SelectAire" in later Manual edition*

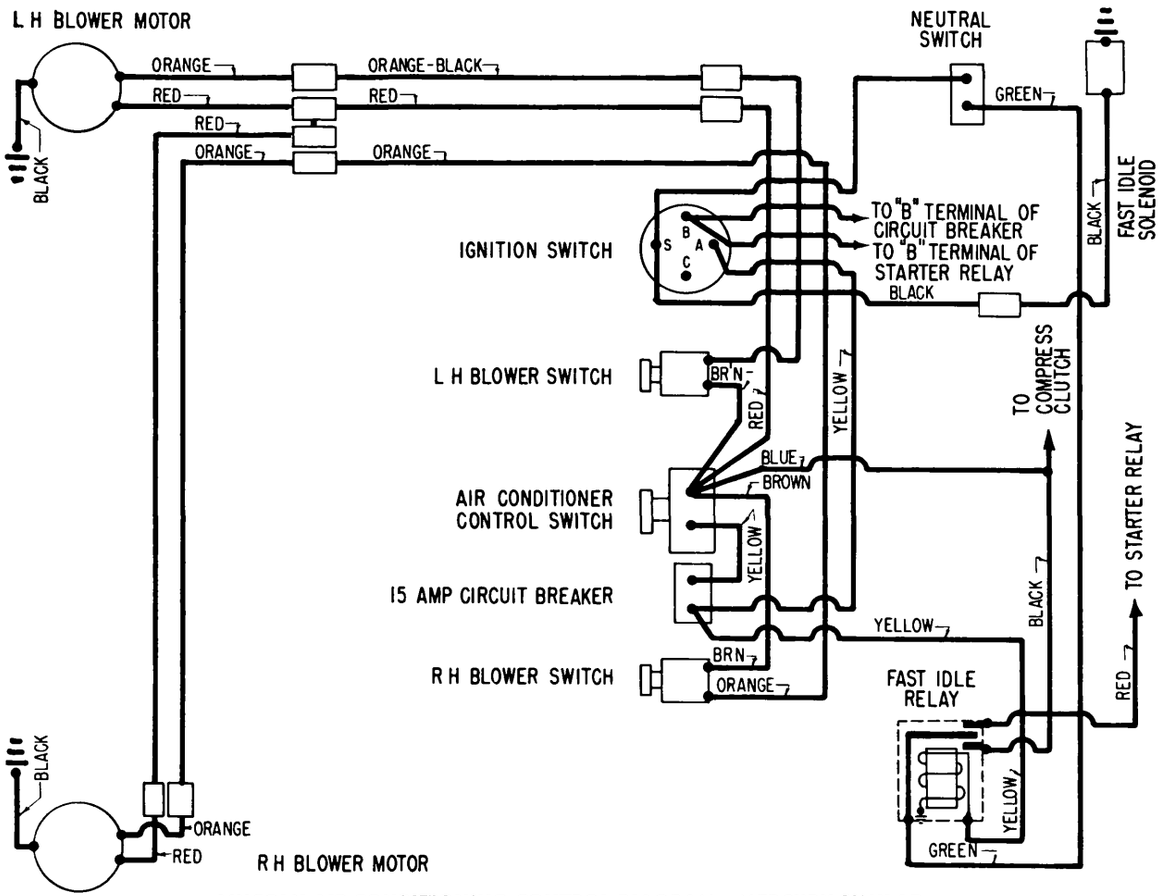
LINCOLN & MERCURY

Lincoln & Continental (1956)
Mercury (1956)

►CHANGES, CAUTIONS, CORRECTIONS

► *CLUTCH ASSEMBLY INSTALLATION CAUTION*· When installing clutch assembly to compressor shaft, special self-locking capscrew with nylon insert in threads, 5/16" -24 x 1", Part No. 358606-S, and a flat washer, Part No. 358605-S, must be used, otherwise retention of clutch assembly to shaft cannot be assured. Torque to 18-22 ft. lbs.

► *CIRCUIT BREAKER CAUTION & REPLACEMENT* If vehicle is allowed to stand in hot sun for extended periods, interior temperature can become extremely high, causing 15 ampere circuit breaker in blower circuit to cycle as soon as blowers are turned on. To correct this condition, 15 ampere circuit breaker can be replaced with a 20 ampere circuit breaker, Part No. B6A-14526-G. If 20 ampere circuit breaker is used it will be necessary to replace 18 gauge blower switch feed wire with a 16 gauge wire.



► *GASKET PRODUCTION CHANGE* Copper gaskets previously used at all connections were discontinued during 1956 production except for gasket between high pressure tube and evaporator. With the one exception connections are between parts made of different metal. **Once a connection is opened, copper gaskets must be used to prevent leaks.** Part Nos. of gaskets required are 354076-S, 77-S, 78-S & 354981-S.

DESCRIPTION: Similar in design and operation to previous models. Evaporator unit and allied parts are mounted in trunk compartment of car. System uses Freon-12 as refrigerant. A modulator valve performs same functions as bypass control valve used on other systems, in addition to providing a means for temperature control through a control lever on dash. For functioning of the various components of the system, *See "Lincoln Air Conditioning" in 1954 Annual Data or "Lincoln & Mercury" in later Manual dition and note the following design changes*

► *DESIGN CHANGES* Magnetic clutch is used (disconnect pulleys discontinued), electrical control similar to previous models except that wire has been added from control cutout switch to supply battery current to magnetic clutch, dehydrator and receiver are combined into a single unit with no shut-off valves at the receiver (pump down of system no longer possible), Freon capacity is 6½ lbs., 1956 Compressors are identical in interior construction with those of 1955 but are not interchangeable due to tapered shaft designed to accommodate the magnetic clutch, oil separator is available on factory installed models. In 1955 high pressure service valve was inverted. For this reason, direction the valve must be turned during service operations must be reversed.

OPERATION: *See "Lincoln Air Conditioning" in 1954 Annual Data or "Lincoln & Mercury" in lat r Manual edition.*

PRECAUTIONS: *Before disconnecting any part of air conditioning equipment or lines, see "Air Conditioning Service Cautions".*

LINCOLN AIR CONDITIONING CONTROL DIAGRAM—MERCURY SIMILAR

ADJUSTMENT: Compressor Belt - Loosen generator-to-bracket bolt. Pull out generator so there is approximately ½" deflection midway between water pump and compressor pulleys with normal thumb pressure.

Automatic Throttle Control: With engine warm, air conditioning system operating, and transmission in neutral, adjust knurled nut at end of operating rod of the control assembly to obtain an idle speed of 800 RPM, tighten locknut. Check idle to make sure that it returns to normal whenever air conditioning is turned off or the transmission is shifted out of neutral.

COMPRESSOR REMOVAL (To Work on Engine): Isolate compressor by turning both high and low pressure service valves to extreme clockwise position, then loosen cap on high pressure service valve gauge port, and allow gas to escape until compressor and attaching hoses are relieved of refrigerant pressure. *(CAUTION–* Loosen cap a small amount only, and do not remove it until pressure is completely relieved). Raise car on hoist or jacks and remove splash pan. From underneath car, remove generator adjusting bracket bolt. Loosen generator-to-compressor mounting bolts, swing generator inward, and disengage the two belts from generator and compressor pulleys. Disconnect generator leads, remove generator mounting bolts and remove generator from car. Remove generator-to-cylinder block bolt and compressor-to-lower bracket bolt. Lower car and complete operation in engine compartment. Disconnect high and low pressure hoses from compressor. Remove compressor mounting bolts. Loosen angle bracket bolt and remove compressor from engine.

COMPRESSOR INSTALLATION: Reverse removal procedure. Adjust compressor belts (see ADJUSTMENTS above). Connect high and low pressure hoses *(NOTE–* Be sure to replace metal gaskets in hose connections). Evacuate compressor and attaching hoses (see "Evacuating Compressor & Adding Partial Charge of Refrigerant" below).

TROUBLE SHOOTING: *See "Air Conditioning Trouble Shooting".*

LEAK TESTING: *See "Leak Testing Air Conditioning System".*

CHECKING, ADDING OIL TO COMPRESSOR, EVACUATING & ADDING PARTIAL CHARGE OF REFRIGERANT: *See "Ford, Lincoln, Mercury" in 1955 Annual Data or "Lincoln & Mercury" in later Manual edition.*

FRIGIDAIRE & HARRISON

Buick (1956)
Cadillac (1956)
Chevrolet V8 (1956)
Oldsmobile (1956)
Packard (1956)
P ntiac (1956)

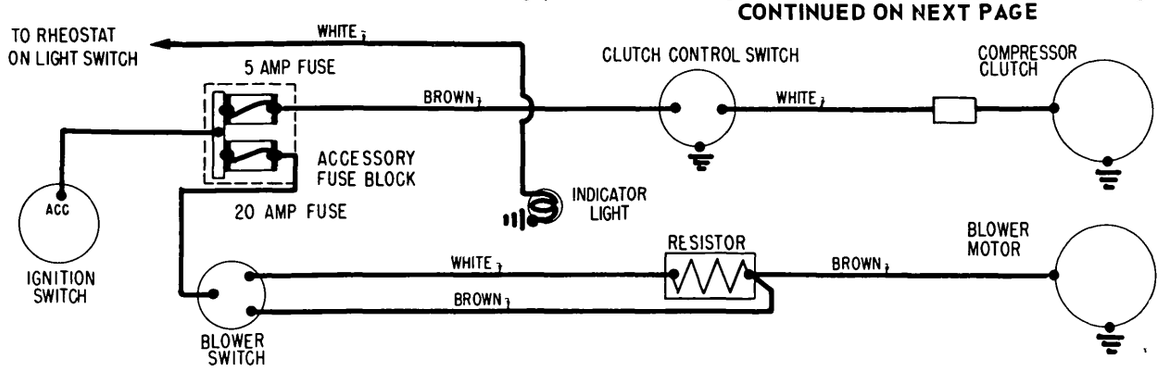
►CHANGES, CAUTIONS, CORRECTIONS

►*CLUTCH COVER INSTALLATION CAUTION:* To avoid distortion of clutch cover, capscrews should be tightened to 3-5 ft. lbs. only instead of 5-7 ft. lbs. previously specified.

►*BUICK CLUTCH SWITCH CAUTION:* Some early clutch switches were incorrectly assembled during manufacture in that switch terminals were inadvertently reversed causing connection terminal to be improperly color coded. In event this has happened, the feed line (brown wire) will be connected to ground, causing 5 ampere fuse to burn out with air conditioner turned off. It is not necessary to replace switch unless contacts are burned. Reverse wires so they are opposite to the color markings on the case.

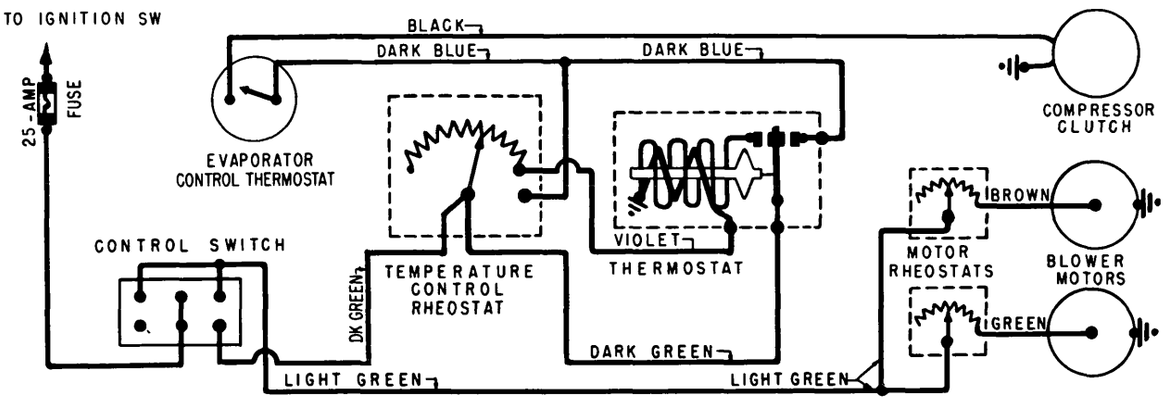
►*CADILLAC CONTROL SWITCH "SHORTING" CORRECTION:* If shorting occurs when toggle switch on control panel is turned "ON", check positioning of dark green wire connector on the terminal post of the temperature control lever. Connector must be installed with flat side of connector up to avoid possibility of its contacting the temperature control lever causing 25 ampere fuse to blow.

►*CADILLAC POOR COOLING OR ENGINE OVERHEATING CORRECTION:* May be due to excessive refrigerant in system. To correct, purge Freon from high pressure side of compressor with system operating at 1500 RPM engine speed, until bubbles appear in sight glass. Then add 1 lb. of Freon-12. Check oil level in compressor, add oil as necessary.



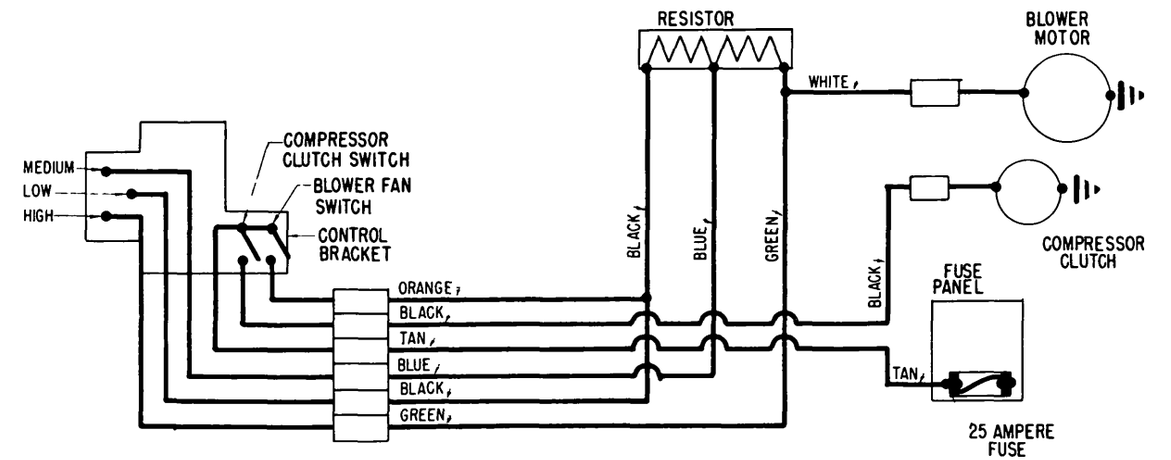
►*CLUTCH AIR GAP SHIM CAUTION:* There are two sets of shims in the clutch assembly; one set forward and one set to rear of the clutch plate. To adjust air gap, **shims should be added or removed from the rear set only.** Front set of shims controls spacing of the front clutch plate friction facing to its mating surface on the pulley (this spacing should be .010").

►*CADILLAC COMPRESSOR WHINING NOISE CORRECTION:* Remove clamp holding liquid and discharge lines, just to rear of radiator shroud. Straighten and align suction and discharge lines (leak test to assure that bending of lines has not caused leaks). Loosen four screws that attach compressor to its front and rear supports. Loosen bolt on block and nut on intake manifold that attach rear support to engine. Loosen compressor belts. Center compressor as much as possible between front and rear brackets, tighten two screws attaching compressor to front support. Tighten bolt and nut that attach rear support to engine. Finally, tighten the two screws that attach compressor to the rear support. Re-tighten compressor belts.



►*CLUTCH SLIPPAGE CORRECTIONS:* Check clutch air gap to see that it is within limits of .025-.035". If head pressures are high due to excessive refrigerant in system, proceed as for "Poor Cooling or Engine Overheating Correction" above. Check for oil or grease on clutch friction facings, worn clutch friction facings, and pulley wobble. Check nylon actuating balls for flat spots or distortion.

►*PONTIAC COMPRESSOR NOISE CORRECTION:* Move doughnut type rubber spacer which is around discharge



CONTINUED ON NEXT PAGE

BUICK AIR CONDITIONING CONTROL DIAGRAM

CADILLAC AIR CONDITIONING CONTROL DIAGRAM

CHEVR LET AIR CONDITI NING CONTR L DIAGRAM

FRIGIDAIRE & HARRISON (C ntinued)

hose (just behind radiator-to-fender upper brace) back towards fire wall about 9". This will prevent discharge hose from vibrating against fender skirt. After repositioning this spacer, make sure that screws protruding through the fender skirt just behind the radiator-to-fender taining screws as necessary to protect from chafing discharge hose. Later production cars have two spacers, one as indicated above and one just behind the radiator-to-fender upper brace.

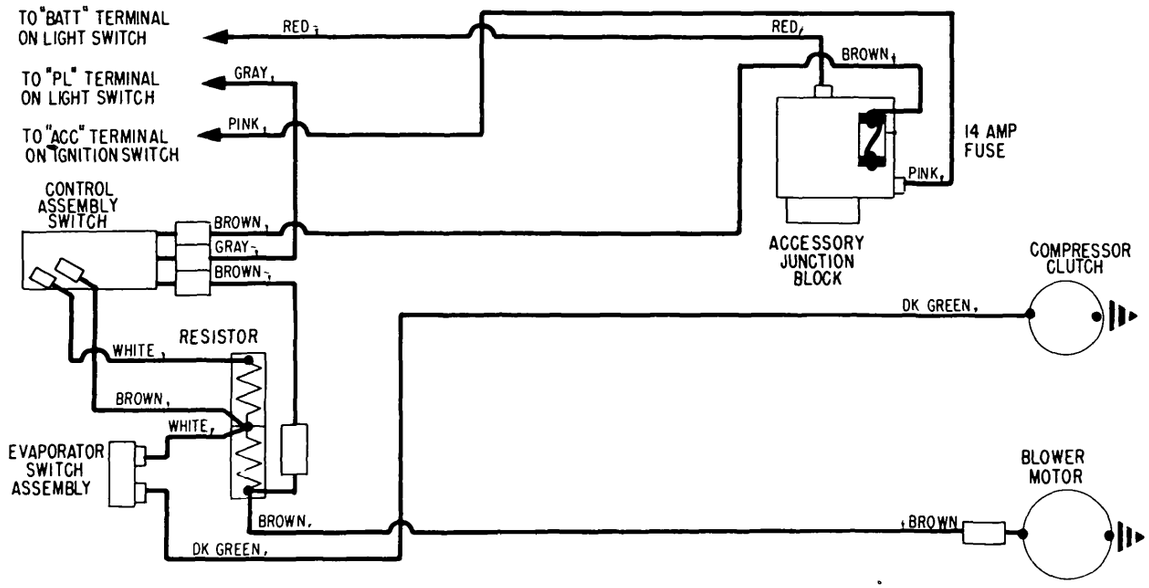
► *CADILLAC 305 HP SHORT CIRCUITING AT FAST IDLE CONTROL CORRECTION:* Bend terminals on fast idle solenoid away from possible contact with throttle rod. Jumper wire terminals should be taped.

DESCRIPTION: Similar in design and operation to previous models. *See "Frigidaire (G.M.)", "Chevrolet", or "Pontiac" in 1955 Annual Data or "Frigidaire & Harrison" in later Manual edition.*

PRECAUTIONS: *Before disconnecting any part of air conditioning system or lines, see "Air Conditioning Service Cautions".*

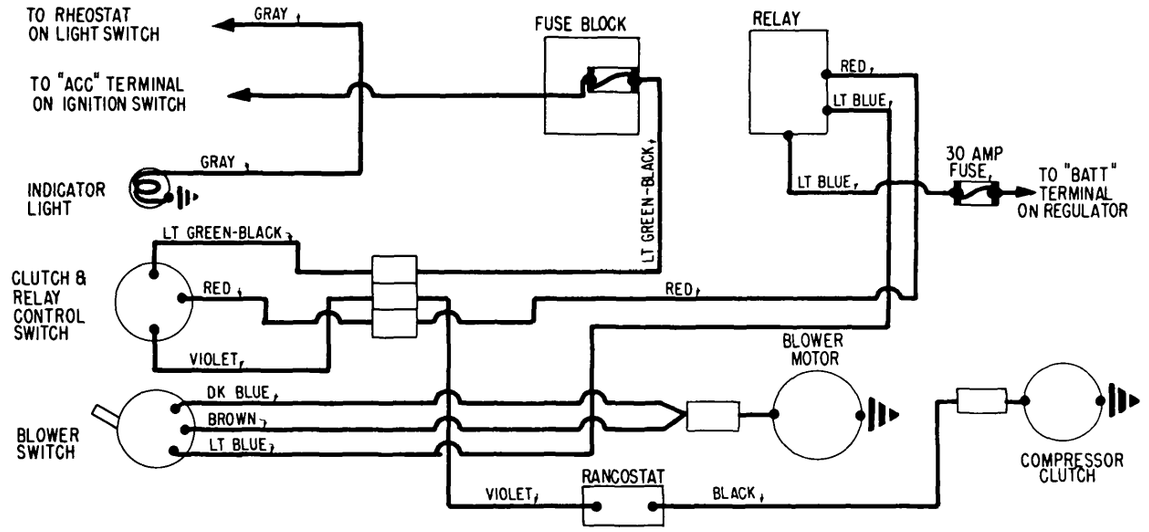
MAINTENANCE & INSPECTION: *See "Frigidaire (G.M.)", "Chevrolet", or "Pontiac" in 1955 Annual data or "Frigidaire & Harrison" in later Manual edition.*

ADJUSTMENTS: Compressor Belt – Adjust as follows:



Buick – With torque wrench at generator pulley, tighten belts until 25-30 ft. lbs. torque slips generator pulley on belts. *NOTE* - This specification supersedes previous specification of ½" deflection midway between fan and compressor pulleys.

Cadillac – Loosen two generator mounting bolts approximately four turns. Loosen generator adjusting strap screw. Place Fan Belt Adjusting Tool, No. J-3046, over head of front mounting bolt and rotate until arm on tool contacts edge of generator drive end plate. Place a 7/8" socket over the tool and place a 50 ft. lb. torque wrench in socket. Pull outward on torque wrench until 27 ft. lbs. torque is indicated on scale. Tighten generator adjusting strap screw. Remove tool and tighten mounting bolts to 15-18 ft. lbs.



Chevrolet V8 – Loosen compressor brace bolt and compressor bracket pivot bolt. Check to see that lower brace bolt and compressor bracket-to-engine mounting bolts are drawn up tight. Assemble belt tensioning tool J-4435 or similar 50 ft. lb. torque wrench. Position tool on seal and coil housing with lug on tool facing toward rear of car and inserted into unused hole in compressor mounting flange on battery side of electrical connector *(NOTE* - It may be necessary to shift connector in clip slightly to obtain clearance for proper engagement of tool). Apply 30-40 ft. lbs. torque to compressor, tighten brace and bracket pivot bolts.

Oldsmobil – Loosen generator attaching bolts. Place Tool J-4170 under generator between bracket and generator housing. Attach torque wrench to tool and apply torque of 20 ft. lbs. Tighten attaching bolts while holding tension on belt.

Packard – Using Tool J-5577 and a torque wrench, tighten belts to 58 ft. lbs. Tighten compressor-to-mounting bracket bolts while maintaining this 58 ft. lb. torque.

OLDSMOBILE AIR CONDITIONING CONTROL DIAGRAM

PONTIAC AIR CONDITIONING CONTROL DIAGRAM

Pontiac – Loosen three bolts retaining idler pulley to mounting bracket (pump support bracket on power steering equipped cars - heads of bolts are behind pulley). Insert torque wrench in square hole at end of power steering pump (or idler pulley) bracket. Apply 60 ft. lbs. torque if new belt is being installed, 53-57 ft. lbs. if used belt is re-installed.

Magnetic Clutch: Energize clutch coil from battery and check clearance between clutch plate armature (not rear pulley cover ring) and coil housing at three different positions. The clearance should be .025-.035". If clearance not correct, it will be necessary to remove pulley and add or remove shims accordingly. Shims are available in the following sizes: .010", .015", .020", .025". By proper selection of shims .005" variance in clearance can be obtained.

CONTINUED ON NEXT PAGE

FRIGIDAIRE & HARRISON (C ntinu d)

Expansion Valve (Buick, Cadillac, Oldsmobile): Remove cap from expansion valve, turn adjusting screw fully clockwise, then counter-clockwise 5 complete turns (Cadillac), 4½ turns (Buick & Oldsmobile). *NOTE* - This supersedes setting of 5 complete turns on Buick. If this does not eliminate ineffective cooling condition, replace expansion valve, assuming that remainder of system is in good operating condition.

Expansion Valve (Chevrolet & Pontiac): If refrigerant is flooding through valve in abnormal quantity (heavy sweating or frosting may occur), close valve adjusting stem ½ turn clockwise. If insufficient refrigerant being supplied to cooling coils, open valve ½ turn counter-clockwise. If necessary, repeat above operation by turning valve in ½ turn increments at a time. *NOTE* - Allow system to balance out before attempting further adjustments. Be sure evaporator is completely de-iced before attempting any adjustment.

Thermostatic Switch (Chevrolet): *(NOTE* - In full off position, REFR control should be full "UP" and the switch actuating lever fully toward driver's side of car. Adjustment should be made to engage compressor when REFR control is depressed 1/8-1/4"). If icing or frosting condition exists in evaporator (results in poor or no cooling) thermostatic switch is probably set too cold. To adjust remove fiber cover from end of switch assembly and turn adjusting screw one turn clockwise (raises temperature 3° F.). Test operation of unit and check for icing, repeating adjustment as required. Reinstall fiber cover.

"Hot Gas" By-Pass Valve (Buick): Disconnect valve control cable, remove valve control lever and counter-balance spring. Remove nylon cam follower. Connect suction and pressure gauges to compressor. Set engine speed as outlined in table below. Turn slotted screw in valve spring sleeve in or out to give 28-30 lbs. pressure on suction pressure gauge. Reassemble and adjust control cable. *NOTE* - Occasionally a thermostatic expansion valve will stick during long periods of disuse. Rapping sharply on valve housing will usually free needle and place valve in operation.

Ambient Temp.	Eng. RPM	Ambient Temp.	Eng. RPM
60	575	100	1300
70	740	110	1550
80	915	120	1800
90	1100		

"Hot Gas" By-Pass Valve (Oldsmobile): Remove cap from gauge fitting on low pressure line near evaporator assembly *(NOTE* - Gauge fitting has Schrader valve). Install Adapter, Tool J-5420, on the low pressure gauge line and connect the adapter to the gauge fitting on the low pressure line. Purge the gauge and hose by openi ng the low pressure gauge valve for a few seconds. Start engine and allow to run at 2000 RPM, move refrigeration control lever against the detent, and turn blower speed on "Low". Observe pressure gauge and adjust only if it is not 29-30 psi. If necessary to adjust pressure setting, control cable and lever and cam will have to be disconnected from the by-pass valve in order to insert Tool J-6389 into valve. After valve pressure has been adjusted to 29.5 psi. control cable adjustment will have to be made as indicated below. Turn adjusting scre w clockwise to increase pressure; counter-clockwise to decrease pressure.

Control Cable Adjustment (Oldsmobile) – Check to insure cable is not kinked and operates freely, then disconnect return spring. Place control lever in extreme right position. Disconnect control cable from lever and loosen control cable clamp on the by-pass valve bracket. Loosen lock screw on lever assembly. With lever against stop, position cam so that it just touches the nylon plunger. Tighten lock screw in this position. Install control wire coil over the lever pin and while pushing the cable conduit toward the lever, tighten the cable clamp. Install return spring. Move control to the left and back to the extreme right position. Again check to make sure that cam is against nylon plunger.

Thermostat Control Cable (Pontiac): Place control lever to "Outside" position. Loosen thermostat control cable clamp (on top of air distributor housing on right side of instrument panel). Hold cable and housing assembly so housing cannot move and slide cable assembly toward right side of car to position temperature valve lever to extreme right position. While holding in this position, tighten cable clamp.

Compressor Clutch & Blower Switch Adjustment (Oldsmobile): Pull air hoses from manifold, remove two air manifold attaching screws, and move manifold towards steering column. From under glove box, loosen two switch capscrews on control assembly. Turn ignition switch to accessory position. Position control lever to "Blower" position. Pivot switch assembly in or out until blower just turns on, then tighten screws. To check adjustment, move control to "OFF" position. Move control lever to right and compare control lever position when blower starts and compressor clutch engages. Blower motor should go on when lever is 7/8" from extreme left position. Clutch should engage when lever is 1¼" from extreme left or "OFF" position.

Clutch & Relay Control Switch Adjustment (Pontiac): Remove radio tuner assembly if car is so equipped. Position air conditioning control lever to "VENT" position and blower switch down for high speed. Loosen two clutch and relay control switch locating bracket screws and pull switch and bracket assembly towards rear of car. Set hand brake and start car. Move switch and locating bracket assembly towards front of car slowly until blower motor operates; hold this position. Tighten clutch and relay control switch locating bracket screws. Move A.C. control switch to "ON" position and check air conditioning operation (compressor clutch coil will energize and operate compressor). Turn off ignition, replace tuner assembly.

Fast Idle Adjustment (Chevrolet): Adjust hand throttle wire guide stop to limit engine speed to 900 RPM with control pulled out and transmission in neutral. Check to see that fast idle control linkage does not interfere with normal operation of carburetor linkage when fast idle is not in operation. *CAUTION* - Place parking brake "ON" when necessary to run engine while servicing air conditioning system. Use extreme care to avoid shifting Powerglide equipped vehicles into "D", "L", or "R" positions while fast idle is operating and car is standing still.

COMPRESSOR REMOVAL & INSTALLATION (T W rk on Engine): *(CAUTION - See "Air Conditioning Service Cautions" before disconnecting compressor).* Proceed as follows:

Removal (Standard Method): Remove protective caps from gauge fittings of high and low pressure valves on rear end of compressor. Connect charging lines of Pressure Gauge Set to gauge fittings of both valves, with both valves of manifold closed. Remove protective caps and firmly close both valves on rear of compressor by turning valve stems clockwise. Open valves on manifold to discharge all pressure from compressor. Remove any brackets mounted to compressor head flange and mounting bracket. Remove retaining bolt and lockwasher to disconnect valve and mounting plate assembly from rear of compressor. Cover openings in valves and compressor with tape to exclude dirt. Disconnect clutch solenoid wire, then loosen belts and remove compressor from mounting on engine.

Installation (Standard Method): Reverse removal procedures and note the following: (See "Clutch Slippage Corrections" above. If new compressor is installed see note below). Operate compressor for 10 minutes at fast idle, leak test around valve mounting plate. Check system for sufficient Freon charge.

Removal (Optional Method): *See "Pontiac" in 1955 Annual Data or "Frigidaire & Harrison" in later Manual edition.*

Installation (Optional Method): *Same as "Removal" above.*

► *NEW COMPRESSOR INSTALLATION CAUTION:* Oil from old compressor should be drained and oil measured. Oil in new compressor should be drained completely and an amount of oil equal to that drained from original compressor should be replaced. **Aft r new compressor is installed, but befor it is op rated,** purge it of air by loosening pressure relief valve (at top of compressor) until a slight hiss of escaping gas is noted. Bleed for one or two seconds, then tighten pressure relief valve. Operate compressor at fast idle for a few minutes to build up head pressure, then repeat purge. *CAUTION* - Do not loosen relief valve too far or fast, because if it pops out, the whole charge will be lost.

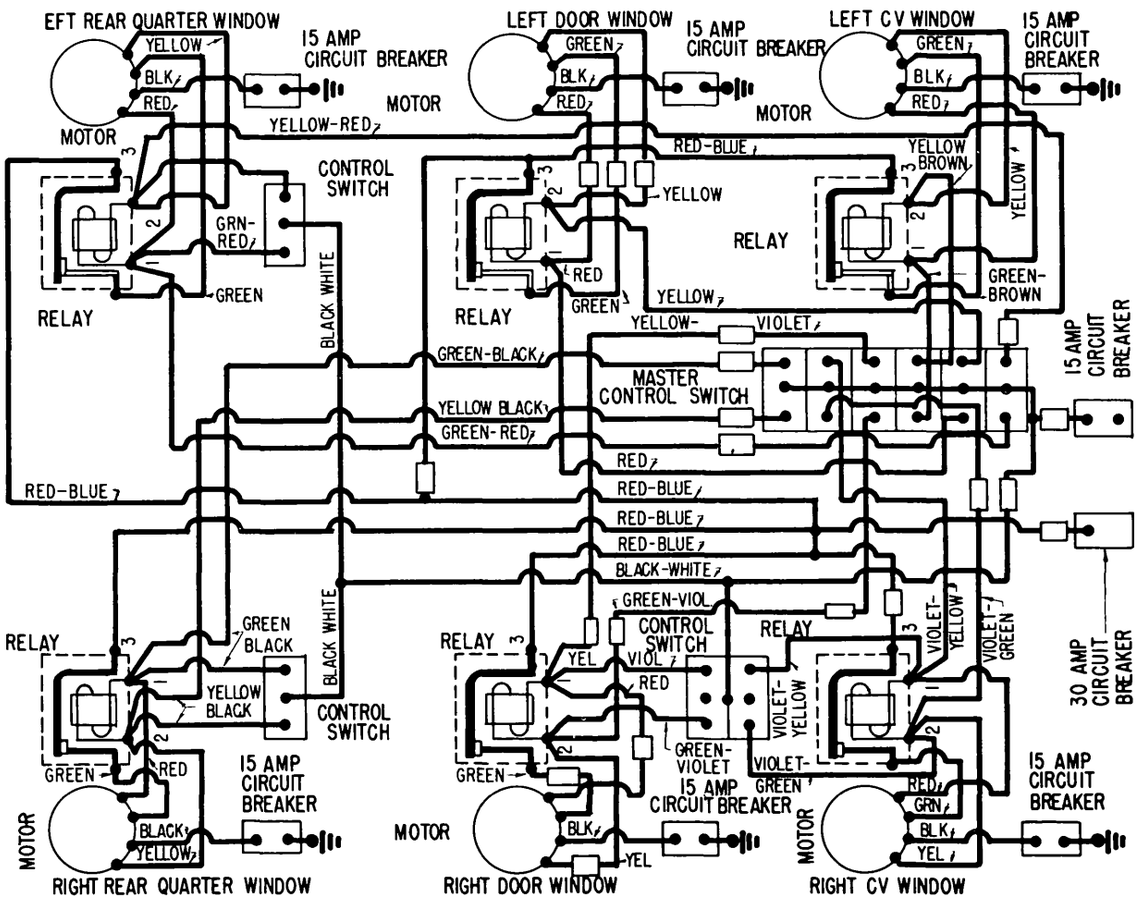
LEAK TESTING: *See "Leak Testing Air Conditioning System".*

TROUBLE SHOOTING: *See "Air Conditioning Trouble Shooting".*

CHECKING, ADDING OIL TO COMPRESSOR, & ADDING PARTIAL CHARGE OF REFRIGERANT: *See "Pontiac", "Chevrolet", or "Frigidaire" in 1955 Annual Data or "Frigidaire & Harrison" in later Manual edition.*

CAPACITIES: (Buick) 5.5 lbs. (Cadillac) 5 lbs. (Chevrolet) 2.5 lbs. (Oldsmobile) 3¾ lbs. (Pontiac) 5 lbs.

FORD, LINCOLN, MERCURY



Continental (1956)
Ford (1956)
Lincoln (1956)
Mercury (1956)
Thunderbird (1956)

► *SAFETY RELAY CAUTION* If windows can be operated with ignition switch "OFF", check wire connection to relay. Red wire should go to "Bat" terminal on light switch, Black wire should go to "Bat" terminal on starter relay, and Yellow wire should go to circuit breaker. If relay is not found to be by-passed because of improper wire connection, proceed as follows Bend safety relay to a vertical position, tap relay slightly to open points. With ignition switch turned "ON", operate window a few times. Then turn off ignition switch and attempt operation of windows. If windows can still be operated and further tapping of the relay will not open the points, safety relay is defective and should be replaced.

DESCRIPTION: Similar in design and operation to previous electric types.

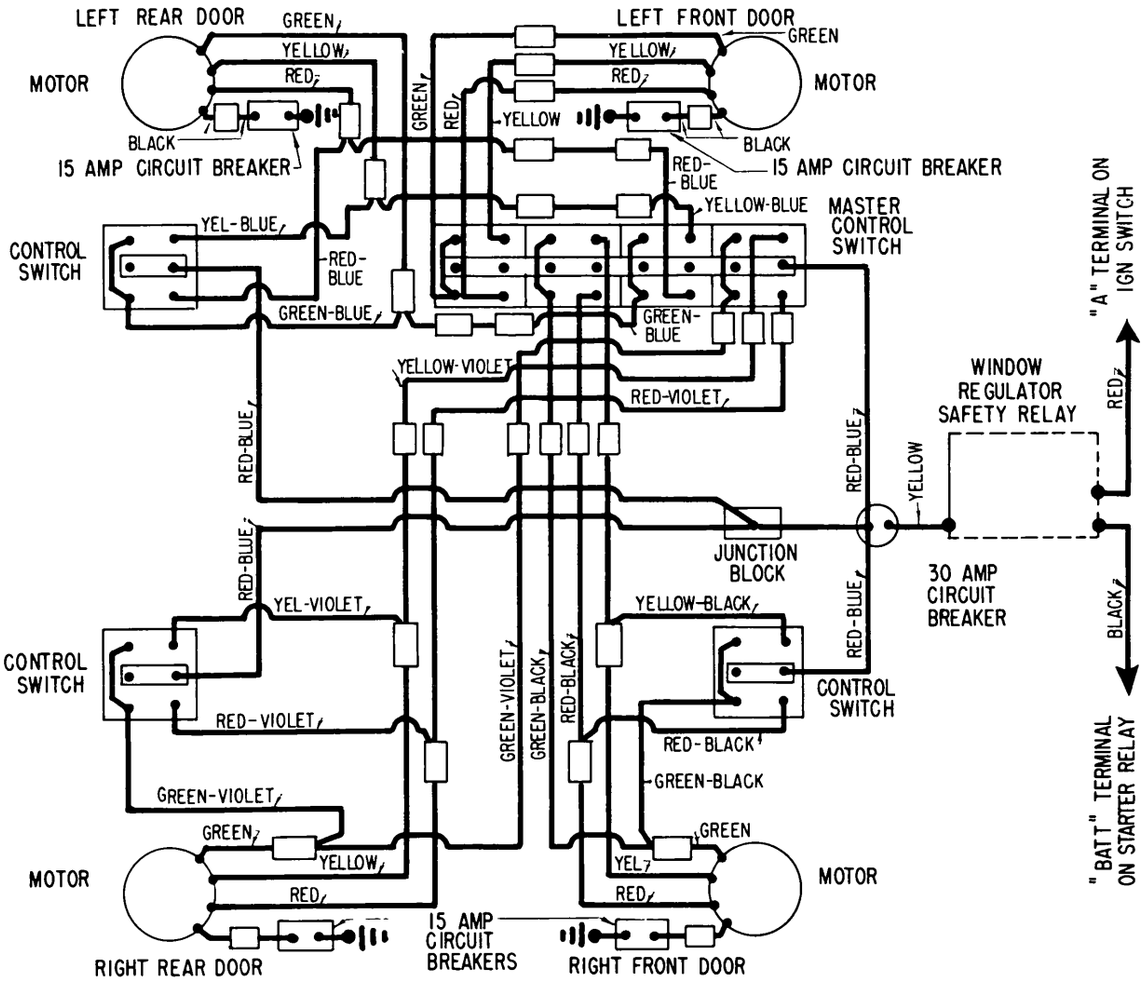
REMOVAL & INSTALLATION: Continental – Disconnect battery ground. Remove door lock control rod knob, garnish moulding and moulding caps from inner door panel. Loosen set screw securing door handle to arm. Unscrew handle from arm. Remove upper moulding from arm rest panel assembly by prying moulding from retainer. Remove screws securing arm rest panel assembly to bottom of door inner panel and one screw at hinge side panel. Working through access holes, remove screws securing arm rest panel to door inner panel. Remove arm rest panel from door by lowering outer end of panel and raising front end to clear mounting bracket. Remove upper trim panel. Remove water seal from door inner panel. With window in half closed position, remove access hole cover plate, and lower window stop. Lower window glass and remove two spring type retainers that secure glass channel rollers to window regulator arms. Remove rollers from arms. Raise window to full up position and place rubber wedge between window glass and door inner panel to hold window in up position. Disconnect wires from motor to relay at bullet connectors. Remove capscrews securing regulator assembly to inner door panel, remove window regulator assembly through access hole. To install, reverse removal procedure.

Ford & Thunderbird: (Except Victoria Quarter Window). Disconnect motor wires at bullet connectors (on Convertible quarter assemblies, disconnect ground wire from circuit breaker on floor pan). Remove motor-to-panel brace on all door assemblies. On rear doors, remove screw that attaches circuit breaker to regulator support bracket and regulator assembly, remove the screws that attach support bracket to the inner door panel, then remove regulator support bracket and circuit breaker. On both door and quarter assemblies partially remove the spring retainers from the roller assemblies in glass channels, and disengage regulator arms from rollers (only one arm and roller on Convertible quarter assembly). On door assemblies, work through the door access hole. Raise window glass manually, wrap several strips of adhesive material over top of door, stick ends to each side of glass. Remove mounting screws that secure regulator assembly to inner door or quarter panel. Slide regulator assembly forward to release roller from guide on inner panel. Remove assembly through access hole. To install, reverse removal procedure.

CONTINENTAL WINDOW CONTROL WIRING DIAGRAM

Ford (Victoria Quarter Window): Disconnect motor ground wire at circuit breaker on floor pah, and other motor wires at bullet connectors. Remove entire glass and regulator panel assembly from body, remove glass from panel. Remove arm link and bushing assemblies in order to disengage the regulator arm from the front track. Remove the four regulator attaching screws from outer side of panel, then remove regulator assembly from panel. To install, reverse removal procedure.

Lincoln (Front Windows) Disconnect battery ground. Remove door locking control rod knob and garnish moulding. Disconnect courtesy light wires at bullet connectors. Remove inside door handle, escutcheon plate, screw attaching arm rest to inner panel bracket, trim panel. Remove access hole cover plate, window glass stop bracket with stop attached, two spring type retainers that connect glass channel rollers to window regulator arms, remove rollers. Raise window to full up position and tape glass securely with masking tape to door glass channel and frame assembly. *(NOTE* - On models without channel and frame assembly, use a rubber wedge to hold window glass in up position). Remove four capscrews that secure regulator assembly to inner door panel. Disconnect motor-to-relay wires at bullet connectors, remove window regulator assembly. To install, reverse removal procedure.



CONTINUED ON NEXT PAGE

FORD, LINCOLN, MERCURY (C ntinu d)

Lincoln (Rear Windows): Lower window to full down position. Disconnect battery ground. Remove door locking control rob knob and garnish moulding, inside door handle, and screw attaching arm rest to inner panel bracket. Pry off trim panel. Disconnect window switch wires from switch. Remove access hole cover plate and window glass stop. Remove two spring type retainers that connect glass channel rollers to window regulator arms, remove rollers. Raise window to full up position and tape glass securely with masking tape to door glass channel and frame assembly. Remove four capscrews that secure regulator to inner door panel. Disconnect wires from motor to relay at bullet connectors. Remove window regulator assembly. To install, reverse removal procedure.

Lincoln (Quarter Windows): Lower quarter window to full down position. Disconnect battery ground. Remove rear seat cushion and rear seat back cushion. Remove sheet metal screws that secure trim panel to quarter panel and remove trim panel. Disconnect wires at bullet connectors from window switch and cigar lighter ground. Remove positive wire from cigar lighter. Remove quarter trim water shield. Disconnect wires from motor to relay at bullet connectors. Remove seven capscrews securing quarter window and panel assembly to quarter panel. Move quarter window and panel assembly to rear and lift front end upward to remove. Remove two nuts securing window glass to glass channel rollers. Remove window glass. Remove four capscrews securing window regulator assembly to regulator panel assembly, remove window regulator assembly. To install, reverse removal procedure.

Mercury (Front Windows): Disconnect battery ground. Remove door locking control rod knob and garnish moulding. Remove inside door handle, door handle escutcheon plate, screws attaching arm rest to inner panel. Remove trim panel from door. Remove wires from switch. Remove vinyl shield, window glass stop, two spring type retainers that connect glass channel rollers to regulator arms, remove rollers. Raise window to full up position and tape glass securely with masking tape to door glass channel and frame assembly. *(NOTE* - Cn models without channel and frame assembly, use a rubber wedge to hold window glass in up position). Remove four capscrews that secure regulator assembly. Disconnect wires from motor to relay at bullet connectors. Remove motor support bracket and relay from inner door panel. Remove regulator assembly through access hole. To install, reverse removal procedure.

FORD WINDOW CONTROL WIRING DIAGRAM

Mercury (Rear Windows): Lower window to full down position. Disconnect battery ground. Remove door locking control rod knob and garnish moulding, inside door handle, and arm rest to inner panel attaching screws. Pry off trim panel. Disconnect window switch wires from switch. Remove vinyl shield and window glass stop. Remove two spring type retainers that connect glass channel rollers to window regulator arms, remove rollers. Raise window to full up position and tape glass securely with masking tape to door glass channel and frame assembly. Remove three capscrews that secure regulator assembly to inner door panel. Disconnect wires from motor to relay at bullet connectors. Remove regulator assembly through access hole. To install, reverse removal procedure.

Mercury (Quarter Windows): Lower window to full down position. Disconnect battery ground. Remove rear cushion and rear seat back cushion. Remove sheet metal screws that secure window garnish moulding, remove moulding. Remove sheet metal screws that secure trim panel to quarter panel and remove trim panel. Disconnect wires at bullet connectors from window switch. Remove vinyl shield. Disconnect wires from motor to relay at bullet connectors. Remove capscrews securing quarter window and regulator panel assembly to quarter panel. Move quarter window and regulator panel assembly to rear and lift front end upward to remove. Remove two nuts securing window glass to glass

CONTINUED ON NEXT PAGE

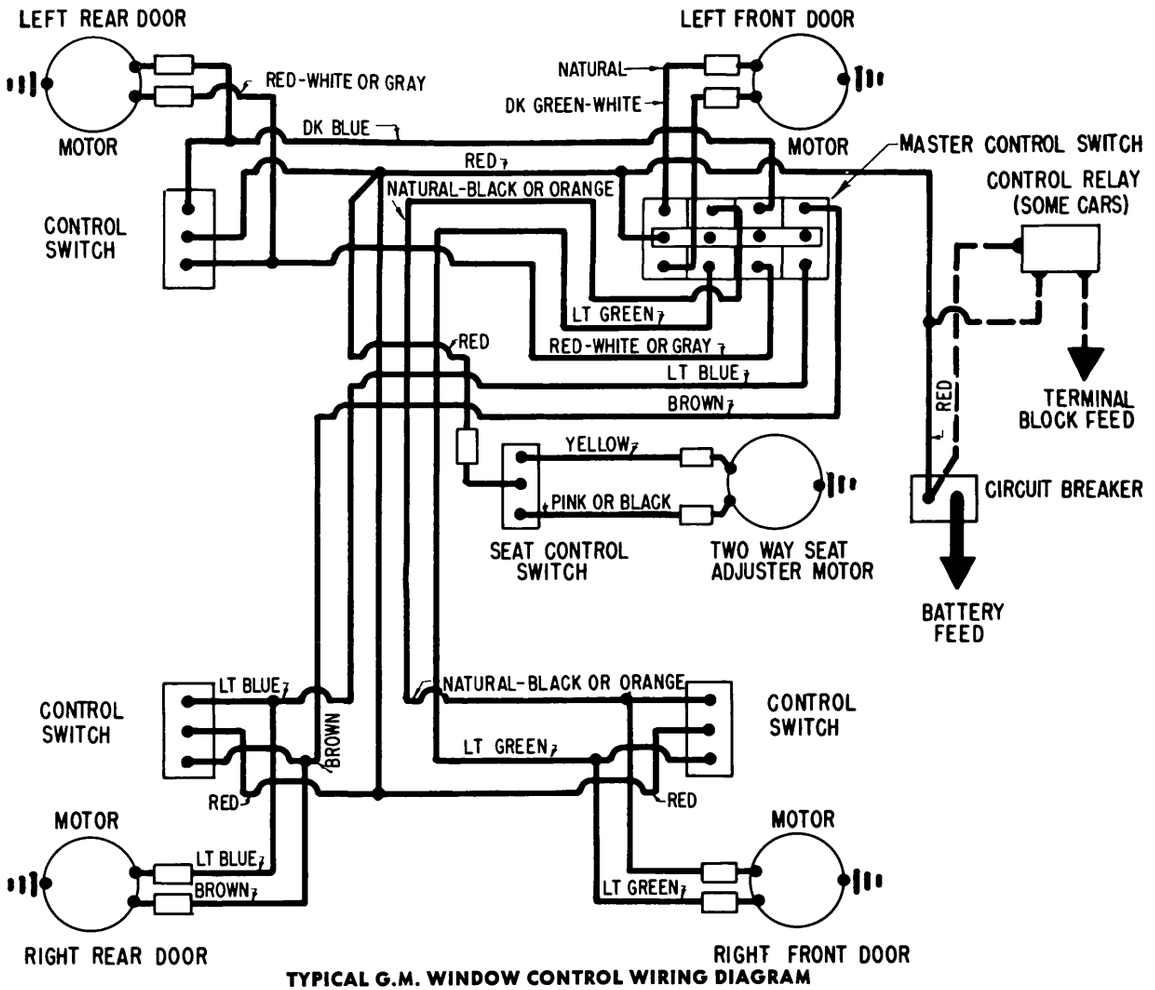
LINCOLN & MERCURY WINDOW CONTROL WIRING DIAGRAM

Buick (1956)
Cadillac (1956)
Chevrolet (1956)
Oldsmobile (1956)
Pontiac (1956)



DESCRIPTION: Similar in design and operation to those used on previous models.

FRONT DOOR WINDOW REGULATOR REMOVAL: Lower window, remove door trim pad (and heater duct on some cars), access hole covers, and tape that covers access hole. Disconnect motor leads from wiring harness. Remove screws securing window assembly to regulator cam. *(NOTE - On most models it will be necessary to remove window assembly. On others, after disengaging window assembly from regulator cam channel, glass can be propped up in position). (CAUTION - After window regulator assembly is disengaged from regulator DO NOT OPERATE REGULATOR MOTOR).* Remove ventilator division channel lower adjusting stud and nut. Remove stationary cam attaching screw and cam. Disengage cam from regulator and remove from door. Remove regulator attaching screws and remove regulator from door. To install, reverse removal procedures. Seal inner door panel. *NOTE* - Regulator lift arm should be in the "down" position when installing regulator.

REAR DOOR WINDOW REGULATOR REMOVAL: Lower window, remove door trim assembly and inner panel access hole cover. Insert a screwdriver through access hole which is located in inner panel forward of large inner panel access hole, and carefully spread spring clip on regulator balance arm. At same time insert another screw-driver behind upper edge at front of large inner panel access hole and carefully pry regulator balance arm from window frame pin. Through access hole located above and slightly to the rear of the center of the large inner panel access hole remove window sash channel upper screw, then remove lower screw. Detach cam from regulator lift arm and remove from door. *(CAUTION - After window regulator assembly is disengaged from regulator DO NOT OPERATE REGULATOR MOTOR).* Lift window to up position, engage female wedge plate with male wedge plate (located on hinge pillar), then prop rear of window in up position Remove inner panel cam screws, detach cam from regulator balance arm and remove from door. Loosen center guide shoe jam nut, unscrew guide shoe from support and remove shoe from guide Swing center guide upward to provide clearance for removing regulator. Detach regulator motor lead wires, and regulator attaching screws. Position regulator balance arms in line with lift arm to facilitate removal of regulator through access hole. To install, reverse removal procedures. Make sure regulator balance arm spring clip is properly installed on balance arm

REAR QUARTER WINDOW REGULATOR REMOVAL: Remove rear quarter window *(CAUTION - After window regulator assembly is disengaged from regulator DO NOT OPERATE REGULATOR MOTOR).* Disconnect motor leads from wire harness, remove regulator attaching screws Remove regulator and motor assembly through access hole. To install, reverse removal procedure. Apply medium-bodied sealer around attaching holes on quarter inner panel side of regulator.

G.M. ELECTRIC

TYPICAL G.M. WINDOW CONTROL WIRING DIAGRAM

REGULATOR MOTOR REMOVAL (WITH REGULATOR ASSEMBLY REMOVED FROM CAR): *(CAUTION - The regulator arm which is under tension from the counter-balance spring can cause serious injury if motor assembly is removed without locking sector in position).* Clamp regulator assembly securely in a vise so that arm is free and motor is in an upward position. Drill a ¼" hole through regulator backplate and sector at a point which will miss motor housing and teeth in sector (Not closer than ¾" on front doors, nor closer than ½" on rear doors to edge of backplate or sector). Insert a 3/16" bolt through holes in backplate and sector and install nut to bolt (DO NOT TIGHTEN BOLT). Remove three motor attaching bolts, remove motor assembly from regulator. To install, reverse removal procedure. Regulator motor rubber pad should be cemented to inner panel side of motor. Be sure to remove temporary nut and bolt after motor is installed

► *NOTE: Motor is a sealed unit and is serviced only as an assembly and should not be disassembled.*

DOOR SWITCH ASSEMBLY REMOVAL: Remove garnish or belt finishing molding and door inside handles Disconnect terminal block with attached wires from switch assembly by carefully pulling block to disengage it from switch studs. With a suitable tool, pry open the retaining tabs at each end of switch and remove complete switch assembly from trim pad Remove switch from escutcheon by depressing the four tabs with a sharp pointed tool inserted through holes in end of escutcheon and prying them free.

QUARTER WINDOW SWITCH ASSEMBLY REMOVAL: Remove garnish molding and pull trim panel out slightly, then proceed as outlined for "Door Switch Assembly Removal" above.

CONTINUED ON NEXT PAGE

G.M. ELECTRIC (C nt.)

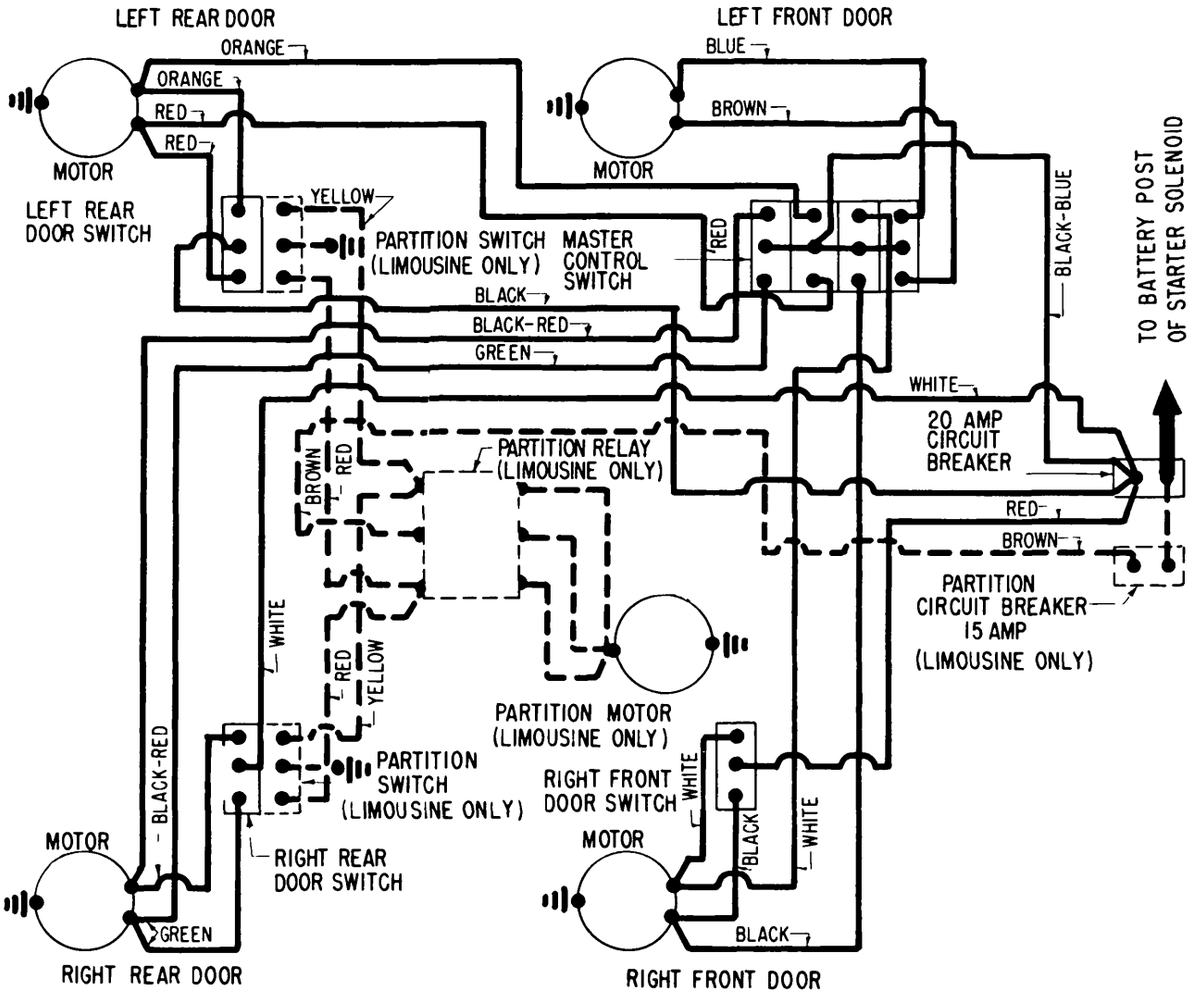
TROUBLE SHOOTING (ELECTRICAL):

Window Will Not Operate From Immediate Control Switch, But Will Operate From Master Control Switch: Check as follows
1) Feed wire to immediate switch
2) Immediate control switch
3) Motor leads from intermediate switch to motor

Window Will Not Operate From Master Switch But Will Operate From Intermediate Switch: Check as follows
1) Operation of master switch
2) Motor leads from master switch to motor

Window Will Not Operate From Intermediate Nor Master Switch. Operation of Other Windows Is Satisfactory: Check as follows
1) Operation of intermediate and master switches
2) Motor leads from each switch to motor
3) Operation of motor.

Windows Will Not Operate From Master Switch But Will Operate From Intermediate Switches: Check as follows
1) Feed wire from circuit breaker to master switch
2) Operation of master switch.



Windows Will Not Operate: Check as follows
1) Battery
2) Circuit from battery to circuit breaker.
3) Circuit breaker.
4) Feed wire from circuit breaker to switches
5) Operation of all switches

TROUBLE SHOOTING (MECHANICAL) & CORRECTIVE MEASURES: Diagnose trouble and correct as follows

Evidence of Pinion Gear Overtravel on Sector Gear: If check of regulator assembly reveals that motor pinion gear jammed at end of regulator sector gear, extra teeth may be filed at end of sector gear *CAUTION*—It is important that extra teeth conform to rest of teeth to prevent recurrence of condition Carefully check added teeth for proper fit with pinion gear teeth

Extreme Sideplay of Sector Gear: If backplate or side of sector gear next to backplate shows that surfaces are contacting on any portion of travel of sector gear, assembly should be replaced (paint will be scraped off at areas of contact)

Lift Arm Pins Too Loose: If any of the lift pins (studs which retain nylon roller to regulator assembly) are loose, they should be tightened to prevent pins from falling off and disengaging window from regulator during operation Tighten by using normal riveting procedure If they cannot be tightened satisfactorily, replace regulator

CHRYSLER, DESOTO, DODGE, PLYMOUTH WINDOW CONTROL WIRING DIAGRAM

Nylon Rollers Binding in Channels: If rollers do not slide easily in their channels, greater clearance can be obtained by filing edge of channel or aligning channel to roller with pliers

Bent or Distorted Regulator Backplate: Replace regulator assembly

Lubrication: If operation noisy due to lack of lubrication between coils of counter-balance spring, lubricate between coils with a graphite grease Lubricate all studs with a medium grade oil

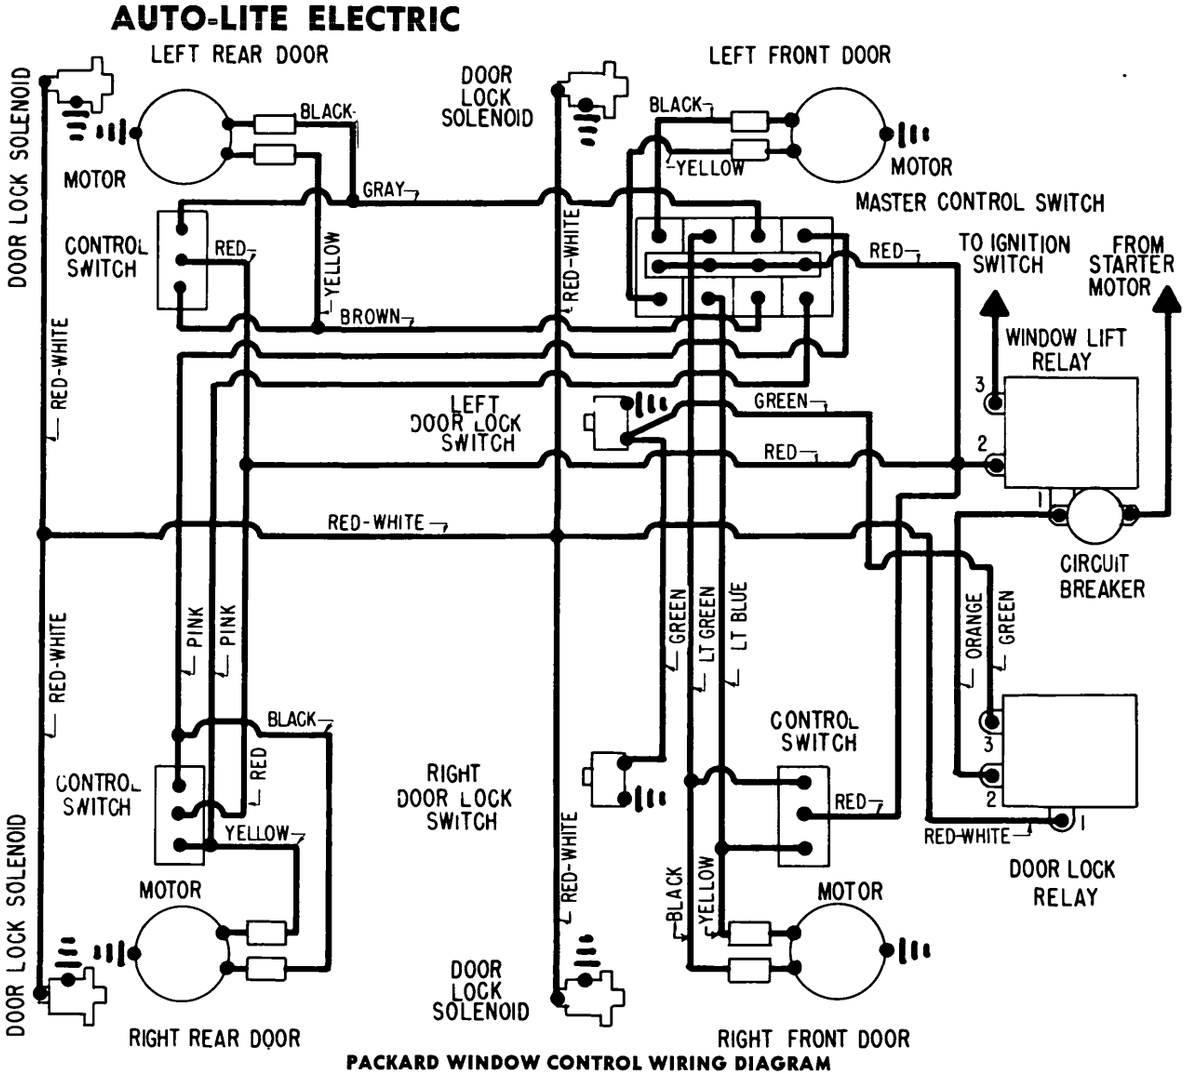
SERVICE PARTS: **Window Lift Motor** - No 4900218 or 4900219
Relay - (Oldsmobile & Buick) No. 1116895.

Chrysler & Imperial (1956)
DeSoto (1956)
Dodge (1956)
Packard (1956)
Plymouth (1956)
Studebaker (1956)

DESCRIPTION: Similar in design and operation to type used on previous models except that relays are no longer used on door windows but are used on some models in conjunction with partition and rear quarter windows.

REMOVAL & INSTALLATION: Proceed as follows:

Window Lift Motor (Except Studebaker): Remove door handle, escutcheon plate, garnish molding, arm rest and trim panel. Disconnect wires from motor. Remove attaching nuts that hold motor to gear box, pull motor down and away from drive shaft. To reinstall, reverse removal procedure.



Studebaker–Remove regulator assembly (see below). Remove motor-to-regulator bracket capscrews. Slip motor off bracket and disengage motor shaft from coupling. To install, make sure coupling fully engages gear shaft. Then align motor shaft and coupling, slip motor into position. Install retaining capscrews. Install regulator (see below).

Window Lift Assembly (Except Studebaker): Removal– Disconnect battery, remove garnish molding, door handle and escutcheon plate. Remove arm rest and window lift control switch, then door trim panel. Remove wires from motor. Remove clips from regulator pins holding lower glass channel. Raise glass manually and prop the glass. Raise glass before loosening capscrews so that it is out of working area. Remove four regulator-to-door attaching screws. Remove pivot guide retaining pin. Lower motor and regulator assembly out through opening in door.

►*CAUTION:* If gear box is to be replaced, remove regulator counter balance spring before removing. Counter balance spring has 220° of wrap. Use large pliers when removing. Failure to remove spring before disassembly can result in personal injury.

Installation–Place motor and regulator assembly through opening in door, insert intermediate pivot arm pin into guide inside door shell **(there is no clip)**. Install four regulator attaching screws finger tight. *(NOTE*–After regulator screws installed, check to see that intermediate pivot arm did not slip out of guide during installation). Remove window prop, lower window and insert control arms into glass channel, using leather washer on each side of channel, secure with clip. Connect motor wires and battery cable, operate window up and down several times to help align glass in channel. Stop window half way and tighten regulator attaching screws. Check glass for alignment. Replace trim panel and other parts in reverse order of removal.

Wind w Lift Ass mbly (Stud bak r): R m val–Raise window, remove door handle and arm rest. Remove trim panel, disconnect wires from switch, then remove trim strip from door. Remove sealing tape from inspection holes and tape edges of large inspection hole with masking or friction tape. Remove window stop bracket bolts, turn bracket as required and remove from door. Remove relay bolts, and remove relay, leaving wires attached. If window is in up position, turn ignition switch on and lower window by holding ground wire to dark green wire at relay terminal. Lower window just enough to expose regulator arms and window lift channel. Turn ignition switch off. On all doors, except President Classic rear doors, remove hairpin clip and plain washer from each regulator arm guide pin, then disengage lift channel from guide pins. Lift glass all the way manually and insert a punch or small screwdriver through one of trim strip retainer holes to hold glass in up position. On the President Classic rear door, remove ventilator assembly. Remove window glass from door to provide clearance within door for regulator removal. Disconnect motor-to-relay wires at relay, remove relay. Loosen idler track rear screw just enough to keep it snug. With a hand inside door, hold idler track or end of regulator arm. *(NOTE*–Because regulator arm which engages idler track is springloaded make certain idler track or end of regulator arm is well supported). Remove idler track front screw and carefully lower arm and track until pivot point can be seen through access hole. Then, while holding end of track, remove track rear screw and lower track until it rests against regulator sector. Remove four regulator-to-door panel screws and lower regulator. Then, by revolving drive coupling, move sector to provide clearance required to permit tipping regulator for removal. On front door regulator, move sector to approximately the center

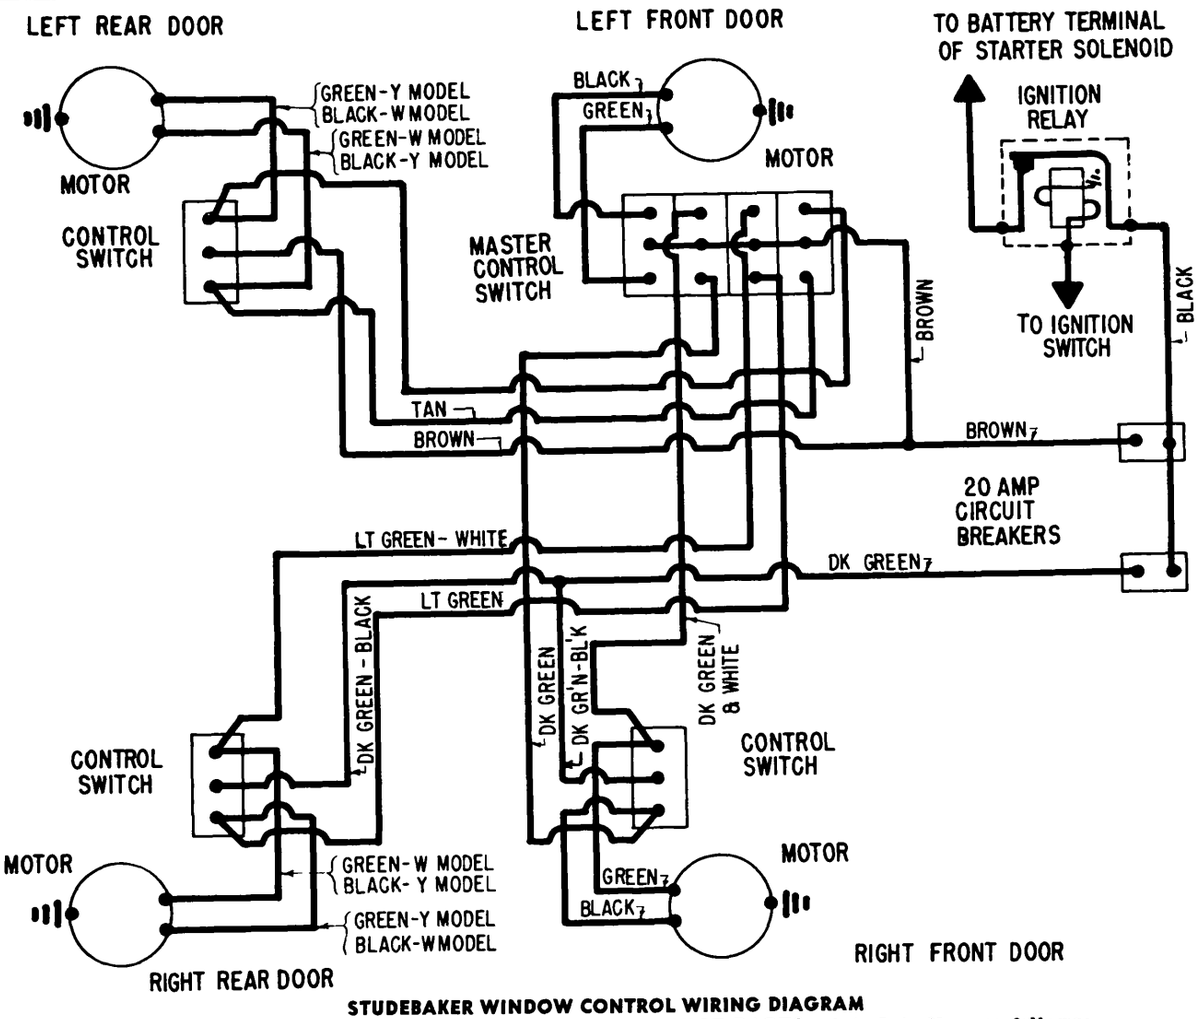
PACKARD WINDOW CONTROL WIRING DIAGRAM

CONTINUED ON NEXT PAGE

AUTO-LITE ELECTRIC (C nt.)

position. Shift regulator assembly forward on all doors except President Classic rear door (to rear). Keep the motor end down. Turn and tip assembly and start regulator arms out through inspection hole Continue to turn and, at same time, lower ends of regulator arms and lift assembly out of door

Installati n—Apply Lubriplate or high melting point grease to sector gears, idler track, arm guide pins, and balance spring Place sector in approximately same position as for removal (center position for front doors 1/3 of its travel from down position for rear doors) Insert motor end through inspection hole Keep ends of regulator arms down, move assembly into door As mounting bracket clears edge of inspection hole lower motor and move assembly forward (rearward on rear door of President Classic). Turn assembly, insert regulator arms in door. On front door, be sure sector clears window front guide channel Sector must be positioned between guide channel and door inner panel Position regulator on door panel and install retaining capscrews Swing idler track into position with arms nearly vertical but with front track screw clear, install but do not tighten front track screw Lift idler track using front screw as a pivot align the bracket with hole in panel install track rear screw Tighten both front and rear track screws securely Connect motor wires to relay Turn ignition switch on and lower sector and regulator arms by touching ground wire to dark green wire relay terminal. On President Classic rear door, place glass in door. Install rear ventilator frame assembly. On all models (exc. President Classic) remove screwdriver and lower glass carefully Engage lift channel with regulator guide pins and install plain washers and retaining clips Hold ground wire on upper terminal of relay and raise window Position window stop bracket within door and install retaining bolts Loosen bolts and move stop and bumper down Lower glass until top of glass is flush with bottom of window opening on all front doors and approximately 2" above bottom of opening on rear door of 4-Door models Then raise stop until stop bumper contacts lift channel, tighten bolts Make sure all connections on relay are tight and install relay within door Install door panel trim strip, connect wires to switch in trim panel, and install trim panel



OPERATIONAL TEST: Connect ammeter in electrical circuit and operate window Ammeter reading should be constant and without fluctuation If reading fluctuates, there is a bind in either glass or linkage

TROUBLE SHOOTING: Diagnose trouble as follows

All Windows Inop rativ : Loose connection or break in wires from power source, defective ignition switch relay (Studebaker), all circuit breakers defective.

Both Right Windows or Both Left Windows Inoperative (Studebaker 4-D or Models), B th Front Windows Or Both R ar Windows In perative (Oth rs): Faulty circuit breaker or circuit breaker wire

On Window Inoperative: Faulty relay (if so equipped) or operating switch, bind in regulator linkage or window glass, motor burned out

STUDEBAKER WINDOW CONTROL WIRING DIAGRAM

Window Operable In One Direction Only: Faulty relay (if so equipped) or operating switch, broken wire or loose connection, faulty motor

Window Operates In Wrong Direction From Master Or Door Switch: Field wires from motor reversed at relay (if so equipped)

Window Operates In Wrong Direction From Either Master Or Door Switch, Correctly From Other Switch: Operating wires reversed at switch

Window Operates From One Switch Only: Defective switch, broken or grounded wire or loose connection

Circuit Breaker Cuts In & Out Continuously—Window Will N t Operate: Grounded wires, relay (if so equipped) points stuck, faulty switch

Window Operat s Sluggishly Or Circuit Breaker Cuts In & Out When Window Is Operated: Bind in regulator assembly or window channel, broken wire, loose connection, or partial ground, defective motor

SERVICE PARTS: Auto-Lite Nos. as follows·

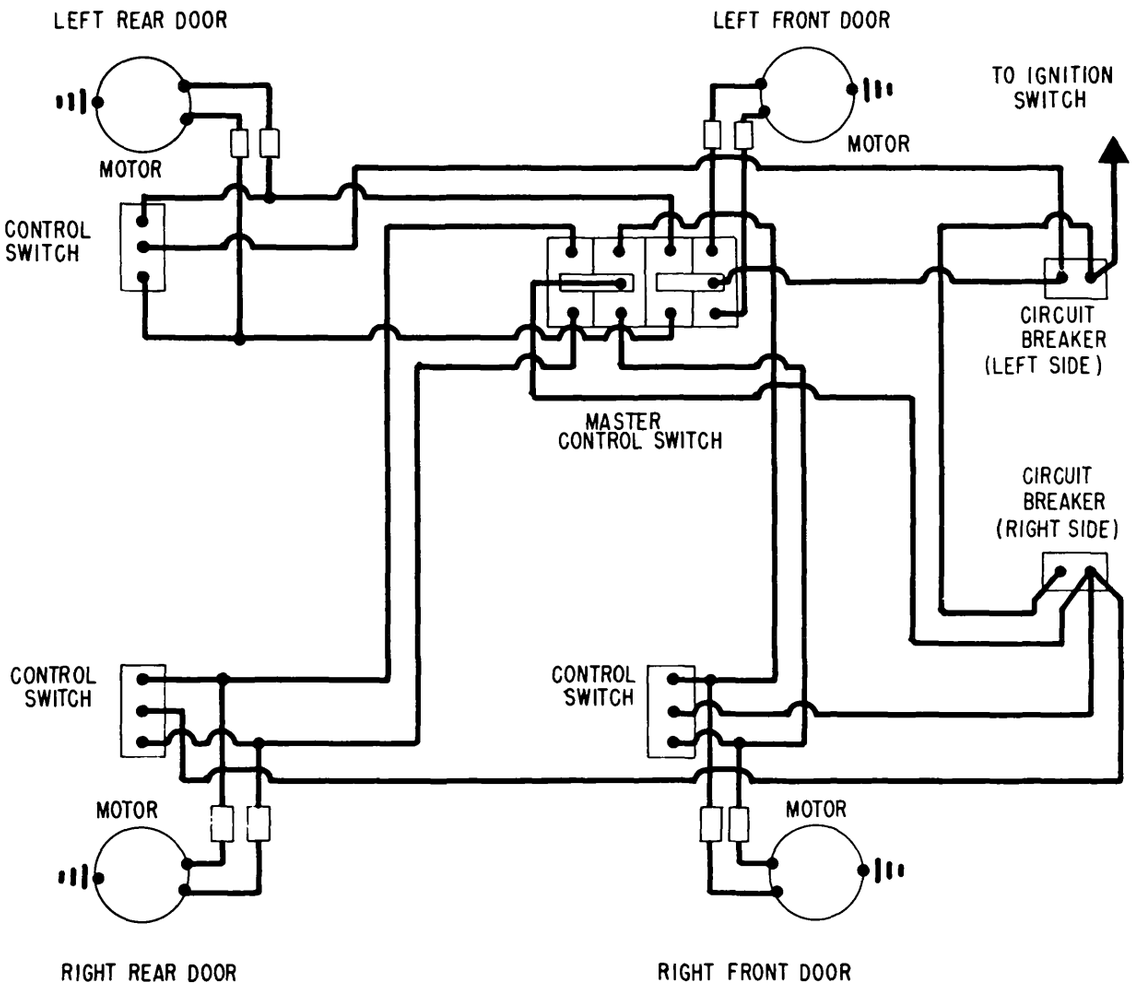
Hudson Hornet & Wasp (1956)
Nash Ambassador & Statesman (1956)

DESCRIPTION: Similar in design and operation to previous electric types except that relays are no longer used.

REMOVAL & INSTALLATION: *See "Hudson & Nash" in 1955 Annual Data or later Manual edition and note the following.*

Front Door Window Regulator: Ignition must be in "OFF" position. Remove door trim panel. Disconnect regulator arm from cross arm assembly by removing the key slotted retainer from grooved stud riveted in cross arm assembly. Move glass to fully raised position. Disconnect motor-to-switch wires. Remove regulator-to-door screws, then remove assembly through large opening in panel. Before reinstalling regulator, glass should be raised and lowered by hand to insure free operation. All cross arm and regulator moving parts should be lubricated with Lubriplate. Two spacers must be reinstalled between regulator and inner door panel at upper mounting bolts when installing regulator to panel. Move door glass down to align hole in end of regulator arm with stud on cross arm assembly. Install spring washer, then fiber washer to stud. Install arm on stud and fasten with the retainer.

Master Multiple Control Switch: Insert putty knife between switch ends and mounting plate to compress springs which will release switch. Before removing wire harness (single assembly), disconnect battery. *NOTE* - Shortest pair of wires are connected to forward terminals of switch. Red wires are connected to the center terminals with the shortest connected to the front center terminal and the remaining red wire to the rear center terminal.



TROUBLE SHOOTING: All Windows Fail to Operate in Either Direction or Operate Slowly – Battery dead or too low to operate motor; circuit breaker inoperative; battery ground loose or terminal in control circuit loose or corroded.

One Window Fails to Operate: Motor loose in mounting causing poor ground; break in wire.

Windows Operate Intermittently on One Side of Car: Loose connections; defective circuit breaker.

SERVICE PARTS: Motor – No. 4477319 (Hudson), No. 4477318 (Nash).

HUDSON, & NASH WINDOW CONTROL WIRING DIAGRAM

FORD, LINCOLN, MERCURY

Contin ntal (1956)
Ford (1956)
Lincoln (1956)
Mercury (1956)
Thunderbird (1956)

► *LINCOLN SEAT SWITCH PRODUCTION CHANGE & INSTALLATION CAUTION:* New switch, Part No. FDU-14545-D, has been released for production and service. Switch is designed to provide positive positioning in the fore-aft and up-down positions, eliminating possibility of moving toggle into an intermediate dead spot causing intermittent operation. When installing switch, make sure seat trim panel is properly installed. Attaching bracket must be installed so that attaching wings angle downward, to avoid pinching fingers when the seat moves to the pull-up position. In event fore-aft or up-down of seat switch causes only clutch solenoid or motor to operate, check position of switch. Switch is properly positioned when flat on threaded shank of switch is parallel with flat of hole in seat cushion shield.

► *FOUR-WAY SEAT BINDING CORRECTION (FORD & MERCURY):* Check both sides of the horizontal equalizing bar gear for rough or raised areas; file smooth. Carefully remove any burrs on the equalizing bar bearing face. Adequately lubricate all moving parts and contact surfaces. Add ¼" flat washers between seat track and retainer.

DESCRIPTION: (Except Lincoln) - Similar in design and operation to previous electric types.

Lincoln - Single motor provides horizontal and vertical movement. The adjusters are operated by an actuator assembly consisting of a reversible motor (12 Volt), relay and a gear box and jackscrew. The regulator motor is controlled by a toggle type switch. Two spinning nut and solenoid assemblies, located on regulator jackscrew, transmit movement to the seat adjusters by means of a torque tube assembly and links. In each of the spinning nut assemblies is a free-wheeling spinning nut which is mounted in ball bearings and free-wheels with the jackscrew unless locked out of free-wheeling by the solenoid located on top of the spinning nut. When spinning nut is locked out of free-wheeling, spinning nut moves forward or rearward on jackscrew, thereby transmitting movement to seat adjusters by means of connecting links and torque tube assembly.

REMOVAL & INSTALLATION (Ford, Mercury, Thunderbird): *NOTE* - It is not necessary to remove seat assembly from car in order to replace either the horizontal or vertical regulator assembly, motor, or relay. These parts can be removed from behind and underneath front seat. To replace either seat frame or track assembly requires removal of entire power seat assembly from car.

Pow r Seat Assembly: Run seat to extreme forward position in order to expose Phillips head mounting screws at forward ends of upper tracks. Disconnect battery ground cable. At each regulator motor, disconnect motor ground wire at bullet connector and disconnect cable-to relay wires from relay. Remove front seat shields. Remove control switch from left hand shield. Loosen and remove seat track mounting bracket stud bolts and nuts from underside of floor pan. Remove seat track assembly (with seat frame attached). To install, reverse removal procedure.

Seat Tracks: With power seat assembly removed from car (see above) remove rolled pin attaching horizontal regulator jack to bracket on seat frame. At both right and left seat tracks, remove the Phillips head screw and stud nut attaching upper track to seat frame. Remove seat frame from track assembly. To install, reverse removal procedure.

Regulator Assemblies: When replacing horizontal regulator, remove left seat side shield, remove nut and bezel that retain control switch or switches to side shield and remove switch from shield. If vertical regulator is to be replaced, remove right seat side shield. Disconnect the assist spring (left for horizontal regulator, right for vertical regulator) using a stiff wire with loop on end. Hook loop of wire to rear loop of spring and pull spring back so as to disengage it from the arm and link assembly. Disconnect motor ground wire at bullet connector and disconnect cable-to-relay wires. Drive rolled attaching pin from each end of regulator assembly with a ¼"x12" drill rod. Remove regulator, motor, and relay as an assembly. To install, reverse removal procedure.

Relays: Remove regulator and motor assembly to which relay is attached. Disconnect motor-to-relay wires and remove relay from motor. To install, reverse removal procedure.

Motors: Remove regulator assembly to which motor is attached. Remove nuts that retain motor to regulator assembly, remove motor. Remove the rubber regulator drive coupling and relay from motor. To install, reverse removal procedure.

Regulator Shaft, Gear, or Housing Assembly: Remove regulator assembly from seat and remove motor and relay assembly from regulator. Place regulator assembly in a bench vise having soft jaws to retain the jackscrew. Remove regulator gear housing assembly. Remove shaft gear retaining nut from shaft. Place assembly in a press, and press shaft assembly from gear and housing assembly. Remove spacer assembly from shaft, and remove gear and key from housing. To install, reverse removal procedure.

CONTINENTAL SEAT CONTROL WIRING DIAGRAM

F RD, LINC LN, MERCURY SEAT CONTROL WIRING DIAGRAM

Buick (1956)
Cadillac (1956)
Oldsmobile (1956)
Pontiac (1956)

► *CADILLAC SEAT "CHUCK" CORRECTION:* Remove left seat side panel. Remove outer rear hold-down bolt which is ¾" long. Add two .12" thick washers, Part No. 4588818, between floor pan and adjuster assembly. Replace old bolt with new 1¼" long bolt, Part No. 4676744. Correction is made on left seat adjuster assembly only.

► *ACTUATOR ROLL PIN INSTALLATION CAUTION:* When replacing an actuator spinning nut assembly or an actuator assembly (less spinning nuts) roll pins should be installed so that center of protruding portion of pin is located **between** threads of the jackscrew. If pin installed in center of a thread there is a possibility pin may shear or cause assembly to jam. When installing roll pins in jackscrew, install pin so that 1/16" of pin protrudes above jackscrew threads.

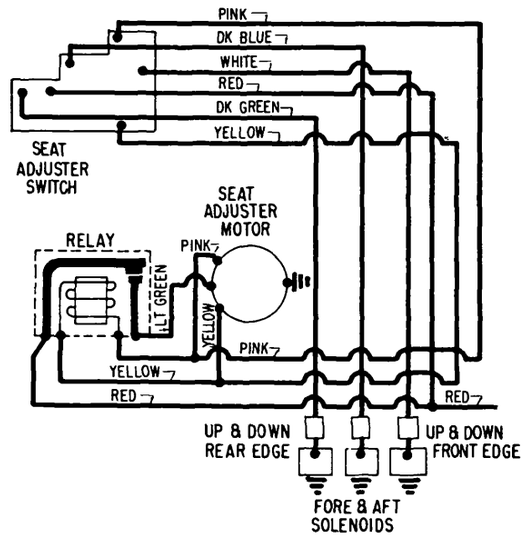
G.M. SIX-WAY SEAT CONTROL

DESCRIPTION: The new 6-Way Seat Adjusters provide horizontal and vertical movement, and forward and rearward tilt. The adjusters are operated by an actuator assembly consisting of a reversible motor (12 Volt), relay, and a gear box and jack screw. The regulator motor is controlled by single bar type or three button type type switch (see below) located on front seat left side panel. Three spinning nut-and-solenoid assemblies, located on regulator jackscrew, transmit movement to the seat adjusters by means of a torque tube assembly and links. In each of the spinning nut assemblies is a free-wheeling spinning nut which is mounted in ball bearings and free-wheels with the jackscrew unless locked out of free-wheeling by the solenoid located on top of the spinning nut. When spinning nut is locked out of free-wheeling, spinning nut assembly moves forward or rearward on jackscrew, thereby transmitting movement to seat adjusters by means of connecting links and torque tube assembly.

Single Bar Type Switch Operation: To move seat fore or aft, switch bar is moved fore or aft; to move front of seat up or down, move front of bar up or down; to move rear of seat up or down, move rear of bar up or down.

► *BAR TYPE SWITCH CAUTION:* To avoid damage to motor or solenoids, front and rear of switch bar should not be operated simultaneously in different directions - motor will not operate with switch in this position.

Three Button Switch Operation: To move front of seat up or down, move front button up or down; to move seat fore or aft, move center button fore or aft; to move rear of seat up or down, move rear button up or down.



► *OLDSMOBILE SERIES 98 COUPE SEAT CONTROL NOTE:* In addition to control by bar type control switch, seat operates rearward when either door is opened, and forward when either of the seat backs is tilted forward. This feature effective only when ignition switch is "OFF".

REMOVAL & INSTALLATION: Front Seat Assembly (Including Seat Adjusters & Actuator Assembly): Operate seat to raised position. Under front of seat disconnect adjuster control wire harness from adjuster feed wire harness and detach control harness from clip on floor pan. Disconnect lighter feed wire (where applicable) and detach wire from clip on floor pan. On Cadillac, remove screws securing rear floor carpet to right and left adjusters. On all cars, remove seat adjuster to floor pan bolts, then with aid of helper lift seat assembly, with adjusters and actuator assembly attached, from body. To install, reverse removal procedure. Make sure ground wire is secured under seat adjuster floor pan bolt. When installing seat assembly to body, carefully align seat adjuster attaching holes with attaching holes in floor pan to avoid possible binding of seat adjuster linkages. Seat adjusters should be parallel when properly aligned. Check operation of seat to extreme limit of each position. On Oldsmobile 98 Coupes, check operation of automatic feature.

Front Seat Assembly (Less Seat Adjusters & Actuator Assembly): Operate seat to fully raised position and midway between full forward and rearward horizontal positions. Remove both right and left seat side panels. Under front of seat disconnect control wire harness from adjuster feed wire harness. Detach lighter feed wire and detach wire from clip on floor pan; remove ground wire from under seat adjuster bolt. At both adjusters remove front and rear seat adjuster-to-seat frame attaching bolts. Tilt seat assembly rearward and remove control wire harness from spring clips along front of seat bottom frame. With aid of helper carefully lift seat assembly (less seat adjusters and actuator assembly) from body. To install, reverse removal procedure. Make sure ground wire is secured under seat adjuster floor pan bolt. Check operation of seat to extreme limit in each position. On Oldsmobile 98 Coupes, check operation of automatic feature.

Front Seat Adjuster: Remove seat assembly including seat adjusters and actuator assembly (see above). Place seat assembly upside down on a covered bench. Remove seat side panel and counterbalance spring from adjuster being removed. Support torque tube assembly with board between torque tube and seat front and rear rails on side of seat from which adjuster is being removed. Remove cotter keys and washers securing adjuster links to torque tube assembly and cotter key and washer securing torque tube link to adjuster. Remove both front and rear seat adjuster-to-seat frame attaching bolts. Lift adjuster slightly, then carefully work adjuster outboard to disengage it from torque tube. Disengage link from adjuster. If removing right adjuster, remove cotter key and washer and disengage actuator assembly from support pin. To install, reverse removal procedure.

Adjuster Actuator Assembly: Operate seat midway between forward and rearward horizontal positions. Operate front of seat to up position and rear of seat midway between up and down positions. Remove seat assembly including seat adjusters and actuator assembly. Place assembly upside down on covered bench. Remove both right and left seat adjuster counterbalance springs. Check to see that all spinning nut attaching screws are accessible for removal. If screws not accessible, hook up control harness feed wire to power and ground seat frame; hook up control switch, then operate actuator to position spinning nuts so that all screws are accessible. Disconnect the three spinning nut solenoid feed wires at connectors. Disconnect control harness feed wires from motor relay. Remove anti-creep spring from center spinning nut. Remove shoulder screws securing spinning nuts to mounting supports. Remove cotter key and washer securing actuator to support pin. Raise spinning nut mounting supports to vertical position. Raise front of actuator sufficiently to allow unit to be removed from support pin, then remove actuator assembly from seat. To install, reverse removal procedure. Connect relay and solenoid wires.

G.M. SIX-WAY SEAT CONTROL WIRING DIAGRAM

Adjuster Actuator Spinning Nut Assembly (Including Solenoids): Remove seat adjuster actuator assembly (see above). Carefully drive roll pins out of jackscrew. Insert drift punch or suitable tool into spinning nut frame mounting hole, rotate spinning nut frame slowly until drift punch engages in locking nut of spinning nut, then unscrew complete spinning nut assembly from jackscrew. To install, reverse removal procedures. *CAUTION - See "Actuator Roll Pin Installation Caution" above.*

CONTINUED ON NEXT PAGE

G.M. SIX-WAY SEAT CONTROL (C ntinued)

Adjuster Actuat r Spinning Nut Solenoids: Remove seat assembly (less seat adjusters and actuator assembly). Disconnect solenoid feed wire at connector. Remove solenoid cover carefully bending down tabs at bottom of cap and pulling upward. Remove solenoid plunger, plunger shunt, and shunt spring. Remove nut and washer securing solenoid ground wire to spinning nut frame. Carefully push solenoid forward or rearward and remove from retainer on spinning nut assembly. To install, reverse removal procedure. Solenoid plunger should move up or down freely; if necessary, move solenoid slightly forward or rearward to allow free movement of plunger. Before installing seat assembly, hook up feed wire with control harness and check operation of solenoid.

C ntr l Switch: Remove switch and escutcheon assembly from seat side panel. Depress clips at sides of switch with pointed tool inserted through holes, remove clips. On button type switch, remove switch from switch escutcheon. Cn bartype switch, remove switch, insulating cover retaining plate, two (2) anti-rattle springs and actuating bar from switch escutcheon. To install, reverse removal procedures. Cn bar type switch, make sure springs are properly positioned when installing the actuating bar.

LUBRICATION: Jackscr w – Thoroughly wipe off old lubrication. Apply Lubriplate No. 630 AA-W (winter grade). Operate adjuster to all positions and to extreme limit. Wipe off excess lubricant.

TROUBLE SHOOTING: S at Adjuster Motor Does Not Op rate – Short or open circuit between power source and motor; defective motor.

Seat Adjuster M tor Op rates, But Seat Adjusters Are N t Actuat d: Short or open circuit between switch and affected solenoid; defective solenoid.

Seat Adjust r M t r Op rat s, Rear Edge of Seat Cannot b Adjust d (Oth r Op rations Normal): Short or open circuit between switch and affected solenoid.

Seat Adjust r M t r Op rat s, Front & Rear Edge of Seat M v Up & R arward, But Will Not Move Seat Down & F rward: Short or open circuit between one of motor field wires and seat control switch; defective field coil in motor.

Seat Adjust r M t r Op rat s, Front & Rear Edge of Seat M v Down & F rward, But Will Not Move Seat Up & R arward: Short or open circuit between one of motor field wires and seat control switch; defective field coil in motor.

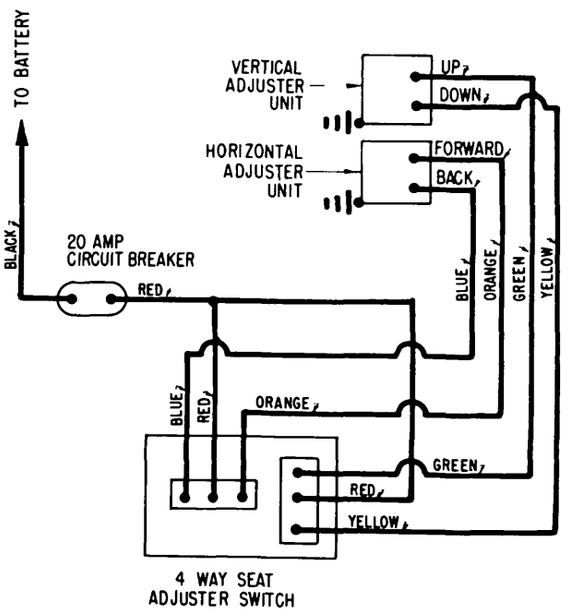
AUTO-LITE ELECTRIC

Chrysler & Imperial (1956)
DeSoto, Dodge, Plymouth (1956)
Packard (1956)



DESCRIPTION: Seat adjusting mechanism is electrically operated, using reversible type motors. Motors operate worm shaft and sleeve through a worm head. Fore-aft and up-down movements are controlled individually, each having a separate but similar system, including a switch, motor, and regulator.

REMOVAL & INSTALLATION: Proceed as follows:

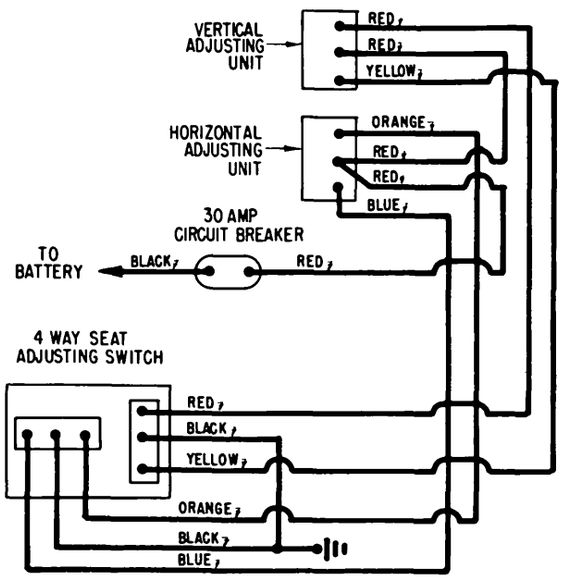
Front Seat Assembly: Remove front cushion, disconnect battery. Disconnect seat adjuster control wires. Remove floor pan-to-seat guide attaching capscrews, remove guide from seat assembly. To install, reverse removal procedure.

Left Seat Guide & Vertical Power Unit: Remove front seat cushion. Disconnect battery and seat adjuster control wires to motor (*CAUTION* - To facilitate removal of vertical bar clevis pin, the front seat assembly should be elevated to highest position of travel and blocked before attempting removal of pin). Remove vertical bar pins attaching vertical power unit shaft and sleeve to front seat frame. Remove power link pin, floor pan-to-seat guide attaching capscrews and guide from seat assembly. To reinstall, adjust power unit to the two pins (adjustment made by turning unit coupling). Install rear of unit on rear pin and secure. Raise seat manually, install front end of unit into torque bar, attach clevis pin, and secure(*NOTE*–Length

CONTINUED ON NEXT PAGE

CHRYSLER & DESOTO 4-WAY SEAT CONTROL

AUTO-LITE ELECTRIC (C nt.)



of unit may be varied by turning coupling manually) Reinstall wires and reconnect battery Check operation of seat and replace seat cushion

H rizontal Power Unit & Shaft Assembly: Remove front seat cushion, disconnect battery and seat adjuster wires to motor. Remove power unit retaining snap rings and the horizontal power unit assembly *NOTE* - To facilitate removal of horizontal bar clevis pins, lower seat to lowest point before attempting to remove unit To reinstall, reverse removal procedure.

S at Tracks: Remove jack assemblies and the two rear and front retaining bolts that hold seat track to floor pan Slide seat track outward, causing it to disengage from two horizontal torque rods When removing right track, it will be necessary to disengage one connecting link from a pivot pin. To reinstall, engage torque rods in track assembly Install rear seat track retaining screws, but do not tighten Install jacks, operate seat in all directions to properly align seat tracks and torque rods. Tighten front seat track retaining screws, raise seat, and tighten rear seat track retaining screws

NOTE–Do not lubricate vertical power unit shaft ball and nut.

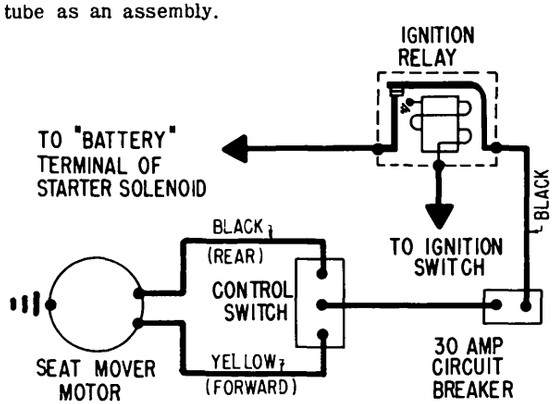
SERVICE PART NOS· Motor - (Chrysler, DeSoto, Dodge, Plymouth) Auto-Lite No EPK-4001 *NOTE* - Horizontal & Vertical Motors are the same

DODGE 4-WAY SEAT CONTROL

STUDEBAKER SEAT CONTROL

Studebaker (1956)

DESCRIPTION: Seat adjusting mechanism is electrically operated, using reversible type motor which turns screw jack. Control of system is through a switch and relay. Seat adjuster provides fore-and-aft movement.



REMOVAL : Proceed as follows:

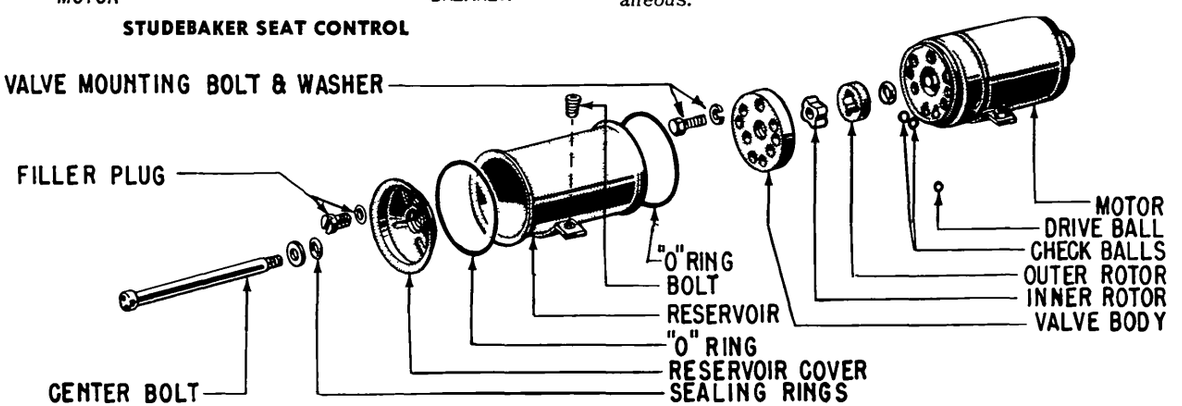
Torque Tube Assembly: Remove seat cushion. Remove cotter pins and take out clevis pins connecting torque tube arms with torque tube links. Remove torque tube clamps and remove torque tube.

Motor: Remove seat cushion and two motor operating wires at switch Remove motor-to-adjuster bracket nuts and ground wire. Remove motor by sliding it out of adjuster bracket and flexible connector.

Seat Track: Remove seat cushion. Take out shoulder bolt fastening torque tube link to seat track support. Remove capscrews and washers holding seat track to floor pan. Support seat frame on wooden blocks, take out two seat frame-to-seat track screws, remove track.

Seat Frame: Remove seat cushion. Remove cotter pins and take out clevis pins connecting torque tube arms to torque tube links. Take out frame-to-seat track capscrews and flat washers, remove seat frame and torque tube as an assembly.

STUDEBAKER SEAT CONTROL



SERVICE PARTS: Mot r–Studebaker No. 310448.
Relay (Motor)–Studebaker No. 310217.
Relay (Ignition Switch)–Studebaker No. 310216.

POWER OPERATED TOP MOTOR & PUMP (ROTOR TYPE)

DESCRIPTION: Motor - 12 Volt, direct current, reversible type. Serviced by replacement

Pump - Rotor type. Pump housing is attached to motor frame by two through bolts from end cover The outer rotor fits into the pump housing and the inner rotor revolves, within the outer rotor. The pump is connected to the motor armature shaft by means of a drive ball located in a hole in end of armature shaft. The drive ball fits into a groove in the inner rotor. The valve body is mounted to the pump body by five mounting bolts. The reservoir is attached to the valve body by a center bolt which engages threads in center of valve body. Reservoir is sealed at each end with a neoprene "O" ring.

OPERATION: Hydraulic pressure is created by the rotation of the inner rotor gears, and is exhausted through one of two ports in the pump housing. Since motor is reversible, either port may be on the vacuum or pressure side of the pump, depending on direction of pump rotation When pump rotors turn, hydraulic pressure is created through one side of the pump while the other side of the pump becomes the vacuum side. Two small check valves are seated in the valve housing and are held in place by a fulcrum and lever-type retainer. The vacuum created on the inlet side of the pump pulls the ball against its seat and thus cuts off the reservoir from the inlet side of the pump. This seating action of the ball at the inlet side permits the ball on the other end of the fulcrum to raise off its seat in the outlet side of the pump. At the beginning of pump rotation, fluid from the reservoir can pass into the pressure side of the pump but is prevented from entering the vacuum side. During rotation, excess fluid can pass from pressure side back to the reservoir. When pump rotation is reversed, pressure and vacuum sides are reversed, and the check balls and fulcrum act to make the pressure reversal almost instantaneous.

TYPICAL P WER TOP MOTOR & PUMP (ROTOR TYPE)

G.M. HYDRO-LECTRIC

Buick (1956)
Cadillac (1956)
Chevr l t (1956)
Oldsmobile (1956)
P ntiac (1956)

DESCRIPTION: Similar in design and operation to models previously used. System is a sealed unit and is not vented to the atmosphere, making it unnecessary to replace hydraulic fluid periodically. System is "self-air bleeding". Should air become trapped in lines due to replacement of hydraulic units, a few operational cycles of the top will expel trapped air into reservoir.

CHECKING FLUID LEVEL: With top in raised position, disconnect positive or negative battery cable. Remove pump and motor shield, in rear compartment, and place absorbent material below reservoir. Remove filler plug from reservoir. On motor and pump assemblies installed horizontally, fluid should be at lower edge of filler cap hole. On motor and pump assemblies mounted vertically, fluid level should be 2" from top of reservoir. If fluid low, add hydraulic fluid Delco No. 11 (G.M. Hydraulic Brake Fluid Super No. 11).

REPLACING FLUID (Aft r Repairs): Cylinders and hydraulic system contains more fluid than one filling of reservoir will supply. Check reservoir frequently during refilling of system. Air in system will automatically bleed out with a few operations of top.

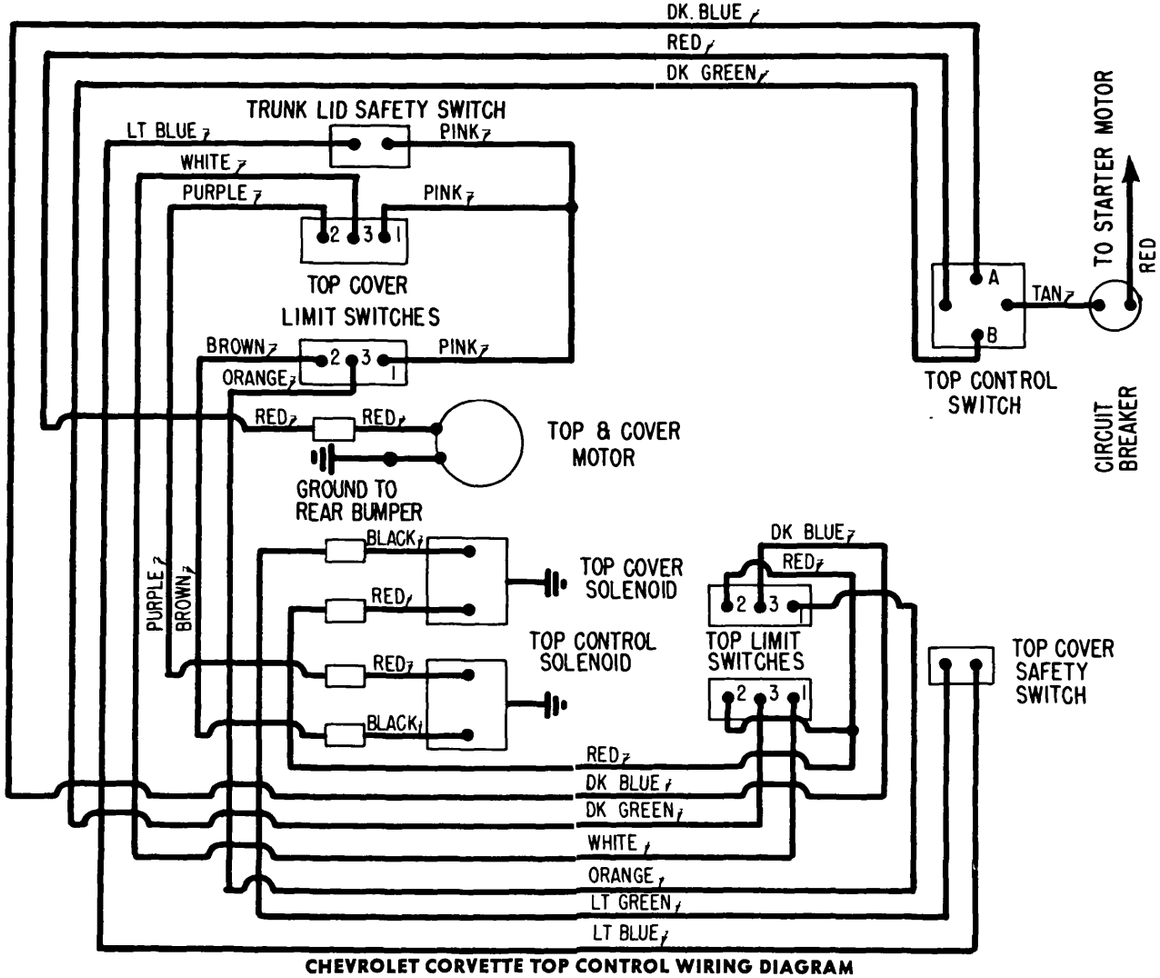
CHECKING HYDRAULIC PRESSURES: Remove motor and pump assembly. Install plug in one port and pressure gauge in port to be checked. Actuate motor with an applied terminal voltage of 9.5-11.0 volts. Gauge should show a pressure between 240 and 280 PSI. Check pressure in other port. *NOTE*–A difference in pressure readings may exist between pressure port for top of cylinders and for bottom of cylinders. This condition is acceptable if both readings are within the limits of 240-280 PSI. If pressure not within specified limits, unit is defective and should be repaired or replaced.

CHECKING OPERATION OF LIFT CYLINDERS: Remove rear seat cushion and folding top compartment side panel assembly. Operate folding top control switch and observe lift cylinders during up and down cycles for these conditions;

1) If movement of cylinder rods is not coordinated or sluggish when motor is actuated, check hydraulic hoses from the motor and pump to cylinders for kinks.
2) If one cylinder rod moves slower than other, cylinder with slow moving rod is defective and should be replaced.
3) If both cylinder rods move slowly, or do not move at all, check pressure of pump. See "Checking Hydraulic Pressures" above.

MOTOR & PUMP ASSEMBLY: *See "Power Operated Top Motor & Fump (Rotor Type)".*

SERVICE PARTS: **Motor** - (Chevrolet & Pontiac) No. 4683708, ('3uick, Cadillac, Oldsmobile) No. 4683710. *NOTE* - Motor replaced as an assembly only.



CHEVROLET CORVETTE

Chevrolet Corvette (1956)

DESCRIPTION: Power operated folding top and folding compartment cover. A safety switch in the rear compartment breaks the folding top circuit and prevents top mechanism from operating while rear compartment lid is open. This prevents damage to finish of either rear compartment or folding top compartment lids. A second safety switch, in the top compartment, prevents operation of the top compartment cover or folding top operating mechanism unless cover is unlatched. Hydraulic motor will run but a by-pass prevents pressure build-up in the system. Raising and lowering operations require about 20 seconds each.

OPERATION: **Raising The Top** - Unsnap top compartment end straps at outer edge of each seat back. Push button located on seat separator panel. This unlatches the folding top compartment and at the same time completes the folding top electrical circuit. *(CAUTION* - Do not attempt to operate top without first unlatching the top compartment cover). **Push** folding top control and hold it in until the folding top compartment-cover opens, the top lifts out, and the cover closes. Push top compartment cover down until it latches. Unhook snap fasteners and allow rear bow to drop. Latch rear bow to the body. Latch header to windshield. Snap both top compartment end straps.

Lowering The Top: Unlatch header and rear bow. Double check to see that all latches are completely free and not caught in any way. Unsnap both top compartment end straps. Hook rear bow with straps provided. Push button to unlatch top compartment cover. **Pull** the folding top control and hold until top compartment cover opens, the top folds into the compartment, and the cover closes. Push cover to close on latch. Snap top compartment end straps.

CHEVROLET CORVETTE TOP CONTROL WIRING DIAGRAM

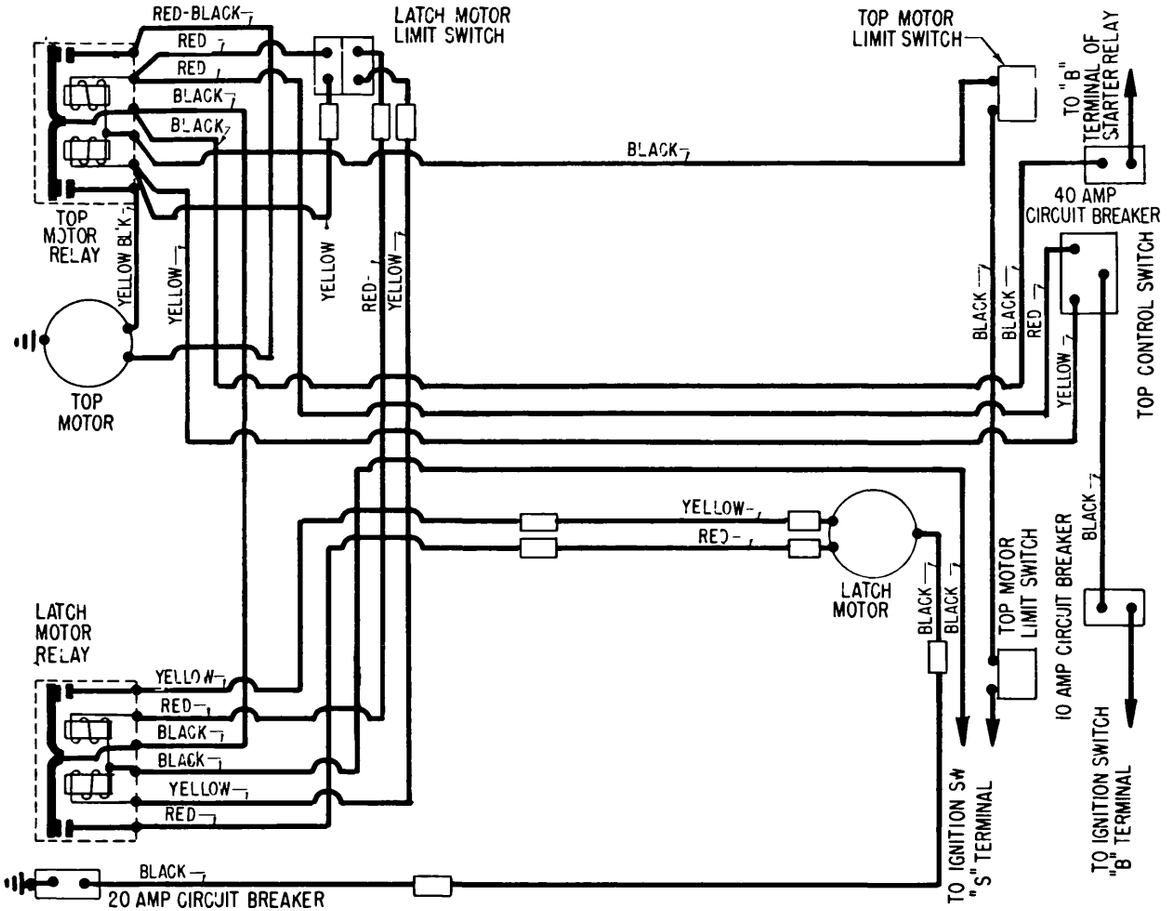
Lincoln (1956)

► *SLOW RAISING & LOWERING OF TOP CORRECTION:* If raising or lowering of top takes more than 14 seconds, it may be due to collapse of hoses under rear seat. Hoses are secured by two clamps and when tightened can collapse hoses and restrict flow of fluid to and from right hydraulic lift cylinder. To correct, insert flat washer, ¼" inside diameter and 3/16" thick, between clamp and floor pan. When reinstalling clamps make sure there is sufficient sealer around holes in floor pan.

DESCRIPTION: Power Top Control – Hydraulic-electric type. System consists of an electric motor, hydraulic pump, and two hydraulic cylinders. A valve and port assembly directs flow of fluid in the system. The elec-motor is controlled through a circuit breaker, limit switches, control switch, and relay.

Top Locking Mechanism – Consists of an electric motor and two transmission assemblies which are connected to and driven by the motor through two casing and cable assemblies. These two components are located in the No. 1 top bow and engage and lock into two lock nut housing assemblies which are attached to the inside of the windshield header bar. Locking mechanism is controlled automatically by a limit switch mounted in the left rear top linkage stack compartment.

ADJUSTMENTS: The following adjustments should only be made after top stack adjustment is correct. *Do not overheat motor while making adjustments.*



Locking Mechanism Limit Switch: Adjust limit switch, located in left rear quarter, so locking motor will start just before the No. 1 bow contacts the windshield header bar. Make sure it will operate the motor in the up direction, too.

Locking Mechanism Nut Housing: Nut housing can be adjusted up and down and slightly from side to side with respect to windshield header bar. In addition, it can be given a certain amount of tilt to rear by installing caster shims between windshield header bar and locknut boss on the nut housing. Locknuts should free-wheel or ratchet.

Locking Mechanism Transmission Assembly: Transmission assembly can be moved fore and aft with respect to No. 1 top bow because of floating tapping plate installation and slotted holes. *See Note below.*

Locking Mechanism Locking Screw: Can be adjusted for length by first loosening Allen setscrew in hex head and then turning screw transmission shaft until desired length is obtained. *CAUTION* - Do not attempt any trial locking of top unless Allen setscrew is properly tightened.

LINCOLN POWER TOP & LATCH CONTROL

LINCOLN POWER TOP & LATCH CONTROL WIRING DIAGRAM

► *LOCKING MECHANISM TRANSMISSION ASSEMBLY NOTE:* A new "Floating" type transmission assembly, transmission cover plates, and folding top No. 1 bow are being used on some cars. These parts have been designed so that the transmission assemblies will be able to "float" in the No. 1 bow and center themselves in the locknut assemblies. This will assist to avoid misalignment and binding of lockscrews in locknut assemblies. *CAUTION* - During adjustments of this assembly it is suggested that motor cover assembly be off to permit checking motor temperature. Do not permit motor to become too warm to touch. Allow it to cool.

MOTOR & PUMP ASSEMBLY (POWER TOP): *See "Power Operated Top Motor & Pump (Rotor Type)".*

CHECKING FLUID LEVEL: *See "Auto-Lite Electric Top Control".*

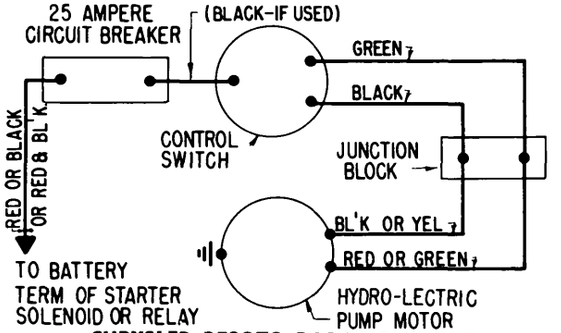
SERVICE PARTS: Power Top Mtr – Lincoln No. B6A-15667-A.
Locking Mechanism Motor – Lincoln No. B6A-7653508-A.

AUTO-LITE POWER TOP CONTROL

Chrysler, DeSoto, Dodge (1956)
Ford, Mercury (1956)
Packard (1956)
Plymouth (1956)

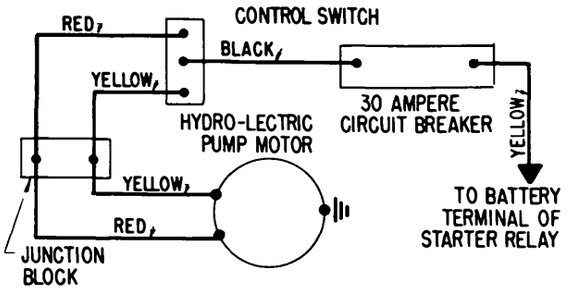
DESCRIPTION: Hydraulic-electric type. System consists of an electric motor, hydraulic pump and two hydraulic cylinders. A valve and port assembly directs flow of fluid in the system. The electric motor is controlled through a circuit breaker, switch, and on some cars, a relay.

► *FORD & MERCURY SLOW RAISING OR LOWERING OF TOP CORRECTION:* If raising or lowering of top takes more than 14 seconds, it may be due to collapse of hoses under rear seat. Hoses are secured by two clamps and when tightened can collapse hoses and restrict flow of fluid to and from right hydraulic lift cylinder. To correct, insert flat washer, 1/4" inside diameter and 3/16" thick, between clamp and floor pan. When reinstalling clamps make sure there is sufficient sealer around holes in floor pan.



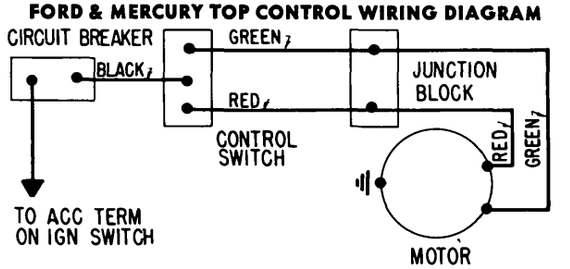
MOTOR & PUMP ASSEMBLY: *See "Power Operated Top Motor & Pump (Rotor Type)".*

CHECKING FLUID LEVEL: Remove rear seat cushion, then proceed as follows.



Ford, Lincoln, Mercury: Loosen filler plug in end of reservoir. Operate top three times to remove all air from system. With top in "UP" position, remove filler plug and check oil level. If hydraulic fluid does not run from filler hole, add enough hydraulic brake fluid to raise level to edge of filler plug hole.

Others: Check fluid level in reservoir. If low, check for a leak due to a broken line or loose connection. Fill reservoir until fluid runs out of filler hole. Use hydraulic brake fluid such as MoPar Super Brake Fluid After filling reservoir, raise and lower top several times to force out air in system. Always check fluid level when top is "DOWN".



SERVICE PARTS: Motor - (Chrysler, DeSoto, Dodge Plymouth) Auto-Lite No. EMJ-4104, (Ford, Mercury) Ford or Mercury No. B6A-15667-A. *NOTE* - Motor replaced as an assembly only.

CHRYSLER, DESOTO, DODGE, PLYMOUTH TOP CONTROL WIRING DIAGRAM

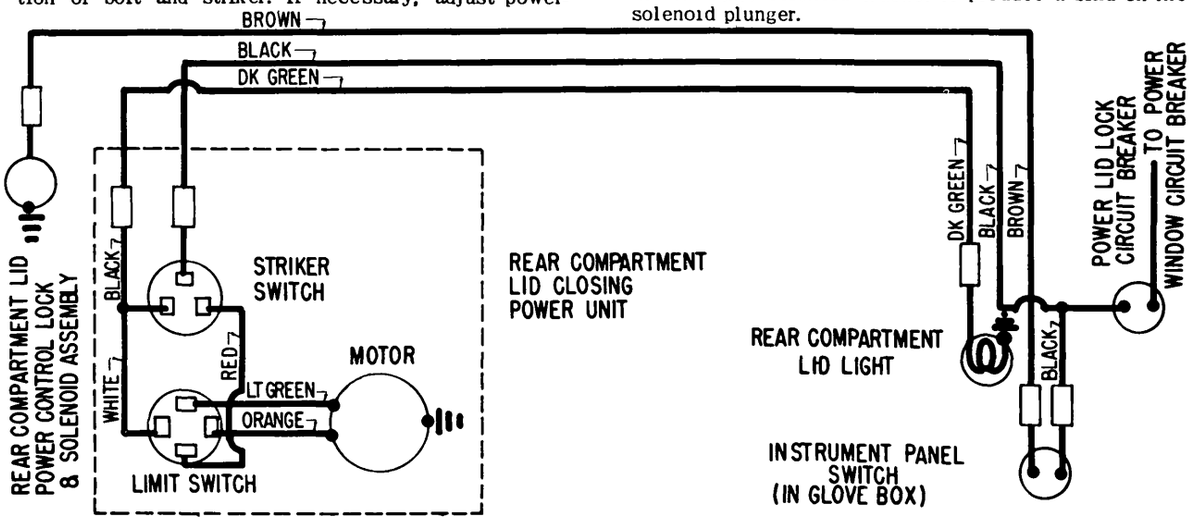
FORD & MERCURY TOP CONTROL WIRING DIAGRAM

PACKARD TOP CONTROL WIRING DIAGRAM

CADILLAC REAR COMPARTMENT LID LOCK

Cadillac (1956). Optional.

DESCRIPTION: Trunk Lid Lock Unit consists of a power-operated closing unit and a solenoid-operated lock assembly. Closing unit fastens to inside of rear end panel at lid lock position. Its 12-Volt motor operates a jackscrew mechanism which retracts and extends trunk lid striker approximately 1". This action creates a pressurized seal between lowered lid and trunk opening. The solenoid operated lock assembly fastens to rear compartment lid at the normal lid lock position and operates like past model lid locks in that it can be unlocked from the outside with a key. In addition, a remote unlocking solenoid permits unlocking the lid from inside body by means of a switch located in glove compartment.



OPERATION: Locking - When trunk lid is lowered manually to a position approximately 1" above closed position, lid lock bolt engages the lock striker and depresses the striker switch, actuating closing unit motor, causing jackscrew to retract striker, pulling lid shut until proper closing pressure seal is reached. At this pressure a spring-loaded limit switch breaks the circuit and stops motor. Lid remains locked until lock assembly is again actuated.

Unlocking - When trunk lid is unlocked by either key or switch, lock bolt is disengaged from the striker, releasing striker switch and completing circuit to reverse action of power closing motor. The motor raises the striker and lid upward approximately 1" to a counterbalanced position. From this position lid may be raised manually. A light on instrument panel signals when lid is unlocked.

REMOVAL & INSTALLATION: Remove four bolts and lockwashers securing power closing unit within trunk compartment, remove unit. *NOTE* - Mark position of tab flanges to insure accurate replacement of unit. To install, reverse removal procedures.

ADJUSTMENTS: Striker & Lock Bolt - Place modeling clay over striker and lower lid until lock bolt makes an impression in the clay. Observe relative lateral position of bolt and striker. If necessary, adjust power-closing unit horizontally by loosening the four bolts and lockwashers retaining power-closing unit within trunk compartment and sliding unit to right or left in slotted holes.

Solenoid - Solenoid-to-lock attaching screws are slotted to permit fore and aft adjustment of solenoid to insure free release of lock bolt. If adjusting solenoid, be sure not to rotate solenoid bracket to produce a bind on the solenoid plunger.

CADILLAC REAR COMPARTMENT LID LOCK C NTR L DIAGRAM

VACUUM WINDSHIELD WIPERS (CABLE OPERATED)

Buick (1956)
Cadillac (1956)
Chevrolet (1956)
Continental (1956)
Lincoln (1956)
Oldsmobile (1956)
Packard (1956)
Pontiac (1956)

►CHANGES, CAUTIONS, CORRECTIONS

►*CADILLAC BLADE OVERTRAVEL CORRECTION:* May be caused by mispositioning of equalizer spring assembly on serrated shaft of transmission pulley. Assembly should be installed so that surface of rubber guard over tang end of spring is 1/8-1/4" from the stop tab. If gap is incorrect, remove lock ring, remove and install spring assembly in specified position. This condition may occur on either or both transmission pulleys.

►*CADILLAC BLADE FAILURE TO RETURN TO PARK POSITION CORRECTION:* Condition is usually due to interference between coupler shaft and coupler retainer plate. To correct, remove coupler retainer plate and file contacting surfaces between plate and shaft.

►*CADILLAC BINDING OR NOISY OPERATION (Due To Bent Equalizer Spring Guard or Endplay Between Equalizing Spring Retainer & Serrated Pulley Shaft):* To correct, bend equalizer spring guard outward to provide clearance between it and the pulley stop tab, or upward to clear equalizer spring rubber guard. To eliminate the endplay, pack a ribbon of high melting point, fibrous grease such as wheel bearing or water pump grease around inside of equalizer spring. This condition was eliminated in production on cars beginning with engine No. 015829 by the installation of an inertia spring tension washer.

►*CADILLAC FAILURE OF WIPER MOTOR TO SHUT OFF:* If wiper blades continue to operate with wiper switch in "OFF" position or if they begin to operate when the ignition switch is turned "ON", Windshield Washer Pump, Part No. 1464887, must be replaced. This condition is caused by the vacuum by-passing through the hydrostatic valve.

DESCRIPTION: Drive is through auxiliary pulleys and cable to windshield wiper transmission at each side of windshield (Chevrolet uses two drums, and Lincoln uses a lever as auxiliary drives). Tensioners are located within each wiper transmission (Buick, Cadillac, Chevrolet, Oldsmobile & Pontiac), in auxiliary drive (Continental), in pulley brackets (Others).

CABLE ADJUSTMENT: Buick, Cadillac, Chevrolet, Oldsmobile & Pontiac (Except CAM-O-MATIC Equipped Cars) - Push in on end of transmission shaft. Spring-loaded pulleys will unlock and tension cables.

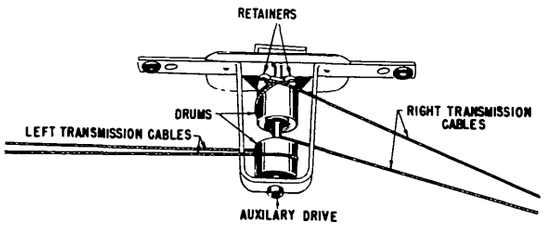
Cam-O-Matic Equipped Cars - Remove arm and blade assembly by raising upper section of wiper arm to disengage cam follower from cam. With wiper arm in raised position, carefully pull or pry arm from transmission shaft. Push in on end of transmission shaft. Spring-loaded pulleys will unlock and tension cables.

Continental: Loosen wing nut on auxiliary drive. Adjust cable tension. Tighten wing nut.

Lincoln: No adjustment except to see that tensioners are free to operate.

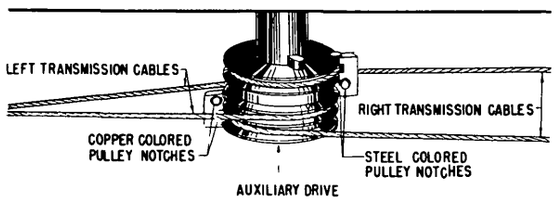
REMOVAL & INSTALLATION: Wiper Motor - Remove screws securing motor to auxiliary drive, detach control cable and vacuum hose from motor, remove motor. To install, reverse removal procedure.

Auxiliary Drive Assembly: Buick & Cadillac - Remove upper section of instrument panel. Remove arm and blade assemblies (Cam-O-Matic). (See ADJUSTMENT for Cam-O-Matic removal). Obtain slack in cables by pushing in on end of transmission shaft. With helper inside car to pull on cable to hold slack, release end of transmission shaft to lock cable in slack position. Observe attachment of transmission cables at auxiliary drive pulleys to assure proper reassembly, disconnect cables from auxiliary drive pulleys. Remove screws securing auxiliary drive, remove auxiliary drive assembly. To install, reverse removal procedure.



Chevrolet, Oldsmobile & Pontiac - Remove instrument panel compartment box. Obtain slack in cables by pushing in on end of transmission shaft. With helper inside car to pull on cable to hold slack, release end of transmission shaft to lock cable in slack position. Observe attachment of cables to auxiliary drive, then detach cables from pulleys or drums. Remove screws securing wiper motor, remove motor. Remove screws securing drive to dash, remove auxiliary drive. To install, reverse removal procedure.

Continental - Remove lower insulator panels and carpet. Remove two screws securing control tower to tunnel brackets. Remove glove box liner and screws from check straps. Remove screws securing glove box hinge to brace. Disconnect spring at firewall. Slide check arms from glove box door. Remove glove box. Remove screws securing control tower to firewall and screws on right hand side securing control tower to instrument panel brace. Remove screws securing speaker frame to lower control panel. Lower control tower using care not to kink bowden wires. Remove antenna lead, hot wires and two speaker leads, remove radio. Loosen wing nut on idler puller and retract tension on cables, disconnect cables. Remove capscrews securing auxiliary drive to firewall, remove auxiliary drive. To install, reverse removal procedure.



Lincoln - Remove screws securing auxiliary drive to cowl, remove auxiliary drive. To install, reverse removal procedure.

Wiper Transmissions: Buick & Cadillac - Remove wiper blade and arm assembly (see ADJUSTMENT for Cam-O-Matic removal). Remove upper section of instrument panel. Obtain slack in cables by pushing in on end of transmission shaft. With helper inside car to pull on cable to hold slack, release end of transmission shaft to lock cable in slack position. Observe attachment of transmission cables at auxiliary drive pulleys to assure proper installation, then disconnect cables from auxiliary drive pulleys. Remove transmission spanner nut, escutcheon, cam, and reveal molding clip. Remove transmission support bolts, rubber gasket and retainer nuts. Disconnect windshield washer hose, and carefully pull transmission down through shroud panel and remove from body. To install, reverse removal procedure. *NOTE* - Copper-colored cable ends must be installed to copper-colored pulley notches and steel-colored cable ends to steel-colored pulley notches.

Chevrolet, Oldsmobile & P ntiac - Remove wiper blade and arm assemblies. Remove instrument panel glove box. Obtain slack in cables by pushing in on end of transmission shaft. With helper inside car to pull on cable to hold slack, release end of transmission shaft to lock cable in slack position. Observe attachment of transmission cables to auxiliary drive, then disconnect cables from pulleys or drums. Remove escutcheon spanner nut. Lift esctucheon from body, disconnect washer hose and remove escutcheons. Remove transmission spacer spanner nut. On inside of body pull each transmission down through shroud panel, remove from body. To install, reverse removal procedure. *NOTE* - Right transmission cables are crossed.

CHEVROLET AUXILIARY DRIVE

AUXILIARY DRIVE (BUICK, CADILLAC, OLDSMOBILE, PONTIAC)

Continental (Right Hand) - Remove wiper arm, nut, and gasket. Remove cowl trim panel, glove box liner, defroster nozzle and windshield washer hose. Remove capscrew securing transmission to brace, remove transmission. Remove capscrew and special bolt securing spacer to cowl top, remove spacer. To install, reverse removal procedure.

Continental (Left Hand) - Remove three screws securing wiper switch plate to underside of instrument panel, and eight screws securing courtesy light switch plate to instrument panel. Remove wiper arm, nut and gasket. Remove washer hose. Remove capscrew securing transmission to brace, remove transmission. Remove capscrew and special bolt securing spacer to cowl top, remove spacer. To install, reverse removal procedure.

Lincoln - Remove wiper arm and blade. Remove nut, spacer and gasket that secure transmission to cowl top. On right side, remove defroster outlet. Remove glove

CONTINUED ON NEXT PAGE

VACUUM WINDSHIELD WIPERS (CABLE OPERATED) (C ntinu d)

compartment box. Pull cable tensioner toward center of car and lock in this position with drift pin through hole provided. Remove drive cable from auxiliary drive, remove transmission. To install, reverse removal procedure. When installing, be sure to rig cables properly on pulleys before connecting to auxiliary drive. Take drift pin out of cable tensioner and allow pulleys to take up slack.

Cable Tensioner (Lincoln): Remove defroster outlet from right side. Remove glove compartment box. Pull cable tensioner toward center of car, and lock in this position with a drift pin through hole provided. Remove drive cable from auxiliary drive. Remove two capscrews that secure tensioner to cowl panel, remove tensioner. To install, reverse removal procedure.

WINDSHIELD WIPERS (LINK & CRANK ARM)

Chevrol t, Truck Mod ls (1956)
Ford, Cars & Light Trucks (1956)
Hudson, All Models (1956)
Mercury (1956)
Nash, All Models (1956)
Rambl r (1956)
Studebaker, Champion (1956)
Thund rbird (1956)
Willys, All M dels (1956)

DESCRIPTION: Wiper consists of single motor unit connected to right and left hand wiper arm shafts by flat or round metal links. Motor control valve is either integral with motor or is a separate remote control depending on car application.

REMOVAL & INSTALLATION: Wiper Motor - (Except Rambler) Remove radio. On Hudson & Nash models, remove wiper motor access hole cover. Disconnect vacuum hose and control cable. Remove link retainers and disconnect links. Remove motor mounting screws and lower wiper motor assembly. To install, reverse removal procedure.

Rambler - Open heater control valve. Drain approximately two quarts of liquid from radiator to lower coolant level. Disconnect heater hoses and remove heater core. Remove rain baffle below motor. Remove link retainers. Disconnect control conduit and vacuum hose from motor. Remove motor mounting screws and lower wiper motor assembly. To install, reverse removal procedure.

Pivot Shaft: Remove wiper arm and blade. Remove link from pivot shaft. Remove nut, spacer and gaskets as required, remove pivot shaft. To install, reverse removal procedure. *NOTE* - On Hudson, Nash & Rambler models it will be necessary to remove cowl air intake for access to retaining nuts.

CHEVROLET & PONTIAC ELECTRIC

Chevrolet, Trucks & Pass. Cars (1956)
Pontiac (1956)

DESCRIPTION & OPERATION: Similar in design and operation to previous model. *See "Chevrolet Electric Windshield Wiper" in 1955 Annual Data or later Manual edition and note the following design changes:*

► *1956 DESIGN CHANGES:* On 1956 models, a wire spring and pawl replaces coil spring used to load drive assembly disc on 1955 models. 1956 drive assembly does not include ear used on 1955 models. Instead spring loaded pawl projects from periphery of disc. Switch assembly mounting screw sizes have been changed from No. 6-32 x ½" to No. 8-32 x 3/8", thereby limiting the amount of switch adjustment possible.

ADJUSTMENT: Three adjustments are required as follows:

Switch Adjustment: Remove switch housing cover. Move latch assembly switch arm against fiber cam until switch contacts snap to low speed position. Further lateral movement of latch switch arm should separate contacts Nos. 1 and 2 and hold contacts Nos. 3 and 4 closed, thus forming high speed circuit. If latch assembly switch arm travel is insufficient to perform above functions, move contacts into their low and high speed positions, loosen two switch mounting screws and shift switch assembly as required. When unit is stopped, breaker arm should contact fiber cam and move it sufficiently to snap switch contacts into their parked position. If motor does not stop when dash control is turned to "OFF" position, switch assembly mounting screws should be loosened again and switch shifted toward breaker arm. *(NOTE* - On later models using No. 8-32 x 3/8" switch mounting screws, amount switch assembly can be moved is very limited. If necessary, breaker arm may be bent toward fiber cam). Minimum clearance between arm and cam guide should be 1/32".

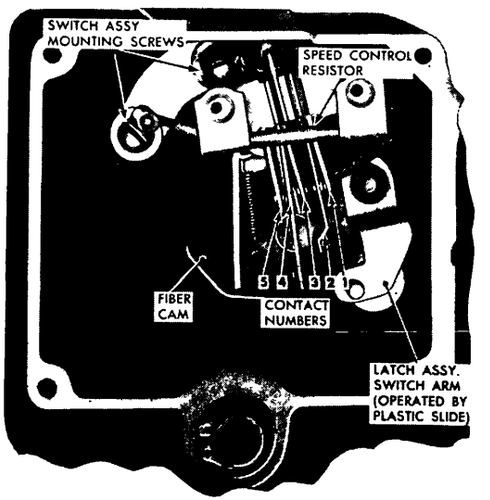
Armature Endplay Adjustment: Connect a DC ammeter in the circuit, start wiper, and note ampere draw. Tighten armature endplay adjusting screw located in end of cast motor housing until a rise in current draw is noted, then back off adjusting screw slowly until ampere draw returns to initial reading. Back off screw an additional 1/8 turn as a safety factor. To lock adjustment, either restake or tighten jam nut.

Drive Assembly Endplay Adjustment: Use endplay washers beneath snap ring on drive assembly shaft.

TROUBLE SHOOTING: *CAUTION - Disconnect unit from source of power before removing switch cover.*

Unit Will Not Turn On: No voltage at wiper unit; unit improperly grounded; defective soldering at switch terminals; defective motor; contacts 3 & 4 not making contact when unit turned on, or contacts dirty; circuit breaker contacts dirty, or defective circuit breaker.

Unit Will Not Shut Off: Failure of oscillating arm to trip contacts 3 & 4; poor fit between oscillating arm and oscillating shaft slot allowing excessive circular play of oscillating switch arm; jumper between contacts 2 & 4 shorted to ground.



Slow Sp ed Operation in Both Slow & Fast Positions: Switch breaker arm which is operated by external switch slide not opening contacts 1 & 2; short between switch cover and switch assembly; switch fiber cam not seated properly in slot and failing to open contacts 1 & 2.

Normal Fast Operation in Both Slow & Fast Speed P sitions: Speed control contacts 1 & 2 not making contact at low speed position (resistor is in circuit in both slow and fast positions of switch).

Excessive Speed in High Speed Positions, Slow Speed Satisfactory: Switch assembly resistor open.

Excessive Speed in Both Low & High Speed Positions: Defective soldering of black shunt field lead to switch assembly; open shunt field.

REMOVAL & INSTALLATION: Motor - Loosen screw securing Bowden wire to motor and remove cable. Disconnect feed wire from under dash panel. Remove mounting screws. *NOTE* - Ground wire is mounted under one of auxiliary drive mounting screws. To install, reverse removal procedure.

CHEVROLET & PONTIAC ELECTRIC WINDSHIELD WIPER CONTROL

► *INSTALLATION CAUTION:* Shims between motor unit and dash panel hold drive unit in proper alignment. Incorrect number of shims, or no shims at all, cause bind in drive resulting in sluggish operation or complete stoppage. Note number of shims before removing motor.

Auxiliary Drive & Transmission Removal: *See "Vacuum Windshield Wipers (Cable Operated)".*

OVERHAUL: Proceed as follows:

Switch: Removal & Disassembly - Remove switch cover *(CAUTION* - Disconnect unit from source of power before removing switch cover). Remove switch assembly mounting screws and lift out switch to extent of slack in connecting wires. Complete removal of switch assembly by placing a hot soldering iron against three lead connections to switch. Code connection points to insure proper re-installation. Remove switch breaker arm from end of oscillating shaft by removing plastic retainer. *CAUTION* - Do not remove latch assembly switch arm.

CONTINUED ON NEXT PAGE

CHEVROLET & PONTIAC ELECTRIC (Continued)

Cleaning & Inspection - Check switch contacts for foreign material or deformation. Clean contacts with cloth dampened with carbon tetrachloride or remove small imperfections with emery paper. Replace switch, if contacts broken. Check for foreign matter bridging insulators at base of switch. Should any insulator be broken or oil soaked, replace by removing the two screws holding contacts and insulators and replacing insulators with like thicknesses of tag board or other non-conducting gasket material. Check to see that breaker arm fiber contact surface is in good condition.

Reassembly & Installation - *(NOTE* - If work is to be done on oscillating and drive section, delay reassembly of switch components until that work is completed). To reinstall and reassemble, reverse removal procedure. Solder green wire to terminal closest to mounting bracket, red wire to center terminal, and black wire to terminal closest to resistor side of switch.

Oscillation & Drive Assembly: Removal & Disassembly - Perform all operations given under "Removal & Disassembly of Switch" except that it is not necessary to unsolder leads. Remove snap ring and any washers from drive assembly shaft. Remove screws and lockwashers securing oscillating and drive section cover. *(CAUTION* - Check to see that latch assembly is not in park position). Carefully tap both the oscillating shaft on which breaker arm (previously removed) was attached and the drive assembly shaft out of housing from switch compartment side with soft drift. To separate oscillating mechanism from connecting rod, remove "E" type retaining ring from drive pin and lift out oscillating mechanism. To complete disassembly of oscillating and drive section, remove snap ring and separate remainder of parts. *NOTE* - Further disassembly of cover and linkage should not be attempted since these parts are furnished only as assemblies for service. Do not attempt to remove latch assembly toggle or arm. If necessary, latch spring can be replaced with toggle installed.

Cleaning & Inspection - Clean all parts except nylon gear with cleaning solvent and dry with air. Check all parts for deformations and repair or replace as necessary. Check nylon gear for worn or broken teeth. Clean cover and connecting rod linkage of all old lubricant and check for bent parts. Replace if defective.

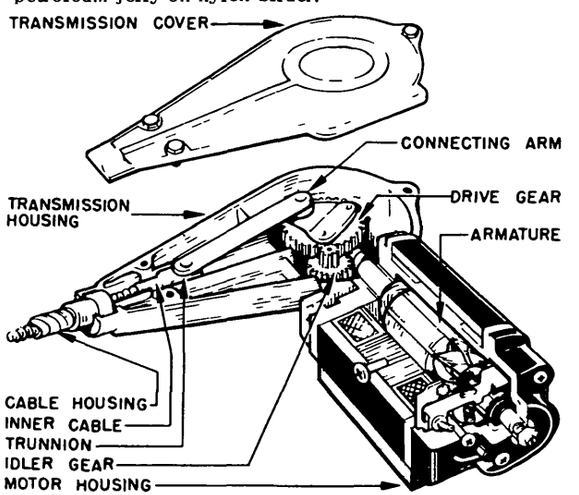
Reassembly & Installation - Connect spring to drive disc as follows

1955 Models - Insert inner tang of coil spring into slot in hub of drive disc and force spring flush with disc. Wrap spring around hub approximately ½ turn and hook behind pin on disc.

1956 Models - Position pawl on pin in drive disc, then place wire spring on pawl and catch hooked end under offset end of pawl. Straight leg of spring should then be forced against side of disc center hub.

Install drive disc and spring on nylon gear. Place cam and drive pin and yoke on disc. Be sure drive pin is cradled in slot on yoke.

1955 Models - Insert cushion in yoke before assembling above parts.



To complete assembly of oscillation components, place endplay washers and retaining washer on lug and secure with snap ring. Measure total endplay within unit with a feeler gauge and add or remove washers until total endplay is .008" or less. Lubricate between yoke, cam and drive pin, disc and at all pivot points on cover linkage with light oil. Then place a light grease coating on armature shaft, nylon gear teeth, and on linkage pivot points previously oiled. DO NOT GREASE TOGGLE OR ARM Insert drive pin through connecting rod and secure with "E" type retainer. Check to see that toggle is **not** in parked position, then insert oscillating shaft and gear shaft through bores in housing. Tap as required to fully seat shafts. Secure cover with screws and lockwashers. Install breaker arm in slot of oscillating shaft and secure with plastic retainer. Re-install switch components as described under "Switch Reassembly & Installation". Place endplay washers as required on end of gear shaft until total endplay is approximately .010", then complete installation by installing snap ring.

Motor: *(NOTE* - For Removal & Installation see above).

Disassembly - Remove two tie bolts securing case to housing. Remove endplay adjusting screw and locknut. Strike steel case lightly with mallet to partially loosen it from motor field and wiper housing. Insert a tool through the armature adjusting screw opening and push against the end of the armature to back off the case. Without breaking electrical connections, separate case from the armature *(CAUTION* - Do not lose thrust ball from commutator end of armature). Once armature is removed, insert brush retainer spring No. 5096576 between ends of brushes to prevent possibility of pulling leads out of brushes. If necessary, remove felt washer and thrust disc from motor disc. Armature may be taken out of field. Should it be necessary to free case assembly from field, unsolder field leads attached to brush holders

Cleaning & Inspection - Inspect field and armature for damage due to overheating. Check to see that brush leads are firmly attached both to brushes and their connections at brush holders. Check brushes for wear. If brushes are worn to within 3/16" of brush lead, or pigtail, they should be replaced. Check circuit breaker contacts, file lightly to remove irregularities. Inspect leads from brush and circuit breaker plate for worn insulation or breaks. Be sure that green lead is held to base insulator by clip to prevent lead chaffing on armature. To replace brush, remove retainers installed during disassembly and remove brush springs. Place hot soldering iron against brush lead connection on brush holders, remove old brushes, install new brushes. Check connections. To reinstall brushes in holders, compress spring within holder and hold fully compressed with a thin instrument inserted through slot in brush holder. Push brush into holder with lead upward to project through slot in holder, hold brush tightly, and remove instrument retaining spring. Hold brush installed, install other brush, then install spring retainer, Part No. 5096576.

Reassembly - To reassemble, reverse removal procedure. Use a 6" to 8" length of string around brush retainer to pull it out after armature commutator is inserted. Use a high melting point grease to stick thrust ball in commutator end of armature. Use light oil on felt washer, petroleum jelly on nylon slider.

METROPOLITAN WINDSHIELD WIPER

METROPOLITAN WINDSHIELD WIPER

Metropolitan (1955-56)

DESCRIPTION: Consists of an electric motor and transmission assembly, armor protected cable with drive shaft and housing assemblies, and control switch assembly. Motor and transmission assembly is mounted behind instrument panel on right wheelhouse panel and operates right and left wiper arm drive shafts by reciprocal action of a serrated cable within the armored cable housing.

REMOVAL & INSTALLATION: ***NOTE—Motor & Transmission Assembly and Wiper and Drive Shaft Assembly can be removed as a unit or separately, as follows:***

Motor & Transmission Assembly—Remove transmission cover, and from inside wheel housing, remove one nut securing assembly to wheelhouse panel, and from under the hood, remove the other nut The nut located inside the wheelhousing is on the top ledge of the wheelhouse panel under the fender, and is not readily visible. Disconnect wire at motor and remove the unit after disconnecting Wiper Drive Shaft Assembly from transmission connecting arm.

Wiper Cable & Drive Shaft Assembly—Remove glove box and the two defroster nozzles. Remove windshield wiper arms, friction nuts and rubber grommets from wiper shafts. From under the instrument panel, remove the screws attaching each drive housing to body and remove housing, and drive shaft & cable assembly.

Installation: Reverse removal procedure and position wiper arms on shafts so that both arms have equal travel.

Motor Specifications

Current Draw—2.0-3.25 amperes①.
Current Draw—7.5-8.5 amperes②.
Field Coil Resistance—8.4-9.0 ohms.
①—With motor cold and driving both blades on a wet windshield.
②—With motor stalled (cold motor).

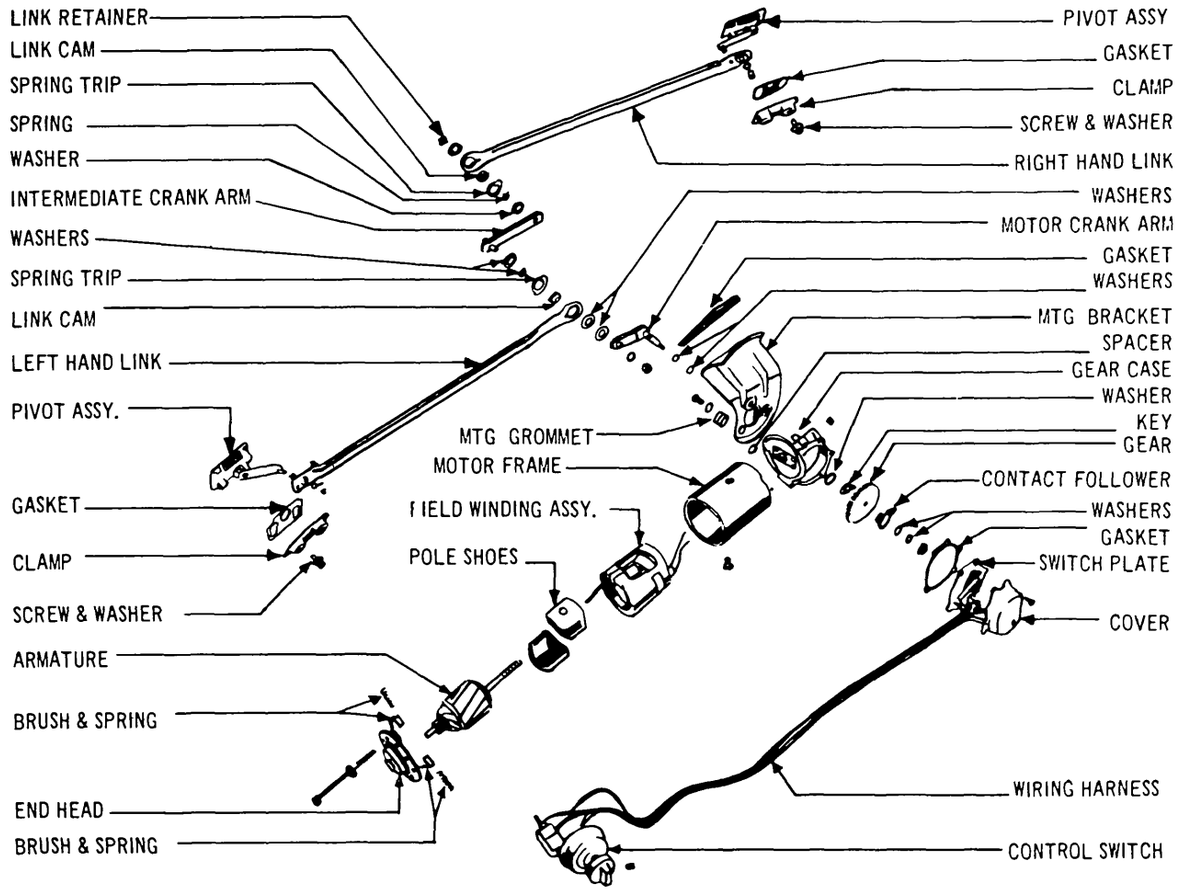
DESCRIPTION: Similar in design and operation to previous models.

REMOVAL, OVERHAUL & INSTALLATION: *See "Auto-Lite Electric" Windshield Wipers in 1955 Annual Data or later Manual edition. Note the following:*



► *WIPER MOTOR REMOVAL CAUTION (Variable Speed Type):* Wiper should be operated and shut off by disconnecting it at circuit breaker, or by turning off ignition key. Damage to motor switch and spring parking cam, upon removal of switch cover, will result if cranks are in parked position.

Wiper Links (Chrysler, DeSoto, Dodge, Plymouth): Springs and spring releases are **not** interchangeable.

Studebaker: Removal - Remove radio. Disconnect wiper motor wires from switch and circuit breaker. Swing cover to one side and remove main link nut, remove main link. Remove nuts and screws that hold motor to cowl panel. Remove nut, shakeproof washer, and screw that fastens motor to cowl panel flange, remove motor. Remove clip from main link pin, remove right connecting link from pin. Remove wiper arms. Unscrew driver retaining nuts on outside of cowl and remove spacers. Slip drivers (transmission) down through cowl panel, remove drivers and connecting link assemblies from car. *NOTE* - Left connecting link cannot be removed from main link

Disassembly - Remove motor through bolts and slip end plate off. The armature may be removed by pulling straight out. Unsolder brush leads and remove brushes and springs. Unscrew retaining screws on parking switch cover. Unsolder wires from parking switch, if it is necessary to replace switch. On Auto-Lite wiper driven gear retaining nut may be removed and the gear and output shaft taken out. Do not disassemble shaft and gear on the American-Bosch wiper as they are pressed together. Armature and output shaft bushings are not serviced.

AUTO-LITE ELECTRIC

AUTO-LITE ELECTRIC WINDSHIELD WIPER

Reassembly - Reverse disassembly procedure. Apply Lubriplate grease to gears.

Installation - To install, reverse removal procedure. To be sure main link will be positioned correctly on main shaft, start motor and then turn switch off. When motor stops it will be in parked position. Place main link on drive shaft so that lugs fit in drive slots. End of left connecting link must be to left of center of main link and pin must be to right of center of main link

Adjustment - Parking position is adjustable by means of lever on front of wiper drive. It may be necessary to allow wiper to operate a few minutes in order to get it warm enough to operate properly. If blades do not park properly, move lever (Auto-Lite) or turn hex head (American-Bosch) as required.

Adjustment (Chrysler, DeSoto, Dodge, Plymouth): Adjust wiper parking position by moving cam adjustment lever which sticks out of switch cover.

CONTINUED FROM PRECEDING PAGE

REAR MAIN BEARING OIL SEAL: Wiper seal installed in rear groove in bearing cap and block (oil slinger operates in front groove).

Oil Seal Installation – With crankshaft out of engine (see Crankshaft Removal). and bearing cap off, install length of new packing in groove in block. Use Tool J-6349 and drive seal into place. With tool in place, cut off each end of packing 1 64" above bearing edge. Repeat operation in bearing cap. Use arbor press or vise to press packing into place.

ENGINE BALANCING

ENGINE BALANCE CHECK & UNBALANCE CORRECTION: 1) – Connect a tachometer to engine and run engine at progressively higher speeds (with transmission in neutral). Note degree of vibration at various speeds.

2) – If greatest vibration is noted at approximately 2800 RPM, either the torus cover, flywheel, or flex plate may be out of balance. To correct, add a washer under one of the four flex plate-to-flywheel attaching nuts. Recheck for vibration. If the addition of the washer increases vibration, remove washer and place it under one of the other three attaching nuts until the best over-all balance is obtained. In order to perfect the balance, it may be necessary to add additional washers under other flywheel-to-torus cover attaching nuts in the area of the first washer.

3) – If greatest vibration is noticed at 3500 RPM, the flywheel or flex plate may have excessive lateral runout. Check runout as follows: Remove transmission and inspect flywheel for weld spots which may hold flex plate away from the flywheel.

4) – Mount a dial indicator on rear of engine. Rotate flex plate to check each leg for runout on the surface that contacts the flywheel. The total runout at this point should not exceed .010". If the runout is in excess of .010", use the flex plate leg which is the most rearward as a standard. Then bend back the legs that are too far forward until they are within .005" of standard leg. *NOTE* – Be sure to bend the complete leg.

5) – Install transmission. Tighten flex plate-to-wheel nuts alternately to 5 ft. lbs. Then, tighten to 15-20 ft. lbs. Recheck engine for vibration. If vibration continues to exist at 3800 RPM, the flywheel and torus assembly have excessive runout and should be replaced.

NOTE: The flex plate checking procedure should be followed whenever transmission is removed

CAMSHAFT & BEARINGS

CAMSHAFT REMOVAL: Remove hood lock plate support plate. If car is equipped with air conditioning, remove the condenser (see "Air Conditioning" in Miscellaneous Section). Remove radiator core and remove timing chain and sprockets. Remove valve lifters and slide camshaft slowly forward out of engine. *CAUTION – Do not allow camshaft lobes to score camshaft bushings.*

Camshaft Alignment Check: Check camshaft for proper alignment whenever it is removed from the engine. *See "Camshaft Alignment Check" below.*

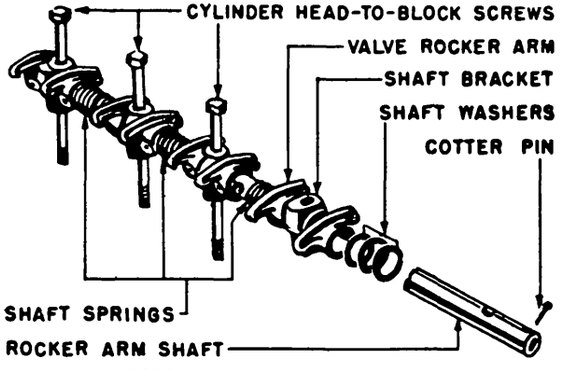
Camshaft Bushing Removal & Installation: Use Bearing Remover & Installer Tool J-3063 to pull old bushings out. Install new bushings with same tool and see that oil holes in bushing line up with oil holes in block (check oil leads with piece of wire after tool removed).

Camshaft Installation: Lower camshaft into position between radiator grille and engine and guide it carefully into cylinder block. Be sure distributor is timed correctly when inserting camshaft. Reverse removal procedure.

TIMING CHAIN

TIMING CHAIN REMOVAL: Set engine in firing position for No. 6 cylinder. Remove water pump (see Cooling on car page), oil pan (see Oil Pan Removal), crankshaft pulley and engine front cover. Take out the two camshaft sprocket screws and lockwashers. Remove sprocket with chain from camshaft, remove crankshaft sprocket.

Timing Chain Installation: Reverse removal instructions given above. Timing marks on sprocket must be together and aligned with straightedge across shaft centers.



VALVE SYSTEM

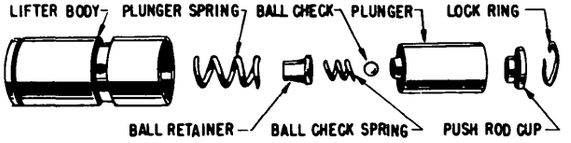
VALVE STEM SEALS

VALVE STEM OIL SEALS: Seals are installed in lower groove (nearest valve head) ahead of valve keepers. Check for proper sealing after keepers installed by striking end of valve stems to seat keepers, then using suction cup (similar to type used for grinding valves), compress cup on valve spring retainer. If cup will not stick, seal is broken and a new seal should be installed.

ROCKER ARMS

ROCKER ARM ASSEMBLY: Remove rocker arm covers. Remove secondary wiring and distributor cap as an assembly. Remove four cylinder head cap screws which hold rocker arm assembly to cylinder head and remove rocker arm assembly.

CADILLAC ROCKER ARM ASSY.



Disassembly & Reassembly: See illustration for correct order of parts. Parts can be removed from shaft by removing cotter pin at end.

Installation: Install rocker arm assembly in position on cylinder head with notches on each end of rocker shaft pointing downward and toward center of engine, and rocker arm brackets with larger machined surface next to head. Install four cylinder head screws and tighten to specifications. Install rocker arm covers and secondary wiring with distributor cap assembly. Tighten cover screws to specifications.

HYDRAULIC LIFTERS

VALVE LIFTERS: Hydraulic, Barrel Type. Consisting of plunger and valve assembly operating within a cylinder formed by valve lifter tappet or body (See illustration). Oil is introduced to this unit from main oil gallery through hole in side of lifter plunger and body.

Removal: Disconnect power brake vacuum line from intake manifold. Remove heater hoses from clips on rocker arm covers and remove covers. Remove intake manifold. Remove valve compartment cover screws. Loosen engine ventilator pipe clampscrew at flywheel housing, remove long ventilator pipe screw at valve compartment and remove cover. Remove rocker arm assemblies (*NOTE* – When only one or two lifters are to be removed, do not remove rocker arm assembly. Compress valve spring, slide rocker arm over and remove the push rod.) Remove push rods, keeping them in order so they may be replaced in the same location. Using Valve Lifter Remover Tool J-3049, remove lifters from engine. Keep lifters in order so they may be replaced in the same location.

HYDRAULIC VALVE LIFTER

Disassembly: Press down on center of valve lifter push rod cup, and with a pointed tool, remove lockwire from groove. Invert lifter and slide out push rod cup, plunger, ball retainer and spring. *NOTE*— If plunger is stuck in body, place lifter push rod end down, in Valve Lifter Plunger Remover Tool J-4160. Holding tool firmly in hand with thumb over lifter body, strike tool sharply on block of wood until plunger falls out of body.

Cleaning & Inspection: Wash all parts in a suitable carbon solvent and remove all trace of carbon and varnish. Inspect plunger and lifter body for scoring or other damage that would prevent free movement. Inspect lower end of lifter body for nicks or indentations. If any exist, replace complete lifter assembly. Dry lifter parts with air, then install plunger in lifter body without other parts and check for free movement. Plunger should drop of own weight into body bore.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Reass mbly: Place ball on its seat in lower end of plunger while holding plunger upside down. Place small spring on ball. Position ball retainer over ball and end of plunger. Move retainer up and down to be sure spring is in working order. Place spring over ball retainer. Lower lifter body over plunger assembly on an angle to seat spring. If necessary probe with a small wire through oil h le to allow assembly to be seated. Turn assembly right side up and fill plunger with clean engine oil. Jiggle ball with a small piece of wire until oil drains out of plunger into body and trapped air is released from body. Refill plunger with oil and place push rod cup on plunger. Position lock wire over cup. Using Valve Lifter Lock Wire Installer J-2730, press lock wire into groove.

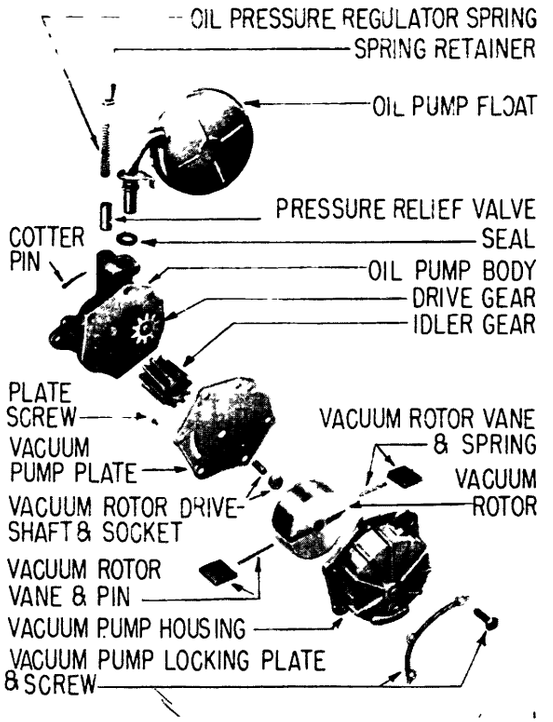
Testing (Leak Down Rate)—Remove distributor cap, coil and rocker arm covers as an assembly. Set timing mark "C" on harmonic balancer to the pointer and observe position of distributor rotor. Check each lifter as outlined in following table, using Valve Lifter Leakdown Tool J-3074:

With rotor at No. 1 firing position (pointing toward rear of engine), check:

No. 1 Intake	No. 3 Exhaust	No. 6 Exhaust
No. 1 Exhaust	No. 4 Exhaust	No. 7 Intake
No. 2 Intake	No. 5 Intake	No. 8 Intake
No. 2 Exhaust	No. 6 Intake	No. 8 Exhaust

With rotor at No. 6 firing position (pointing toward front of engine) check:

No. 3 Intake	No. 5 Exhaust
No. 4 Intake	No. 7 Exhaust



Insert feeler gauge of tool between valve stem and rocker arm, at the same time compressing the tool "pop-out" spring against valve spring *(NOTE*—Tool should be installed as quickly as possible to avoid any unnecessary leakdown of lifter). Note the interval of time during which the tool is held in place by valve spring pressure. It will be found through this test that bad lifters or lifter will have the shortest leakdown time.

OILING SYSTEM

►*AIR IN OILING SYSTEM (Causing oil foaming or noisy Hydraulic Lifter operation): See Oil Pump Reassembly below for sealing of pump intake float tube and Oil Pump Installation for correct positioning of oil pan baffle.*

OIL PUMP

OIL PUMP REMOVAL: Drain engine and remove oil pan (see Oil Pan Removal). Remove oil pan baffle and disconnect vacuum line at engine block. Remove two nuts securing oil pump to rear main bearing cap, and remove oil pump, vacuum pump, oil float and screen assembly. *NOTE* - Oil pump drive shaft is now loose and should be removed.

CADILLAC OIL & VACUUM PUMP ASSY.

Disassembly: Remove float and felt seal. Remove pressure regulator valve, spring and spring retainer. Remove six screws holding vacuum pump to oil pump and remove vacuum pump and line. Slide idler gear off idler shaft and pin from collar on end of drive shaft and press collar off shaft. Slide oil pump drive gear out of body.

Inspection: Inspect strainer screen for dirt, float for leaks and check condition of seal. Inspect oil pressure regulator valve for nicks and burrs, drive gear for nicks and burrs, vacuum pump plate for wear by pressing it down on surface plate.

Oil Pump Specifications-Backlash between drive gears - .008-.012". Clearance drive shaft to pump body - .0010-.0025", wear limit .005". Clearance pump body to gears - .003-.005", wear limits .006". End play in pump gears-.001-.004", wear limit .006".

Pressure Regulator Specifications - Clearance valve plunger and housing - .0020-.0035", wear limits .005". Spring Free Length - 2 21 32". Spring Pressure - 5¼-5¾ lbs. at 1 7 16".

Assembly: Install drive gear in pump body, press collar on shaft and install lock pin. Slide idler gear into pump body, place vacuum pump assembly with hexagonal drive shaft under oil pump and install six screws and locks. Slide oil pump strainer into opening in pump body and install locking pin. Check felt seal to be sure it is located correctly. *CAUTION* - Screen must face cover of oil pump.

Installation: Install oil pump drive shaft, oil pump assembly over studs, guiding vacuum fitting into block. *NOTE* - Position pump so drive shaft does not bind against block. Install two nuts and tighten to specifications.

VACUUM PUMP

VACUUM PUMP (Removal): Drain engine oil and remove oil pan. Remove oil pan baffle and disconnect vacuum line at engine block. Remove six screws holding vacuum pump to oil pump, and remove vacuum pump with the oil pump idler gear. Remove hexagonal drive shaft. ***CAUTION***—Oil pump idler gear may fall when pump removed.

Dissassembly - Remove two cap screws holding plate to vacuum pump and remove plate from dowels. Turn pump upside down and shake out rotor assembly. Remove vanes, pin and spring from rotor.

Vacuum Pump Clearances—Vane to cover plate .002-.005". Rotor to cover plate .004-.007". Socket to cover plate .0144-.0324". Socket to rotor face .0104-.0254". Rotor to shaft .0010-.0023". Rotor to depression in body cavity .0005-.0034"

Installation—Install vacuum lines to pump and replace hexagonal shaft. Install idler gear in oil pump and install vacuum pump below oil pump with six screws. Connect vacuum line to engine block. Install oil pan baffle, then install oil pan.

Reassembly—Inspect inside of body for scores or wear. Inspect plate for wear and dress down on surface plate. (CAUTION—Make sure that all parts are clean and that no foreign material is in housing). Install vanes and spring in rotor. Compress vanes and install rotor in pump body. Position plate on doweled pump body so that hole in plate lines up with hexagonal hole in rotor. Install screws in cover plate.

PROPELLER SHAFT NOTES

PROPELLER SHAFT CENTER BEARING ASSEMBLY: Remove two center-bearing-support-to-support frame bolts (nuts are tack welded, DO NOT REMOVE). Remove "U" bolts and lock at rear axle pinion, slide propeller shaft and front yoke off transmission mainshaft and through frame tunnel section. *NOTE* - Be careful not to nick yoke. Disassemble propeller shafts, remove center bearing support assembly from propeller shaft by tapping on center bearing bracket with soft head hammer. Remove spacer if so equipped. Remove center bearing support bolts and separate bushings, washers, center bearing bracket and center bearing support. To reassemble, reverse disassembly procedure.

MODEL IDENTIFICATION

ENGINE & SERIAL NUMBER: Stamped on upper right corner at front face of right hand block, on right frame side member just to rear of front engine support, and on lubrication plate attached to front face of left door lock pillar.

Series	First 1957 Nos.
60S	5760000001
62	5762000001
75	5775000001
86	5786000001

Identification - First two figures indicate year, third and fourth indicate series (last six figures are numbered consecutively regardless of series).

Engine Unit Number Note: Use for identification. Stamped on top of crankcase to rear of left hand block with a prefix (see below) indicating model.

Series	Engine Unit Prefix
60S, 62 (Standard)	76X-1 and up
60S, 62 (Air Conditioning)	76K-1 and up
75, 86 (Standard)	77X-1 and up
75, 86 (Air Conditioning)	77K-1 and up
62 (Dual Carbs.)	70QX-1 and up
62 (Dual Carbs. & Air Cond.)	70QK-1 and up

► *ENGINE NUMBER NOTE: "L.C." will be added as a suffix to engine unit number on all engines built to low compression specifications.*

► *NOTE:* Mark * preceding Engine Unit Number indicates cylinder bore and pistons are .010" oversize.

TUNE-UP

COMPRESSION PRESSURE: 165 to 185 lbs. (at cranking speed). 212 to 230 lbs. (at 1000 RPM).

VACUUM READING: Not specified.

► *VACUUM CHECKING CAUTION: When checking engine vacuum, shut off engine before removing vacuum hose. Plunger in vacuum operated throttle check will increase engine speed to approximately 900 RPM if hose is removed with engine running. Set hand brake firmly before checking engine vacuum.*

VALVE TAPPET CLEARANCE: None in service (hydraulic lifters).

MANIFOLD HEAT CONTROL: Automatic thermostatic type. This valve diverts exhaust gases of left hand cylinder bank through carburetor heating passages in intake manifold to right hand exhaust system, during warm-up period.

► *MANIFOLD HEAT CONTROL VALVE CAUTION:* Some cars after Engine No. 090000 had "B" type valve which adversely affects engine performance. "B" type should be replaced with "A" type, Part No. 3510508, which has larger bore diameter and 180° counterweight.

► *ENGINE DETONATION (OPERATION IN LOW OCTANE AREAS): See Note under Engine Specifications for recommended changes for foreign travel.*

IGNITION

FIRING ORDER: 1–8–4–3–6–5–7–2.

Cylinders - RIGHT BANK 2–4–6–8. LEFT BANK 1–3–5–7.

SPARK PLUG GAP: .035".

Spark Plugs - AC No. 44 (All Engines), 14 mm. Torque to 20-25 ft. lbs.

► *SPARK PLUG NOTE:* If car consistently operated at above normal speeds, cooler spark plugs, AC No. 43, may be installed.

COIL: Delco-Remy 1115082.

Ignition Current - 1.25 amps. idling. 3 amps. stopped.

Resistor - Delco-Remy No. 1927809. 1.40-1.65 ohms. On coil bracket.

► *COIL RESISTOR NOTE: Resistor is connected in lead from ignition switch-to-coil.*

DISTRIBUTOR: Delco-Remy 1110876 (Standard), 1110877 (Eldorado Eng. early), 1110898 (Eldorado Eng. later). *See "Delco-Remy Window Distributors" in Electrical Section*

Condenser - Delco-Remy 1932004. **Capacity** .18-.23 mfd.

Contact Point Set - Delco-Remy 1931988.

Breaker Gap - .016" (new & used points).

Cam Angle - 26-33°.

► *BREAKER GAP AND CAM ANGLE NOTE:* Setting cam angle at 30° will provide .016" breaker gap.

Brush Spring Tension - 19-23 ozs.

Rotation - Counter-clockwise viewed from above.

Automatic Advance

Degrees Distr.	RPM	Degrees Eng.	RPM
Start	450	1-4	900
6-7.75	1300	12-15	2600
11-13	2075	22-26	4150

Vacuum Spark Control: 1116103 or 1116122 (1110876 & 1110877 Distr.). 1116124 (1110898 Distr.).

Vacuum Advance - 1116103

Distr. Degrees	Eng. Degrees	Vacuum (" of Hg)
Start	0	6.8-8.5
15.5	31	13.5-16

Vacuum Advance – 1116122

Distr. Degrees	Eng. Degrees	Vacuum (" of Hg)
Start	0	8-10
12	24	13.5-15.5

Vacuum Advance - 1116124

Distr. Degrees	Eng. Degrees	Vacuum (" of Hg)
Start	0	6.25-8.25
12	24	12.75-14.50

IGNITION TIMING

Setting - 5° BTDC.

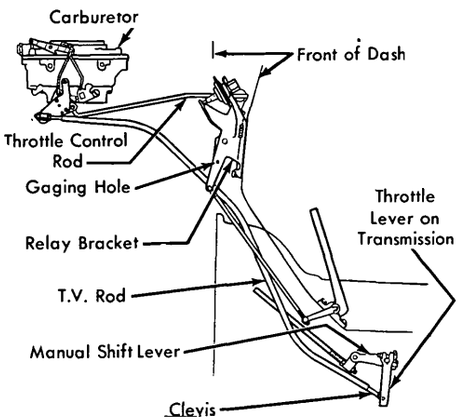
Timing - Disconnect vacuum line to distributor, and with engine idling at 400 RPM, set timing at point "A" on harmonic balancer in line with pointer on cover.

Timing Mark - Timing indicator marked on harmonic balancer with two lines "A" (5° BTDC), "C" (TDC).

CARBURETOR

► *CARBURETOR APPLICATION: One 4-Barrel Carter or Rochester carburetor used on all models except Eldorado. Two Carter 4-Barrel carburetors used on Eldorado.*

► *POOR PERFORMANCE DURING WARM-UP CORRECTION: See MANIFOLD HEAT CONTROL above.*

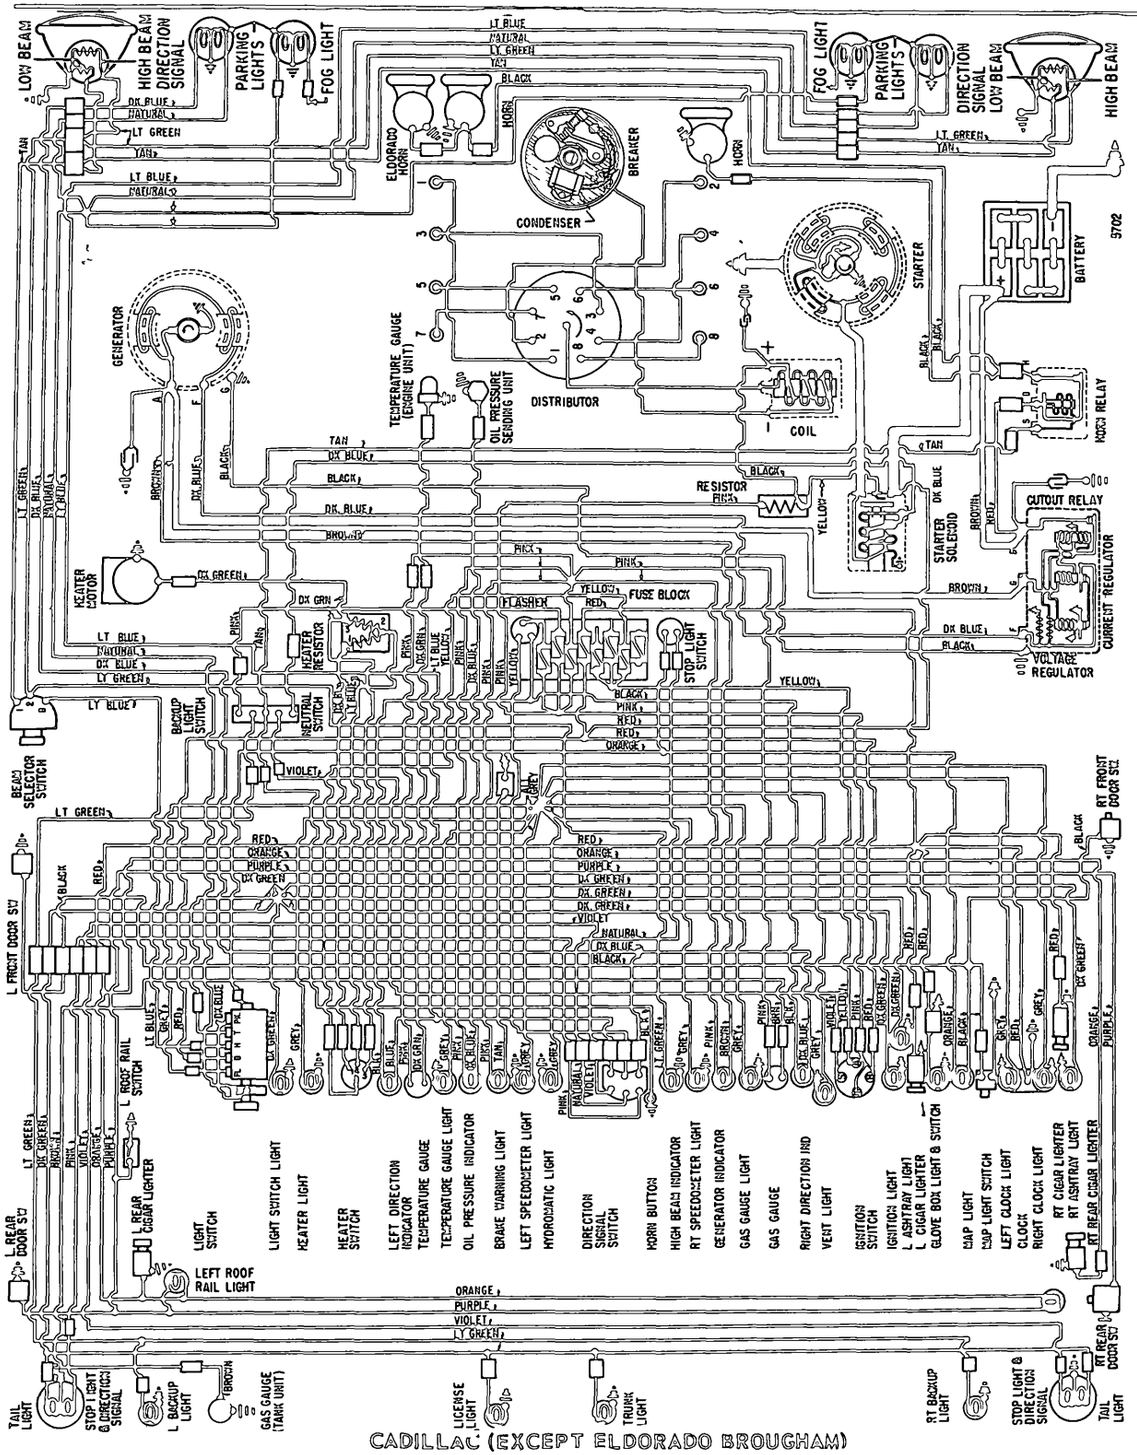


► *IDLE SPEED (AIR CONDITIONED CARS): Summer and Winter Idle Speed Adjustment is different as follows:*

Summer Setting (Air Conditioner in Operation) - With transmission selector lever in either "Dr" range, and with air conditioner "ON" set idle speed at 420 RPM (Cars with Standard Engine). 490-510 RPM (Cars with Eldorado Engine).

Winter Setting (Air Conditioner Not in Operation) - With transmission selector lever in either "Dr" range, and with air conditioner "OFF" set idle speed at 420 RPM (Cars with Standard Engine), 490-510 RPM (Cars with Eldorado Engine).

Idle Speed-Up Control Adjustment (Cars with Air Conditioning): With engine at normal operating temperature and slow idle adjustment completed, turn air conditioner "ON" and place transmission selector lever in "N" position. Adjust engine idle speed to 900 RPM by loosening locknut on diaphragm shaft and turning knurled nut to obtain specified RPM. Tighten locknut.



Throttle Check Adjustment: Allow engine to idle and make sure that throttle check plunger is not in contact with throttle relay lever. Open throttle wide momentarily to allow engine manifold vacuum to drop and throttle check plunger to come out. Let throttle snap shut and observe delay caused by throttle check. If engine races throttle check plunger is too long. If engine stalls, plunger is too short. Adjust plunger screw as necessary for correct operation.

CADILLAC HYDRA-MATIC THROTTLE LINKAGE

THROTTLE LINKAGE ADJUSTMENT: Remove clip from carburetor throttle rod trunnion and remove trunnion from relay bracket lever (at front of dash). Place a ¼" drill shank through gauging hole in relay lever and dash relay bracket. With engine running, set throttle lever to hot idle position (Air Conditioner turned "OFF"). Adjust carburetor throttle rod trunnion to allow free entry into dash relay lever and install trunnion and spring clip. Push end of throttle valve rod (rod from carburetor to transmission throttle lever) toward rear of car to position transmission throttle lever against its stop. Bring rear jam nut up against trunnion with throttle in hot idle position. **Back off jam nut three complete turns.** Tighten front jam nut, making certain linkage does not bind in any position. *NOTE:* It will be necessary to check and adjust throttle valve jam nut slightly to obtain smooth shifting. This should be done after completion of all other carburetor adjustments.

CONTINUED ON NEXT PAGE

CADILLAC (EXCEPT ELDORADO BROUGHAM)

CONTINUED FROM PRECEDING PAGE

▷ *THROTTLE LINKAGE ADJUSTMENT NOTE:* Throttle valve adjustment is set at 1½ turns (instead of 3 turns) at the factory. This setting should be changed to 3 turns after 500 to 2000 miles of operation.

ROCHESTER 4GC
(Standard Engine)

Rochester 4GC. Early - No. 7010100 (without Air Conditioning), No. 7010101 (with Air Conditioning). Later - 7012000 (without Air Conditioning), 7012001 (with Air Conditioning).

▷ *CARBURETOR PRODUCTION CHANGES AND RECOMMENDED PARTS AND SETTING CHANGES FOR IMPROVED PERFORMANCE: See "Cadillac (Carter & Rochester) Carburetors" in Carburetion Section.*

▷ *MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrels feed Cyls. 2-3-5-8. LEFT barrels 1-4-6-7.*

▷ *IDLE SPEED ADJUSTMENT NOTE: Idle Air By-Pass screw on throttle body is used to adjust idle speed. Throttle valves are normally closed at slow idle.*

Idle Mixture & Speed Setting - Special procedure required to insure correct mixture and speed (idle air) screw settings. *See "Cadillac (Carter & Rochester) Carburetors" in Carburetion Section.*

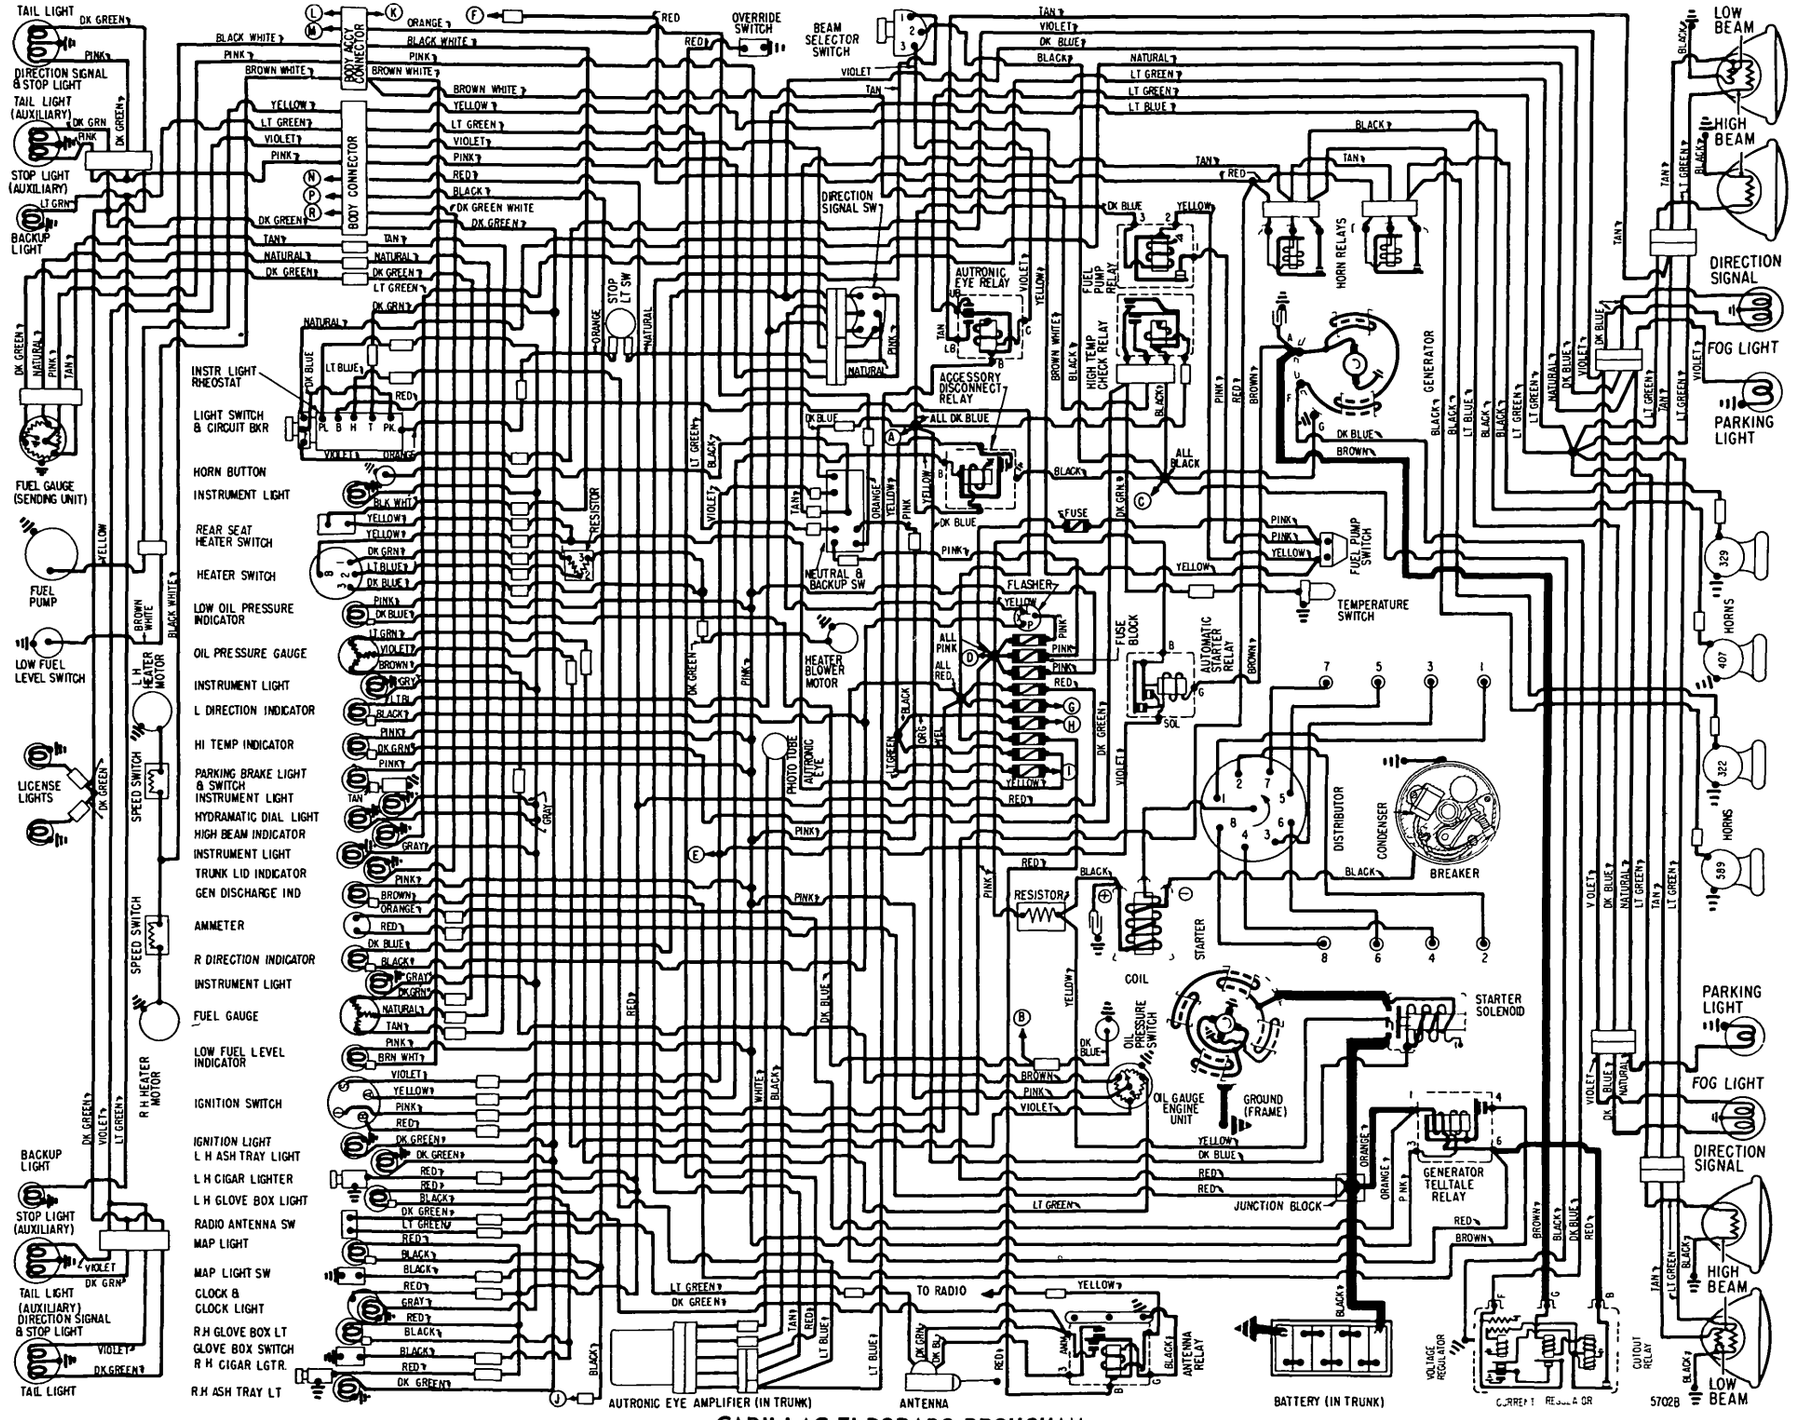
▷ *OTHER DATA: See "Cadillac (Carter & Rochester) Carburetors" in Carburetion Section.*

Hydra-Matic Throttle Linkage Adjustment: *See "CARBURETOR" above.*

Fuel Pump Pressure: 5¼-6½ lbs. at idle speed.

CARTER AFB
(Standard Engine)

Carter AFB 2479S (Without Air Conditioning), No. 2480S (With Air Conditioning).



▷ *CARBURETOR REPLACEMENT NOTE:* Use Carburetor No. 2479S with Idle Speed-Up Control, Carter No. 202-114U, to replace Carburetor No. 2480S on air conditioned cars.

▷ *PRODUCTION CHANGE AND APPLICATION NOTE: This carburetor used on some cars after Engine No. 101833.*

Hydra-Matic Throttle Linkage Adjustment· *See "CARBURETOR" above*

Fuel Pump Pressure· 5¼-6½ lbs. at idle speed.

CARB. EQUIPMENT

Fuel Pump: AC mechanical type (Exc Brougham) Electrical type mounted in gas tank (Brougham) Vacuum pump is part of engine oil pump

Replacement Fuel Pump (Exc. Brougham) - AC No 4362

Pressure - 5¼-6½ lbs at 1800 RPM

See "Fuel Pumps" in Carburetion Section

Gasoline Gauge: AC Electric

	Brougham	Others
Dash Unit (AC No)	1518655	1518739
Tank Unit (AC No)	1518565	1518588

See "Fuel Gauges" in Carburetion Section

Low Fuel Level Indicator (Brougham): Light on instrument panel comes on when fuel level in tank drops to 3 gallons (2 gals usable) *See Wiring Diagram*

BATTERY

Delco 3 FMR70-W (Exc. Brougham). 12 Volt, 11 plate, 70 ampere hour capacity (20 hr rate)

(Brougham) 12 volt, 11 plate, 72 ampere hour capacity (20 hr rate)

Battery Location - Separate compartment in right rear quarter panel accessible from trunk (Brougham) under hood on tray attached to radiator cradle (Others)

Battery Ground - Negative

Engine Ground - Engine to cowl

STARTER

Delco-Remy No 1107668 (Brougham), No. 1107657 (Others)

Armature - Delco-Remy No 1932185 (1107657 Str)

Drive - Overrunning clutch (solenoid pinion shift)

Rotation - Counterclockwise at commutator end

Brush Spring Tension - 35 ozs min

Performance Data - 1107668

Torque	RPM	Volts	② Amperes
0 ft lbs	3600-5100	10 6	65-100
①	Lock	3 5	300-360

Performance Data - 1107657

Torque	RPM	Volts	② Amperes
0 ft lbs	3240	10 6	91
①	Lock	3 5	395

① - Armature locked ② - Includes solenoid

Starting Switch (Exc. Brougham): Delco-Remy Solenoid Switch 1119910 mounted on starter and controlled by Ignition & Starter Switch Delco-Remy 1116536 Turn key full RIGHT against spring tension to start

Starting Switch (Brougham): Delco-Remy Solenoid Switch 1119910 mounted under starter and controlled by Ignition & Starter Switch Delco-Remy 1116536 (turn ignition "ON") and Automatic Starter Relay Delco-Remy 1119924 (Vacuum and Electric controlled) *NOTE* - Should Automatic Starter fail turn Ignition & Starter Switch to full RIGHT against spring tension to start

►*ACCESSORY DISCONNECT RELAY (Brougham) NOTE·* Delco-Remy No 1116927 Relay limits battery load by opening circuits to Air Conditioning Heater and Radio while starter is cranking engine

Neutral Safety & Back-up Light Switch· Delco-Remy 1998170 (Brougham) 1998137 (Others) Located on steering column

Adjustment - *See "Hydra-Matic Drive" in Trans Sect*

GENERATOR

Delco-Remy. Used as follows

Models	Generator No.	Armature No.
60S 62 All,75,86 Early	1102086	1932900
75, 86 Later Std	1102099	1932900
75, 86 Air Cond Early	1102060	1935778
75, 86 Air Cond Later	1102100	1935778
Brougham	1106989	1936778

Performance Data

Generator	Amperes	Volts	RPM
1102086, 99	35	14 0	2510
1102060, 100	40	14 0	2320
1106989	55	13 0	1580

Rotation - Counterclockwise at commutator end

Brush Spring Tension - 20 ozs (1106989), 28 ozs (Others)

Field Current - 1 69-1 79 Amperes (1102086,99), 2 66-2 86 Amperes (1102060,100), 2 14-2 28 Amperes (1106989) at 12 Volts

Generator Charge Indicator: Red light on instrument panel *See Diagram*

Belt Adjustment: Use Belt Tensioner Gauge J-6733 Loosen or tighten belt tension adjusting nuts so Red line on Gauge is even with the shoulder

REGULATOR

Delco-Remy. Used as follows

Model	Regulator	Generator
60S,62 All, 75 86 Early	1119002	1102086
75, 86 Later Std	1119002	1002099
75,86 Air Cond Early	1119163	1102060
75,86 Air Cond Later	1119163	1102100
Brougham	1119175	1106989

►*"DOUBLE CONTACT" REGULATOR NOTE Regulators 1119163 & 1119175 have new Double Contact Voltage Regulator*

Cutout Relay

Cuts In - 11 8-13 5 Volts

Contact Gap - 020"

Air Gap - 020"

Voltage Regulator

Setting (1119002) - 13 8-14 8 Volts at 125°F (ambient Temperature)

Setting (1119163 & 1119175) - 14-14 6 Volts (Operating on lower contacts), 3-5 Volts lower (Operating on upper contacts)

Contact Gap (1119163, 175) - 016"

Air Gap - 075" (1119002) 080" (1119163, 175) With armature pressed down to point where contacts just touch

Checking & Adjusting - *See "Delco-Remy 12 Volt Regulators" in Electrical Section*

Current Regulator

Setting - 32-37 Amperes (1119002), 37-42 Amperes (1119163), 53-57 Amperes (1119175)

Air Gap - 075" with armature pressed down to point where contacts just touch

Checking & Adjusting - *See "Delco-Remy 12 Volt Regulators" in Electrical Section*

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

MISC. ELECTRICAL

H adlamps: Sealed Beam. Two headlamps standard on all models except Brougham. Four headlamps standard on Brougham. *See "4-Headlight" in Electrical Section.*

Autr nic Eye: *See "Autronic Eye" in Electrical Section.*

Dir ction Signal: *See "Direction Signals" in Electrical Section.*

St p Light Switch (Location): Mechanical type, mounted on brake pedal retaining bar flange.

Adjustment - Rotate cam on pedal bar until stoplights are off, when pedal is in fully released position. Adjust cam until stoplights come on at slightest movement of pedal.

FUSES: Located on fuse panel under instrument panel, except as noted below.

Air Conditioner - 25 amps. (Brougham), 20 amps. (Other).
Air Ride - 6 amps. (Brougham).
Back-up Lights - 9 amps.
Body Feed (Brougham) - 25 amps., protects Cigar Lighter, Clock, Glove Box-Map-Roof Rail lights.
B dy Feed (Others) - 25 amps., protects Cigar Lighters, Clock, Dome or Bow light, Glove Box & Trunk Light.
Fuel Pump - 6 amps. (Brougham). Left side front speaker housing.
H ater - 20 amps.
Instruments - 9 amps. Protects Instruments and all Tell-Tale lights. Instrument lights are protected by Lighting Circuit Breaker.
Direction Signals - 9 amps. *NOTE* - Cut four coils off early 6 amp. fuse holder spring for 9 amp. fuse.

CIRCUIT BREAKERS: (Lighting) - 25 amps. (Brougham), 20 amps. (Other). Located in lighting switch. Protects the following circuits: Ash Tray, Fog, Head, Instrument, Parking and Stop Lights. *NOTE* - Map light protected by circuit breaker on all except Brougham.
Hydro-Lectric System (When used) - 40 amps., located on left inner cowl panel.
S ats & Windows - 40 amps., located on left inner cowl panel. *NOTE* - Protects Brougham Trunk Lid Power Circuit.
Trunk Lock (Electric) - 5 amps., located on left inner cowl panel. Protects Trunk Lid locking circuit.

ENGINE

►*AIR CONDITIONED CAR SERVICE CAUTION: Before disconnecting any part of air conditioning equipment or lines for access to engine, see "Air Conditioning Service Cautions" in Miscellaneous Section.*

ENGINE SPECIFICATIONS: V8 Overhead valves. Two engines used. Standard engine has Single 4-barrel Carburetor, Eldorado engine has Two 4-barrel carburetors with special intake manifold.

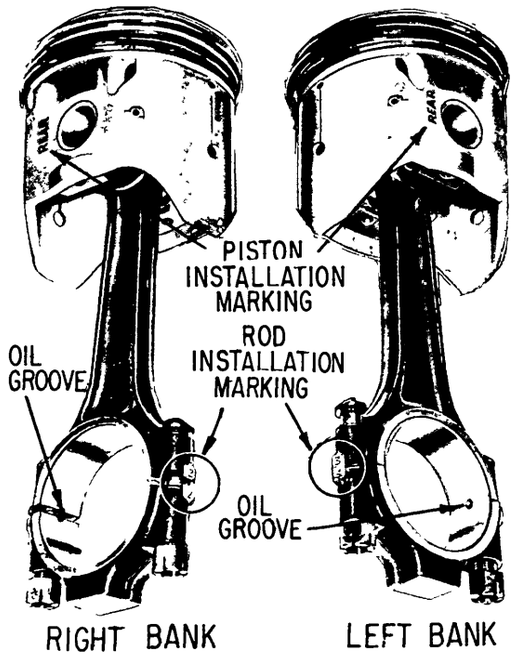
Bore	Stroke	Displacement	Rated HP
4"	3 5/8"	365 cu. ins.	51.2

Engine	C mpr. Ratio	D velop d HP
Standard	10.0-1	300 at 4800 RPM
Eldorado	10.0-1	325 at 4800 RPM

Compr ssion Pressure - *See TUNE-UP.*

►*OVERSIZE CYLINDER BORE CAUTION:* Engines with mark * preceding Engine Unit No. (on rear of crankcase) have .010" Oversize cylinder bore and pistons. *See "Original Bore & Pistons" in Cadillac Special Data.*

►*ENGINE OPERATION IN LOW OCTANE FUEL AREAS (Foreign Travel):* Standard 1957 engine requires 97 (Research Method), 87 (Motor Method) Octane rating gasoline to prevent detonation. When only lower Octane rating gasoline is available, compression ratio should be lowered. Install special low compression pistons. Part No. (Std.) 3630787 or (.010") No. 3630788, (.020") No. 3630789, (.030") No. 3630790 Oversize. *NOTE* - No changes in Distributor, Carburetor or Timing required.



►*LOUD CLICKING NOISE CORRECTION & PISTON PRODUCTION CHANGE:* To correct loud clicking noise (under light load conditions) which stops when spark plug wire is disconnected from noisy cylinder, replace early type cam ground scuff band piston with later round head type. New design pistons entered production with Engine No. 091632 (Air Cond. Cars), No. 091594 (less Air Cond. Cars), No. 094206 (Brougham).

►*CLICKING OR RATTLING NOISE CORRECTION:* To correct, rebend oil filter line where it contacts front engine cover due to vibration. This noise is similar to noise produced by pressure regulator valve.

►*ENGINE BALANCE CHECK & UNBALANCE CORRECTION: See "Engine Balancing" in Cadillac Special Data.*

ENGINE REMOVAL: *See "Engine" in Cadillac Special Data.*

OIL PAN REMOVAL: *See "Oil Pan" in Cadillac Special Data.*

CADILLAC PISTON & ROD ASSY.

CYLINDER HEAD: *See "Cylinder Head & Manifold" in Cadillac Special Data.*

TIGHTENING TORQUES: *See "Tightening Sp cifications" in Cadillac Special Data.*

PISTONS

►*ORIGINAL CYLINDER BORE CAUTION:* Engines with mark * preceding Engine Unit No. (on left rear of crankcase) have .010" oversize pistons and cylinder bore. Standard cylinder bore size: 4:0000-4:0020".

Original Bore & Pistons - *See "Original Bore & Pistons" in Cadillac Special Data.*

Pistons - Two types used. Early type had cam ground scuff bands on top and second lands, later type had round top pistons without scuff bands. *See "Clicking Noise Correction" early type piston cars above.*

Weight - 22.72 ozs. (less pin).

Removal - Piston and rod assemblies removed from above. Install connecting rod Guide studs J-3224; on connecting rod bolts to guide rod out through bore without nicking or scratching. *CAUTION - Do not nick lower edge of bore when pushing rod up.*

Fitting New Pistons: Use micrometer or feeler gauge. *See "Pistons" in Cadillac Special Data.*

Replacement Pistons: Standard (Code "L" or "M") and .010", .020", .030" Oversize with rings and pin.

Installing Pistons: Install in cylinder with piston pin boss marked "Rear" toward rear of engine. *See "Connecting Rods" (below) for installation of pistons on rods.*

PISTON PINS

Pin is pressed in connecting rod.

Diameter - 1.000". **Length** - 3 3/32".

Pin Fit in Piston - .00005-.0001" clearance at 70°F. Not fitted in field (replace piston & pin assembly).

Pin Fit in Rod - (NOTE - Special tools required). *See "Piston Pins" in Cadillac Special Data.*

PISTON RINGS

Top compression ring is chrome plated, second compression ring is lubrited. An expander is located behind oil ring.

Ring	Width	End Gap ①	Sid Cl aranc
Compr.(#1&2)	5/64"	.013-.023"	.0017-.0035"
Oil (#3)	3/16"	.013-.023"	.0008-.0026"

① - With Standard 4.0000" cylinder.

Replacement Rings: Standard, .010", .020", .030", oversize.

►*REPLACEMENT RING NOTE:* Use re-ring sets with chrome top compression ring and expander behind oil ring or multi-piece oil rings.

Installing Rings: Chamfered face of both compression rings must be installed toward top of piston.

CONNECTING RODS

Length - 6.625" (center to center).
Weight - 23.49 ozs.
Crankpin Journal Diameter - 2.2488-2.2493".
Out- f-R und Limits - .00025".
Bearings - Durex 400, bearing shell is steel backed aluminum. Bearing halves interchangeable. No shims.
Cl aranc - .0005-.0021" (Service limit .0035").

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Replacement Bearings: Furnished in standard size only.
Installing Rods: Install piston and rod in cylinder bore with "REAR" on piston toward rear of engine and numbers on lower end of rod down. Numbers 1,3,5,7 are in left bank, 2,4,6,8 are in right bank.

CRANKSHAFT

Journal Diameters - 2.625".
Out-of-Round Limits - .0025".
Bearings - Rear, steel backed babbitt, shell type insert. All other bearings are Moraine 400 Aluminum.

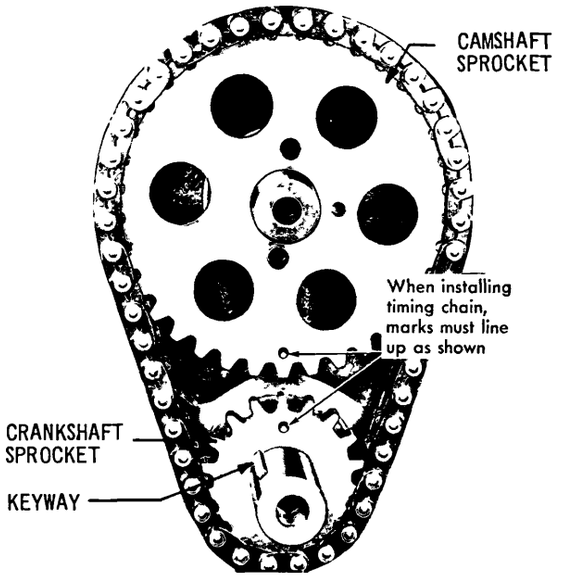
►*REAR MAIN BEARING INSTALLATION CAUTION:* For proper alignment of thrust surfaces of rear main bearing proceed as follows: Install upper and lower inserts in block and bearing cap. With rear oil seal in place and mating surfaces clean, install bearing cap and tighten screws to 1-2 ft. lbs. torque. Using a plastic hammer, drive crankshaft forward, then rearward, then forward again (*CAUTION* - Pound on counterweights, not on connecting rods). Tighten bolts evenly to specifications. Check to make sure crankshaft is not binding.

►*MAIN BEARING CAPSCREW NOTE: Lockwashers not used under heads of bearing cap retaining screws.*

Clearance - .0008-.0025" (service limit .002" front, .003" others).
Replacement Bearings: Furnished in standard size only.
End Thrust: Taken by flanged rear main bearing.
End Play - .001-.005" (service limit .010").

►*HARMONIC BALANCER TO CRANKSHAFT SCREW PRODUCTION CHANGE & CAUTION:* Use only new type screw Part No. 1468651 with smaller diameter shank between threaded portion and head of screw and install without lockwasher, but include flatwasher. This replaces old screw Part No. 455012. Tighten screw to specifications.

Crankshaft Removal: *See "Crankshaft & Bearings" in Cadillac Special Data.*
Rear Main Bearing Oil Seal Installation: *See "Crankshaft & Bearings" in Cadillac Special Data.*



CAMSHAFT

►*CAUTION:* Handle shaft with care to avoid damage or mis-alignment. Check whenever removed.

Removal, Alignment & Installation - *See "Camshaft & Bearings" in Cadillac Special Data.*
Bearings - Steel backed babbitt bushings.
Clearance - .001-.0022" (service limit .004" max.).
Bearing Out-of-Round Limit - .002" max.
Timing Chain: Link-Belt side guide type. **Width** 11/16", **Pitch** .500", **Length** 23" or 46 links.
Installation & Removal - *See "Timing Chain" in Cadillac Special Data.*

Camshaft Setting: Both sprockets marked "0". Mesh chain with sprockets turned so that marks adjacent and in line with straightedge across shaft.

►*CAUTION:* Install chain as a unit with camshaft sprocket (sprocket press fit on shaft with locating dowel and two retaining capscrews).

CADILLAC VALVE TIMING MARKS

VALVES

Tappet Clearance: None in service, hydraulic.

Valve	Head Diam.	Stem Diam.	Length
Intake	1.875"	.3415-.3425"	4.688"
Exhaust	1.437"	.3415-.3420"	4.694"

Valve	Seat Angle	Lift	Stem Clearance
Intake	ℂ 44°	.451"	ℚ .0010-.0025"
Exhaust	ℂ 44°	.451"	ℚ .0010-.0025"

ℂ - New Valves (Valves in service can be refaced to 45° if seat width recommendation not exceeded).
ℚ - New valves and guides. Worn limit .005" maximum.

►*NEW VALVE SEAT CAUTION:* Do not lap or grind so that seat width is more than 1/64" (1° difference between valve and seat angle designed to provide "hairline" contact.

Valve Seat Recommendations - 3/64-1/16" (moderate speed or city driving), 1/16-3/32" (high speed driving). Cut seat so that distance from outer edge to edge of flange on valve head not more than 1/32".
Valve Stem Oil Seal - Rubber oil seal installed in lower groove on valve stem (below valve keeper).
Oil Seal Installation - *See "Valve System" in Cadillac Special Data.*
Valve Guides: Pressed in cylinder head from combustion chamber side with longest chamfer end pointing toward rocker arm side of head. Use Remover Tool J-3062 to drive out old guides (toward top of head), and Installer Tool J-3066 to drive new guides in (tool plate serves as stop for driver).
Valve Springs: Free Length 2.25" (Approx.).

Valve Spring Specifications	Pressure	Length
Valve Closed	60-65 lbs.	1.946"
Valve Open	155-165 lbs.	1.496"

►*SPRING INSTALLATION CAUTION:* Lower end of valve spring must be seated in recess in cylinder head.
Valve Lifters: Hydraulic.
See "Valve System" in Cadillac Special Data.
Valve Lifter Removal - *See "Valve System" in Cadillac Special Data.*

►*HYDRAULIC LIFTER PRODUCTION CHANGE & CAUTION:* Beginning with Engine No. 042804, new type Hydraulic Lifter Assembly & Pushrod entered production. DO NOT mix new type Hydraulic Lifter Assembly or Pushrod with earlier type. New type Hydraulic Lifter Part No. 5231740 requires the usage of New Type Pushrod Part No. 1468453. New lifter has wider relieved section with only one oil feed hole. New Pushrod does not have grooves at ends and is .187" shorter than early type.

Rocker Arm Assembly: *See "Valve System" in Cadillac Special Data.*

►*ROCKER ARM COVER PRODUCTION CHANGE:* Gasket contact flange increased to 1/8" width approx. Engine No. 007149. Gasket increased in same manner. Cover with gasket is interchangeable with earlier type when used together. When installing New Type Cover & Gasket, tighten cover attaching screws to new specifications.

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above.

►*VALVE TIMING NOTE: Specifications are "Without Ramp"*

Intake Valves - Open 25° BTDC Close 78° ALDC.
Exhaust Valves - Open 75° BLDC. Close 28° ATDC.
Valve Timing Check - Not practical to check in field. Manufacturer recommends removing timing chain cover and checking timing gears.

OILING SYSTEM

Crankcase Capacity: 5 qts. Add one qt. when changing filter.
Normal Oil Pressure: 30-35 lbs. min. at 30 MPH. 15 lbs. at idle speed.
Pressure Regulator Valve - On oil pump. Not adjustable.
Oil Pressure Indicator (Exc. Brougham) - Light on instrument panel controlled by pressure switch AC No. 1508648, mounted on engine.
Oil Pressure Indicator (Brougham) - Light on instrument panel controlled by pressure switch AC No. 1508624, mounted on engine.
Oil Pressure Gauge (Brougham) - AC electric in addition to Indicator.
Dash Unit - AC No. 1518655.
Engine Unit - AC No. 1508566.
See "Oil Pressure Gauges" in Miscellaneous Section.
Oil Pump: Helical gear. Mounted on rear main bearing cap.
Oil Pump Removal & Overhaul - *See "Oiling System" in Cadillac Special Data.*
Vacuum Pump: Part of Oil Pump Assembly. *See "Vacuum Pump" in Cadillac Special Data.*
Oil Filter: Full flow (Brougham), Partial flow (Others). Replace element every 6,000 miles or more frequently in dusty areas.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Crankcase Ventilation: Air intake in oil filler cap (oil wetted type) with outlet connection at rear of valve compartment cover, and outlet pipe extending down below engine at right corner.

COOLING

►*BELT TENSIONER GAUGE NOTE:* Belt Tensioner Gauge Tool No. J-6733 released for field service for more accurate belt adjustments. Place Gauge on belt, loosen belt tension adjusting nuts, and tighten or loosen belt until red line on barrel is in line with shoulder.

Water Capacity: (With Heater) Models 62, 60S, 86-20 qts.; Model 75-21 qts.; Brougham 22½ qts.

(Without Heater) Except Brougham 19 qts.

Pr ssure Valve: AC No. 850800. Radiator filler cap. Opens at 12-15 lbs.

Th rmostat: Dole type. In water outlet at top of pump body.

Standard Setting - Starts to open at 163° to 168°F.

High Temp. - Starts to open at 177° to 182°F.

Water Pump: Packless, sealed ball bearing type.

See "Cadillac" in Water Pump Section.

Pump Removal - Drain cooling system. Remove all belts. Disconnect throttle spring. Detach Power Steering pump and bracket assembly and secure to one side. Remove two remaining thermostat housing screws, housing and thermostat. Disconnect lower radiator hose and upper and lower heater hoses. Loosen clamp on transmission Oil Cooler hose. Remove remaining pump flange to cyl. block screws and remove Oil Cooler hose. On Air Cond. cars, remove two compressor mounting bracket screws from water pump flange. Loosen compressor support screw and move support away. Remove water pump and gaskets.

T mperature Gauges (Exc. Brougham): AC electric.

Dash Unit - AC No. 1513326.

Engine Unit - AC No. 1513130.

T mperature Gauge (Brougham): AC No. 1513301. Mechanical.

High Temperature Indicator (Brougham): Light on instrument panel controlled by thermal switch in left cylinder head. Light comes on when engine temperature reaches approx. 239°F.

HYDRA-MATIC DRIVE

"Jetaway". Four speed hydraulically controlled automatic transmission of same design as used on previous models.

►*WHISTLING AND/OR BUZZING NOISE CORRECTION: See "Dual-Coupling Hydra-Matic" in Transmission Section.*

►*PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION: See "Dual-Coupling Hydra-Matic" in Transmission Section.*

►*TESTING & TROUBLE SHOOTING: See "Dual-Coupling Hydra-Matic" in Transmission Section.*

Lubricati n - Check fluid level avery 2,000 miles, drain and refill every 12,000 miles or once a year. Use only Cadillac Hydra-Matic Fluid.

►*LUBRICATION CHANGE NOTE:* When vehicle is driven under heavy duty conditions (heavy city traffic, continuous mountain driving, prolonged driving during hot weather) it is advisable to drain and refill transmission at 6,000 mile intervals.

Capacity - 12 qts. (approximately). *NOTE* - The correct level is ¼" below the "Full" mark with transmission hot and engine running.

Checking Fluid Level - Run engine with selector lever in "N" (Neutral) or "P" (Park) position at 800 RPM for 1½ minutes to normalize temperature and to be sure coupling is full. Reduce engine speed to slow idle, clean dipstick and check fluid level. With engine running, add fluid through dipstick tube to bring fluid level to ¼" of "FULL" mark on dipstick. *NOTE* - From "LOW" to "FULL" mark on dipstick requires 1 qt. of fluid.

Throttle Linkage Adjustment: *See CARBURETOR above.*

►*OTHER HYDRA-MATIC SERVICE DATA: See "Dual-Coupling Hydra-Matic" in Transmission Section.*

UNIVERSALS

Mechanics. Needle bearing type. Three used with two piece propellor shaft and center bearing.

Propeller Shaft Center Bearing: *See "Propeller Shaft" in Cadillac Special Data.*

REAR AXLE

Own Make. Hypoid gear, semi-floating with Hotchkiss Drive.

See "Cadillac Hypoid" in Rear Axle Section.

►*REAR WHEEL BEARING OIL LEAK CORRECTION:* Check for rubber flashing or nick indicating defective "O" ring located between bearing and housing and replace if found defective.

►*OVERHAUL CAUTION:* Manufacturer recommends that Carrier Assembly be serviced by replacement. DO NOT disassemble this unit or attempt service work other than oil seal and universal joint replacement

Axle Identification - Gear ratio identified by number stamped on front face of carrier assembly at end of oil return passage. *NOTE* - Brougham rear axle assemblies further identified by letter "B" preceeding axle ratio number.

Series	Ratio	Mark
60,62 Exc.Eldorado & AC Cars	3.07-1	3
75,6278,6237S,60&62 With AC Ⓒ	3.36-1	6
86 Ⓒ	3.77-1	7
Brougham	3.36-1	B6

Ⓒ - Optl. on 60 & 62 without AC. Ⓒ - Optl. on 75.

►**Pinion Bearing Pre-Load Caution:** Must be adjusted each time pinion shaft nut loosened. *See "Cadillac Hypoid" in Rear Axle Section.*

Axle Shaft Removal: Remove wheel and take out screws holding brake drum on axle shaft flange and remove drum. Remove nuts and lockwashers from bolts holding bearing retainer and backing plate on axle housing, use Puller J-942-1 and Slide Hammer J-2619 to remove axle shaft.

►*CAUTION:* Use care not to damage axle shaft oil seal when sliding axle shaft out and do not disturb position of backing plate on housing.

C mmercial Cars -Remove wheel, remove nut and washer on end of shaft. Use Puller (Snap-On No. S4567 or similar five jaw type) to remove wheel hub and brake drum. Disconnect brake line. Take out retaining screws and remove dust shield (bearing retainer) and backing plate. Use Puller J-838 to pull axle shaft and bearing assembly out, using care not to damage oil seal in housing.

Differential Carrier Removal: Disconnect rear universal joint and remove lubricant from rear axle housing. Remove axle shafts (see above). Remove nuts and washers holding carrier to axle housing and remove entire assembly with gasket. *See "Overhaul Caution" above.*

Wheel Bearings: Sealed ball-bearing type.

►*CAUTION:* Check bearings for loss of lubricant when shaft removed. If bearings spin freely indicating loss of lubricant, replace bearings.

Pinion Bearing Preload Adjustm nt: Pinion should be adjusted whenever nut on end of pinion shaft disturbed (for universal joint yoke or oil seal replacement).

See "Cadillac Hypoid" in Rear Axle Section.

SHOCK ABSORBERS

Delco. Direct acting permanently sealed airplane type.

(Brougham) - Mounted in tower on frame crossmember (front), lower end attached to bracket at rear edge of lower suspension arm (rear).

(Others) - Located within coil springs (front), "Sea-Leg" type installation (rear).

Shock Abs rbers

Series	Ⓒ Fr nt	Ⓒ Rear
60S, 62	5535529	5535530
75, 86	5535531	5535532

Ⓒ - Cadillac part numbers.

FRONT SUSPENSION
(Exc. Brougham)

Independent type with direct acting shock absorbers within coil springs.

See "Cadillac" in Suspension & Wheel Alignment Section.

Steering Axis Inclination - 4°

Caster - 0° to Neg. 1°. Adjustment must be equal within ½° or less on both sides of car.

Camber - Neg. 3/8° to Pos. 3/8° with ¼-½° more positive camber on left side.

Toe-In - 3/16-1/4" (standing). Loosen clamp bolts, turn adjusters at outer end of each tie rod equally.

►*TIE ROD PRODUCTION CHANGE & CAUTION:* New tie rod entered production with Engine No. 023831 requires accurate positioning of sleeve clamps to eliminate interference with frame. All cars after Engine 023830 should have openings in clamps d wn and clamp bolts parallel with ground.

Toe-Out on Turns - With outer wheel turned 20°, inner wheel should be 22°40'.

FRONT SUSPENSION
(Brougham)

Independent type with direct acting shock aborbers with "Air Suspension" in place of coil springs.

See "Cadillac" in Suspension & Wheel Alignment Section.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Steering Axis Inclination - 4°.
Caster - 0° to Neg. 1°. Adjustment must be equal within ½° or less on both sides of car.
Camber - Neg. 3/8° to Pos. 3/8° with ¼-½° more positive camber on left side.
Toe-In - 1/8" ± 1/32" (standing). Loosen clamp bolts, turn adjusters at outer end of each tie rod equally.

►*TIE ROD PRODUCTION CHANGE & CAUTION:* New tie rod entered production with Engine No. 023831 and requires accurate positioning of sleeve clamps to eliminate interference with frame. All cars after Engine 023830 should have openings in clamps **down** and clamp bolts parallel with ground.

STEERING

Power Steering: Saginaw (In-Line) Hydraulic. Hydraulically operated in-line power steering gear which combines the recirculating ball type gear with a concentric hydraulic booster.
See "Saginaw (In-Line) Power Steering" in Steering Sect.

►*FRONT TIRE RUB CORRECTION:* Reposition stabilizer bar to center it. If tires still rub stabilizer bar, install new type Steering Knuckle Stop Part No. 1468700 on each side. The stop is "U" shaped metal stamping attached to lower suspension bar by the rear outer spherical joint attaching bolt.

Steering Linkage: *See "Steering Linkage" in Steering Section.*
Steering Wheel & Horn Button Removal: *See "Saginaw (In-Line) Power Steering" in Steering Section.*
Steering Gear Removal: *See "Saginaw (In-Line) Power Steering" in Steering Section.*

BRAKES

Bendix (Hydraulic) Single Anchor (Without Eccentric). Conventional two shoe. Parking brake applies rear wheel service brakes.
See "Bendix Hydraulic Single Anchor (Without Eccentric)" in Brake Section.

►*BRAKE SPRING SILENCER NOTE:* Brake Drum Silencer Spring discontinued with Engine No. 012025 as unnecessary with improvements in brake assemblies.

►*BRAKE SQUEAK CORRECTION:* 1) Replace Washer Part No. 5456106 (if perfectly flat). This washer must flex into face of star wheel as brakes are applied. 2) Increase clearance (for adjuster in brake shoe web to eliminate bind) by filing the brake shoe web.

Drums - Diameter 11.995-12.005". **Out-of-Round Limit (I.D.)** - (62,60S) .007" (front & rear), (75,86) .007" front, .006" rear. Regrinding limits 12.060".
Wheel Cylinder Diameter - 1 1/8" front, 1" rear.
Lining: Molded type riveted to shoes. Primary shoe lining has ½" wide circumferential groove 1/8" deep full length.
Replacement Linings - Furnished in Standard size only.

Lining Length & Width

Model	Primary	Secondary
62,60S (front & rear)	10.12" x 2½"	12.98" x 2½"
75,86 (front & rear)	12.98" x 2½"	12.98" x 2½"

Thickness - ¼" All.
Braking Power - (62,60S,75) 55.8% front, 44.2% rear. (86) 52.8% front, 47.2% rear.
Clearance - .010" (top), .015" (bottom). Adjusting screw backed off 14 notches from point where wheel can just be turned by hand.
Standard Master Cylinder: Located on left frame side member.
Checking Fluid - Master cylinder reservoir located on left front fender apron adjacent to Hydrovac Power Unit. Fill to within ¾" of top.
Removal - Remove heat guard. Disconnect outlet fitting and brake filler tube fitting. Disconnect pedal to relay rod from relay by removing snap ring and retainer. Remove screw securing master cylinder to frame and disconnect pedal from actuating arm and remove master cylinder.
Power Brakes: Hydrovac Power Unit. Used with standard master cylinder.
See "Hydrovac Power Unit" in Brake Section.

►*HYDROVAC BRAKE CONTROL VALVE AIR SEAL PRODUCTION CHANGE & CAUTION:* Effective with engine No. 025800 Hydraulic Control Valve Air Seal reversed to assist hydraulic seal in prohibiting brake fluid from being drawn into vacuum side of system and into intake manifold. If above difficulty experienced on early cars, reverse Air Seal as described above.

►*POWER BRAKE BUZZING NOISE CORRECTION:* Air in fluid at control valve assembly causes valve vibration when brakes are released or applied, causing buzzing noise. To correct bleed system, especially at fitting above control valve assembly. Repeat if necessary. If correction NOT permanent, check for air leaks into fluid at master cylinder, wheel cylinders or within power unit itself.

►*HYDROVAC POWER BRAKE HYDRAULIC CYLINDER SEAL NOTE:* Hydraulic cylinder secondary seal Part No. 2248162 (In late repair Kit No. 1467730 or order separately) incorporated in power brake unit on late production cars to eliminate possibility of brake fluid leakage between cylinder and end plate. Seal is located under hydraulic cylinder lock nut. Install this seal on early production cars for correction of leaks in this area.

Removal of Power Unit - Disconnect filler tube, vacuum inlet, hydraulic inlet and outlet fittings and cap lines. Remove four bolts securing unit to cowl and remove unit.

MISC. MECHANICAL

Windshield Wipers: Cable operated - Vacuum type.
See "Windshield Wipers" in Miscellaneous Section.
Trunk Lid Lock: Trunk lid electric lock operated by switch in glove compartment.
See "Cadillac Rear Comprtment Lid Lock" in Misc. Sect
Trunk Lid Control (Brougham): Reversible electric motor operating a jack screw and limit switches which control opening and closing of the trunk lid.
See "Eldorado Brougham Lid Lock" in Miscellaneous Section.
Power Window Regulators: Electric, with reversible motor in each window.
See "Electric Window Regulators" in Miscellaneous Section.
Power Top Control: Hydro-Lectric with "sealed" system which does not require periodic draining and refilling.
See "Top Controls" in Miscellaneous Section.
Door Lock (Eldorado Brougham): Front door lock solenoid controlled by switch in each door. Rear door lock solenoid controlled by neutral switch (that causes inside handle to free wheel), plus a safety interlock switch which controls interlock solenoid which prohibits transmission selector lever from moving into drive position with either rear door open.
See "Eldorado Brougham Door Locks" in Miscellaneous Section.
Power Seat Adjusters (2-Way): Electric type with single reversible type motor for horizontal adjustment.
See "GM 2-Way Seat Regulators" in Miscellaneous Section.
Power Seat Adjusters (6-Way): Electric type with single adjustable motor. *See "GM 6-Way Seat Regulators" or "Eldorado Brougham Seat Regulators" in Misc. Sect.*
Air Conditioning: Frigidaire & Harrison, with magnetic compressor clutch (compressor operates only with switch "ON").
See "Frigidaire & Harrison (GM) Air Conditioning" in Miscellaneous Section.

TIGHTENING SPECIFICATIONS

	6 Cyl. Ft. Lbs.	V8 Ft. Lbs.
Cylinder Head	90-95	60-70
Intake Manifold	① 15-20	25-35
Exhaust Manifold	①15-20	25-35
Oil Pan	② 12 1/2-15	②12-15
Main Bearing Caps	100-110	60-70
Flywheel	50-65	55-65
Con Rod Caps	35-45	30-35
Rocker Arm Support Bracket	25-30	
Rocker Arm Cover		2 1/2
Engine Front Cover	6-7 1/2	6-8
Clutch Housing	45-55	25-35

①—Tighten two end clamp bolts to 25-30 ft lbs.
②—Corner bolts Tighten other flange bolts to 6-7½ lbs. (6 Cyl.), 6-9 lbs. (V8).

ENGINE

6 CYL. PASS. CARS

ENGINE REMOVAL: Drain cooling system, crankcase, and transmission and proceed as follows

1) Scribe alignment marks on hood around hood hinges Disconnect right hand headlamp, parking lamp, and horn wires and remove wires from radiator core support brace. Remove both horns. Remove radiator hoses and heater hoses on models so equipped On Powerglide models, remove and plug oil cooler lines.

2) Remove radiator core support to fender bolts, core support to fender side baffle bolts and core support to front cross member bolts. Remove radiator core and core support Remove battery, battery support and battery cables.

3) Disconnect starter and generator wires, engine to body ground strap, oil pressure indicator wire at switch on block and coil primary lead at coil Remove windshield wiper motor Remove temperature indicator element from cylinder head Remove air cleaner

4) Disconnect gasoline feed pipe from fuel pump and disconnect vacuum lines at intake manifold Remove exhaust pipe to manifold bolts. Disconnect carburetor control rod from dash panel bell crank. Remove transmission control rods. Remove clutch control bellcrank and control rods on conventional transmission models On overdrive models, disconnect overdrive wires and cables. On Powerglide models, remove oil filler tube and plug opening

5) Disconnect speedometer cable at transmission Split universal joint Remove propeller shaft. Remove rocker arm cover and install lifting hooks from Kit J-4536 in cylinder head bolt holes. Raise engine slightly and remove all four engine mounts Remove the engine and transmission from chassis as a unit.

V8 PASS. CARS

ENGINE REMOVAL· Drain cooling system, crankcase, and transmission and proceed as follows

1) Scribe alignment marks on hood around hood hinges and remove hood from hinges Remove radiator hoses and heater hoses Remove radiator core support to core bolts and shims On Powerglide & Turboglide cars remove and plug oil cooler lines Remove radiator core

2) Remove battery, battery support and battery cables. Disconnect starter and generator wires, engine to body ground strap, oil pressure indicator wire at switch on block and coil primary lead at coil

3) Remove windshield wiper motor. Remove temperature indicator element from cylinder head. Remove air cleaner, fan blade and pulley Disconnect gasoline feed pipe from carburetor and vacuum lines from intake manifold Remove distributor and coil Disconnect carburetor control rod from dash panel bell crank

4) Disconnect exhaust cross over pipe from exhaust pipe and muffler assembly Remove transmission control rods Remove clutch bell crank and control rods on conventional transmission models On Overdrive models, disconnect overdrive wires and cables On Powerglide & Turboglide cars remove oil filler tube, plug opening and disconnect oil cooler lines Disconnect speedometer cable at transmission

5) Split rear universal joint and remove propeller shaft Remove choke heat tube and rocker arm cover and install two eye bolts and spacers from Kit J-4536-A in cylinder head bolt holes. Raise engine slightly and remove all four engine mounts Remove engine and transmission from chassis as a unit, tilting engine to clear radiator core support

6 CYL. TRUCKS

ENGINE REMOVAL (6 CYL. TRUCKS): Drain cooling system, crankcase, and transmission, then proceed as follows·

1) Disconnect hood springs and hinges, remove hood. Remove radiator support bracket-to-fender bolts, support-to-frame crossmember bolts, then remove radiator and support.

2) Remove battery cable and ammeter wire from starter switch terminal. On vehicles with push-button starter, remove battery cable and ammeter wire from large terminal on solenoid and starter switch wire from small terminal (tape end of battery cable to prevent shorting).

3) Disconnect coil lead from distributor terminal and pull coil high tension wire from center of distributor cap. Remove two coil mounting screws and lay coil with wires attached on dash. Disconnect engine ground strap from frame, gasoline line from fuel pump, generator and field wires from generator.

4) Remove air cleaner and disconnect choke and throttle control cables from carburetor (when used). Remove temperature indicator element from cylinder head and disconnect oil pressure line at cylinder block.

5) Disconnect windshield wiper and Hydrovac vacuum lines (if so equipped). Remove exhaust pipe flange-to-manifold bolts. Remove starter pedal, then remove accelerator pedal from accelerator rod (if so equipped).

6) One ½ and ¾ Ton with conventional transmission, remove control rods from bellcrank on left side of clutch housing. On automatic transmission models, disconnect transmission control and throttle linkage rods from transmission. On 1 Ton models, remove coolant line clips from dash and frame panels. On other models, remove floor mat and transmission floor pan cover.

7) On 1 Ton models, remove cotter key and pin attaching parking brake pull rod assembly to parking lever. On 1½ and 2 Ton models, disconnect parking brake lever return spring from brake operating lever and remove cotter key and pin attaching inner and outer levers to parking brake operating lever.

8) On 1, 1½, and 2 Ton models, remove transmission cover with parking and gearshift lever. Place piece of cardboard on top of transmission to prevent dirt falling in during removal.

9) Disconnect speedometer cable from transmission and clutch link-to-pedal arm (if so equipped). Remove propeller shaft.

10) Remove rocker arm cover, rocker arm attaching bolts, rocker arm, shaft assembly and pushrods.

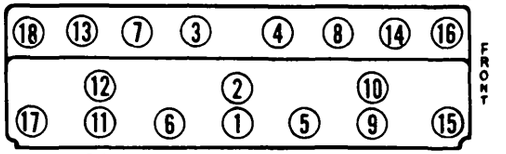
11) With Lift Kit J-4536-A, raise engine slightly, remove all four engine mounts and raise engine and transmission from chassis as a unit. Remove crankcase ventilator pipe, then remove starting motor, generator and fan belt.

V8 TRUCKS

ENGINE REMOVAL (V8 TRUCKS): Same as V8 Pass. Cars except as follows Remove windshield wiper motor Disconnect Hydra-Matic oil cooler and plug the openings. Remove propeller shaft.

ENGINE MOUNTINGS

PASS. CARS & TRUCKS



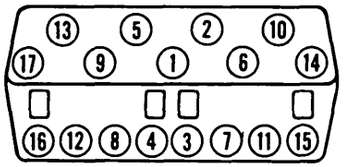
ENGINE MOUNTING REPLACEMENT: (Front Mounts)— Remove top and bottom stud nuts and remove washer and cushion between each nut and the cross member or engine bracket Raise front of engine (On V8 models, remove the distributor cap before raising engine). *CAUTION—Raise engine only far enough for clearance.* Replace necessary cushions

Rear Mounts· Support engine weight to relieve rear mounts Remove mount attaching bolts from frame outrigger and flywheel housing (or Powerglide Transmission) and remove support Install new support and bolts and tighten securely with engine weight resting on mounts

CYLINDER HEAD & MANIFOLD

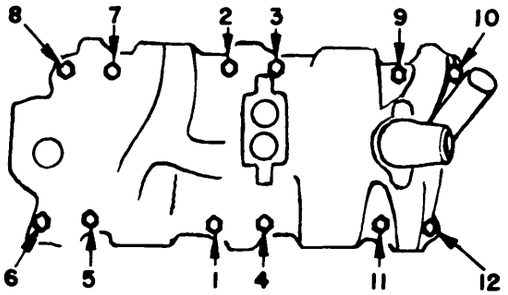
ALL ENGINES

CYLINDER HEAD INSTALLATION (6 CYL. ENGINES): Use torque indicating wrench to tighten cylinder head capscrews in correct sequence as shown in diagram



CHEVROLET 6 CYL CYLINDER HEAD

CYLINDER HEAD INSTALLATION (V8 ENGINES): Coat steel head gasket with a good head gasket paste and install gaskets in position on cylinder block Install heads over dowels in block Coat threads of all bolts with Permatex No 3 (head bolts protrude into water passages) Use a torque indicating wrench and tighten bolts a little at a time to 60-70 ft lbs in the sequence shown in diagram



INTAKE MANIFOLD INSTALLATION (V8 ENGINES): Install manifold end gaskets on cylinder block Coat ends of intake manifold side gaskets around water passages with a good sealing compound and install heads Tighten bolts a little at a time to 25-35 ft. lbs torque

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

CHEVROLET V8 CYLINDER HEAD

CHEVROLET V8 INTAKE MANIFOLD

PISTON PINS

V8 ENGINES

PISTON PINS (V8 ENGINES): Removal - Install pilot of Tool J-5538 (see alteration note below for 1957 283" Engine), plus adapter tool 5538-9 (265" engine), on puller screw, with pilot, through piston and pin. Install tool support over threaded end of puller screw with small end of support against piston. Install nut loosely on puller screw and place assembly in arbor press so that pin can be pressed out through support.

► *1957 283" ENGINE TOOL J-5538 ALTERATION NOTE:* Tapered end of support must be cut back at smaller angle to centerline of support to avoid breakage of bottom piston ring land.

Installati n: Lubricate pin holes and position connecting rod in its respective piston so that flange or heavy side of rod at bearing end will be toward **front** of piston (cast depression in head of piston and "F" marks on piston struts) on #1-#3-#5-#7 pistons and rod flange to **rear** of piston on #2-#4-#6-#8 pistons. Install piston pin on puller screw and pilot on screw. Install puller screw through piston and rod, indexing pilot through piston and rod. Install support over threaded end of puller screw with small diameter toward piston. Install nut on puller screw and tighten with a torque wrench to start piston pin into connecting rod *(CAUTION–If pin can be started into connecting rod with l ss than 15 ft. lbs. torque, clearance is excessive).* Install in arbor press and press piston pin in until pilot bottoms in support to properly position pin in rod.

CRANKSHAFT & MAIN BEARINGS

ALL ENGINES

6 CYL. & V8 MAIN BEARING REPLACEMENT (With Engin in Car): Upper bearing halves can be "rolled" out for replacement. Proceed as follows:

1) Remove spark plugs and remove engine oil pan. Remove bearing cap and bearing shell.

2) Install main bearing shell removing and installing tool (or use a cotter pin bent as required). Rotate crankshaft in direction of usual rotation and roll upper bearing shell out of engine.

3) Oil new bearing shell and insert plain (un-notched) end of shell between crankshaft and block on the indented or notched side. Rotate bearing into place. Install new bearing shell in bearing cap.

REAR MAIN BEARING OIL SEAL (6 CYLINDER ENGINE): Remove rear main bearing cap and remove old seal from groove. Insert new packing in bearing cap and roll firmly into place with a rounded tool (roll from both ends toward center). Use a round block of wood, same diameter as crankshaft flange, to hold packing in place. Cut off both ends of packing evenly and flush with bearing cap face. Install upper half of seal in crankcase in same manner, with engine out of car.

REAR MAIN BEARING OIL SEAL (V8 ENGINE): Remove rear main bearing cap and remove old seal from groove. Insert new seal in groove with fingers, and then with Tool J-5788 (Oil Seal Installer), and a hammer, pound seal firmly into groove. Cut the small portion of the seal that protrudes from groove flush with surface of bearing cap. Replace upper half of seal in crankcase in same manner, with engine out of car.

VIBRATION DAMPENER

6 CYL. ENGINES

VIBRATION DAMPENER (6 CYL. ENGINE): Removal– Remove radiator. On Powerglide models, remove oil cooler lines and plug outlets, Remove fan belt and install Puller J-1287-B and pull dampener assembly from crankshaft.

Installation: Remove puller and install two 3/8"-16 x 1" (16 thread) capscrews in dampener to support wheel portion during installation. Position dampener on crankshaft with key and keyway on alignment and drive dampener on shaft until it bottoms against crankshaft gear. Use a heavy hammer and bar through the grille, taking care that a straight installation is made. Remove the two capscrews previously installed. Install radiator.

V8 ENGINES

VIBRATION DAMPENER (8 CYL. ENGINE): Removal - Remove radiator hoses, on Powerglide and Turboglide models disconnect cooler lines from radiator core, and remove radiator core. Note spacer shims if any. Remove fan belt, fan and pulley. Install Tool 1287 and remove harmonic balancer.

Installation - Install two 3/8"-16 x 1½" capscrews to hold hub and flywheel portion of dampener together during assembly. Coat cover seal contact on dampener with engine oil and position dampener on crankshaft. Use Tool J-5590 and drive dampener on shaft until hub bottoms on timing sprocket. Remove the two screws installed previously and install pulley, fan, and fan belt. Install radiator.

ENGINE FRONT COVER

ALL ENGINES

FRONT OIL SEAL INSTALLATION: Pry old seal out of front cover. Install new seal so that open end of seal is toward inside of cover and drive it into position with Oil Seal Driver J-996. *CAUTION–Support cover at sealing area while installing seal.*

CAMSHAFT & BEARINGS

6 CYL. ENGINES

CAMSHAFT REMOVAL & INSTALLATION: Remove rocker arm and pushrod covers. Remove rocker shaft assembly, pushrods and valve lifters. Remove timing gear cover attaching screws and two bolts that are installed from back through front main bearing cap, remove cover and gasket. Pull crankshaft gear with Puller T-126-R. Remove two camshaft thrust plate screws by working through holes in camshaft gear. Remove camshaft and gear assembly by pulling it through front of block *(CAUTION-*Support shaft carefully to avoid damage to camshaft bearings). To install camshaft, reverse removal procedures.

6 CYL. CAMSHAFT BEARING REPLACEMENT: Use Bearing Remover & Replacer J-6356. Install No. 1 and No. 2 bearings first, then rear two bearings. *(CAUTION* –Align oil holes in bearings with oil holes in block before pulling into place), Install plug flush to 1/32" deep from clutch housing face of case.

Reaming: Special reamer with four cutters on one bar recommended by car manufacturer (for proper alignment). Insert reamer through #1, #2, & #3 bearings. Start reamer cutter in all four bearings at the same time (wash metal cuttings away with a liberal supply of kerosene while reaming), turn reamer slowly until cutters pass through bearings. Remove reamer by rotating in same direction as when reaming bearings and withdraw from engine. Bearing cuttings must be blown out with compressed air. Install camshaft and check bearing clearances with narrow feeler gauge. Clearance should be .0015-.0035". Install expansion plug to rear of rear bearing.

V8 ENGINES

CAMSHAFT REMOVAL & INSTALLATION: Remove rocker arm covers and intake manifold. Back off rocker arm nuts until arms may be pivoted away from pushrods. Remove pushrods and valve lifters. *NOTE* - Keep pushrods and lifters so that they can be returned to original positions. Remove fuel pump and fuel pump pushrod. Remove grille assembly. Drain radiator and remove oil cooler lines from core (cars with Powerglide or Turboglide). Remove radiator core, note shims if any. Remove fan belt, fan and pulley. Remove harmonic balancer with Tool J-1287-B. Remove water pump and oil pan. Remove front end cover and gasket. Align timing marks on sprockets, remove three camshaft sprocket bolts and remove camshaft sprocket and timing chain together. *NOTE* - Tap sprocket with plastic faced hammer lightly to dislodge sprocket. Install two 5/16"-18 x 4" bolts in two of the camshaft bolt holes and withdraw camshaft from engine. *CAUTION* - Camshaft journals are the same size and care must be exercised to avoid damage to bearings. To install camshaft, reverse removal procedure.

V8 CAMSHAFT BEARING REPLACEMENT: Use Bearing Remover & Replacer J-6356. Remove bearing nearest center of block first, then No. 2 and No. 4 bearings, and finally front and rear bearings (with this sequence

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

minimum number of turns are required to locate Remover & Replacer for removal of next bearing). When installing, install No. 1 or front bearing first. This bearing will act as guide for tool and center the No. 2 and No. 3 bearings being pulled into place. *(CAUTION*–Use care when installing rear bearing due to smaller size of oil pressure holes in rear bearing. When installing end plug, install flush to 1/32" deep to maintain level surface on rear of cylinder block).

TIMING GEARS

6 CYL. ENGINES

REPLACEMENT TIMING GEARS: Fibre type camshaft gear and steel crankshaft gear used on passenger cars. Aluminum camshaft gear and steel crankshaft gear used on trucks.

TIMING GEAR INSTALLATION: Gears are press fit on crankshaft and camshaft and must be removed and installed as follows

Crankshaft Gear–To remove gear, attach Puller T126-R by threading puller screws in tapped holes in gear, pull gear off. When installing gear, make certain that two woodruff keys installed in crankshaft keyways, drive gear on shaft until it seats against shoulder on shaft

Camshaft Gear–To remove gear, install Gear Remover J-971 on shaft in back of gear (remover consists of support sleeve), place camshaft assembly in arbor press *(CAUTION*–Thrust plate must be positioned so that it will not be damaged by woodruff key in shaft as shaft pressed out), press shaft out of gear. To install gear, place shaft in arbor press (support shaft securely directly back of front bearing journal), install gear spacer ring and thrust plate over end of shaft, and install woodruff key in shaft keyway. Install camshaft gear and press it on shaft until it bottoms against the gear spacer ring. End clearance of thrust plate should be 001- 003" Install the camshaft assembly in engine block, being careful not to damage bearings or cams. With crankshaft installed turn camshaft and crankshaft so that valve timing marks on gear teeth will line up, then push camshaft into position. Install camshaft thrust plate-to-block screws and tighten securely. Camshaft and crankshaft gear runout should not exceed .004" for camshaft and .003" for crankshaft. Backlash between timing gear teeth should not be less than .004" nor more than .006". *CAUTION*–Press on hub only when installing camshaft gear.

TIMING CHAIN

V8 ENGINE

TIMING CHAIN: Removal–Remove vibration dampener, timing chain cover, and oil slinger. Rotate engine until timing marks on sprockets are in alignment and adjacent Remove three camshaft sprocket screws and remove camshaft sprocket and chain together

Installation: Install chain on camshaft sprocket. Hold sprocket vertical with chain hanging below, and line up 'O' timing marks on both sprockets so they are adjacent and in line with a straight edge across shaft centers. Align dowel in camshaft with dowel hole in sprocket and install sprocket on camshaft. Draw camshaft sprocket onto shaft using the three mounting bolts. Tighten to 15-20 ft. lbs. *CAUTION–Do not attempt to drive sprocket onto shaft as welch plug at rear of engine can be dislodged.*

VALVE SYSTEM

ALL ENGINES

ENGINE NORMALIZING PROCEDURE (For Valve Tappet Clearance Adjustment): Clearance changes while engine is warming up. Adjust only after engine has been 'normalized' as follows· Run engine at 600 RPM and check oil temperature with thermometer at overflow pipe on valve rocker arm shaft connector until no change noted in oil temperature for a period of five minutes (oil temperature will become stabilized at some point between 150° and 225°F). This normalizing period will be from 5 to 30 minutes depending on engine temperature when started.

VALVE TAPPET ADJUSTMENT

6 CYL. & V8 ENGS. WITH HYDRAULIC LIFTERS

NOTE–Required when cylinder head has been removed or when rocker arm or valve assemblies have been replaced.

6 Cylinder Engines: The hydraulic lifters must be at the lowest point of travel when adjusted (piston in firing position). Remove distributor cap and turn engine until rotor is in firing position (points just breaking) for cylinder being set. Starting with #1 cylinder, turn valve adjusting screw down until rocker arm just contacts valve. This can be determined by checking push rod side play at adjusting screw end while turning the adjusting screw. At the point where no side play can be felt, continue turning the adjusting screw down 1-1/2 turns and tighten lock nut securely. Adjust each cylinder following the same sequence as the firing order (1-5-3-6-2-4).

V8 Engines: With No. 1 Cyl. at TDC firing position, adjust Exhaust valves 1-3-4-8, Intake valves 1-2-5-7 by backing off the adjusting nut on rocker arm until there is play in valve push rod, then tighten adjusting nut to just remove all push rod-to-rocker arm clearance, **then tighten adjusting nut an additional 3/4 turn** to place hydraulic lifter in center of its travel. Crank engine one revolution so that #6 cylinder is in firing position, and then proceeding as above, adjust Exhaust valves 2-5-6-7, and Intake valves 3-4-6-8.

VALVE STEM OIL SEALS

6 CYL. ENGINES

VALVE STEM OIL SEAL INSTALLATION: Seal consists of synthetic rubber ring installed in second groove of valve stem directly under valve locks on all valves. When assembling valves, install seal as follows· Install valve spring and spring retainer on valve stem, compress spring until lower groove on valve stem is exposed, install seal in this groove *(CAUTION* - Seal must seat flat in groove and not be twisted). Install valve locks in upper groove in valve stem, relieve spring tension, check to see that seal is properly retained in spring retainer and that locks are engaged.

V8 ENGINES

VALVE STEM OIL SEAL INSTALLATION: Two seals used as follows 1) Cup shaped cap or shield installed over upper end of valve spring (retained by spring retainer) and 2) synthetic rubber ring installed in second groove of valve stem directly under valve locks These seals used on all valves Install as follows

Oil Shield (Exc. Hi-Lift Camshaft Engin s) - Install shield on top of valve spring with cupped side down over spring before installing spring retainer

Oil Stem Seal - Install in same manner as seal on 6 cyl engines (above)

VALVE GUIDES

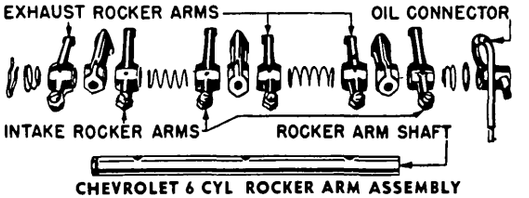
6 CYL. ENGINES

VALVE GUIDE INSTALLATION (6 CYL. ENGINES): Install guides to proper position in head with the following special tools (see table below for correct height of guide above machined surface of cylinder head). Use Valve Guide Driver J-5599 to install exhaust valve guides and Driver J-5598 to install intake valve guides. After guides installed, ream to .343".

Valve Guide Installati n H ight

Engine	Intak	Exhaust
235" & 261"	1"	15/16"

ROCKER ARMS



6 CYL. ENGINES

ROCKER ARMS (6 CYL. ENGINES): Diamond bored and "granodized" (no bushings) and fit directly on rocker arm shafts. Different rocker arms used as follows:

Rocker Arm Id ntificati n

Type & No. ©	Cylinder	Part N .
L H Intake (5)	2-4-6	3837029
R H Intake (6)	1-3-5	3837030
L H Exhaust (7)	1-3-5	3837031
R H Exhaust (8)	2-4-6	3837032

© - Indicated identification number cast on arm

CHEVROLET 6 CYL ROCKER ARM ASSEMBLY
(REAR ASSY. SHOWN—FRONT ASSY. SIMILAR)

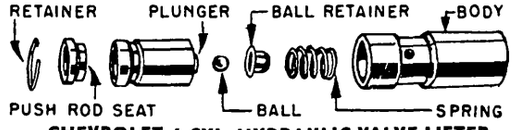
Installation: Assemble rocker arms as indicated in illustration with open end of shaft toward center, and baffle in rear shaft open end in vertical position.

V8 ENGINES

► *1957 ROCKER STUD REPLACEMENT NOTE:* Replacement Rocker Studs now furnished for service are 2.50" long (shorter than 1956 studs which were 2.70" long) and must be installed with NEW Tool 6880. *CAUTION* - DO NOT attempt to install 1956 type stud (2.70" long) with Tool 6880 as stud will break through cylinder head.

ROCKER ARM STUD REPLACEMENT (V8 ENGINES): *See Note above.* Replacement studs furnished .003" Oversize (No. 3747003) & .013" Oversize (No.3747001). **Rem val** - Remove old stud by placing Spacer J-5802 over stud, adding flat washer and nut, and turning nut down to pull stud out of head.

CONTINUED ON NEXT PAGE



CONTINUED FROM PRECEDING PAGE

Installati n - Ream stud hole for correct oversize stud using Reamer J-5715 for .003", J-6 036 for .013" oversize. Coat press-fit area of stud with hypoid lubricant and use NEW Tool 6880 to drive stud in head (tool will position stud to correct height of 1.36"). *CAUTION* - Use Tool 6880 only with 1957 type 2.50" long studs.

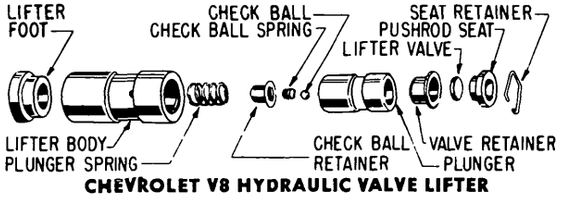
HYDRAULIC LIFTERS
6 CYL ENGINES

HYDRAULIC VALVE LIFTERS Barrel type consisting of plunger and valve assembly operating within a cyl inder formed by valve lifter tappet or body (see illustration) Oil is introduced to this unit through oil gal lery in block

R moval Remove rocker arm assemblies pushrod cover pushrods and valve lifters *NOTE* - Keep valve lifters and pushrods in order so they may be returned to original positions

CHEVROLET 6 CYL. HYDRAULIC VALVE LIFTER

Disassembly Hold assembly down with a pushrod and remove plunger retainer pushrod seat plunger ball check valve ball retainer and spring Clean all parts in solvent and inspect each part for nicks or burrs and wear Replace lifter assembly if any parts damaged or show excessive wear



Reass mbly Invert plunger and place spring over it Assemble lifter body over the complete assembly with holes in lifter body and plunger lined up Turn assembly over and fill with SAE 10 oil insert Tool 4274 into plunger and force down to insert pin through lifter body and plunger and remove tool Fill assembly with SAE 10 oil and install pushrod seat and spring retainer Press down on seat and remove pin

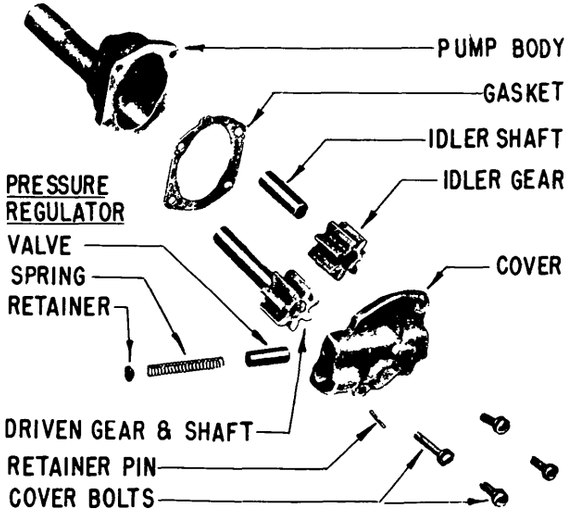
V8 ENGINES

HYDRAULIC VALVE LIFTERS: Barrel type consisting of lifter body pushrod seat inertia valve check ball ball retainer pushrod seat retainer plunger and plung er spring Oil is supplied under pressure from main oil gallery line

R moval Remove rocker arm covers intake manifold back off rocker arm nuts until arms may be pivoted away to remove pushrods Remove hydraulic lifters

Disassembly: Hold plunger down and remove retainer Remove pushrod seat inertia valve and valve retainer Remove plunger with check ball check ball spring, check ball retainer and retainer spring from lifter body Invert lifter body and remove lifter body foot

CHEVROLET V8 HYDRAULIC VALVE LIFTER



R ass mbly: Insert check ball in plunger with check ball spring retainer and retainer spring While holding in this position install lifter body over plunger assembly and insert lifter body foot in body Turn assembly over and place lifter valve retainer in plunger drop inertia valve in retainer insert pushrod seat in retainer De press plunger in body and insert pushrod seat retainer *NOTE* - Fill lifter body and plunger with SAE 10 oil before installing inertia valve retainer valve and pushrod seat

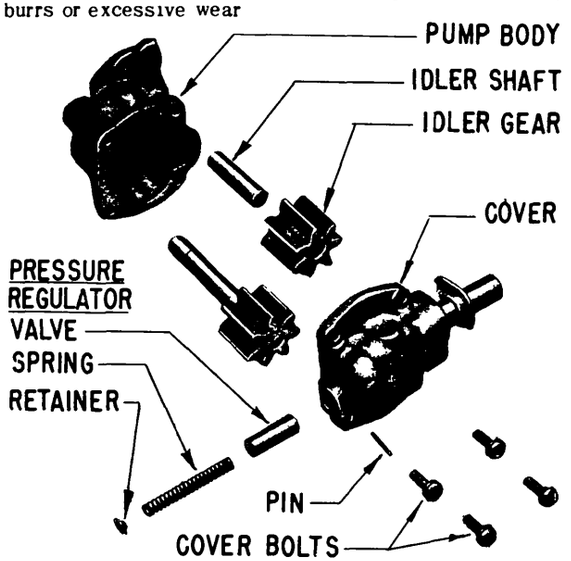
OILING SYSTEM
6 CYL. ENGINES

OIL LEAD TO VALVE ROCKER ARMS (6 CYL. ENGINES): Rocker arm shaft oil line pipe extends forward to push rod compartment from a fitting in tappet ledge just above rear camshaft bearing, to center of engine then upward to a fitting between the hollow rocker arm shafts To replace this pipe, cut a new pipe to proper length, install new nipples at each end and install pipe to cylinder block fitting, then bend pipe to contour so that clearance is provided for the push rods and push rod cover and so that end of pipe extends straight up for cylinder head lubrication

OIL PUMP
6 CYL. ENGINES

6 CYL. OIL PUMP (Removal & Disassembly): Drain oil, remove oil pan and disconnect oil pump-to-block oil line Remove oil pump retaining sleeve lock screw and remove oil pump and oil pump-to-block oil line Remove pressure oil line from pump and remove pump cover attaching screws, cover, gasket, idler gear and drive gear and shaft Remove regulator valve pin and valve parts. Remove intake pipe and fixed screen as an assembly. Wash all parts in solvent and inspect pump body for cracks or excessive wear. Check shaft for looseness in housing and gear and cover for wear.

CHEVR LET 6 CYL. OIL PUMP



Ass mbly Install drive gear and shaft in body Install idler gear with smooth side toward cover. Install cover and new gasket Tighten screws securely and check to see that shaft turns free Install pump oil line to pump, leaving it loose

Installation Install pump in block and align oil lines and install retaining sleeve lock screw and tighten securely *(CAUTION*–Make sure tapered end of lock screw draws down into hole in oil pump body) Tighten oil pump-to-block oil line and pump-to-screen oil line connector nuts securely. Replace intake pipe and screen.

► *NOTE* Oil pump pickup pipe should be installed with pickup pipe screen horizontal and toward bottom of oil pan

V8 ENGINE

V8 OIL PUMP (Removal): Drain oil remove oil pan pump-to rear main bearing cap bolt and remove pump Remove extension shaft clip and extension shaft and collar Remove pump cover attaching screws cover, idler gear and drive gear and shaft *CAUTION - DO NOT DISTURB PICKUP PIPE IT IS LOCATED AT ASSEMBLY* If removed pickup pipe should be installed with pick-up screen horizontal and toward bottom of oil pan Wash all parts in solvent and inspect all parts for cracks, burrs or excessive wear

CHEVROLET V8 OIL PUMP

Assembly: Place drive gear and shaft in pump body and install idler gear so that smooth side of gear will be toward cover Install cover and attaching screws Tighten screws to 6-9 ft lbs and check to see that shaft turns freely Assemble collar end of extension shaft assembly over pump drive shaft aligning tang on extension shaft with slot in end of pump drive shaft In stall retaining clip with flat end of clip in groove of pump drive shaft

Installation: Assemble pump and extension shaft to rear main bearing cap aligning slot in top end of extension shaft with drive tang on lower end of distributor drive shaft Install pump to rear main bearing cap bolt and tighten to 45-50 ft lbs and install oil pan

MODEL IDENTIFICATION

Series	Model Designation Serial Prefix	Model
1500 ①	A	ONE-FIFTY
2100	B	TWO-TEN
2400	C	BEL-AIR
1508	D	SEDAN DELIVERY

① - Except Sedan Delivery.

SERIAL NUMBER: Stamped on plate attached to left front door hinge pillar post.

Starting Serial Number - 100001 (at each plant) for all models.

► *SERIAL NUMBER NOTE: Serial Number (example B57F100025) includes following identification information in sequence.*

Series ①	Year	Assy. Plant ②	Serial No.
B	57	F	100001

① - See "Serial Prefix" in Model Identification above.
② - See Assembly Plant Designation below.

Car Assembly Plant Designation

A - Atlanta	K - Kansas City	S - St. Louis
B - Baltimore	L - Los Angeles	T - Tarrytown
F - Flint	N - Norwood	W - Willow Run
J - Janesville	O - Oakland	

ENGINE NUMBER: Stamped on right side of engine block to rear of distributor.

► *ENGINE NUMBER NOTE: Engine Number (example T 101 A) includes following identification information in sequence:*

Plant ①	Month ②	Day ③	Engine Type ④
T	1	01	A

① - "F" Flint, "T" Tonawanda.
② - "1" (January) "2" (February), etc.
③ - "01" (First Day), "02" (Second Day), etc.
④ - See Model Type Designation below.

Model Type Designation

Equipment	Engine Number Suffix
3-Speed Trans.	A
Heavy Duty Clutch	AD
Powerglide	B

TUNE-UP

COMPRESSION PRESSURE: 130 lbs. minimum with all cylinders equal within 20 lbs. at cranking speed.

VALVE TAPPET CLEARANCE: None in service (hydraulic).

MANIFOLD HEAT CONTROL: Thermostatic type. Check for free operation. Should require ½ turn from unhooked to hooked position. *Distorted spring should be replaced.*

IGNITION

FIRING ORDER: 1–5–3–6–2–4.

SPARK PLUG GAP: .035".

Spark Plug - AC No. 44 (Std.). No. 45 (Hotter, for continuous City operation). C-43 COM (Colder, for continuous heavy duty service). 14mm. Tighten to 20-25 ft. lbs

COIL: Delco-Remy 1115087.

Ignition Current - 1.8 amps. idling, 4 amps. stopped.
Resistor - Delco-Remy 1931614. 1.40-1.62 Ohms.

► *COIL RESISTOR NOTE:* Resistor connected to ignition switch by two leads and is by-passed during cranking (second lead provides direct connection to coil when key turned to "Start Engine" position.

DISTRIBUTOR: Delco-Remy 1112403.

Condenser - Delco-Remy 1928111. **Capacity** - .18-.23 mfd.
Contact Point Set - Delco-Remy 1924571.
Breaker Gap - .016-.021" (new points), .0125-.0175" (used points).
Cam Angle - 28-35° with .016" gap.

► *BREAKER GAP CAUTION - Manufacturer recommends final check with feeler gauge or dial indicator if dwell meter used to set points.*

Breaker Arm Spring Tension - 19-23 ozs.
Rotation - Clockwise viewed from above.

Automatic Advance

Degrees Distr.	RPM	Degrees Eng.	RPM
0-2	375	0-4	750
4-6	700	8-12	1400
9-11	1350	18-22	2700
12-14	1750	24-28	3500

Octane Selector: Adjustment on distributor provides 10° spark advance or retard from center "0" position.

Vacuum Spark Control: Delco-Remy 1116089.

Vacuum Advance

Distr. Degrees	Eng. Degrees	Vacuum (" of HG)
Start	0	4-6
7.5	15	7.5-10

IGNITION TIMING

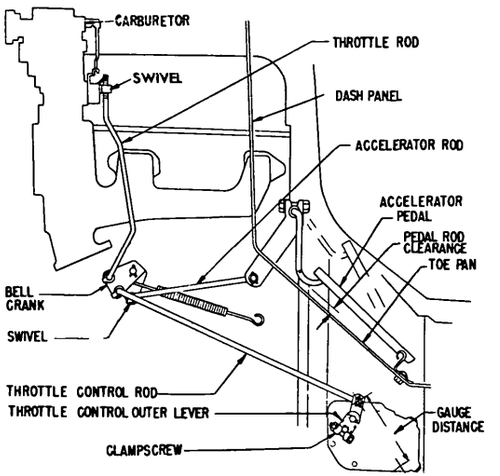
Setting - At TDC *Set timing at IDLE SPEED with vacuum line connected*

► *IGNITION TIMING PROCEDURE CHANGE: Previous recommendation of setting timing at 1000 RPM with vacuum line disconnected has been discontinued*

Timing Mark - Steel ball insert in flywheel lined up with pointer in inspection hole in right front face of housing with Octane Selector set on "0". Then adjust selector as follows:

Octane Selector Setting - Set for slight ping when accelerating with a wide open throttle.

CARBURETOR



THROTTLE LINKAGE ADJUSTMENT (POWERGLIDE CARS): Engine must be at normal operating temperature and transmission warm (choke valve wide open and fast idle inoperative with throttle stopscrew against low step of fast idle cam) when adjustments made.

1) Adjust engine idle speed to 425 RPM with selector lever in "D" (Drive) range (set hand brake firmly to hold car while making adjustments).

2) Disconnect control rod from throttle lever on transmission cover. Remove lower bolt at rear of transmission side cover. Rotate throttle valve control outer lever assembly counterclockwise to the open throttle position.

3) Hold lever in this position and with throttle valve outer lever gauge J-5806 set at 7.09" measure distance from left side cover lower rear bolt to hole in throttle lever. If pins of gauge will enter holes, adjustment is correct. If necessary to adjust, loosen lever to clamp attaching screw and adjust lever on throttle shaft as necessary. Reconnect throttle rod.

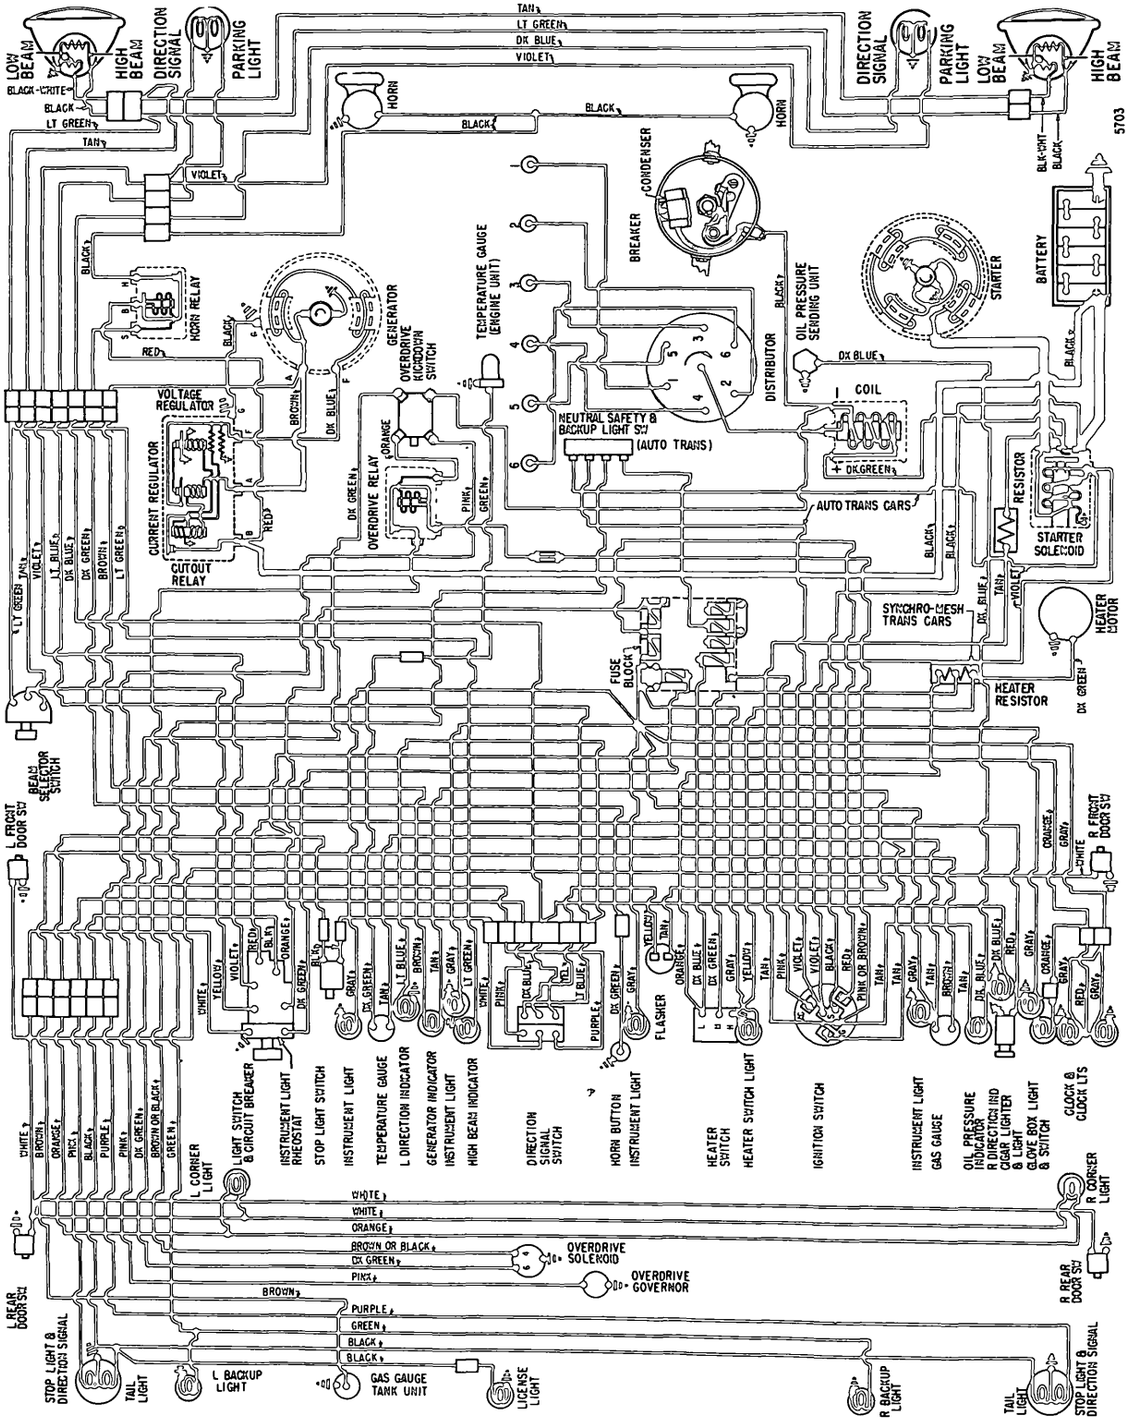
4) Disconnect bellcrank-to-transmission throttle lever rod at throttle valve lever. Disconnect accelerator-to-bellcrank rod at bellcrank.

POWERGLIDE THROTTLE LINKAGE

5) Force bellcrank-to-transmission throttle lever rod forward against its stop in transmission (open throttle position) and adjust bellcrank-to-carburetor throttle rod for free entry of swivel pin in throttle valve lever, with carburetor throttle valve in wide open position.

6) With carburetor throttle valve held in wide open position and accelerator fully depressed, adjust accelerator-to-bellcrank rod for free entry of swivel pin into hole in bellcrank.

THROTTLE RETURN CHECK ADJUSTMENT (POWERGLIDE CARS): With engine idle speed set at 425 RPM, shut off engine, close choke valve and position throttle stopscrew on highest step of fast idle cam. Using a 9/32" wrench on flat section of return check shaft, hold from turning, and turn the adjusting screw until it just contacts throttle contact arm.



Model ROCHESTER BC	Rochester No.
Std Transmission	7009657
Powerglide	7009656
Governor Controlled Engine	7009784

► *CHOKE SETTING CHANGE FOR IMPROVED PERFORMANCE: See "Choke Adjustment" below*

► *METERING JET CHANGE FOR IMPROVED PART THROTTLE PERFORMANCE. See Rochester Single & Dual Jet Specification Table for latest jets.*

Idle Setting - 1-2½ turns open.
Idle Speed (Synchro-mesh) - 475 RPM.
Idle Speed (Powerglide) - 425 RPM with Powerglide selector lever in "D" (Drive) range.
Float Level - 1 9/32" (Gauge M-250) With air horn inverted and gasket in place, position Gauge M-250 over the floats with the tang inserted in the discharge nozzle. Bend float arms as necessary so that top of each float just touches the gauge and the float is centered between the gauge legs.
Float Drop - Bend float tang as necessary to obtain a distance of 1¾" from the gasket surface to bottom of the float, with the air-horn upright and the float hanging free.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Choke Adjustment: Three notches lean. *NOTE* - This supersedes previous setting of one notch rich (Synchro-mesh cars), and one notch lean (Powerglide cars).

Fast Idle: With fast idle adjusting screw on next to highest step of fast idle cam, Gauge BT-99 (.076") should just slide between lower edge of choke valve and carburetor bore. To adjust, bend connector rod.

▷ *OTHER DATA: See "Rochester BC Carburetors" in Carburetion Section.*

FUEL PUMP PRESSURE: 3½-4½ lbs.

CARB. EQUIPMENT

Fuel Pump: AC. Diaphragm type.
Replacement Fuel Pump - AC No. 4149 (Fuel only), No. 4138 or 707 (Fuel & Vacuum).
Pressure - 3½-4½ lbs. at 450-1000 RPM.
See "Fuel Pumps" in Carburetion Section

Gasoline Gauge: AC. Electric type.
Dash Unit - AC No. 1518711.
Tank Unit - AC No. 1518775 (Sta. Wgn.), 1518776 (Others). *See "Fuel Gauges" in Carburetion Section.*

BATTERY

Delco 2SMR53W. *12 Volt.* 9 plate, 53 ampere hour capacity (20 hr. rate).
Battery Ground - Negative.
Engine Ground - Engine to cowl at rear head bolt.

STARTER

Delco-Remy 1107652. Armature - 1932185.
Drive - Overrunning clutch (solenoid pinion shift).
Rotation - Counterclockwise at commutator end.
Brush Spring Tension - 35 ozs. minimum.

Performance Data

Torque	RPM	Volts	①Amperes
0 ft. lbs.	6200-9400	10.6	49-76
	Lock	4.25	270-310

① - Includes solenoid.

Starting Switch: Delco-Remy Solenoid Switch 1119781 mounted on starter and controlled by Ignition & Starter Switch 1116535.
See "Delco-Remy Starter Solenoid (Without Relay)" in Electrical Section.

Neutral Safety & Back-up Light Switch: Delco-Remy 1998173 (Powerglide cars only).
Adjustment - *See "Chevrolet Powerglide" in Trans. Sect.*

GENERATOR

Delco-Remy. Used as follows:

Application	Generator No.	Armature No.
6 Cyl. Std.	1100326	1928952
6 Cyl. Pwr. Strg.	1102041	1929640
6 Cyl. Air Cond.	1102083	1932900
6 Cyl. A.C. & P.Strg.	1102084	1938761

Performance Data - Cold

Generator	Amperes	Volts	RPM
1100326	25	14.0	2570
1102041	30	14.0	2210
1102083, 84	35	14.0	2510

Rotation - Counter-clockwise at commutator end.
Brush Spring Tension - 28 ozs.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Field Current - 1.5-1.62 amps. (1100326), 1.48-1.62 amps. (1102041), 1.69-1.79 amps. (1102083,84), at 12 volts.

Belt Adjustment: 5/16" belt deflection midway between water pump and generator pulleys.

REGULATOR

Delco-Remy. Used as follows:

Delco-Remy Regulator No.	Generator No.
1119000	1100326
1119003	1102041
1119168	1102083,84

Cutout Relay

Cuts In - 11.8-13.5 volts.
Contact Gap - .020".
Air Gap - .020" with contacts just closed.

Voltage Regulator

Setting - 13.8-14.8 volts at 125°F.
Air Gap - .075" with armature pressed down to point where contacts just touch.
Checking & Adjusting - *See "Delco-Remy 12 Volt Regulators" in Electrical Section.*

Current Regulator

Setting (1119000) - 23-27 amperes.
Setting (1119003) - 27-33 amperes.
Setting (1119168) - 33-37 amperes.
Air Gap - .075" with armature pressed down to point where contacts just touch.
Checking & Adjusting - *See "Delco-Remy 12 Volt Regulators" in Electrical Section.*

MISC. ELECTRICAL

Headlamps. Sealed Beam. *See Electrical Section.*
Directional Signals: *See Electrical Section.*
Autronic Eye: *See Electrical Section.*
Lighting Switch Removal: Pull handle out to headlamp position. Depress switch shaft retainer (under dash) and remove knob and shaft assembly. Remove retaining ferrule, escutcheon and bezel, then remove switch assembly. Disconnect multi-plug connector. *NOTE* - Use screwdriver inserted in side of switch to pry plug from switch.
Stop Light Switch Location: Mechanical type mounted under dash in contact with brake pedal.
Adjustment - Adjust position of switch so that stop light comes on when brake pedal is depressed 5/8" from fully released position.
LIGHTING CIRCUIT BREAKER: One 13 amp. circuit breaker located on main lighting switch, protects headlamp and parking light circuits.
FUSES: All fuses except as noted below are contained on the accessory junction block located on upper inside of dash panel to left of steering column.
Panel & Accessory Lamps - 3 amps. *See Note below.*
Tail, Dome, Glove Box, Clock & Stop Lamps - 9 amps. *See Note below.*
Heater (Without Air Conditioner) - 10 amps.
Air Conditioner (Includes Heater) - 20 amps.
Backing Light - 9 amps.
Overdrive - 9 amps. Located in feed line to relay.
►*NOTE:* If car not equipped with accessory junction block, these fuses will be found in an in-line fuse holder back of instrument panel.
Horn Relay: Delco-Remy 1116920.
Contact Closes - 5.0-9.5 volts.
Contact Gap - .027".

ENGINE

►*AIR CONDITIONED CAR SERVICE CAUTION: Use extreme care when disconnecting any part of air conditioning equipment or lines for access to engine. See "Air Conditioning Service Cautions" in Miscellaneous Section.*

ENGINE SPECIFICATIONS: 6 Cyl., Valve in head.

►*ENGINE SERVICE NOTE:* Data below applies to all 6 Cyl. Engines: 235" (Pass. Cars), 235" & 261" (Trucks). See Chevrolet Truck for 235" & 261" Truck engine specifications.

Bore	Stroke	Displacement
3 9/16"	3 15/16"	235 cu. ins.

Compr. Ratio	Rated HP	Developed HP
8.0-1	30.4	140 at 4200 RPM

Compression & Vacuum Reading - *See TUNE-UP.*
ENGINE REMOVAL: *See "Engine" in Chevrolet Special Data.*
OIL PAN REMOVAL: Remove bolts attaching steering idler arm bracket to frame side rail, and drop for clearance. Remove pan retaining bolts and drop pan. *NOTE* - Crankshaft may have to be turned so oil pan will clear front cross member.
CYLINDER HEAD: *See "Cylinder Head & Manifolds". in Chevrolet Special Data.*
ENGINE MOUNTINGS: *See "Engine Mountings" in Chevrolet Special Data.*
TIGHTENING TORQUES: *See "Tightening Specifications" in Chevrolet Special Data.*

PISTONS

Aluminum alloy, cam ground, tin plated, with pin offset 5/64".
Weight - 1.18 lbs. (235" engine), 1.36 lbs. (261" Engine).
Removal - Pistons and rods removed from above.
Clearance - .005-.0011", Measured 1.29" from top of piston. Selective fit.
Replacement Pistons: Furnished Std. & .001", .020", .030", .040" Oversize. *STANDARD AND .001". PISTON NOTE* - Two sizes pistons furnished for Standard and .001" Oversize as follows:
235" Engine - Std. - Marked **S4** (3.5625-3.5630"), **S5** (3.5630-3.5635"), **.001" Oversize** - Marked **S6** (3.5635-3.5640"), **S7** (3.5640-3.5645").
261" Engine - Std. - Marked **S4** (3.7500-3.7505"), **S5** (3.7505-3.7510"), **.001" Oversize** - Marked **S6** (3.7510-3.7515"), **S7** (3.7515-3.7520").

Fitting New Pistons: Use .0015" x ½" feeler (part of Tool J-5513). With piston and cylinder clean and dry, insert feeler and inverted piston into cylinder to a point where center of piston pin hole is flush with top surface of block (feeler 90° from pin hole). Pull required to withdraw feeler must be 7-18 lbs.
Installing Pistons: Install piston with notch in piston and mark "Front" toward front of engine.

PISTON PINS

Locked in rod. No bushing used in piston.
Diameter - 235" Eng. - .8660-.8665". **261" Eng.** - .9270-.9275".
Pin Fit in Piston - .00015-.00025" clearance. With both piston and pin at 70°F., and light film of oil on pin, pin should hold own weight in either piston pin boss. It should be possible to install pin in piston with thumb pressure.
Replacement Pins: Furnished Std & 0015", .003", .005" Oversize.

PISTON RINGS

Ring	Width	End Gap	Sid Clearanc
Compr.(1&2)	.0930-.0935"	①	②
Oil(3)	181-.188"	③ .015-.055"	.000-.008"

①- (235" Eng.) .007-.020". (261" Eng.) .010-.020"
②- (235" Eng.) .001-.003". (261" Eng.) .002-.0035"
③- On Rails.

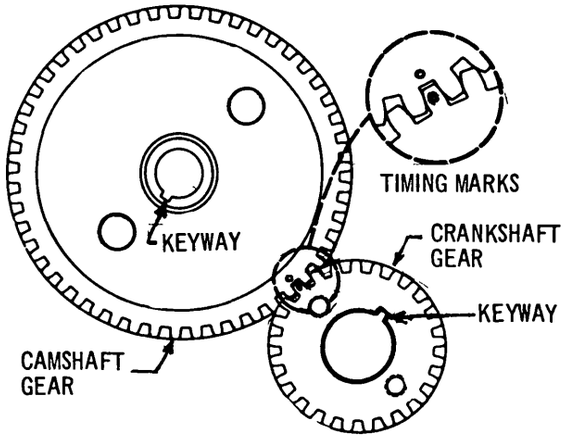
►*RING INSTALLATION CAUTION:* Install Compression rings with side marked "TOP" up.

CONNECTING RODS

Length - 6.81" Center-to-center.
Crankpin Journal Diameter - 2.311-2.312".
Lower Bearing - Replaceable precision type.
Clearance - .001-.003" (New), .001-.004" (Used).
Sideplay - .005-.012".
Replacement Bearings: Std. & .001", .002", .010", .020" Undersize.
Installing Rods: Install rods with piston pin clamp and number on rod lower end toward camshaft.

CRANKSHAFT

Journal Diameters - **(1)** 2.6835-2.6845", **(2)** 2.7145-2.7155", **(3)** 2.7455-2.7465", **(4)** 2.7765-2.7775".
Clearance - .001-.003" (New), .001-.004" (235" Eng. Used), .001-.0045" (261" Eng. - Used).
Bearings - Thin wall babbitt with steel back.
Bearing Adjustment: Precision type. Replace bearings.
End Thrust - Taken by No. 3 (rear intermediate) main bearing.
End Play - .003-.009".
Replacement Bearings: Furnished Std. & .002", .010", .020", .030" Undersize.
Bearing Installation: Can be replaced without removing engine.
See "Crankshaft & Main Bearings". in Chevrolet Special Data.
Crankshaft Rear Main Bearing Oil Seal: *See "Crankshaft & Main Bearings". in Chevrolet Special Data.*
Crankshaft Front Oil Seal: *See "Engine Front Cover" in Chevrolet Special Data.*
Vibration Dampener: *See "Vibration Dampener". in Chevrolet Special Data.*



CAMSHAFT

Journal Diameters - **(1)** 2.1537-2.1547", **(2)** 2.0912-2.0922", **(3)** 2.0287-2.0297", **(4)** 1.9662-1.9672".
►*NOTE:* Journal out-of-round limits .001". Run-out limits .002".
Bearing Type - Steel backed babbitt lined bushings, not precision type, require reaming.
Clearance - .0015-.0035".
End Thrust: Controlled by spacer and thrust plate behind camshaft sprocket.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

End Play - .001-.005".
Timing Gear: Fibre camshaft gear, steel crankshaft gear.
Back Lash - .003-.005".
Replacement Timing Gears & Installation: See *"Timing Gears" in Chevrolet Special Data.*
Camshaft Setting: Timing is correct when timing marks on gears are together.

CHEVROLET 6 CYL. VALVE TIMING MARKS

Camshaft Removal & Replacement: See *"Camshaft & Bearings" in Chevrolet Special Data*
Engine Front Cover Oil Seal (Crankshaft Front Seal): See *"Engine Front Cover" in Chevrolet Special Data*

VALVES

Tappet Clearance: (Pass. Cars) - None in service (hydrulic).
(Trucks) - 235" Eng. - .016" Intake, .018" Exhaust Hot. 261" Eng. - .020" Intake & Exhaust, Hot.
See *"Valve System" in Chevrolet Special Data*

Valve	Head Diam.	Stem Diam.	Length
Intake	1 7/8"	.3410-.3417"	6.364-6.394"
Exhaust	1 1/2"	.3410-.3417	①

Valve	②Seat Angle	Lift	Stem Clearance
Intake	30°	.4004"	.001-.0027"
Exhaust	45°	.4004"	.001-.0027"

① - 235" Eng., 4.905-4.930"; 261" Eng., 4.902-4.932"
② - Face Angle 29° Intake, 44° Exhaust.

►*VALVE GRINDING CAUTION:* Replacement valves are furnished with face angles of 30° and 45° When seats are ground to recommendations of 30° and 45°, valves must be faced to recommended angle of 29° (Intake) and 44° (Exhaust).
Valve Seat Width - 3/64-1/16" (Intake), 1/16-3/32" (Exhaust).

Valve Stem Oil Seal Installation: See *"Valve System" in Chevrolet Special Data*
Valve Guids: *Precision type, pressed in head.*
Valve Guide Installation - See *"Valve System" in Chevrolet Special Data*
Valve Springs: *Install springs with closed coil end down*

Spring Specifications

	Pressure	①Length
Valve Open (All)	.194-210 lbs.	1 29/64"

① - Free Length 2 5/32" (Conv.), 2 15/64" (Auto Trans.)

►*VALVE SPRING HEIGHT CAUTION:* Check installed height of valve springs. If distance from spring seat in head to top of valve spring exceeds 1 55/64", install shim approximately 1 16" thick. At no time should shim spring be installed to obtain installed height of less than 1 51/64".
Valve Lifters (Pass Cars): Hydraulic type. See *"Valve System" in Chevrolet Special Data*
Valve Lifters (Trucks): Mechanical type. Removed from above.
Rocker Arm Assembly: See *"Valve System" in Chevrolet Special Data*

VALVE TIMING

See *"Camshaft Setting" under CAMSHAFT above*
►*VALVE TIMING NOTE:* Specifications are for valve timing with Zero valve lash and apply to both 235 & 261" engines. See *Valve Timing Check below*
Intake Valves - Open 10°30' BTDC. Close 53°30' ALDC
Exhaust - Open 49° BLDC Close 15° ATDC
Valve Timing Check - *CAUTION.* It will be necessary to replace the hydraulic valve lifter and pushrod operating No. 1 exhaust valve, with a conventional lifter and pushrod). Remove all tappet clearance from No. 1 exhaust valve Turn engine over until this valve just starts to close and until triangular flywheel mark lines up with pointer on right face of flywheel housing. Mount dial indicator on rocker arm shaft with stem of indicator contacting No. 1 exhaust valve adjusting screw and set dial indicator to .063". Turn crankshaft until indicator hand just stops moving. Timing is correct if indicator reading is ZERO plus or minus .005". A greater or lesser reading indicates either excessive gear wear or improperly installed timing gears. Reset tappet clearance to specifications.

OILING SYSTEM

Crankcase Capacity: 5 qts. (refill), 5½ qts. (dry).
Normal Oil Pressure: 30 lbs. at 1170-1200 RPM
Pressure Regulator Valve - In oil pump body. Not adjustable.
Oil Pressure Indicator - Light located at right side of instrument cluster, controlled by pressure switch, Delco-Remy 1998149 or AC No. 1508425, located in main oil gallery on left side of engine Switch closes when pressure drops to 4-7 lbs
Oil Pump: Gear type. Located in crankcase, driven by distributor gear.
Oil Pump Overhaul—*See "Oiling System" in Chevrolet Special Data.*
Oil Filter Element: AC P-115
Rocker Arm Oil Lead & Overflow Pipe: *See "Oiling System" in Chevrolet Special Data.*
Crankcase Ventilation (Standard): Air intake through valve rocker arm cover, outlet through pipe on right side of engine.
Servicing — On all models with air cleaner mounted on valve rocker arm cover, wash filter element with solvent and re-oil at 2000 mile intervals or more often if required by operating conditions.
Crankcase Ventilation (Optional): Positive Type. Vacuum operated ventilator consisting of a vacuum pipe from oil filler pipe to ventilator valve in fitting on intake manifold. Valve is spring loaded, variable opening type giving constant crankcase ventilation at all speeds. **Valve must close at idling to give proper air-fuel mixture.**
Servicing — Every 10,000 miles (or oftener if required) clean vacuum pipe, valve, and filler pipe thoroughly. Filler cap gasket must seal tightly.
►*VACUUM VALVE CAUTION:* If improper action of spring is suspected due to spring being distorted, or etched from corrosive action, the valve assembly should be replaced.

COOLING

►*RADIATOR REMOVAL CAUTION (POWERGLIDE CARS): Transmission oil cooler is part of radiator lower tank, and must be TIGHTLY SEALED after removal or during repairs to avoid entrance of foreign material.*
Water Capacity: 16 qts (17 qts with heater).
Pressure Valve: AC No. 850795. Radiator filler cap. 7 lb. type. **Replacement Valve** - AC No. RC-1.

Thermostat: Harrison. In cylinder head water outlet.
Standard — No. 3133595 (stamped 151) 151°. Can be used for alcohol anti-freeze.
Optional—No. 3123994 (stamped 160), 160°, No. 3133597 (stamped 170) 170°.

Temperature Gauge: AC electric.
Dash Unit - AC No. 1513317.
Engine Unit - AC No. 1513321.
See *"Temperature Gauges" in Miscellaneous Section*

Water Pump: Packless type with sealed ball-bearing shaft. See *"Chevrolet" in Water Pump Section*

CLUTCH

Own. Diaphragm Spring type. 9½" (Std.), 11" (HD) See *"Chevrolet (Own)" in Clutch Section*

Clutch Disc - (Std. 9½") Chevrolet No. 3737944 (Woven - Hub marked White), No 3737942 (Molded - Hub not paint marked), (Heavy Duty 11") Chevrolet No 38-36906 (Woven - Hub marked Pink).

Pedal Adjustment Pedal free travel ¾-1 Loosen check nut at connecting link at clutch fork Turn adjusting nut to remove all lash at fork, **then back off two turns.** Tighten check nut.
Removal: Remove transmission (see Transmission Removal below). Remove throwout bearing from fork. Remove clutch fork tension spring from fork, disconnect clutch fork pushrod. Remove clutch fork by forcing it forward and toward center of vehicle. Install Clutch Pilot Tool J-5824, to support clutch assembly during removal. Loosen clutch attaching bolts one turn at a time until diaphragm spring is released. Remove Pilot Tool, then remove clutch assembly from car. *CAUTION:* When installing clutch, align "X" mark on clutch cover with "X" mark on flywheel.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

SYNCHRO-MESH TRANSMISSION

Own. Three speed synchro-mesh (Std.) three or four speed (close-ratio) optional.
See "Chevrolet 3-Speed" in Transmission Section.

Transmission Control: *See "Transmission Controls" in Transmission Section.*

Removal: Drain Transmission and disconnect speedometer cable and shift rods. Disconnect propeller shaft at rear universal and slide shaft toward rear to disengage from transmission. Remove two top transmission to clutch housing screws and install Guide Pins J-1126. Remove the two lower screws and slide transmission back until clutch spines are disengaged. Remove transmission from below car.

OVERDRIVE

Warner R10. Solenoid operated type with governor control and throttle operated kickdown.
See "Chevrolet Overdrive" in Transmission Section.

Overdrive Control: *See "Warner R10 & R11 Overdrive Control" in Transmission Section.*

Removal: Same as for Synchro-mesh transmission (above) after disconnecting control cable and wiring

POWERGLIDE TRANSMISSION

Torque converter and hydraulically operated planetary gear unit with manual controls.

►*PRODUCTION CHANGES & REPLACEMENT PARTS CAUTIONS. See "Chevrolet Powerglide" in Trans. Section.*

►*TESTING & TROUBLE SHOOTING: See "Chevrolet Powerglide" in Transmission Section.*

Lubrication: Check fluid level in transmission every 1000 miles. Oil should be added only when level gets down to "Add One Quart" mark on dipstick. Change oil, remove and clean oil suction screen every 25,000 miles. Use only AUTOMATIC TRANSMISSION FLUID "Type A" bearing an "AQ-ATF" marking on container.
Capacity - 4½ qts. (refill), 10½ qts. (after overhaul).

►*POWERGLIDE DRAINING CAUTION—There is no drain plug on converter. Drain transmission case only, add 4½ qts. of fluid initially, recheck after idling engine.*

Checking Fluid Level—Engine must be idling with the parking brake set, transmission warm, and the control lever in "N" range when taking dipstick readings. Dipstick is located under hood on right side

Throttle Linkage Adjustment: *See CARBURETOR above.*

►*OTHER POWERGLIDE SERVICE DATA: See "Powerglide" in Transmission Section.*

UNIVERSALS

Own. Yoke & Spider (trunnion) type.

►*CAUTION* - Rear universal companion flange nut controls rear axle pinion bearing preload. Preload must be adjusted whenever companion flange nut loosened. *See "Chevrolet Pass. Car (Hotchkiss Drive)" in Rear Axle Section.*

REAR AXLE

Own. Semi-floating, hypoid gear type with Hotchkiss Drive. *NOTE* - "POSITRACTION" Limited Slip Differential Optl.
See "Chevrolet Pass. Car (Hotchkiss Drive)" Rear Axle & "Spicer Power-Lock Differential" in Rear Axle Section.

►*PINION BEARING PRELOAD CAUTION:* Rear universal joint companion flange nut controls rear axle pinion bearing preload. Bearing preload must be adjusted whenever companion flange nut is loosened.

Ratios - 3.55-1 (Std.), 4.11-1 (Overdrive), 3.36-1 (Powerglide).

Backlash - .003-.010" (.005-.008" preferred).

Removal: Raise car and support with jack stands under frame side rails. Remove rear wheels and remove two trunnion bearing "U" bolts from rear universal yoke and separate the joint (tape bearings to trunnion). Disconnect hand brake cable and equalizer and remove cables from clamps at frame. Disconnect hydraulic brake lines at rear axle housing. Disconnect shocks. Support axle assembly on hydraulic jack and remove spring "U" bolts, nuts and anchor plate, and lower axle to floor

Axle Shaft Removal: Raise car and place jack stands under axle housing. Remove tire, wheel and brake drum assembly. Remove four nuts and lockwashers from bearing retainer bolts (on inside of axle flange). Attach axle Puller J-5748, with slide hammer, to flange and remove axle shaft and bearing assembly. Be careful not to disturb backing plate. *NOTE*—If bearing retainer and parking brake strut interfere, raise strut slightly with screw driver to obtain clearance.

SHOCK ABSORBERS

Delco. Direct acting non-adjustable.

Replacement Shock Absorbers

Model	Front	Rear
Pass. Exc.Conv.(No AC)	5531202	5531211
Pass. Exc.Conv.(With AC)	5524088	5531211
Conv.	5524088	5524089
Sed.De. Sta.Wag .Taxi	5524088	5524089

FRONT SUSPENSION

Independent type with direct acting shock absorbers within front coil springs and new spherical type joints connecting control arms and steering knuckles.
See "Chevrolet (Spherical Joint)" in Suspension and "Wheel Alignment Section.

Steering Axis Inclination - 3-4°

Caster - Pos. 1° preferred. Limits Pos. ½° to Pos. 1½°.

Camber - Pos. ½° preferred. Limits 0° to Pos. 1°.

Toe-In - 1/8-1/4".

Toe-Out on Turns - With inner wheel at 20°, outer wheel should be 18°10'

STEERING

Manual: Saginaw Ball Bearing Worm & Nut. Recirculating ball worm and nut.
See "Saginaw Ball Bearing Worm & Nut" in Steering Section

Power Steering: Own (Linkage Type). *See "Chevrolet Power Steering" in Steering Section.*

Steering Linkage: *See "Steering Linkage" in Steering Section.*

Steering Wheel & Horn Button Removal: *See "Saginaw Ball Bearing Worm & Nut" in Steering Section.*

Steering Gear Removal: *See "Saginaw Ball Bearing Worm & Nut" in Steering Section.*

BRAKES

Chevrolet-Bendix. Duo-servo, single anchor hydraulic, without anchor pin adjustment Hand lever applies rear wheel service brakes
See "Chevrolet-Bendix Hydraulic" in Brake Section

►*REPLACEMENT BRAKE SHOE GRINDING CAUTION:* To compensate for lack of brake anchor adjustment, brake shoes are ground to a 057-087" smaller diameter than the drum diameter Grinding shoes to the true drum diameter on bench grinders will cause heel and toe contact, resulting in erratic brake action *NOTE—If spindle mounted type grinder is used, the shoes should be ground to the true drum diameter*

Drums—Diameter 11".

Wheel Cylinder Diameter—Front 1 1/8", Rear 1".

	Brake Lining Width	Thickness
Front Whl	2"	.187-.194"
Rear Whl	1 3/4"	.187-.194"

Length Per Shoe—9.3125" (Primary), 11.6875" (Second-

Braking Power—55.9% (front wheels), 44.1% (rear

Clearance—Single adjusting screw located at bottom of backing plate. Back off adjusting screw 7 notches from slight drag position. Brakes must be free of any drag

Standard Master Cylinder: Located on engine side of firewall in line with brake pedal.

Checking Fluid—Reservoir is integral with master cylinder. Maintain level in cylinder to lower edge of filler hole

Removal—Disconnect hydraulic line from end of cylinder and remove bolted brass fitting. Remove four retaining nuts and lock washers holding master cylinder to firewall and remove cylinder.

Installation—Reverse removal procedure making sure that push rod clevis is straddling the brake pedal. Refill master cylinder and bleed all brake lines. Adjust push-rod-to-main cylinder clearance as follows: Make sure brake pedal returns to fully released position with no binding, and that pedal retracting spring has not lost its tension, then adjust brake pedal clevis to give a barely perceptible end play between main cylinder piston and brake pushrod (1/8-3/8" pedal movement should be felt).

Power Brakes: Std. Trans. - Hydrovac Power Unit. Used with standard master cylinder.
See "Hydrovac Power Unit" in Brake Section.

Auto. Trans. - Bendix Vacuum Power Unit. Replaces conventional master cylinder.
See "Bendix Power Unit" in Brake Section

Removal - Disconnect vacuum lines and hydraulic brakes line. Remove lever-to-pushrod bolt and disengage pushrod from lever. Take out four mounting bolts and remove unit.

MISC. MECHANICAL

Windshield Wipers: Vacuum, cable operated (Std.), Electric type (Optional).
See "Windshield Wipers" in Miscellaneous Section.

Window Regulators: Electric type with reversible motor operating each door window assembly.
See "Power Window Regulators" in Miscellaneous Section.

Power Top Control: Hydro-Lectric. *See "Power Top Controls" in Miscellaneous Section.*

Power Seat Adjuster: Reversible electric motor controls horizontal front seat movement. *See "Power Seat Adjusters" in Miscellaneous Section.*

Air Conditioning: *See "Chevrolet Air Conditioning" in Miscellaneous Section.*

MODEL IDENTIFICATION

Model Designation

Series	Serial Prefix	Model
1500 ①	VA	ONE-FIFTY
2100	VB	TWO-TEN
2400	VC	BEL-AIR
2934	VE	CORVETTE
1508	VD	SEDAN DELIVERY

① - Except Sedan Delivery.

SERIAL NUMBER: Stamped on plate attached to left front door hinge pillar post.

Starting Serial Number - 100001 (at each plant) for all models except Corvette.

► *SERIAL NUMBER NOTE: Serial Number (example VB57F100025) includes following identification information in sequence.*

Series ①	Year	Assy. Plant ②	Serial No.
VB	57	F	100001

① - See "Serial Prefix" in Model Identification above.
② - See Car Assembly Plant Designation below.

Car Assembly Plant Designation

A - Atlanta	**K** - Kansas City	**S** - St. Louis
B - Baltimore	**L** - Los Angeles	**T** - Tarrytown
F - Flint	**N** - Norwood	**W** - Willow Run
J - Janesville	**O** - Oakland	

ENGINE NUMBER: Stamped on pad at front right hand side of cylinder block behind water pump.

► *ENGINE NUMBER NOTE: Engine Number (example T101 C) includes following identification information in sequence.*

Plant ①	Month ②	Day ③	Engine Type ④
T	1	01	C

① - "F" Flint, "T" Tonawonda.
② - "1" (January), "2" (February), etc.
③ - "01" (First Day), "02" (Second Day) etc.
④ - See Model Type Designation below.

Model Type Designation

Pass. Cars (265 Cu. In. Engine)

Equipment	Engine Number Suffix
3-Speed Transmission	C
Overdrive	CD
Heavy Duty Clutch	CE

Pass. Cars (283 Cu. In. Engine)

Equipment	Engine Number Suffix
4-Barrel Carburetor	E
Fuel Injection	EJ
Fuel Injection & Hi Lift Cam	EK
Overdrive & 4-Barrel Carburetor	EC
Dual 4-Barrel Carburetors	EA
Dual 4-Barrel Carburetors & Hi Lift Cam	EB
Dual 4-Barrel Carburetors & Powerglide	FD
Dual 4-Barrel Carburetors & Turboglide	GD
Powerglide	F
Powerglide & Air Conditioning	FA
Powerglide & 4-Barrel Carburetors	FC
Powerglide & Fuel Injection	FJ
Powerglide, Air. Cond. & 4-Barrel Carbs.	FE

Turboglide & 4-Barrel Carburetors	GC
Turboglide & Fuel Injection	GF

Corvette (283 Cu. In. Engine)

Equipment	Engine Number Suffix
3-Speed Trans. & 4-Barrel Carburetors	EF
3-Speed Trans., Fuel Injection & Hi Lift Cam	EL
3-Speed Transmission & Fuel Injection	EM
Dual 4-Barrel Carbs. & Hi Lift Cam	EG
Dual 4-Barrel Carburetors	EH
Dual 4-Barrel Carbs. & Powerglide	FG
Powerglide	FH
Powerglide & Fuel Injection	FK

TUNE-UP

COMPRESSION PRESSURE: 150 lbs. min. (265" & 283" Engines with 2-Bbl. Carb.), 160 lbs. min. (283" Engine with 4-Bbl. Carb.). All cylinders must be equal within 20 lbs.

VACUUM READING: 18-21" steady at idling speed (except Fuel Injection Engines), 13.5" (Fuel Injection Engines).

VALVE TAPPET CLEARANCE: (Corvette Engine with Special Camshaft & Mechanical Lifters) - .012" Intake, .018" Exhaust, HOT. *NOTE* - Intake can be set at .008" for competition. Adjust tappet clearance by turning rocker arm stud nut (self-locking).

► *FUEL INJECTION ENGINE ADJUSTMENT NOTE:* When running engine with rocker covers removed, air cleaner must be installed and a shield should be improvised to prevent oil fumes entering the fuel injection system.

Engines with Hydraulic Lifters - None in service.

MANIFOLD HEAT CONTROL: (Single Exhaust) - Single exhaust pipe with cross over pipe from right exhaust manifold. Heat control valve with thermostatic coil spring located between right exhaust manifold and exhaust pipe. Make sure valve shaft is free to turn. If sticking, free up with kerosene or alcohol containing a small amount of baking soda.

Dual Exhaust - Coil spring and counterweight (same as for single exhaust).

► *DUAL EXHAUST NOTE: With valve closed, most exhaust gases are discharged through left exhaust pipe.*

IGNITION

FIRING ORDER: 1-8-4-3-6-5-7-2.

Cylinders - RIGHT BANK 2-4-6-8. LEFT BANK 1-3-5-7.

SPARK PLUG GAP: .035".

Spark Plugs - (Except Corvette Engine) AC No. 44 (Std.), No. 45 (Hotter - for continuous city operation), No. C-43 COM (Colder - for continuous heavy duty operation) **(Corvette Engine)** AC No 46 (Std.), No 44 (Town & Country operation), No C-43COM (Heavy Duty & High Speed operation) *NOTE* - These plugs supersede previous plugs No C-43 (Std.), and No 43-5 COM (continuous high speed) C-42-1 Com. (Road Racing).

COIL: Delco-Remy 1115087 (Std.), 1115091 (Corvette).

Ignition Current - 1.8 amps. idling, 4 amps. stopped.

Resistor - (Std. - 1115087 Coil) Delco-Remy 1931614, 1.40-1.62 ohms. **(Corvette - 1115091 Coil)** Delco-Remy 1931385.

► *COIL RESISTOR NOTE:* Resistor connected to ignition switch by two leads and is by-passed during cranking (second lead provides direct connection to coil when key turned to "Start Engine" position).

DISTRIBUTOR: Delco-Remy.

Application	Delco-Remy Distr. No.
V8 265" & 283" Eng. (2-Bbl. Carb.)	1110874
V8 283" Engine (4-Bbl. Carb.)	1110890
V8 Corvette Eng. (1 or 2 4-Bbl. Carb.)	1110891
V8 Corvette Eng Fuel Injection (Early)	1110889
V8 Corvette Eng Fuel Injection (Later)	1110905
V8 Corvette Eng Fuel Injection (Later)	1110906

► *DISTRIBUTOR NOTE: Different types used as follows:*

Models 1110874 & 1110890 - New external adjustment "Window" type. *See "Delco-Remy Window Distributors" in Electrical Section*

1110889, 1110891, 1110905 & 1110906 - Double breaker with conventional distributor cap (not window type) Vacuum Spark Control not used (centrifugal weight advance only)

Condenser - Delco-Remy 1932004 (1110874 & 1110890), 1869704 (1110889 & 1110891) **Capacity -** 18-23 mfd

Contact Point Set - Delco-Remy 1931988 (1110874 & 1110890), 1918148 (1110889 & 1110891) 1938330 (1110905 & 1110906)

Breaker Gap (1110874 & 1110890) - *NOTE* - When cam angle properly adjusted (see below), breaker gap opening (.016") will be correct

Breaker Gap (1110889, 1110891, 1110905 & 1110906) - .014-.018" (new points)

Cam Angle (1110874 & 1110890) - 28-32° Set to 30°

Cam Angle (1110889, 1110891, 1110905 & 1110906) - Adjust each set of points to 29° ± 1° with other set of points blocked open with .025" thick insulator Cam angle for both sets of points operating together will be 34° ± 1°

Breaker Arm Spring Tension - 19-23 ozs

Rotation - Clockwise viewed from above.

Automatic Advance - 1110874

Degrees Distr.	RPM	Degrees Eng..	RPM
Start	400	0-4	800
8-10	1150	16-20	2300
15-17	1800	30-34	3600

Automatic Advance - 1110889, 90, 91

IGNITION TIMING

Std. Setting - Set timing to setting indicated below.

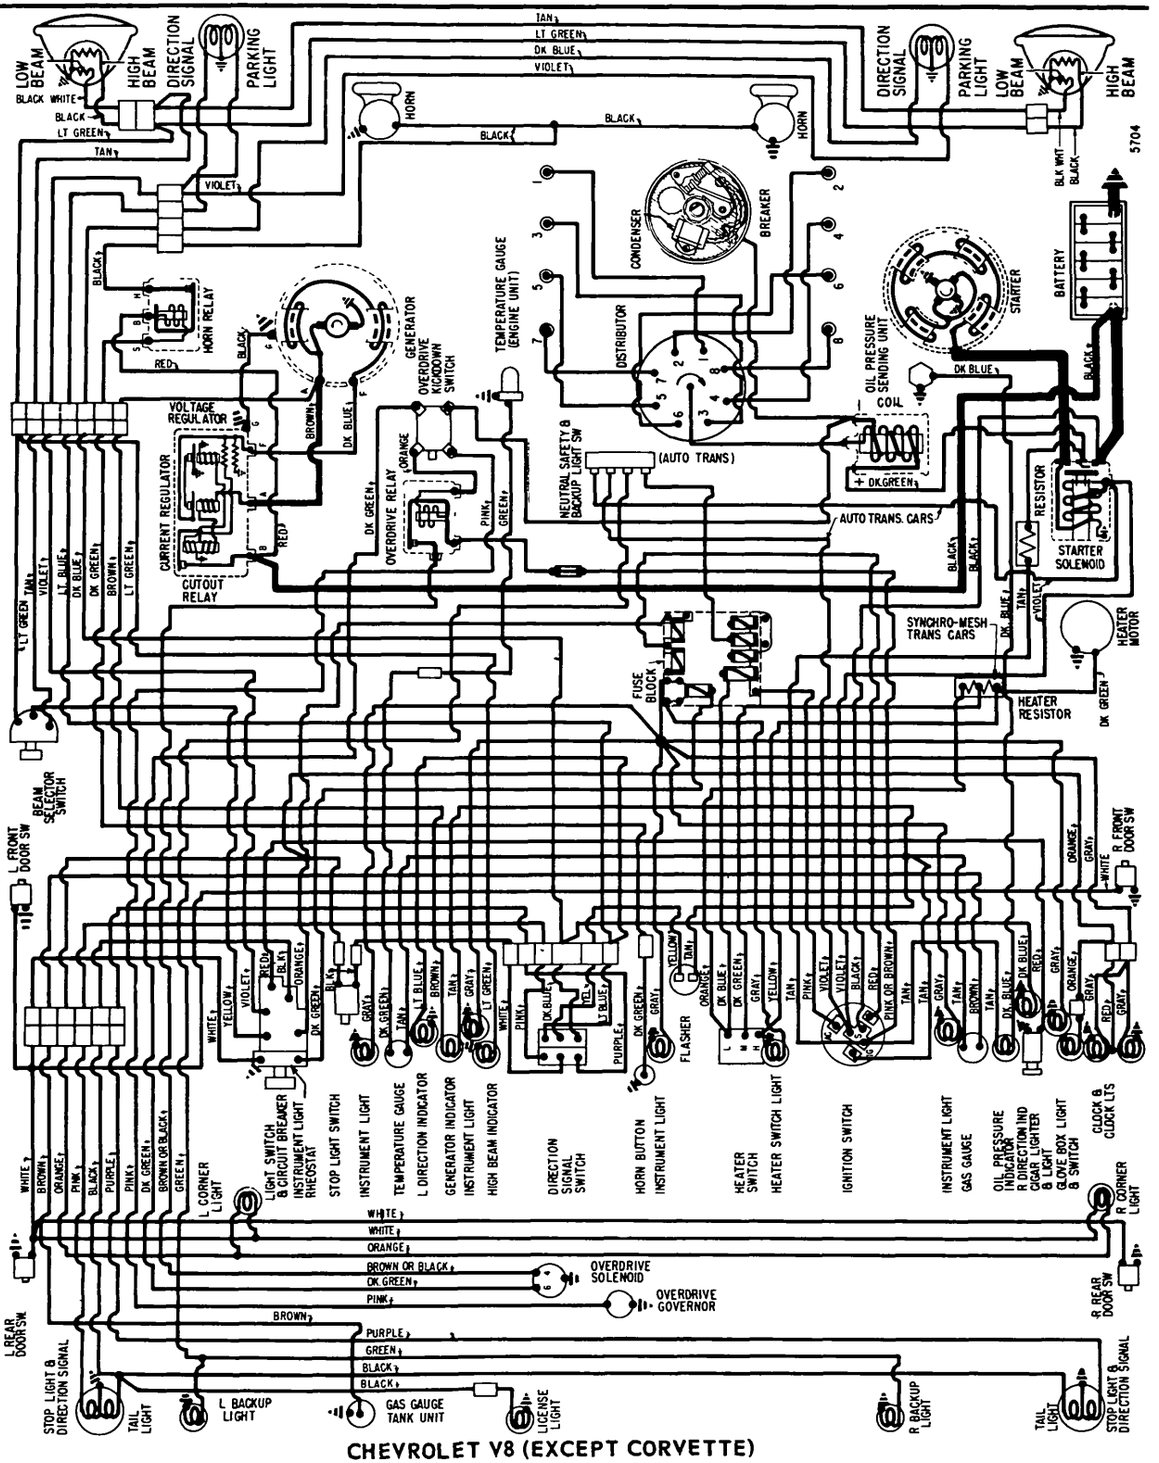
► *IGNITION TIMING PROCEDURE CHANGE: Previous recommendation of setting timing at 700 RPM has been discontinued.*

Ignition Timing Setting

Engine	Setting
V8 265" & 283" (2-Bbl. Carb.)	4° BTDC
V8 283" (4-Bbl. Carb.)	4° BTDC
Corvette (One 4-Bbl. Carb.)	4° BTDC
Corvette (Dual 4-Bbl. Carb.)	① 12° BTDC
Corvette (Fuel Injection) ②	①③ 12° BTDC
Corvette (Fuel Injection) ④	⑤⑥ 4° BTDC

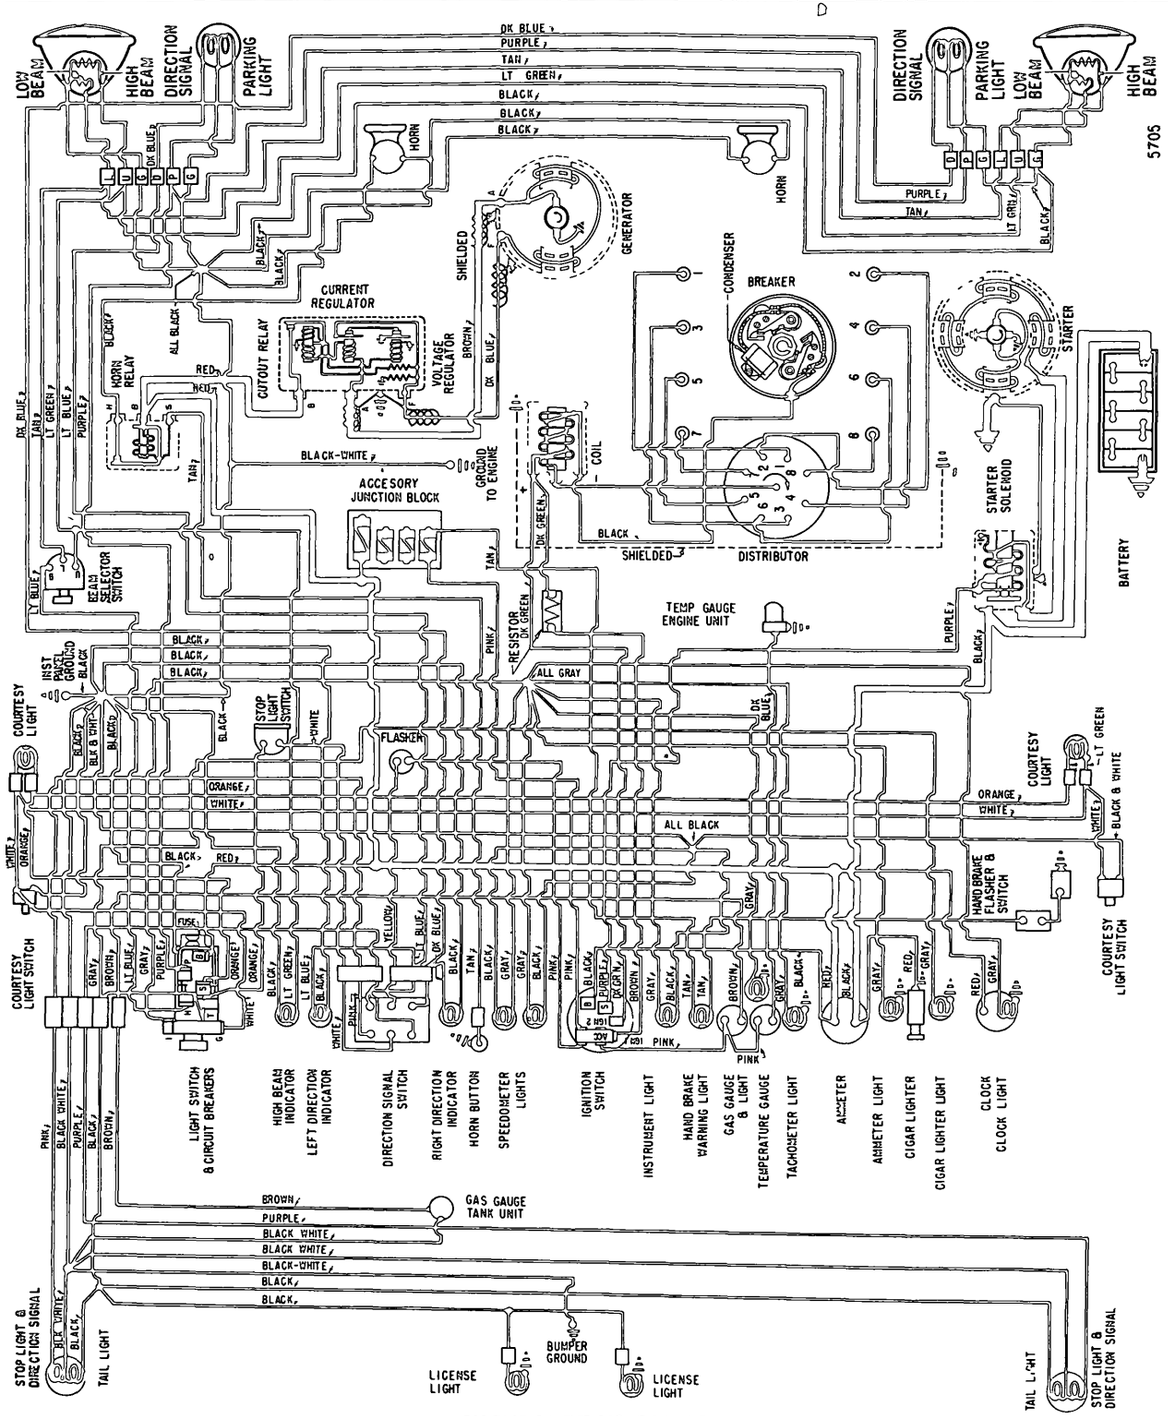
① - Do not exceed 14° BTDC.
② - Automatic Transmission.
③ - Engine idling at 600 RPM.
④ - Synchro-mesh Transmission.
⑤ - Engine idling at 800-850 RPM.
⑥ - Do not exceed 8° BTDC.

Timing Mark - Mark on vibration dampener and an indicator on left side of engine front cover. Indicator is marked with 8 lines on "advance" side of "0" mark, and two lines on "retard" side. Each line indicates 2°.



CARBURETOR

► *CARBURETOR APPLICATION NOTE: Rochester 2GC Dual Carburetor is standard on all models (Exc. Corvette). Rochester 4GC and Carter WCFB 4-Barrel Carburetors used on a mixed basis on all models (Exc. Corvette) with Power Package. ONE or TWO Carter WCFB 4-Barrel Carburetors used on Corvette. Rochester "Ramjet" Fuel Injection System is optional on Corvette 283" Engine.*

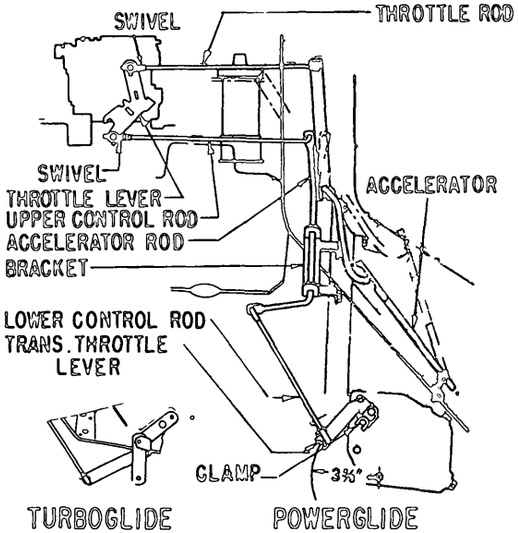


► *FAST IDLE CONTROL CAUTION (AIR CONDITIONED CARS):* Fast idle control is set to provide 900 RPM engine speed when Fast Idle Control Knob is pulled out. Make sure knob is pushed in when making normal fast idle adjustments and that fast idle control linkage does not interfere with normal operation of carburetor linkage when fast idle is not in operation.

THROTTLE LINKAGE ADJUSTMENT: Powerglide Cars - Remove lower control rod and loosen transmission throttle lever clamp screw. Insert Tool J-5906 between transmission left hand side cover lower front bolt and hole in lever. Distance should be 3.60", as indicated on gauge, from centerline of bolt to hole centerline. With gauge in place and holding lever clamp in full detent position (rotated counterclockwise), tighten lever to clamp and remove gauge. Install lower control rod. Disconnect upper control rod from throttle lever on carburetor. Place throttle valve in wide open position and pull upper control rod forward until it is stopped by transmission internal stop. Adjust swivel on end of upper control rod for free entry into throttle lever, then attach swivel to throttle lever. Check adjustment by placing linkage in idle position, then return to wide open throttle by rotating throttle lever on carburetor. Push up on transmission throttle lever and note if lower control rod deflects, which would indicate that transmission is not on

CONTINUED ON NEXT PAGE

CHEVROLET V8 (EXCEPT CORVETTE)



CHEVROLET V8 CORVETTE

CONTINUED FROM PRECEDING PAGE

its internal stop. If rod deflects or throttle valve does not reach wide open position, repeat the adjustment. Depress accelerator pedal and place lowest part of accelerator rod 3/4" (Pass. Cars), 3/8" (Corvette) above floor panel. Disconnect throttle rod at carburetor throttle lever and adjust swivel on rod for free entry in hole in lever with throttle valves wide open.

Turboglide Cars: Remove upper control rod from throttle lever. Place throttle lever in wide open position and pull rod forward until stator control valve spring is overcome and lever is bottomed. Adjust swivel on upper control rod for free entry into hole in lever, then attach swivel. Check adjustment by placing linkage in idle position, then return to wide open throttle position by rotating throttle lever. Push upward on transmission throttle lever and note if lower control rod deflects, indicating that stator control valve spring is not fully

CHEVROLET TRANSMISSION THROTTLE LINKAGE

compressed. If rod deflects, or throttle lever will not reach full detent, repeat the adjustment. *CAUTION - Stall tests must not be performed on cars with this transmission.*

ROCHESTER 2GC 2-BARREL

Model	Rochester No.
Standard Transmission (Early)	7010647
Standard Transmission (Later)	7011131
Powerglide & Turboglide (Early)	7010648
Powerglide & Turboglide (Later)	7011124
Governor Equipped Eng. (Early)	7010719
Governor Equipped Eng. (Later)	7011149

▷ *PARTS CHANGES FOR IMPROVED PERFORMANCE*
See "Rochester 2GC Carburetors" in Carburetion Section

▷ *MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrel feeds Cyls. 2-3-5-8, LEFT barrel 1-4-6-7.*
Idle Setting - After idle speed set to correct specifica-

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

tions (see Idle Speed below), turn both idle mixture screws for smooth idle with highest vacuum reading and RPM.

Idle Speed - 450 RPM (Synchro-mesh), 425 RPM (Powerglide & Turboglide, with selector lever in "D").

Float Level - 1¼" (Gauge BT-129). With air horn inverted and gasket in place, position float level gauge over float so it rests against pump side of power piston shaft, with the outer gauge leg in line with center of float. Bend float arm to adjust.

Float Drop - Bend float tang as required to obtain a distance of 1 29/32" from gasket surface to bottom of float, with air horn upright and float hanging free. Use scale or scribed mark on float and pump gauge.

Automatic Choke Setting: Centered at index.

► *OTHER DATA: See "Rochester 2GC Carburetors" in Carburetion Section*

ROCHESTER 4GC 4-BARREL

Rochester 4GC No. 7009846 (Early), No. 7012126 (Later).

► *PRODUCTION AND PARTS CHANGES FOR IMPROVED PERFORMANCE: See "Rochester 4GC Carburetors" in Carburetion Section*

► *MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrels feed Cyls. 2-3-5-8, LEFT barrels 1-4-6-7.*

Idle Setting - Adjust idle mixture screws for peak vacuum and engine RPM reading.

Idle Speed - 450 RPM (Synchro-mesh), 425 RPM (Powerglide & Turboglide, with selector lever in "D").

► *OTHER DATA: See "Rochester 4GC Carburetors" in Carburetion Section*

CARTER WCFB 4-BARREL

(Power Pkg. & Corvette Eng. With Single Carb.)

Carter WCFB 2555S (Std. Trans.), 2505S (Auto. Trans.), 2655S (All Trans.).

► *CARBURETOR REPLACEMENT NOTE: Carb No 2505S with choke set one point lean can be used to replace No 2555S*

► *MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrels feed Cyl 2-3-5-8, LEFT barrels 1-4-6-7*

Idle Setting - (2505S & 2555S) ¾-1¾ turns open. (2655S) ½-1½ turns open Adjust both screws alike. Turn screws out for richer mixture

Idle Speed (All Carbs.) - 475 RPM (Synchro-mesh), 425 RPM (Powerglide & Turboglide with selector lever in "D")

► *OTHER DATA: See "Carter WCFB Carburetors" in Carburetion Section*

CARTER WCFB 4-BARREL

No. 2626S (Front), No. 2627S (Rear)

(Corvette Engine with TWO Carbs.)

► *CARBURETOR NOTE: "Idle Air Mixture Screws" have been eliminated on these carburetors and the special procedure formerly required is no longer necessary.*

► *CARBURETOR OPERATION NOTE: Front and rear carburetors operate together at idle speed and at high speed for full power operation. Front carburetor throttle begins to open when rear carburetor throttle valves are approximately at half-throttle position.*

Idle Setting - Set both idle mixture screws on each carburetor 1 turn open. Start and warm up engine. With engine at normal operating temperature, set idle speed to correct RPM (see Idle Speed below). Adjust all idle mixture screws individually (rear carburetor screws first, front carburetor screws last), for best engine idle "feel" and highest engine RPM. Reset idle speed to correct figure, readjust all idle mixture screws, finally reset idle speed.

Idle Speed - 600 RPM (With Std. Camshaft), 800-850 RPM (With "SR" Racing Camshaft).

Synchronizing Carburetors: Adjust accelerator pedal so it is 3/8" above toeboard (carpet removed) with throttle valve of rear carburetor wide open. With rear carburetor on wide open throttle, adjust front carburetor control shaft until throttle on front carburetor is wide open and against throttle stop. Tighten locknut on front control shaft. *NOTE* - When linkage is properly adjusted, front carburetor will begin to open when rear carburetor is at approximately half-throttle.

► *OTHER DATA: See "Carter WCFB Carburetors" in Carburetion Section*

ROCHESTER "RAMJET"

(Optional on Corvette 283" Engine)

► *See "Rochester (Ramjet) Fuel Injection" in Carburetion Section*

FUEL PUMP PRESSURE: 4-5¼ lbs.

CARB. EQUIPMENT

Fuel Pump: AC diaphragm type.

Replacement Pump - (Exc. Corvette) AC No. 4150 Std. (Fuel only), No. 4141S or 708 Optl (Fuel & Vacuum).

(Corvette) - AC No. 4346 (Fuel only)

Pressure - 4-5½ lbs.

See "Fuel Pumps" in Carburetion Section

Gasoline Gauge: AC Electric.

Dash Unit - (Corv) AC 1518244, (Others) 1518711

Tank Unit - Used as follows:

	AC No.
Pass Car (Std.)	1518776
Pass. Car (2 Carb.)	1518784
Sta Wgn. & Sed Del (Exc. 2 Carb.)	1518775
Sta Wgn. (9 Pass.)	1518774
Corvette	1518785

See "Fuel Gauges" in Carburetion Section

BATTERY

Delco 2SMR53W (Std. Pass. Cars), 25M53W (Corvette). 12 Volt, 9 plate, 53 ampere hour capacity (20 hr.rate).

Battery Ground - Negative.

Engine Ground - Engine to cowl at rear head bolt.

STARTER

Delco-Remy 1107664 (Exc. Turboglide), 1107660 (Turboglide).

Armature - Delco-Remy 1935829.

Drive - Overrunning clutch(solenoid pinion shift)

Rotation - Counterclockwise at commutator end.

Brush Spring Tension - 35 ozs.

Performance Data

Torque	RPM	Volts	Amperes
0 ft. lbs.	6900	10 3	.75 max.
10 5 ft. lbs.	Lock	5.8	.435 max.

Starting Switch: Delco-Remy Solenoid Switch 1119919 mounted on starter and controlled by Ignition & Starter Switch 1116535 (Exc. Corvette), 1116512 (Corvette) with key starting. NOTE - Separate Relay, Delco-Remy 1116904, used on Corvette with Powerglide. *See "Delco-Remy Starter Solenoid Switch (No Relay)" in Electrical Section*

Neutral Safety & Back-up Light Switch: Delco-Remy No. 1998173 (Powerglide), 1998174 (Turboglide).

Adjustment - *See "Powerglide" or "Turboglide" in Transmission Section*

GENERATOR

Delco-Remy. Application as follows:

Model	Generator No.	Armature No.
Std. 25 Amp.	1100321	1928952
Std. 30 Amp.	1102041	1929640
Corvette	1102043	1929640
Air Cond. 35 Amp	1102083	1932900
A.C. & Pwr. Strg.	1102084	1938761

Performance Data - Cold

Generator	Amperes①	Volts	RPM
1100321	25	14.0	2750
1102041, 3	30	14.0	2210
1102083, 4	35	14.0	2210

① - Not maximum output. See Regulator Data.

Rotation - Counterclockwise at commutator end.

Brush Spring Tension - 28 ozs.

Field Current - 1.5-1 62 amps. (1100321), 1.48-1.62 amps (1102041,3), 1.69-1.79 amps. (1102083,4), all at 12.0 volts.

Belt Adjustment: 13/16" belt deflection midway between fan and generator pulleys with light pressure applied.

REGULATOR

Delco-Remy. Application as follows:

Regulator No.	Generator No.
1119000	1100321
1119003	1102041, 3
1119002 or 1119168	1102083, 4

Cutout Relay

Cuts In - 11 8-13.5 volts.

Contact Gap - .020".

Air Gap - 020" with contacts just closed.

Voltage Regulator

Setting - 13.8-14.8 volts at 125°F.

Air Gap - .075" with armature pressed down to point where contacts just touch.

Checking & Adjusting - *See "Delco-Remy 12 volt Regulators" in Electrical Section.*

Current Regulator

Setting (1119000) - 23-27 amperes.

Setting (1119003) - 27-33 amperes.

Setting (1119002 or 1119168) - 32-37 amperes.

Air Gap - .075" with armature pressed down to point where contacts just touch.

Checking & Adjusting - *See "Delco-Remy 12 volt Regulators" in Electrical Section*

MISC. ELECTRICAL

Headlamps: Sealed Beam. *See Electrical Section*

Directional Signals: *See Electrical Section*

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Autr nic Eye: See *Electrical Section*

Lighting Switch Removal: Pull handle out to headlamp position. Depress switch shaft retainer (under dash) and remove knob and shaft assembly. Remove retaining ferrule, escutcheon and bezel, then remove switch assembly. Disconnect multi-plug connector. *NOTE* - Use screwdriver inserted in side of switch to pry plug from switch

Stop Light Switch L cation: Mechanical type mounted under dash in contact with brake pedal

LIGHTING CIRCUIT BREAKER: One 13 amp. circuit breaker located on main light switch, protects headlamp and parking light circuits.

FUSES: All fuses except as noted below are contained on the accessory junction block located on upper inside of dash panel to left of steering column.

NOTE - Corvette has two 13 ampere circuit breakers on light switch.

Panel & Access ry Lamps - 3 amps. *See Note below.*
Tail, D m , Gl v B x, Clock & Stop Lamps - 9 amps. *See Note below.*
Heater (Without Air Conditioning) - 10 amps.
Air C nditioner (Includes Heater) - 20 amps.
Radio - 7½ amps.
Backing Light - 9 amps.
Overdriv - 9 amps. Located in feed line to relay.

Horn Relay: Delco-Remy 1116920.
C ntact Close - 5.0-9.5 volts.
Contact Gap - .027".

ENGINE

► *AIR CONDITIONED CAR SERVICE CAUTION: Use extreme care when disconnecting any part of air conditioning equipment or lines for access to engine. See "Air Conditioning Service Cautions" in Miscellaneous Section.*

► *VALVE LIFTER NOTE Hydraulic valve lifter used on all engines with standard camshaft. Mechanical type lifter used on engines with "Hi-Lift" camshaft.*

► *ENGINE NOTE: Specifications for 265" & 283" engines are the same except as noted below.*

ENGINE SPECIFICATIONS: V8. Valve-in-head

Engine	Bore	Str ke	Rated HP	Displacement
265	3 3/ 4"	3"	45.0	265 cu. ins.
283 (All)	3 7/8"	3"	48.0	283 cu. ins

Engine	Compr. Ratio	Developed HP
Turbo-Fire 265 ①	8.0-1	162 at 4400 RPM
Turbo-Fire 283 ②	8.5-1	185 at 4600 RPM
Super Turbo-Fire 283 ③④	9.5-1	220 at 4800 RPM
Corvette ④⑤	9.5-1	245 at 5000 RPM
Corvette ④⑥	9.5-1	250 at 5000 RPM
Corvette ④⑤⑦	9.5-1	270 at 6000 RPM
Corvette ④⑥⑦	10.5-1	283 at 6200 RPM

① - One Single Barrel Carburetor
② - One 2-Barrel Carburetor.
③ - One 4-Barrel Carburetor & Dual Exhaust
④ - Either Standard Pass. Car or Corvette.
⑤ - Two 4-Barrel Carburetors & Dual Exhaust.
⑥ - Fuel Injection & Dual Exhaust.
⑦ - With special "SR" Racing Camshaft.

Compression & Vacuum Reading - See *TUNE-UP*

ENGINE REMOVAL: See *"Engine" in Chevrolet Special Data*

OIL PAN REMOVAL: Disconnect steering idler arm bracket from frame side rail and drop for clearance. Remove retaining bolts and remove pan.

ENGINE MOUNTINGS: See *"Engine Mountings" in Chevrolet Special Data*

CYLINDER HEAD & MANIFOLDS: See *Chevrolet Special Data*

TIGHTENING TORQUES: See *Chevrolet Special Data*

PISTONS

Cast aluminum, slipper skirt, with piston pin offset 5/64".

Removal - Pistons and rods removed from above.

Replacement Pistons: Furnished Std. & .001", .020", .030", .040" oversize. With fitted pins.

► *STANDARD & 001" OVERSIZE PISTON NOTE.* These pistons furnished in TWO sizes as follows:
265" Eng.-Std. - Marked **S4** (3.7500-3.7505"), **S5** (3.7505-3.7510"), **.001" Oversize** - Marked **S6** (3.7510-3.7515"), **S7** (3.7515-3 7520").
283" Eng.-Std. - Marked **S4** (3.8750-3.8755"), **S5** (3 8755-3.8760"), **.001" Oversize** - Marked **S6** (3.8760-3 8765"), **S7** (3 8765-3.8770").

► *283" ENGINE PISTON NOTE* Pistons have four depressions in head to prevent interference with valves at higher engine speeds. "Domed" type pistons are used in 10.5-1 compression ratio engines.

Fitting New Pistons: Use .0015" x ½" feeler (part of Tool J-5513). With piston and cylinder clean and dry, insert feeler and inverted piston into cylinder to point where center of piston pin hole is flush with top surface of block (feeler 90° from pin hole). Pull required to withdraw feeler should be 7-18 lbs.

Installing Pistons: Install pistons with cast depression in head and "F" mark cast in piston strut toward front of block See *Rod Installation*

PISTON PINS

Pin is press fit in connecting rod.

Diameter - 9270- 9273"

Pin Fit in Piston - 00015-.00025" clearance With piston and pin at 60°F., and light film of oil on pin, pin should support own weight in either pin boss.

Pin Fit in Connecting Rod - Pressed in rod *For pin removal and installation, see "Piston Pins" in Chevrolet Special Data*

Replacement Pins: Furnished only in assembly with piston. Replace with new piston and fitted pin assembly

PISTON RINGS

Compression rings are "twist" type (Top ring has **upper** inner edge chamfered, lower ring has **lower** inner edge chamfered) and faces are tapered for correct wiping action Oil ring is 3-piece type (two rails with spacer).

Ring	Width	End Gap	Side Clearance
Compr (1,2)	077- 078"	009-.018"	..0012-.0032"
Oil (3) . .	.181- 188"	① 005- 015" ...	0006- 0084"

① - on rails

R plac ment Rings: Cromflex ring sets furnished Std & .020", .030", 040" oversize

Installing Rings: Install compression rings with mark "TOP" or "G M." upward.

CONNECTING RODS

Length (Center to Center) - 5.7000" **Weight** - 19 02ozs.
Crankpin Journal Diameter - 1.999-2.000".
Lower Bearing - Replaceable precision type. See *"Connecting Rod & Main Bearing Note" under Crankshaft below*
Clearance - .001-.003" (new), .001-.004" (used).
Side Play - .008-.014" (both rods).

Replacement Bearings: Furnished Std., .001", .002", .010", .020" Undersize.

Installing Rods: Install rod in piston so that flange or heavy side of rod at bearing end will be toward **front** of piston (cast depression in head of piston and "F" mark on piston strut) on Nos. 1, 3, 5, and 7 pistons, and rod flange to **rear** of piston on Nos. 2, 4, 6, and 8 pistons. Install rod and piston assembly in cylinder with cast depression in piston head and "F" mark on strut toward front of cylinder block.

CRANKSHAFT

Journal Diameter - 2.2978-2.2988".

► *CONNECTING ROD & MAIN BEARING NOTE (Corvette Engines): Connecting rod bearings and front and intermediate main bearings are special steel backed aluminum alloy with a thin tin-copper overlay*
Clearance - .001-.003" (new), .001-.004" (Used)
End Thrust - Taken by No. 5 (rear) main bearing.
End Play - .002- 006". Check at front end of rear main bearing.

Replacement Bearings: Furnished in 001", .002", .010", .020" Undersize.

Bearing Installation: Not necessary to remove engine or crankshaft from car. See *"Crankshaft & Main Bearings" in Chevrolet Special Data*

Crankshaft Rear Main Bearing Oil Seal: See *"Crankshaft & Main Bearings" in Chevrolet Special Data*

Crankshaft Front Oil Seal: See *"Engine Front Cover" in Chevrolet Special Data*

Vibration Dampener: See *"Vibration Dampener" in Chevrolet Special Data*

CAMSHAFT

► *CAMSHAFT CAUTION.* Different camshafts used as follows:

Model	Chevrolet No.
265" Engine	3704212
283" Engine (Std)	3733431
283" Engine (Hi-Lift Cam)	3736097

Journal Diameters - 1 8682-1 8692" (all journals).
Bearings - Steel backed babbitt lined bushings.
Clearance - .0015- 0035"

Replacement Bearings: "Precision" type (do not require reaming) Use Tool Set J-6098 to remove and install bearings.

Camshaft Setting: Both sprockets marked "O" Install chain with sprocket marks adjacent and in line with straight edge across centers

► *CAUTION.* When installing sprocket on camshaft, line up dowel holes in sprocket and shaft *DO NOT DRIVE SPROCKET ON SHAFT,* use three mounting bolts and DRAW sprocket into place

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Camshaft Removal & Installation: See *"Camshaft & Bearings" in Chevrolet Special Data.*

Timing Chain: Link belt. **Width** - .875". **Pitch** - .500". **Length** - 46 Links.

Engine Front Cover Oil Seal (Crankshaft Front Seal): See *"Engine Front Cover" in Chevrolet Special Data.*

VALVES

Tappet Clearance: (Hi-Lift Cam) - Intake .012" (.008" for competition), Exhaust .018", Hot. **(All Others).** None in service, hydraulic lifters.

►283". *ENGINE VALVE NOTE:* Special lightweight valves used with Hi-Lift Camshaft and mechanical lifters. Identified by swirl polish under head and thin necked stem.

Valve	Head Diam.	Stem Diam.	Length
Intake	1.720"	.3415-.3422"	①4.902-4.922"
Exhaust	1.5"	.3410-.3417"	4.913-4.933"

Valve	②Seat Angle	Lift	Stem Clearance
Intake	45°	③	.001-.0027"
Exhaust	45°	③	.0015-.0032"

①- 4.8799" on cars with "Hi-Lift" camshaft.

②- Face angle 44°.

③- 265" Eng., .3336"; 283" Eng. Std., .3987", Hi-Lift Camshaft, Intake .3938", Exhaust .3998".

Valve Seat Width - .035-.060" (Intake), .062-.093" (Exhaust).

Valve Stem Seal Installation: See *"Valve System" in Chevrolet Special Data.*

Valve Guides: Integral with cylinder head. Ream valve guide holes for oversize valves if valve stem clearance is excessive. Valves with oversize stems furnished .003", .015", .030" Oversize. Use Reamer Set J-5830.

Valve Springs: Install with closed end of coil toward cylinder head, and shield over spring on intake valves.

►*VALVE SPRING NOTE:* Valve spring shield on both intake and exhaust valves on 283" engine.

Spring Specifications

265" Engine

Valve	Spring Pressure	Length
Closed	76-84 lbs.	1.696"
Open	155-165 lbs.	1.366"

283" Engine①

Valve	Spring Pressure	Length
Closed	65-72 lbs.	1.696"
Open	151-165 lbs.	1.306"

①- Except engines with "Hi-Lift" camshaft.

►*VALVE SPRING INSTALLED HEIGHT CAUTION:* Check installed height of valve spring after grinding valves by measuring distance from spring seat in cylinder head to top of valve spring. If this dimension exceeds 1 45/64", install valve spring seat shim furnished 1/32 & 1/16" thick. Installed height of spring must be 1 11/16-1 45-64".

Valve Lifters (Std. V8): Hydraulic type. See *"Valve System" in Chevrolet Special Data.*

Valve Lifters (Corvette): Plain barrel type. Remove in same manner as for hydraulic valve lifters. See *"Valve System" in Chevrolet Section.*

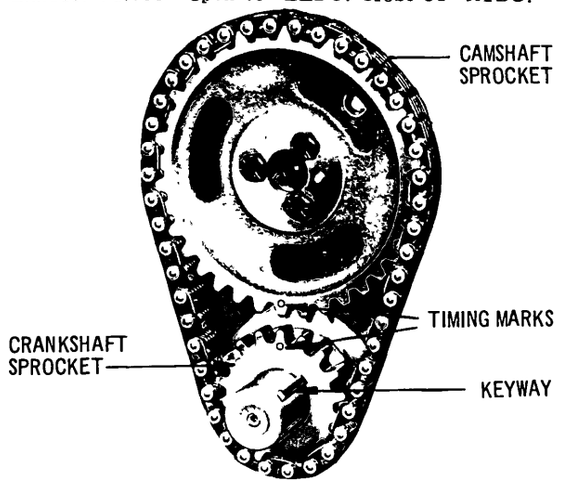
Rocker Arms: Mounted individually on studs pressed into cylinder head.

Rocker Arm Stud Replacement - See *"Valve System" in Chevrolet Special Data.*

VALVE TIMING

See *"Camshaft Setting" under CAMSHAFT above.*

Valve Timing Specifications (265" Engine)



Intake Valves - Open 18° BTDC. Close 72° ALDC.
Exhaust Valves - Open 52° BLDC. Close 20° ATDC.

Valve Timing Specifications (283" Engine) (With Standard Camshaft)

Intake Valves - Open 12°30' BTDC. Close 57°30'ALDC.
Exhaust Valves - Open 54°30' BLDC. Close 15°30' ATDC.

Valve Timing Specifications (283" Engine) (With "Hi-Lift" Camshaft)

Intake Valves - Open 35° BTDC. Close 72° ALDC.
Exhaust Valves - Open 76° BLDC. Close 31° ATDC.

CHEVROLET V8 VALVE TIMING MARKS

OILING SYSTEM

Crankcase Capacity: 4 quarts (refill) 5 qts. (dry)

Normal Oil Pressure: 30 lbs. at 1170-1200 RPM.

Pressure Regulator Valve - In oil pump. Not adjustable.

Oil Pressure Indicator (Std V8) Light located at right side of instrument cluster, controlled by a pressure switch Delco-Remy 1998149 or AC No. 1508425, located in main oil gallery adjacent to distributor. Switch closes when pressure drops to 4-7 lbs.

Oil Pressure Gauge (Corvette) - AC No. 1508131. Not electric.

Oil Filter: Full flow type. Replace element at 6,000 mile intervals. Use new seal, tighten center bolt to 20-25 ft. lbs.

Replacement Filter Element - AC No. PF-131.

Oil Pump: Spur gear type. Located in crankcase, driven by distributor gear.

Oil Pump Overhaul - See *"Oiling System" in Chevrolet Special Data.*

Crankcase Ventilation - Air intake through valve rocker arm cover, outlet through pipe on right side of engine.

COOLING

►*RADIATOR REMOVAL CAUTION (POWERGLIDE OR TURBOGLIDE): Transmission oil cooler is part of radiator lower tank, and must be TIGHTLY SEALED after removal or during repairs to avoid entrance of foreign material.*

Water Capacity: 16 qts. add 1 qt. for heater.

Pressure Valve: AC RC 1, Chevrolet No. 750795. 7 lb. type radiator filler cap.

Thermostat: Harrison. In water outlet on intake manifold.

Standard - No. 3133595 (stamped 151) 151° Can be used for alcohol anti-freeze.

Optl. - No. 3133596 (stamped 160) 160°. No. 3133597 (stamped 170) 170°.

Temperature Gauge: AC electric.

Dash Unit - AC No. 1513317 (Std. V8), 1513198 (Corvette).

Engine Unit - AC No. 1513321.

See *"Temperature Gauges" in Miscellaneous Section.*

Water Pump: Packless type with ball bearing shaft.

See *"Chevrolet" in Water Pump Section.*

CLUTCH

►*CLUTCH NOTE: Both Chevrolet (Own) Diaphragm type & Borg & Beck Coil Spring type Clutches used:*

Chevrolet (Own) Diaphragm Clutch

Car Model	Size	Chevrolet No.
V8 (Std.)	10"	3836723
V8 (Heavy Duty)	11"	3836719

Borg & Beck Clutch

V8 & Corvette (4Bbl. Carb)	①3744753
V8 & Corvette (Two 4 Bbl. Carb)	②3744752

①- Borg & Beck 10A8W Assy. No. 361468.

②- Borg & Beck 10A8 Assy. No. 361466 (use 361468 for service).

See *"Chevrolet (Own)" and "Borg & Beck" Clutches in Clutch Section.*

Clutch Disc (Chevrolet Clutch)

Car Model	Chevrolet No.
Std. 10" (Woven - Blue Hub)	3737946
Std. 10" (Molded - Lt. Brown Hub)	3737948
Overdrive 10" (Woven - Maroon Hub)	3741091
Heavy Duty 11" (Woven - Pink Hub)	3836906

Clutch Disc (Borg & Beck Clutch)

Std. (4 Bbl. Carb) 10" (Black Hub)	③3738227
Overdrive (4 Bbl. Carb) 10" (Lt. Green)	④3738229
Std. (Two 4 Bbl. Carb) 10" (Dark Brown)	⑤3740462

③- Borg & Beck No. 382657.

④- Borg & Beck No. 382653.

⑤- Borg & Beck No. 382657.

Pedal Adjustment: Pedal free travel ¾-1". To adjust, disconnect trunnion on rear end of clutch fork rod from cross shaft (remove cotter pin, washer, and spring), turn trunnion on rod for correct free play (one turn equals approximately 3/16" play), reinstall trunnion.

Removal (Borg & Beck): Remove transmission (see Transmission Removal below). Remove clutch housing pan. Pull out clutch release bearing and sleeve. Mark flywheel, cover, and one pressure plate lug with punch to insure proper reassembly. Loosen holding screws a turn or two at a time to avoid bending rim of cover,

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

until cover is free Remove clutch assembly and clutch disc assembly from clutch housing When removing driven disc be sure to mark flywheel side

Removal (Diaphragm Spring Type): Remove Transmission (see Transmission Removal below) Remove clutch throwout bearing from fork, then clutch fork tension spring from fork. Remove clutch fork by forcing it forward and toward center of vehicle. Install Clutch Pilot Tool J-5824 to support clutch assembly Loosen clutch attaching bolts one turn at a time until diaphragm spring is released Remove tool, then clutch assembly from vehicle *NOTE* - When installing clutch, align "X" marks on cover and flywheel.

SYNCHRO-MESH TRANSMISSION

Own. Three speed synchro-mesh (Std.), three or four speed (close-ratio) optional

See "Chevrolet 3-speed" in Transmission Section

Transmission Controls: *See "Transmission Controls" in Transmission Section*

Removal: Drain transmission and disconnect speedometer cable and shift rods. Disconnect propellor shaft at rear universal and slide shaft toward rear, off transmission output shaft. Remove two top transmission to clutch housing screws and install Guide Pins J-1126. Remove the two lower screws and slide transmission back until clutch gear splines disengaged. Remove transmission from below car.

OVERDRIVE

Warner R10. Solenoid operated type with governor control and throttle operated kickdown. Lockout switch not used.

See "Chevrolet Overdrive" in Transmission Section.

Overdrive Control: *See "Warner R10 &R11 Overdrive Control" in Transmission Section.*

Removal: Same as for synchro-mesh (above) after disconnecting control cable and wiring.

POWERGLIDE TRANSMISSION

Torque converter and hydraulically operated planetary gear unit with manual controls.

► *PRODUCTION CHANGES & REPLACEMENT PARTS CAUTIONS: See "Chevrolet Powerglide" in Transmission Section.*

► *TESTING & TROUBLE SHOOTING: See "Chevrolet Powerglide" in Transmission Section*

Lubrication: Check fluid level in transmission every 1,000 miles, drain and refill at 25,000 mile intervals, with Automatic Transmission Fluid type "A" bearing an "AQ-ATF" marking on container.

Capacity - 4½ qts. (refill), 10½ qts. (after overhaul).

► *POWERGLIDE DRAINING CAUTION:* There is no drain plug on converter. Drain transmission case only, add 4½ qts. of fluid initially, recheck after idling engine.

Checking Fluid Level - Engine must be idling with transmission warm, selector lever in "N" range and parking brake applied. Check fluid level on dipstick located in filler tube on right side of engine opposite starter. Fluid level should be at full mark on dipstick. *NOTE - DO NOT OVERFILL*

Throttle Linkage Adjustment: See *CARBURETOR above.*

► *OTHER POWERGLIDE SERVICE DATA: See "Chevrolet Powerglide" in Transmission Section.*

TURBOGLIDE TRANSMISSION

New "non-shifting" hydraulically controlled, planetary type transmission with three unit torque converter.

► *PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION: See "Chevrolet Turboglide" Transmission in Transmission Section.*

► *TESTING & TROUBLE SHOOTING: See "Chevrolet Turboglide" in Transmission Section.*

Lubrication: Check fluid level in transmission every 1000 miles, drain and refill every 25,000 miles. Use Automatic Transmission Fluid Type A (with "AQ-ATF" mark on container).

Capacity - 3½ qts. (refill), 9½ qts. (after overhaul).

► *TURBOGLIDE DRAINING CAUTION:* There is no drain plug on converter. Drain transmission case only, add 3½ qts. of fluid initially, recheck after idling engine.

Checking Fluid Level (Exc. Air Cond. Cars) - With transmission at normal operating temperature, transmission selector lever in "D" (drive) range, and engine idling, check fluid level on dipstick in filler tube on right side of engine. Fluid level should be at full mark on dipstick. *CAUTION - DO NOT OVERFILL.*

Checking Fluid Level (Air Cond. Cars) - *NOTE* - Regular filler tube and dipstick not used. Fluid Level is checked from beneath car (car on hoist) as follows: With transmission at normal operating temperature, selector lever in "N" (neutral) range, and engine idling, check fluid level by removing cap from oil level tube at rear of transmission oil pan under extension housing. Oil level should be at top of tube. If oil level low, remove speedometer drive gear fitting, add oil through fitting hole until fluid level reaches top of oil level tube.

Throttle Linkage Adjustment: See *CARBURETOR above.*

► *OTHER TURBOGLIDE SERVICE DATA: See "Chevrolet Turboglide" in Transmission Section*

UNIVERSALS

Own. Yoke & Spider (Trunnion) type.

► *CAUTION:* Rear universal companion flange nut controls rear axle pinion bearing preload. Preload must be adjusted whenever companion flange nut loosened. *See "Chevrolet Pass. Car (Hotchkiss Drive)" in Rear Axle Section.*

REAR AXLE

Own. Semi-floating hypoid gear type, with Hotchkiss Drive. *NOTE* - "Positraction" Limited Slip Differential optional.

See "Chevrolet Pass Car (Hotchkiss Drive)" Rear Axle & "Spicer Power-Lock Differential" in Rear Axle Section.

► *PINION BEARING PRELOAD CAUTION:* Rear universal joint companion flange nut controls rear axle pinion bearing preload. Bearing preload must be adjusted whenever companion flange nut is loosened.

Ratios - 3.55-1 (Std.), 4.11-1 (Overdrive), 3.36-1 (Powerglide & Turboglide).

Backlash - .003-.010" (.005-.008" preferred).

Removal: Raise car and support with jack stands under frame side rails. Remove rear wheels and remove two trunnion bearing "U" bolts from rear universal yoke and separate the joint (tape bearings to trunnion). Disconnect hand brake cable and equalizer and remove cable from clamps at frame. Disconnect hydraulic brake lines at rear axle housing Disconnect shocks. Support axle assembly on hydraulic jack and remove spring "U" bolts, nuts and anchor plate, and lower axle to floor.

Axle Shaft Removal: Raise car and place jack stands under axle housing. Remove tire, wheel and brake drum assembly. Remove four nuts and lockwashers from bearing retainer bolts (on inside of axle flange). Attach Axle Puller J-5748, with slide hammer, to flange and remove axle shaft and bearing assembly. Be careful not to disturb backing plate. *NOTE*–If bearing retainer and parking brake strut interfere, raise strut slightly with screwdriver to obtain clearance.

SHOCK ABSORBERS

Delco. Direct acting hydraulic, non-adjustable. Serviced by replacement.

Replacement Shock Absorbers

Model	Front	Rear
Pass. exc. Conv. (No A.C.)	5531202	5531211
Pass. exc. Conv.(With A.C.)	5524088	5531211
Convertible	5524088	5524089
Corvette	5531206	5531213
Sedan Del.,Sta.Wgn.,Taxicab	5524088	5524089

FRONT SUSPENSION

Independent type with direct acting shock absorbers within front coil springs and new spherical type joints connecting control arms and steering knuckles.

See "Chevrolet (Spherical Joint)" in Suspension and Wheel Alignment Section.

Steering Axis Inclination - 3-4°.

Caster - Pos. 1° preferred. Limits Pos. ½° to Pos. 1½°.

Camber - Pos. ½° preferred. Limits 0° to Pos. 1°.

Toe-In - 1/8-1/4".

Toe-Out on Turns - With inner wheel at 20°, outer wheel should be 18°10'.

STEERING

Manual: Different type steering systems used as follows: **Corvette - Saginaw Worm & Roller.** Push-pull adjustment.

Others – Saginaw Ball Bearing Worm & Nut. Recirculating ball type.

See Saginaw "Worm & Roller" or "Ball Bearing Worm & Nut" in Steering Section.

Power Steering: Saginaw Linkage type. *See "Saginaw (Linkage Type)" Power Steering in Steering Section.*

Steering Linkage: *See "Steering Linkage" in Steering Section.*

Steering Wheel & Horn Button Removal: *See "Saginaw Ball Bearing Worm & Nut" in Steering Section*

Steering Gear Removal: *See "Saginaw Ball Bearing Worm & Nut" in Steering Section.*

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

BRAKES

Chevrolet-Bendix. Duo-servo, single anchor hydraulic, without anchor pin adjustment Hand lever applies rear wheel service brakes
See "Chevrolet-Bendix Hydraulic" in Brake Section.

►*REPLACEMENT BRAKE SHOE GRINDING CAUTION*
To compensate for lack of brake anchor adjustment, brake shoes are ground to a 057- 087' smaller diameter than the drum diameter Grinding to the true diameter on a bench grinder will cause heel and toe contact, resulting in faulty brake action *NOTE–If spindle mounted type grinder is used, the shoes should be ground to the true drum diameter*

Drums–Diameter 11"
Wheel Cylinder Diameter–Front 1 1/8", Rear 1'

Lining	Width	Thickness
Front Whl	2"	187- 194'
Rear Whl	1¾"	187- 194"

Length Per Shoe–9 3125' (Primary), 11 6875" (Secondary)
Braking Power–55 9% (Front Wheels), 44 1% (Rear Wheels)

Clearance–Single adjusting screw located at bottom of backing plate Back off adjusting screw 7 notches from slight drag position. Brakes must be free of any drag after adjustment

Standard Master Cylinder· Located on engine side of firewall in line with brake pedal

Checking Fluid–Reservoir is integral with master cylinder Maintain level in cylinder to lower edge of filler hole

Removal–Disconnect hydraulic line from end of cylinder and remove bolted brass fitting Remove four retaining nuts and lock washers holding master cylinder to firewall and remove cylinder

Installation–Reverse removal procedure making sure that push rod clevis is straddling the brake pedal Refill master cylinder and bleed all brake lines Adjust push rod-to-main cylinder clearance as follows Make sure brake pedal returns to fully released position with no binding, and that pedal retracting spring has not lost its tension, then adjust brake pedal clevis to give a barely perceptible end play between main cylinder piston and brake pushrod (1 '8-3 '8" pedal movement should be felt)

Power Brakes: Std. Trans. - Hydr vac P wer Unit Used with standard master cylinder
See "Hydrovac Power Unit" in Brake Section
Auto. Trans. - Bendix Vacuum Power Unit Replaces conventional master cylinder. *See Bendix Power Unit" in Brake Section*

MISC. MECHANICAL

Windshield Wipers: Vacuum, cable operated (Std) Electric type (Optional)
See "Windshield Wipers" in Miscellaneous Section

Power Window Regulators: Electric type with reversible motor operating each door window assembly
See "Power Window Regulators" in Miscellan ous Section

Power Top Controls: Hydro-Lectric *See "Power Top Controls" in Miscellaneous Section*

Power Seat Adjuster: Reversible Electric motor controls horizontal front seat movement *See "Power Seat Adjusters" in Miscellaneous Section*
Air Conditioning: *See "Chevrolet Air Conditioning" in Miscellaneous Section*

MODEL IDENTIFICATION

③ - Updraft Carburetor. ⑤ - 4-Barrel Carburetor.

TUNE-UP

COMPRESSION PRESSURE: (6 Cyl.) 130 lbs. **(V8)** 150 lbs. All cylinders should read alike within 20 lbs.

VACUUM READING:

VALVE TAPPET CLEARANCE: *NOTE - Conventional valve lifters used in 6 Cyl. engine. Hydraulic valve lifters used in V8 engines.*

6 Cyl. Engines - (235") - Intake .016", Exhaust .018". **(261")** .020" All valves.

V8 Engines (With Hydraulic Valve Lifters) - No adjustment required unless cylinder head removed or valve lifters replaced.

MANIFOLD HEAT CONTROL: 6 Cyl. - Thermostatic type. Check for free operation. Should require ½ turn from unhooked to hooked position. Distorted spring should be replaced.

V8 - Thermostatic coil spring type located between right manifold and exhaust pipe.

IGNITION

FIRING ORDER: 6 Cyl. - 1-5-3-6-2-4.
V8 - 1-8-4-3-6-5-7-2.
Cylinders (V8) - RIGHT BANK 2-4-6-8. LEFT 1-3-5-7.

SPARK PLUG GAP: .035".

Spark Plug - AC used as follows:

Model	Std.	① Hot	② Cold
½-1½ Ton	AC-44	AC-45 or 46	C-43COM
2 Ton (Early)	C-42COM	C-43COM	
2 Ton (Later)	C-42-1COM	AC-44	C-43COM

① - City type operation.
② - Continuous heavy duty operation.

COIL: Delco-Remy 1115087.
Ignition Current - 1.8 amps. idling, 4 amps. stopped.
Resister - Delco-Remy 1931614.

► *COIL RESISTOR NOTE (6 Cyl. Trucks Exc. Forward Control):* Resistor connected to ignition switch by two leads. Second lead is connected through starter switch and provides a direct connection to coil when starter switch operated.

► *COIL RESISTOR NOTE (6 Cyl. Forward Control & All V8 models):* Resistor connected to ignition switch by two leads and is by-passed during cranking (second lead provides direct connection to coil when key turned to "Start Engine" position).

DISTRIBUTOR: Delco-Remy. Conventional type used on 6 Cyl. models. "Window Type" used on V8 models. *See "Delco-Remy (Window Type) Distributors" in Electrical Section.*

Engine	Delco-Remy No.
Thriftmaster 235"	1112403
Jobmaster 261"	1112403
Trademaster 265" & 283" (Exc. Hydra-Matic)	1110874
Trademaster 265" (With Hydra-Matic)	1110890
Taskmaster 283" (2-Barrel Carb.)	① 1112349
Super Taskmaster 283" (4-Barrel Carb.)	①② 1112350

① - Without Vacuum Spark Control.
② - Use 1112349 for service replacement.

Condenser - Delco-Remy 1928111 (1112403 Distr.), 1932004 (Others). **Capacity** - .18-.23 mfd.
Contact Point Set - Delco-Remy 1924571 (6 Cyl.). 1931988 (V8).
Breaker Gap (6 Cyl.) - .019" (new points). .016" (used points).
Breaker Gap (V8) - *NOTE - When cam dwell is properly adjusted, breaker gap opening (.016") will be correct. See CAM ANGLE below.*
Cam Angle - 28-35° (6 Cyl.), 28-32° (V8). *NOTE - Set V8 distributors to 30°.*
Breaker Arm Spring Tension - 19-23 ozs.

Automatic Advance - 1112403

Degrees	Distr. RPM	Degrees	Eng. RPM
0-2	375	0-4	750

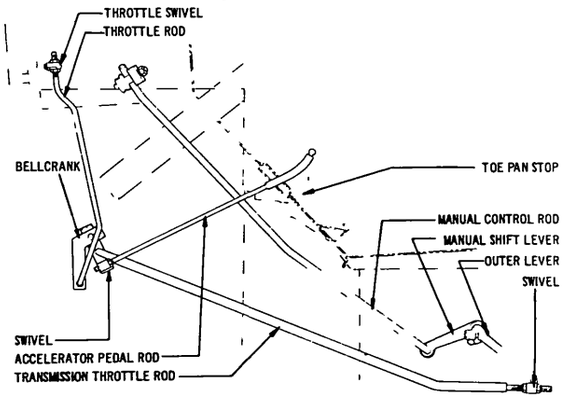
7.5	15	7.5-10

Setting - 6 Cyl. Engines - At TDC. **All V8 Engines** - 4° BTDC. *Set timing at IDLE SPEED with vacuum line connected*

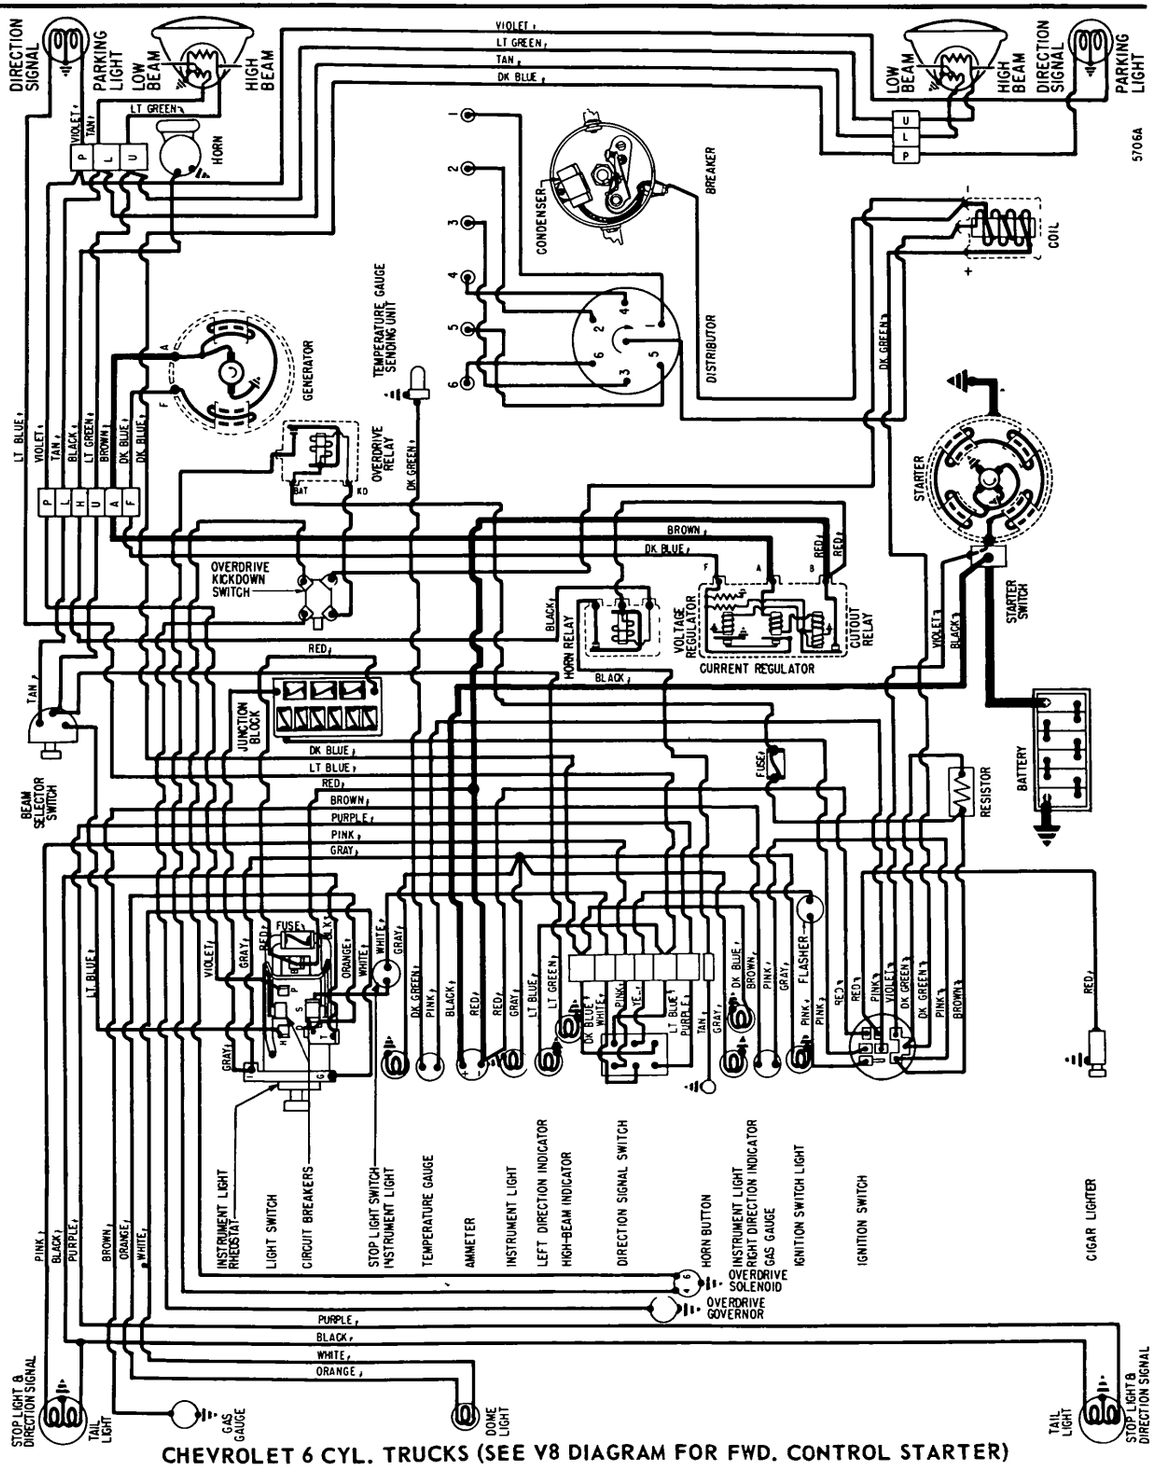


► *IGNITION TIMING PROCEDURE CHANGE: Previous recommendation of setting timing at 1000 RPM with vacuum line disconnected has been discontinued.*

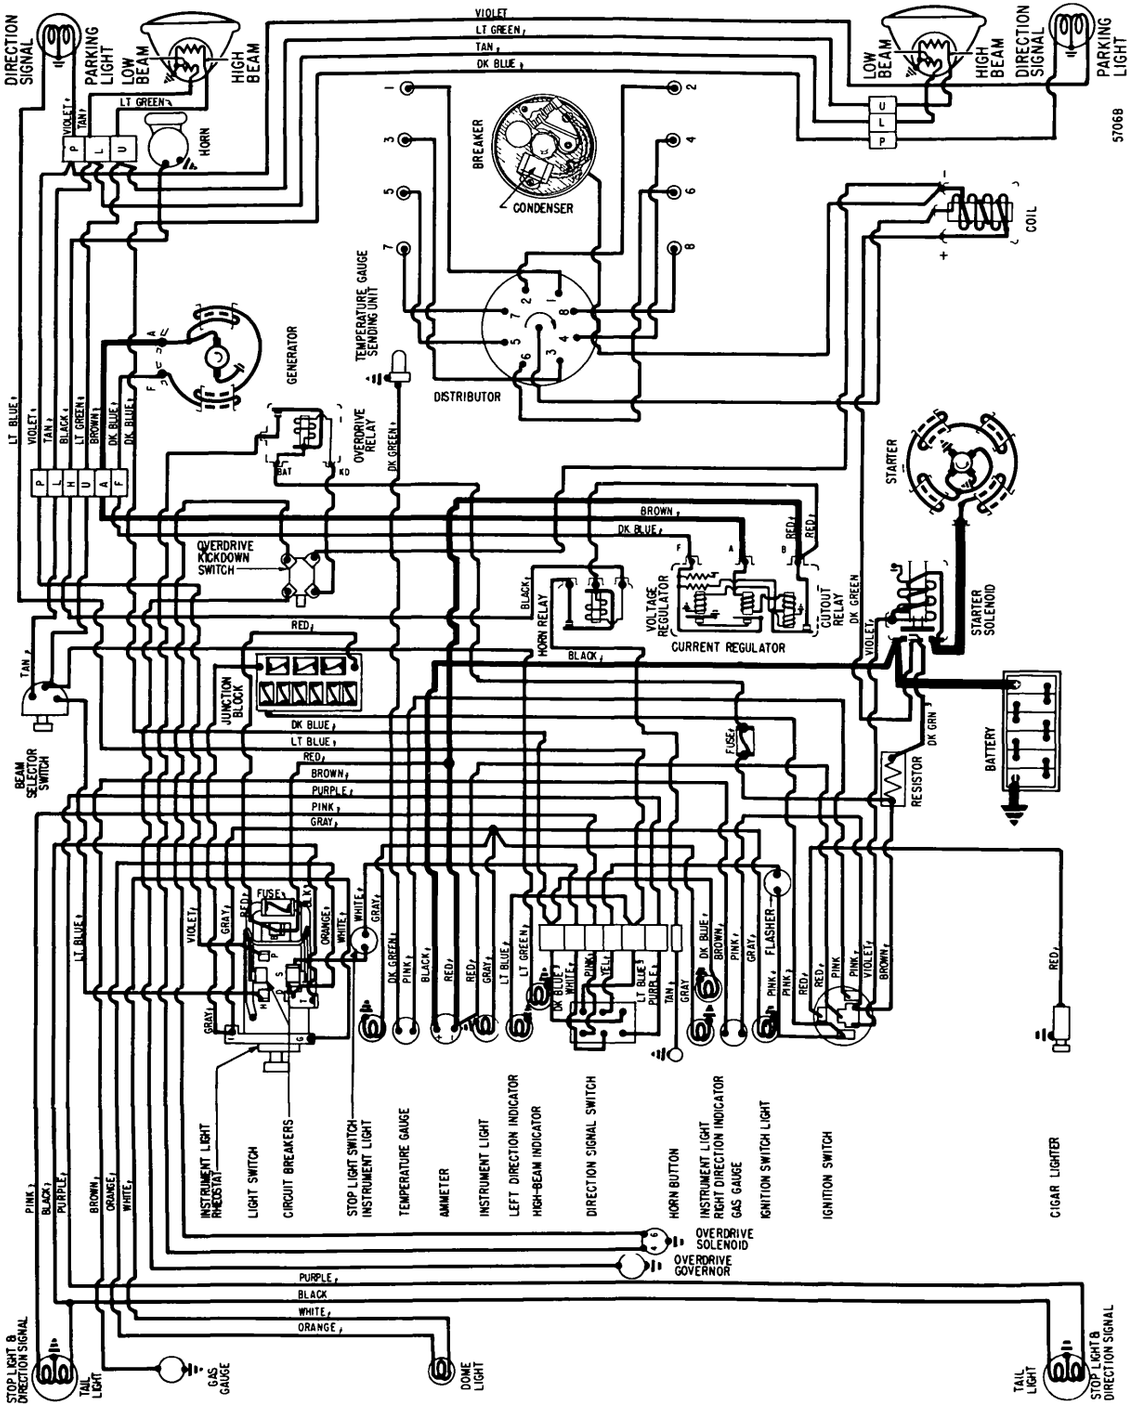
Timing Mark (6 Cyl)) - Steel ball insert in flywheel lined up with pointer in inspection hole in right front faceof housing with Octane Selector set on "0". Adjust Octane Selector as follows: Set for slight ping when accelerating with wide open throttle.

Timing Mark (V8) - Mark on vibration dampener and an indicator on left side of engine front cover. Indicator is marked with 8 lines on "advance" side of "0" mark, and two lines on "retard" side. Each line indicates 2°.

CARBURETOR



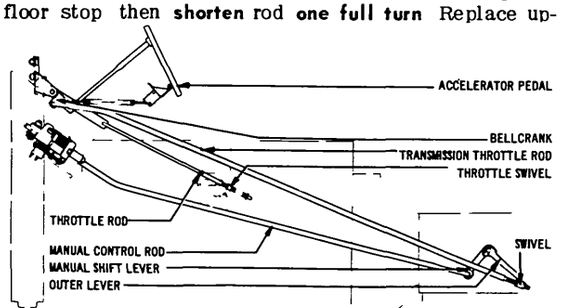
► *CARBURETOR APPLICATION: Rochester "B" & "BC" Carburetors are standard on all 6 Cyl. Models (Exc. Forward Control). Rochester "2G" Carburetor is standard on 265" Trademaster & 283" Taskmaster Engines. Rochester "4G" Carburetor is standard on Super Taskmaster Engines. Carter Updraft Carburetor is standard on Forward Control Models.*



CHEVROLET 6 CYL. HYDRA-MATIC LINKAGE (EXCEPT FORWARD CONTROL)

Throttle Linkage Adjustment (6 Cyl. Hydra-Matic Drive Trucks except Forward Control): With engine at normal operating temperature and idle speed set at 400-450 RPM, remove lower end of carburetor throttle lever-to-bellcrank rod from lever on bellcrank. Install Lever Positioning Gauge J-5609 in hole in lever and gauge hole in pan rail of engine block (hole is located toward rear of bellcrank position), and leave gauge in this position. Remove swivel from bellcrank-to-transmission

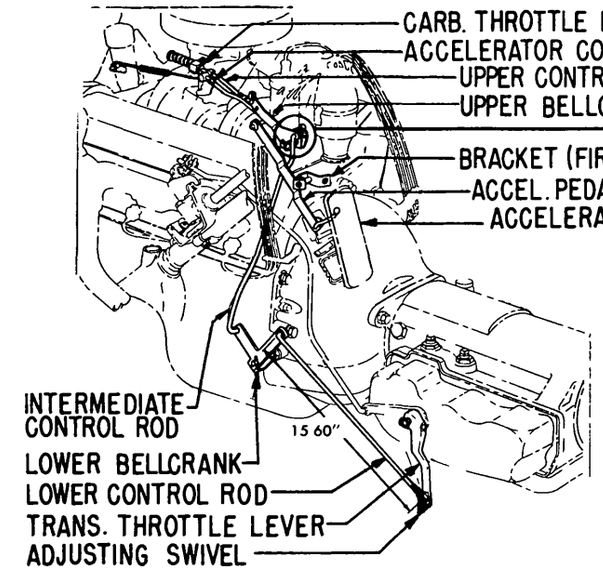
CONTINUED ON NEXT PAGE



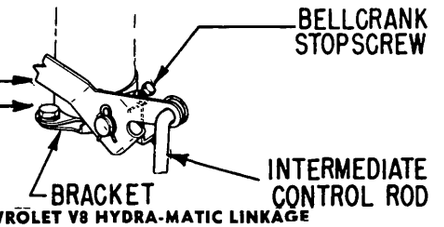
CHEVROLET 6 CYL. TRUCKS (SEE V8 DIAGRAM FOR FWD. CONTROL STARTER)

CHEVROLET V8 TRUCKS (SEE 6 CYL. DIAGRAM FOR PEDAL CONTR. STARTER)

CONTINUED FROM PRECEDING PAGE



outer lever at transmission and move transmission outer lever back against its stop Check distance from hole in outer lever to back of transmission with Gauge J 2545 C Bend lever as necessary for free entry of gauge in lever hole using Tool J-5260 (*CAUTION - Do not apply force to stops at either end of lever travel)* Hold outer lever back against its stop and adjust swivel position on bellcrank-to transmission rod so it just enters hole in transmission lever Remove Positioning Gauge from bellcrank and reinstall rod Recheck engine idle speed with idle screw against stop on carburetor and adjust carburetor throttle to-bellcrank rod so swivel at upper end freely enters hole in throttle lever At this point **shorten** bellcrank-to-transmission outer lever rod by turning swivel locknuts **three and one-half** turns Remove bellcrank to carburetor throttle rod upper swivel from lever and pull rod upward until linkage is stopped by forward stop in transmission Hold in this position and adjust accelerator-to bellcrank rod swivel until accelerator pedal is against floor stop then **shorten** rod **one full turn** Replace up-



CHEVROLET 6 CYL HYDRA-MATIC LINKAGE (FORWARD CONTROL MODELS)

per end of throttle-to-bellcrank rod in throttle lever **Throttle Linkage Adjustment (Forward Control Mod Is With Hydra-Matic Drive)**· With engine at normal operating temperature and idle speed set at 400 450 RPM insert 1/8" diameter pin into gauge pin hole in mounting bracket of accelerator pedal lever Adjust length of throttle rod so that swivel just enters throttle lever Remove swivel from outer lever and move lever back against transmission stop Check distance from hole in outer lever to rear face of transmission with Checking Gauge J-2545-C bending lever as necessary (Tool J 5260) to allow entry of gauge into hole *CAUTION - Do not apply force against stop at either end of lever travel* Adjust transmission throttle rod so that swivel at transmission case just enters outer lever then **shorten** throttle rod **three and one-half turns** of jam nut Tighten nut Remove pin from hole in accelerator pedal lever back off adjusting screw and depress accelerator pedal until outer lever is tight against forward stop on transmission and then turn adjusting screw against accelerator pedal lever Release accelerator pedal turn adjusting screw down **one full turn,** and secure with jam nut

CONTINUED ON NEXT PAGE

CHEVROLET V8 HYDRA-MATIC LINKAGE

CONTINUED FROM PRECEDING PAGE

Throttle Linkage Adjustment (V8 Hydra-Matic Drive Trucks): With carburetor at hot idle, remove lower control rod from transmission throttle lever and hold lever back against transmission stop. Check distance from hole in lever to back of transmission case with Lever Checking Gauge J-2545-C, and bend lever as necessary to allow entry of gauge into hole (Tool J-5260). Adjust lower control rod to 15 60" and install in transmission throttle lever, then install intermediate and upper control rods. **Shorten** lower control rod by loosening adjusting swivel **three and one-half turns** and tightening locknuts. Back off bellcrank stopscrew and rotate upper bellcrank until linkage is stopped by full detent stop in transmission, then turn stopscrew until it contacts bracket. Release upper bellcrank and turn stopscrew in **one-half to one full turn** and lock. **On 3100, 3200, 3600 Series Only** install 1/8" gauge pin through hole in accelerator pedal lever and bracket at firewall, then install accelerator control rod to accelerator pedal lever and rotate lever until bellcrank stopscrew contacts bracket. Adjust length of accelerator control rod so swivel just enters lug on upper control rod.

ROCHESTER "B" & "BC"

Downdraft types with manual choke (Rochester Model "B") and automatic choke (Rochester Model "BC").

Model	Rochester No.
235" (exc. Hydra-Matic) ①	B 7004468
235" (with Hydra-Matic) ①	BC 7009255
261" ①	B 7005140

① - Except Forward Control.

Idle Setting - 1½-2½ turns open (7004468 & 7005140), 2½ turns open (7009255) Turns screw out for richer mixture.

Idle Speed - 450-500 RPM (exc. Auto. Trans. models), 425 RPM (Auto. Trans. models with selector lever in "N" position)

Float Level - 1 9/32" from bottom of each float to cover gasket (do not remove gasket). Use Gauge M-250. With assembly inverted, place gauge with projection inserted in discharge nozzle. Carefully bend float lip vertically so that each float just touches top portion of gauge. Bend float arms to bring them into alignment and to center them in gauge. Tilt assembly 90° on each side and check to see that floats do not touch gauge.

Float Drop - Turn cover right side up so float drops down. Distance from gasket on cover to bottom of each float should be 1¾" on all models. Adjust by bending tang at rear of each float assembly.

► *CAUTION: Both floats must be set alike and must not be twisted out of alignment.*

Accelerating Pump - No seasonal adjustment.

Choke Adjustment: Centered on index.

Fast Idle (7009255): With fast idle screw on next to highest step of fast idle cam, Gauge BT-99 (.076") should just slide between lower edge of choke valve and carburetor bore. To adjust, bend connector rod.

Throttle Linkage Adjustment (Hydra-Matic Drive Trucks): *See CARBURETOR above.*

► *OTHER DATA: See "Rochester B & BC Carburetors" in Carburetion Section.*

ROCHESTER "2G"

Dual downdraft type with manual choke.

Model	Rochester No.
V8 Trademaster 265" (Std.Trans.)①(Early)	7010649
V8 Trademaster 265" (Std.Trans.)②(Early)	7010716
V8 Trademaster 265" (Overdrive) (Early)	7010718
V8 Trademaster 265" (Std.Trans.)①(Later)	7011135
V8 Trademaster 265" (Std.Trans.)②(Later)	7012147
V8 Trademaster 265" (Overdrive) (Later)	7011132
V8 Taskmaster 283" ② (Early)	7010717
V8 Taskmaster 283" ② (Later)	7011143

① - Without governor. ② - With governor.

► *MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrel feeds Cyl. 2-3-5-8, LEFT barrel 1-4-6-7.*

Idle Setting - After idle speed set to correct specifications (see Idle Speed below), turn both idle mixture screws for smooth idle with highest vacuum reading and RPM.

Idle Speed - 475 RPM (Synchro-mesh), 425 RPM with transmission in "N" (Automatic Trans.).

Float Level - 1¼" from air horn gasket to top of float with assembly inverted. Use Gauge BT-129 so it rests against power piston shaft with outer leg in line with center of float. Adjust by bending float arm between pivot and float with Tool BT-69.

Throttle Linkage Adjustment (Hydra-Matic Drive Trucks): *See CARBURETOR above.*

► *OTHER DATA: See "Rochester 2G Carburetors" in Carburetion Section.*

ROCHESTER "4G"

Rochester 4G No. 7009661 (early), 7011161 (later). Four barrel downdraft type with manual choke and vacuum operated governor.

Replacement Package - Rochester No. 7015713.

Idle Setting - Adjust idle mixture screws for highest steady vacuum.

Idle Speed - 450 RPM (Synchro-mesh), 425 RPM (Automatic Trans. with selector lever in "D" range).

Throttle Linkage Adjustment (Hydra-Matic Drive Trucks): *See CARBURETOR above.*

► *OTHER DATA: See "Rochester 4G & 4GC Carburetors" Carburetion Section.*

CARTER

Carter (BB) 871SC (Forward Control Models). Single barrel updraft type with manual choke.

Idle Setting - ½-1½ turns open (turn screw out for richer mixture.)

Idle Speed - 450-500 RPM (Synchro-mesh), 400-450 RPM (Hydra-Matic).

Float Level - Top of float (not seam) 0" to 1/32" below top of bowl with needle valve seated. Use Gauge J-818-13A on top edge of bowl (gasket removed). Press float lever lip firmly against needle.

Accelerating Pump - Inner hole (in plunger shaft and throttle lever) Summer. Outer hole, Winter.

Throttle Linkage Adjustment (Hydra-Matic Drive Trucks): *See CARBURETOR above.*

► *OTHER DATA: See "Carter BB Carburetors" in Carburetion Section.*

FUEL PUMP PRESSURE: 3½-4½ lbs.

CARB. EQUIPMENT

Fuel Pump: **(6 Cyl.)** AC No. 4149 (Std. - Fuel only), 4138 or 707 (Optl. - Fuel & Vacuum).
(V8) - AC No. 4150 (Std. - Fuel only), No. 4304 (Optl. - Fuel & Vacuum).
Pressure - 3½-4½ lbs. (6 cyl.), 4-5¼ lbs. (V8).
See "Fuel Pumps" in Carburetion Section.

Gasoline Gauge: AC Electric.
Dash Unit - AC No. 1518461.
Tank Unit - **Truck Model**
AC No. 1518777 ..... (Utility Cab)
AC No. 1518779 ..... (Utility Exc. Fwd. Cont.)
AC No. 1518780 ..... (Utility Fwd. Cont.)
AC No. 1518778 ..... School Bus
AC No. 1518783 ..... ¾ Ton Fwd. Cont.
See "Fuel Gauges" in Carburetion Section.

BATTERY

Delco 2SMR53W. (Exc. School Bus) - 12 volt, 9 plate, 53 ampere hour capacity (20 hr. rate).
Delco 2SMR72D. (School Bus) - 12 volt, 11 plate, 72 ampere hour capacity (20 hr. rate).
Battery Ground - Negative.
Engine Ground - Engine to frame (6 cyl.). Engine to dash (V8).

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

STARTER

Delc -R my. Application as follows

Mod l	Starter	Armature
6 Cyl. (Exc. Fwd. Cont.)	1107634 ①	1926626
6 Cyl. (Fwd. Cont.)	1107652 ②	1932185
6 Cyl. (Hydra-Matic)	1107677 ② ③	1926626
V8 (Exc. Hydra-Matic)	1107664 ②	1935829
V8 (Hydra-Matic)	1107674 ②	1927343

① - Manual Pinion shift. ② - Solenoid pinion shift.
③ - Delco-Remy 1107633 also used.

Drive (6 Cyl. Synchro-mesh Trans., Exc. Fwd. Cont.) - Overrunning clutch with pedal operated manual pinion shift.

Driv (6 Cyl. Fwd. C nt. & Hydra-Matic Trans., All V8 M d ls) - Overrunning clutch with solenoid pinion shift

R tati n - Counterclockwise at commutator end.

Brush Spring Tension - 35 ozs. minimum.

P rformanc Data - 1107634, 74, 77

Torque	RPM	Volts	Amperes
0 ft. lbs.	6900	10.3	75
10 5 ft. lbs.	Lock	5 8	435

P rf rmance Data - 1107652, 64

Torque	RPM	Volts	① Amperes
0 ft. lbs.	6200-9400	10 6	49-76
	Lock	4 25	270-310

① - Includes solenoid.

Starting Switch (Solenoid Pinion Shift Models): Delco-Remy Solenoid 1119919 (1107652 & 1107664), 1119760 (1107674), 1119793 (1107677). Mounted on starter and controlled by Ignition & Starter Switch 1116537. Turn key full RIGHT against spring tension to start.
See "D lco-Remy Solenoid Starting Switch (Without R lay)" in Electrical Section.

Starting Switch (Manual Pinion Shift Models)· Delco-Remy Switch 1930496. Mounted on starter and actuated by pedal operated lever. Ignition Switch 1116522 is connected to small terminal on side of starter switch to bypass resistor for starting.
See "Delco-Remy Manual Pinion Shift Starter Switches" in Electrical Section.

Hydra-MaticN utral Safety Switch: Delco-Remy 1998110. Mounted on steering column.
Adjustm nt - *See "Hydra-Matic Drive" in Transmission Section.*

GENERATOR

Delc -R my. Used as follows

Mod l	Generator	Armature
Std. (25 Amp.)	1100326	1928952
Optl. (30 Amp)	1105947	1928003
Optl. (40 Amp.)	1106981	1929360
Power Strg.	1102041	1929640
Power Strg. (Optl.)	1106982	1932349

Performance Data - Cold

G n rat r	① Amp res	Volts	RPM
1100326	25	14 0	2570
1102041	30	14 0	2210
1105947	32	14 0	1850
1106981, 2	40	13 0	1500

① - Not maximum output. See Current Re gulator

Rotati n - Counterclockwise at commutator end.

Brush Spring T nsi n - 28 ozs.

Field Current - 1.5-1.62 amps. (1100326), 1 48-1 62 amps. (1102041), 1 54-1.67 amps. (1105947), 1.37-1.50 amps. (1106981, 82). All at 12 volts.

Belt Adjustment: 5/16" (6 Cyl.), 13/16" (V8) deflection midway between water pump and generator pulleys with light load applied to belt.

REGULATOR

Delco-Remy. Application as follows

Regulator No.	Generator No.
1119000 (25 Amp.)	1100326
1119001 (30 Amp.)	1105947
1119003 (30 Amp.)	1102041
1119004 (40 Amp.)	1106981, 82

►*NOTE - Specifications below are for "NORMAL" settings.*

Cutout Relay

Cuts In - 11.5-13 0 volts (1119004), 11 8-13.5 volts (Others).
Contact Gap - .020".
Air Gap - .020" (with contacts just closed).

Voltage Regulator

Setting - 13.6-14 3 volts (1119004), 13 8-14.8 volts (Others).
Air Gap - .075" with armature pressed down to point where contacts just touching.
Checking & Adjusting - *See "Delco-Remy 12 Volt Regulators" in Electrical Se ction.*

Current Regulator

Setting - (1119000) 23-27 Amperes (1119003) 27-33 Amperes, (1119004) 37-42 Amperes.
Air Gap - .075" with armature pressed down to point where contacts just touching
Checking & Adjusting - *See "Delco Remy 12 Volt Regulators" in Electrical Section*

MISC. ELECTRICAL

Headlamps· Sealed Beam. *See Electrical Section.*
Directional Signals: *See Electrical Section.*
Lighting Switch Removal: Disconnect all wires from switch (tag wires for reinstallation), depress switch shaft retainer (on top of switch) and remove knob and shaft. Remove retaining ferrule, remove switch.
Stop Light Switch Location. Attached to under side of toe pan to left of brake pedal.
LIGHTING CIRCUIT BREAKERS: Two 13 ampere circuit breakers located in main lighting switch. One protects headlamps and parking lamps and the other circuit breaker protects all other light circuits except instrument panel lights.
FUSES: Instrum nt Lights - 3 ampere. On lighting switch.
Ov rdrive - 9 ampere In overdrive relay lead
H rn R lay: Delco-Remy 1116920.
C ntacts Cl se - 5 0-9 5 volts.
C ntact Gap - .027".

Super Taskmaster	8.0-1	48.0	③ 175

① - At 4200 RPM. ② - At 4000 RPM. ③ - At 4400 RPM.
Compression & Vacuum Reading - *See TUNE-UP.*

ENGINE REMOVAL: *See "Engine" in Chevrolet Special Data.*
OIL PAN REMOVAL: (6 Cyl. Engine) - Drain oil and remove flywheel housing under pan, flywheel underpan extension, and oil pan screws. Remove oil pan.
OIL PAN REMOVAL: (V8 Engine) - Drain oil, disconnect steering idler arm bracket from right hand frame side rail and drop for clearance. On 5000 Series truck, remove oil gauge tube attaching bolt and remove gauge and tube. Remove oil pan bolts and screws and remove oil pan.
ENGINE MOUNTINGS: *See "Engine Mountings" in Chevrolet Special Data.*
CYLINDER HEAD & MANIFOLDS: *See "Cylinder Head & Manifold" in Chevrolet Special Data.*
TIGHTENING TORQUES· *See "Tightening Specifications" in Chevrolet Special Data.*
►*OTHER ENGINE DATA See 1957 Passenger Car pages and note the following:*
PISTON RINGS (6 CYL. ENGINES): 235" & 261" Engines have "Chrome Plated" top compression rings. Other compression rings are cast iron, oil rings are three piece steel (2 Chrome-Plated Rails & Spacer).
VALVES (ALL ENGINES): Rotocoil Valve Rotators - Used on exhaust valves of some 6 Cyl. & V8 engines.
VALVE LIFTERS (ALL ENGINES): Mechanical type lifters used on all 6 cyl.truck engines. Hydraulic lifters used on all V8 engines

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

VALVE TIMING (ALL ENGINES): As follows

235" Thriftmaster & 261" Jobmaster

Intake Valve - Open 10°30' BTDC. Close 53°30' ALDC.
Exhaust Valve - Open 49° BLDC. Close 15° ATDC.

265" Trademaster

Intake Valve - Open 18° BTDC. Close 72° ALDC.
Exhaust Valve - Open 52° BLDC. Close 20° ATDC.

283" Taskmaster & Super Taskmaster

Intake Valve - Open 12°30' BTDC. Close 57°30' ALDC.
Exhaust Valve - Open 54°30' BLDC. Close 15°30' ATDC.

Valve Timing Check (235" & 261" Engines): Remove all tappet clearance from No. 1 exhaust valve. Turn engine over until this valve opens and just starts to close and until triangular mark on flywheel lines up with pointer in flywheel housing opening. Mount dial indicator on rocker arm shaft support with stem contacting No. 1 exhaust valve adjusting screw, set dial indicator to .063". Turn crankshaft until indicator hand just stops moving. Timing is correct if indicator reading is ZERO plus or minus .004". Reset No. 1 exhaust valve to correct running clearance

OILING SYSTEM

Crankcase Capacity: **(6 Cyl.)** 5 qts. (Thriftmaster), 7 qts. (Jobmaster). **(V8)** 4 qts. (Trademaster), 5 qts. (Taskmaster & Super Taskmaster).

Normal Oil Pressure - 30 lbs. at 1170-1200 RPM.

Pressure Regulator Valve - In pump body, not adjustable.

Oil Pressure Indicator - AC No. 1508246. Not electric.

Oil Pump: Gear type. Located in crankcase, driven by distributor gear.

► *OIL PUMP SCREEN NOTE:* Oil pickup pipe should be installed with pickup pipe screen horizontal and toward bottom of pan.

Oil Pump Overhaul - *See "Oiling System" in Chevrolet Special Data.*

Crankcase Ventilation (Standard): Air intake through valve rocker arm cover, outlet through pipe on right side of engine.

Servicing - On all models with air cleaner mounted on valve rocker arm cover, wash filter element with solvent and re-oil at 2000 mile intervals or more often if required by operating conditions.

Crankcase Ventilation (Optional): Positive Type. Vacuum operated ventilator consisting of a vacuum pipe from oil filler pipe to ventilator valve in fitting on intake manifold. Valve is spring loaded, variable opening type giving constant crankcase ventilation at all speeds. **Valve must close at idling to give proper air-fuel mixture.**

Servicing - Every 10,000 miles (or oftener if required), clean vacuum pipe, valve, and filler pipe thoroughly. Filler cap gasket must seal tightly.

► *VACUUM VALVE CAUTION* If improper action of spring is suspected due to spring being distorted, or etched from corrosive action, the valve assembly should be replaced.

► *TASKMASTER V8 CRANKCASE VENTILATION NOTE:* Positive type crankcase ventilation is Standard.

COOLING

Water Capacity: In quarts for each type engine
½, ¾, 1 Ton (Std.) - 17 (235"), 17½ (265").
½, ¾, 1 Ton (H.D.) - 17½ (235"), 18 (265").
1½ Ton Spec. (Std.) - 17½ (235"), 18 (265").
1½ Ton Spec. (H.D.) - 18 (235"), 18½ (265").
5000 Series - 18 (283" Std.), 18½ (283" Powermatic).
6000 Series (Std.) - 17½ (235"), 17 (261"), 18 (283").
6000 Series (H.D.) - 18 (235"), 18½ (283").
6000 Series (Powermatic) - 21 (261"), 21½ (283").
NOTE - Add 1 qt. for heater.

Pressure Valve: AC No. 850795. Radiator filler cap. 7 lb. type. Replacement Valve - AC No. RC-1.

Thermostat: Harrison. In cylinder head water outlet (6 Cyl.). In water outlet in intake manifold (V8).
Standard - No. 3133595 (stamped 151) 151°. Can be used for alcohol anti-freeze.
Optional - No. 3133596 (stamped 160) 160°. No. 313-3597 (stamped 170), 170°.

Temperature Gauge: AC Electric.
Dash Unit - AC No. 1513138.
Engine Unit - AC No. 1513321.
See "Temperature Gauges" in Miscellaneous Section.

Water Pump: Packless type with sealed ball bearing shaft *See "Water Pumps" in Water Pump Section.*

CLUTCH

Own. (Diaphragm Spring) and Borg & Beck (Coil Spring) types used. Single plate, dry disc type.

Chevrolet (Own) Diaphragm Clutch

Model	Size	Chevrolet No
6 Cyl. (Exc. H.D., Fwd. Contr.)	10"	3836715
6 Cyl. Fwd. Contr. (Exc. 2 ton)	11"	3836719
6 Cyl. ½, ¾, 1, 1½ ton H.D.	11"	3836719
Borg & Beck Clutch		
6 Cyl. 2 ton (261" Eng.)	11"	① 3837155
V8 ½, ¾, 1, 1½ ton	11"	① 3837155
V8 2 ton	11"	3743203

① - Borg & Beck 11A9 No. 361455.
See "Chevrolet (Own)" or "Borg & Beck" in Clutch Section.

Clutch & Clutch Disc Application - As follows

Clutch Disc (Chevrolet Clutch)

Model	Chevrolet No.
Std. 10" (Woven-Red Hub)	3836119
Std. 10" (Molded-Orange Hub)	3836097
H.D. 11" (Woven-Pink Hub)	3836906
Clutch Disc (Borg & Beck)	
Std. 10½" (Dark Green Hub)	③ 3727585
H.D. 11" (Yellow Hub)	④ 3733153

③ - Borg & Beck No. 382528.
④ - Borg & Beck No. 382286.

6 CYL. ENGINES

Pedal Adjustment: Pedal free travel ¾-1" To adjust, loosen checknut and turn adjusting nut on connecting link at clutch throwout fork. *NOTE*—Use finger pressure only when checking clutch free travel.

Removal: Remove transmission (see Transmission Removal). Remove throwout bearing, remove fork by prying fork off ball, remove fork mounting (use ¾" wrench). Install Clutch Pilot Tool K-411 (to support clutch), loosen all six cover bolts evenly, remove assembly from below. *CAUTION*—Do not allow pressure plate to hang on retracting springs (support by hand). When installing clutch align "X" mark on cover with "X" mark on flywheel.

V8 ENGINES

Pedal Adjustment: Adjust clutch pedal until free travel is 1". Make sure that pedal pad contacts toeboard when pedal pressed down.

Removal: Remove transmission (see Transmission Removal). Before removing clutch assembly, punch mark flywheel, clutch cover and one pressure plate lug so these parts may be assembled in their same relative positions. Loosen hold-down screws evenly and remove cover. *NOTE*—Mark flywheel side of driven plate for correct reassembly.

TRANSMISSION

3-SPEED LIGHT DUTY

Own. Three speed, all helical gear type. Constant mesh, synchro-mesh (second & high), sliding gear (low & reverse).
See "Chevrolet 3-Speed (Light Duty)" in Transmission Section.

Transmission Control: Steering column mounted gearshift lever. *See "Transmission Controls" in Transmission Section.*

Removal (½ & ¾ Ton): Drain transmission. Disconnect speedometer cable at transmission and shift control rods from transmission levers. Remove propeller shaft. Remove the two top transmission to clutch housing capscrews and insert two transmission guide pins, Tool J-1126, in these holes. Remove the two lower transmission to clutch housing capscrews. Slide transmission straight back on guide pins until clutch gear is free of splines in the clutch disc

3-SPEED (HEAVY DUTY)

Own. Three speed, constant mesh (second & high), sliding gear (low & reverse).
See "Chevrolet 3-Speed (Heavy Duty)" in Transmission Section.

Transmission Control: Steering column mounted gearshift lever.
See "Transmission Control" in Transmission Section.

Removal: Same as for "3-Speed (Light Duty)" above.

4-SPEED

Own. Four-speed, constant mesh, synchro-mesh, helical gear (2nd, 3rd, & 4th), sliding spur gear (low & reverse). Floor mounted gearshift.

Transmission Control: Floor mounted gearshift lever.

Removal (½ Ton): *See "3-speed (Light Duty)" abov .*

Removal (Other Trucks): Drain transmission, disconnect parking brake and remove lever. Remove propellor shaft, transmission gearshift lever (use Tool K-353). Remove screws that fasten steering jacket grommet to floor and slide grommet up jacket out of way. Remove accelerator pedal and floor mat. Remove sheet metal screws attaching transmission cover to body floor, remove cover. On Forward Control Models, remove both front and rear floor pans. Disconnect speedometer cable from driven gear fitting at transmission rear bearing retainer. Remove two top attaching screws, insert Guide Pins J-1126, remove flywheel underpan, two lower transmission screws, slide transmission straight back, remove transmission from vehicle.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

OVERDRIVE

Warner R10. Used with Chevrolet Truck 3-Speed (Light Duty) Transmission.

See "Chevrolet Overdrive" in Transmission Section.

Overdrive Control: *See "Warner R10 & R11 Overdrive Control" in Transmission Section.*

Removal: Same as for Synchro-mesh Transmission (above) after control wiring and cables have been disconnected.

HYDRA-MATIC DRIVE

Dual Range. Four speed type with fluid coupling.

►*PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION: See Transmission Section.*

►*TESTING & TROUBLE SHOOTING: See "Hydra-Matic Drive" in Transmission Section.*

Lubrication—Check fluid level in transmission every day. Drain & refill every 25,000 miles. Use only "Automatic Transmission Fluid" Type A.

Checking Fluid Level—With selector lever in "N" position, parking brake set, and transmission at normal operating temperature, remove access hole cover plate in floor pan, and **check fluid level with engine at idling speed.** Add sufficient fluid to bring level in transmission to "F" mark on dipstick.

Capacity—8½ qts. (refill), 9 qts. (after overhaul). *NOTE*—1 qt. additional with oil cooler.

Throttle Linkage Adjustment: See *CARBURETOR* above.

►*OTHER HYDRA-MATIC SERVICE DATA*—*See "Hydra-Matic Drive" in Transmission Section.*

UNIVERSALS

Spicer. Needle bearing type.

REAR AXLE

SEMI-FLOATING (HALF-TON)

Own. Semi-floating, hypoid gear type with Hotchkiss drive. *NOTE*—Same design as passenger car axle.

See *"Chevrolet Hypoid Semi-Floating" in Rear Axle Section.*

Ratio—**(Synchro-mesh & Hydra-Matic)** 3.90-1 (39.10) **(Overdrive)** 4.11-1 (37:9).

►*AXLE SHAFT NOTE: Shafts unequal length (right shaft longer) and may be identified by mark stamped on shaft, or by length as follows:*

Axle	Part No.	Length
Left	3694769①	29 5/8"
Right	3694770①	30 5/8"

①—Part No. stamped on axle for identification.

Backlash—.005-.008".

Removal of Rear Axle Assembly: Disconnect and remove parking brake pull back spring. Remove cotter pins and clevis pins from each parking brake cable clevis, and remove clevis. Remove springs and retaining clips from cables at frame brackets. Disconnect universal joint trunnion bearing "U" bolts and split rear universal joint. Disconnect shocks from anchor plates. Disconnect hydraulic brake line to connector at rear frame bracket. Remove spring "U" bolts, nuts and anchor plates. Raise rear of truck and roll assembly out toward rear. *CAUTION—Be careful when pulling parking brake cables through openings in frame.*

Axle Shaft Removal: *See "Chevrolet Hypoid Semi-Floating" in Rear Axle Section.*

Axle Shaft Endplay—Free fit to .014" maximum.

FULL-FLOATING (¾, 1, 1½ & 2-TON) (EXC. LCF MODELS)

Own. Full-floating hypoid gear (straddle mounted pinion) with Hotchkiss drive.

►*AXLE ASSEMBLY NOTE, ¾ & 1-Ton axle assemblies are different design than used on 1½ & 2-Ton with standard rear axle assemblies.*

See "Chevrolet Truck Hypoid Full-Floating" in Rear Axle Section.

►*AXLE RATIO IDENTIFICATION NOTE: Axle ratios are identified by prefix letters in rear axle numbers stamped on top of carrier housing between reinforcing ribs. See Axle Ratios following:*

Axle Ratio Identification

Ratio	Prefix Letters
5.14-1 (36:7)	CA, CB, CE, CF
4.57-1 (32:7)	CC, CD
6.17-1 (37:6)	CG, CH, CJ
7.2-1 (36:5)	CM

Backlash—.005-.008". Screw adjustment.

Removal of Differential Carrier: Drain lubricant, remove axle housing cover and axle shafts, see axle shaft removal below. Remove two trunnion bearing "U" bolts from rear yoke and split rear universal joint (hold bearings on trunnion with tape). Remove bolts and lockwashers holding carrier to axle housing, support carrier in floor jack and roll from under truck.

Axle Shaft Removal (¾ & 1-Ton). Remove eight capscrews and lockwashers in axle shaft flange. Install two ½"x13" screws in special threaded holes in flange (between regular mounting screw holes), turn these screws up evenly to loosen the shaft. Withdraw shaft from housing, remove and discard gasket. *Use new gasket when installing shaft.*

►*CAUTION* Thoroughly clean all lubricant from axle shaft flange and end of wheel hub before installing axle shaft. *Grease at this point will cause loosening of axle shaft flange capscrews.*

Axle Shaft Removal (1½ & 2-Ton): Shaft flange is splined in wheel hub (tight fit) and requires special puller for removal. Remove five capscrews and lockwashers in hub cap, remove hub cap and gasket. Assemble special adapter J-1436-8 on Rear Axle Shaft Bearing & Oil Seal Remover J-1436 (remove jaws), thread adapter into hole in axle shaft flange, pull axle shaft. *NOTE*—When reinstalling axle shaft, tap flange splines into engagement with wheel hub splines (if necessary, rotate wheel slightly to align splines on shaft with both wheel hub and differential side gear splines), use new hub gasket.

►**Axle Shaft Note:** Shafts unequal length (right shaft longer than left). Install in correct position.

Wheel Bearing Adjustment: Remove wheels and axle shafts (see above). Bend back lip of lock in locknut notch, remove locknut and adjusting nut lock. Tighten adjusting nut tight, using special wrench J-2222 (¾ & 1-Ton), J-870 (1½ Ton), J-5670 (2-Ton) while turning hub by hand, then back off nut 45°, check for free turning, install adjusting nut lock with lock tangs aligned with slots in adjusting nut. Bend tang down into notch in adjusting nut, install locknut and tighten securely. Bend tang of lock down into notch of locknut.

HEAVY DUTY FULL-FLOATING (2-TON & LCF MODELS)

Own. Full floating, hypoid gear, roller pinion bearings (straddle mounted pinion), with Hotchkiss drive.

See "Chevrolet Truck Heavy Duty Hypoid Full Floating" in Rear Axle Section.

Ratios—Same as for "Standard Full-Floating" above.

Backlash—.005-.008"

Removal Of Rear Axle Assembly: Same as for "Standard Full-Floating" above.

Axle Shaft Removal: Same as for 1½ & 2-Ton "Standard Full-Floating" above.

►**Axle Shaft Note.** Shafts unequal length (right shaft longer than left). Install in correct position.

Wheel Bearing Adjustment: Same as for "Standard Full-Floating" above.

PLANETARY 2-SPEED

Own. Full-floating, two-speed planetary reduction type with hypoid primary pinion and ring gear.

See "Chevrolet Truck Planetary 2-Speed" in Rear Axle Section.

►*NOTE: Two gear ratios available as follows:*

Power Ratio—6.40-1 (high), 8.72-1 (low). 32:5 Primary gears.

Speed Ratio—5.83-1 (high), 7.95-1 (low). 35:6 Primary gears.

Two-Speed Shift Control: Vacuum power type with control on gearshift lever.

Carrier Assembly Removal: *See "Chevrolet Truck Planetary 2-Speed" in Rear Axle Section.*

Axle Shaft Removal & Wheel Bearing Adjustment: Same as for "Standard Full-Floating" above.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

SHOCK ABSORBERS

Delco. Direct Acting (Airplane Type) shock absorbers as follows:

Shock Absorber Nos.	Front	Rear
½, ¾, 1 ton (Exc. Fwd. Contr.)	5532049	5534435
½, ¾, 1 ton Fwd. Contr.	5513193	5513349
1½, 2 ton (Exc. Fwd. Contr., Sch. Bus)	5521698	5534401
1½ ton Sch. Bus	5521698	5320846
2 ton Sch. Bus	5521699	5534401

FRONT SUSPENSION

Conventional "I" Beam section, with Reverse Elliott ends and semi-eliptic springs.

Kingpin Inclination - 7.16°.

Caster - Pos. 1½° (3100, 3200), Pos. 3° (3600), Pos. 2° (3400, 3500, 3700, 4000, 5000), Pos. 2¼° (3800, 6000).

Camber - Pos. ½° to Pos. 1½°.

Toe-In - 1/8" to 7/32" (½ Ton), ¼" to 5/16" (Others).

Toe-Out on Turns - With outer wheel at 20°, inner wheel should be 22.5° to 23.5°.

STEERING

Manual: Saginaw Ball Bearing Worm & Nut (recirculating ball).
See "Saginaw Ball Bearing Worm & Nut" in Steering Section.

Power Steering: Bendix Linkage Type – *See "Chevrolet Truck (Bendix)" in Steering Section.*

Steering Linkage: *See "Steering Linkage" in Steering Section.*

Steering Wheel & Horn Button Removal: *See "Saginaw Ball Bearing Worm & Nut" in Steering Section.*

Steering Gear Removal: *See "Saginaw Ball Bearing Worm & Nut" in Steering Section.*

BRAKES

►*NOTE: Two different type brakes used on trucks as indicated below.*

Chevrolet-Bendix (Except Rear Wheels of 1½ & 2-Ton Models–Duo-servo, single anchor, hydraulic (without eccentric adjustment).
See "Chevrolet-Bendix Hydraulic" in Brake Section.

►*HALF-TON TRUCK BRAKE SHOE GRINDING CAUTION:* If bench type grinder used, grind shoes to .057" to .087" smaller diameter than drum size. If spindle type grinder used, grind shoe to drum diameter.

Chevrolet-Twinplex (Rear Wheels 1½ & 2-Ton Models)– Two-cylinder, four-anchor type hydraulic. Shoes are self-centering and self-energizing.
See "Chevrolet Twinplex" in Brake Section.

Wheel Cylinders– Size stamped on housing under adjusting lock spring.

Drums–Cast iron with steel web.

Drum Diameter

Model	Front	Rear
½-Ton	11"	11"
¾-Ton	12"	12"
1-Ton	12"	14"
1½ & 2-Ton	14"	15"

Lining–Molded type. Riveted on 1½ & 2-Ton Models and bonded on all others.

Thickness & Width

Model	Thickness	Width
½-Ton (Front Whl.)	.202-.222"	2"
½-Ton (Rear Whl.)	.202-.222"	1¾"
¾-Ton (Front & Rear)	.264-.284"	2"
1-Ton (Front Whl.)	.264-.284"	2"
1-Ton (Rear Whl.)	.267-.287"	2½"
1½ & 2-Ton (Front Whl.)	.267-.287"	2½"
1½ & 2-Ton (Rear Whl.)	.392-.412"	4"

Clearance–Adjust for clearance as follows:

All Models (Except 1½ & 2-Ton Rear Brakes)–Remove adjusting hole cover and turn brake adjusting screw until light drag is felt, then back off adjusting screw 7 notches (Half-Ton Models), or just enough to eliminate brake drag (Other Models), but not more than 7 notches.

Rear Wheels (1½ & 2-Ton Models)–Remove adjusting hole covers from flange plate and turn rear adjusting screw until slight drag is felt, then back off 3 notches. Repeat on front adjusting screw (2 adjustments on each wheel).

Parking Brakes: Hand lever applies rear wheel service brakes on Half-Ton & ¾-Ton Models, and an independent brake on propeller shaft on all other models.

Adjustment (½ & ¾-Ton Models)–*See "Chevrolet-Bendix Hydraulic" in Brake Section.*

Adjustment (1, 1½, 2-Ton Models & ¾-Ton with 4-Speed Transmission)–*See "Chevrolet Twinplex" in Brake Section.*

Master Cylinder: Located under floorboard on left hand side of truck.

Checking Fluid–Maintain fluid level to lower edge of filler hole.

Removal–Remove from below. *CAUTION*–On 1½ & 2 Ton Low Cab Forward, spacer between cylinder and body bracket will fall out when mounting bolts removed.

Installation–Reverse removal procedure. On LCF Models make sure the spacers are reinstalled.

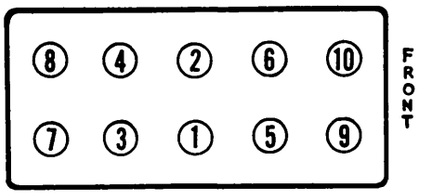
Power Brakes: *See "Hydrovac Power Unit" in Brake Sect.*

Removal–Remove vacuum line, brake fluid line to wheel and master cylinders, and air cleaner hose from vacuum unit. Remove nuts and bolt securing unit to its bracket on right side rail of frame.

MISC. MECHANICAL

Windshield Wipers: Linkage type. Vacuum motor (Std. Equip.). Electric motor (Optl. Equip.).
See "Windshield Wipers" in Miscellaneous Section.

TIGHTENING SPECIFICATIONS



ALL ENGINES	Ft. Lbs
Cylinder Head	85
Intake Manifold	30
Exhaust Manifold	25
Exhaust Pipe Flange Bolt Nut	40
Oil Pan	15
Main Bearing Caps	85
Flywheel	60
Vibration Dampener	135
Crankshaft Pulley	135
Con Rod Caps	45
Camshaft Sprocket	35
Camshaft Sprocket Hub Thrust Plate	15
Rocker Arm Cover	2 5
Valve Lifter Cover	4 1 6

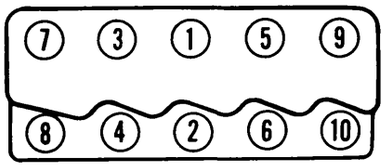
Water Manifold	30
Water Pump Mounting	30
Oil Pump Mounting	33
Clutch Housing	50

ENGINE



ENGINE ASSEMBLY REMOVAL: Drain cooling system, remove battery Remove fan shroud, radiator, and hood. *(NOTE* - Before removing hood, scribe outline of hinge brackets to insure proper adjustment when reinstalling.) Disconnect fuel lines and wires attached to engine units. Remove air cleaner and carburetor. Attach engine lifting Tool C-3466 to carburetor flange studs on intake manifold and attach chain hoist to fixture eyebolt. Raise car and disconnect propeller shaft at transmission Disconnect wires and linkage at transmission. Disconnect wires and linkage at transmission and clutch. Remove exhaust pipe (make sure exhaust system is supported while engine is removed). Drain engine and transmission oil. Remove rear crossmember-to-transmission support attaching bolts. *(NOTE* - Place a roll-away jack under transmission to relieve weight from crossmember. Place a wood block between head of jack and transmission to avoid damaging transmission oil pan. Jack must support weight of rear of engine and must be able to roll with engine as engine is removed). Remove crossmember-to-frame bracket attaching bolts. Remove crossmember and rear engine support Lower car to convenient working height, then remove engine front support mounting bolts With chain hoist, raise engine and, at same time, work engine out of chassis toward left front fender

CYLINDER HEAD & MANIFOLD

Installation: (All models) - Coat new gaskets with sealer install cylinder heads and pushrods Insert cylinder head bolts in rocker arm support brackets *(NOTE* - **SpitFire** engine new secures rocker arm brackets with cylinder head bolts **Fire Power** engine uses all cylinder head bolts to secure rocker arm brackets) Position rocker arm assemblies lining up pushrods with rocker arms Tighten all cylinder head bolts to 60-80 ft lbs in sequence shown in diagram then retighten in same sequence to 85 ft lbs

V8 ENGINES (DOUBLE ROCKER ARM SHAFT)

V8 ENGINES (SINGLE ROCKER ARM SHAFT)

CRANKSHAFT & MAIN BEARINGS

ALL ENGINES

REAR MAIN BEARING SEAL: Rope type seal of braided asbestos With bearing cap, bearing and seal removed, install a new seal in position in cap so that both ends of seal protrude above cap Tap seal down in position with Tool C-3511 until tool is seated in bore Hold tool down and cut off protruding ends flush with cap Install bearing insert and both cap seals The long cap seal should be installed so that when cap is in position, seal is on the oil filter side of engine

ENGINE FRONT COVER

ALL ENGINES

ENGINE FRONT COVER: Removal - Drain cooling system remove radiator *NOTE* - On Air Cond cars remove upper half of fan shroud Loosen power steering pump idler pulley and generator and remove belts Remove fan spacer and pulley *NOTE* - On Air Cond cars remove pulley from water pump fan hub, remove fluid fan drive Remove water pump body to housing bolts and remove pump Pull damper off end of crankshaft (use Puller C-3033) Remove front cover and gasket

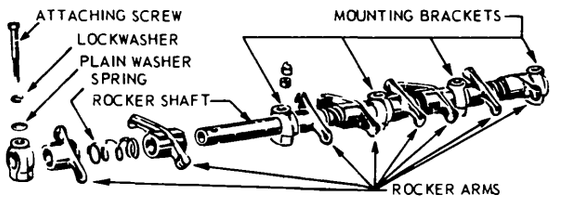
Installation: Be sure mating surfaces are clean and free of burrs Use new gaskets reverse removal procedure, tightening chain cover bolts to correct torque specifications

FRONT OIL SEAL: With chain cover removed (see above), use Tool C-3506 to remove old seal *NOTE* - When installing tool for replacing seal have thin shoulder of installing plate up on **stamped** case cover, and thick shoulder up on **cast iron** case cover Have protective recess in installing plate toward lip of seal retainer Seal is properly installed when neoprene is tight against face of cover

CAMSHAFT & BEARINGS

CAMSHAFT REMOVAL: Remove Engine Front Cover see above, remove crankshaft oil slinger, fuel pump eccentric bolt cup washer and eccentric Remove timing chain with crankshaft and camshaft sprockets Remove intake manifold lifter cover pushrods lifters and distributor Lift out distributor drive gear and stub shaft Remove camshaft thrust plate bolts and oil trough Carefully draw camshaft and spacer out through bearings (do not damage bearings with cam lobes)

VALVE SYSTEM



V8 ENGINES – DOUBLE ROCKER SHAFT

EXHAUST VALVE SEAT INSERT REPLACEMENT: Furnished 010" O S Use special Tool C-3140 (Double Rocker Shaft Engines) to remove inserts After inserts have been removed from engine, smooth any roughness of seat with a blunt drift Valve seat inserts should be from 002- 004" larger than counterbore to insure correct fit If inserts are found to be loose, enlarge counterbore with Tool MH-M-1 and install oversize insert Place inserts in dry ice for approximately 10 minutes Clean counterbore thoroughly and install a chilled insert with valve side up, and drive it into place with Installing Tool C-767

ROCKER ARMS

V8 ENGINES – SINGLE ROCKER SHAFT

ROCKER ARM ASSEMBLY (Single Rocker Arm Shaft): Hold rocker arm shaft and end bracket in a horizontal position with oil grooves facing down Slide an intake rocker arm over shaft and down against bracket, with diagonal slant of arm close to bracket Then slide a spacer spring over shaft

ROCKER ARM ASSEMBLY (SINGLE ROCKER ARM SHAFT)

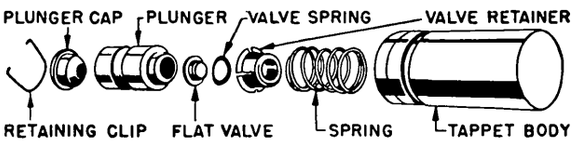
and down against intake rocker arm Next, slide an exhaust rocker arm over shaft and down against spacer spring, followed by a shaft bracket Continue to slide first an intake rocker arm, then a spacer spring followed by an exhaust rocker arm and bracket, over shaft until last bracket has been installed Slide push rods into push rod holes Be sure that rocker arms are in a horizontal position, then lower rocker shaft assembly down on two locating studs on head Install flatwashers and nuts

V8 ENGINES – DOUBLE ROCKER SHAFT

ROCKER ARM ASSEMBLY (Double Rocker Arm Shaft):

Removal: Remove rocker arm covers Place cotter pins in holes of first and last rocker arm brackets to last rocker arm brackets (if not already there) to prevent springs on rocker from pushing assembly apart when cylinder bolts removed Completely loosen ten bolts on each bank that attach rocker arm support brackets to cylinder head and block Grasp support bracket at each end of head pull rocker assemblies and bolts directly away from heads, then remove push rods and place in respective slots in holder C-3068 ***CAUTION—Use care when removing rocker assemblies in order not to jerk cylinder heads off locating dowels which would allow them to drop and become damaged.***

CONTINUED ON NEXT PAGE



CONTINUED FROM PRECEDING PAGE

Installation Insert cylinder head bolts in brackets, with **short** bolts in intake side Insert push rods through push rod holes in heads (short rods in upper intake holes, long rods in lower exhaust holes) Place rocker arm assemblies in position on heads, lining up all push rods to their respective rocker arms Starting at top center tighten all cylinder head bolts to torque indicated in Tightening Specifications above ***When tappets are full, extreme care must be taken when tightening head bolts so that tappets have time to bleed down to their operating length.*** Bulged tappet bodies and permanent noisy operation will result if tappets are forced down too rapidly

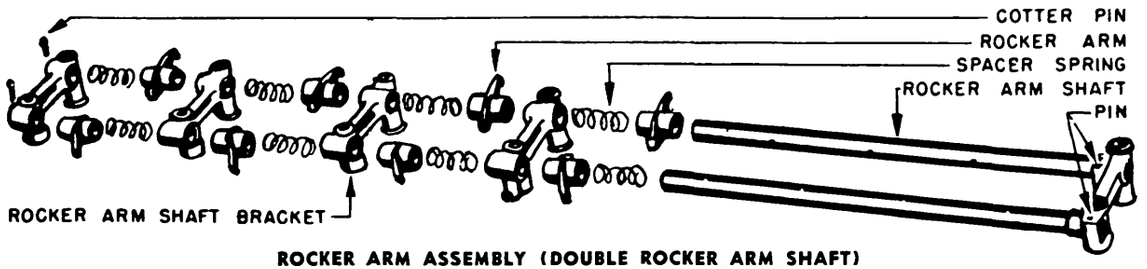
HYDRAULIC VALVE LIFTER

ALL ENGINES

DESCRIPTION: Barrel type Unit consists of plunger and valve assembly operating within cylinder formed by valve lifter body Oil is introduced to this unit through hole in side of lifter plunger

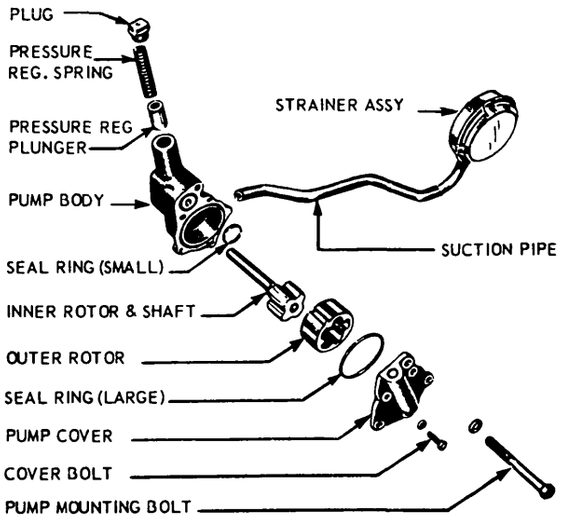
CHRYSLER V8 HYDRAULIC VALVE LIFTER

R moval (All Lifters)· Remove intake manifold carburetor and coil as an assembly Remove lifter cover and gasket rocker arm assembly (or assemblies) and pushrods Use Tool C-3216 (with twisting motion) to remove lifters *NOTE* - Keep lifters in holder Tool C-3068 so each lifter can be returned to its original bore



R m val (One Lifter Only): Drain cooling system to point below level of intake manifold Install valve spring compressor Tool C-3024 over rocker arm so heel of tool rests on valve stem side Make certain valve is seated and lifter body is resting on low point of camshaft lobe (see below) Compress valve spring slide rocker arm to one side and remove pushrod *CAUTION* Be sure piston is well below valve travel before compressing spring Remove intake manifold, carburetor and coil as an assembly Remove valve lifter cover and gasket Lift lifter out of bore with hooked end of tool C-3216 or slide puller portion of tool through push-rod hole seat tool in cap of lifter insert pin through lifter and tool and pull lifter out of bore using a twisting motion

Disassembly: ***(CAUTION—Disassemble one lifter at a time to avoid the possibility of mixing lifter parts. It is very important that lifter parts not be interchanged.)*** Depress lifter plunger with a push rod and remove plunger retainer spring clip, plunger cap, plunger ball check (or flat type valve), valve springs, valve retainer, and plunger spring from lifter body Inspect plunger, lifter body, valves and valve seats for signs of scoring, wear or pitting Check to see that valve exerts a slight pressure on valve spring to insure valve seating Clean lifter assembly in clean solvent and remove all traces of varnish and carbon Blow parts dry with air DO NOT USE A CLOTH AS LINT WILL CAUSE LIFTER TO OPERATE UNSATISFACTORILY



Testing: Remove plunger cap and immerse lifter assembly in an upright position in a container of kerosene ***(CAUTION***—Container and kerosene must be absolutely clean) Allow lifter to fill with kerosene, then remove and replace the plunger cap Holding lifter in an upright position and using tool C-3160, compress plunger slightly a few times to fill lifter body. Then compress lifter firmly with testing pliers, and if plunger collapses instantly as pressure is applied, disassemble, inspect and clean again If second cleaning fails to prevent lifter from collapsing instantly when compressing, replace lifter When cleaning and testing has been completed, remove kerosene and prime lifter lightly with clean engine oil before installing This will prevent possible scoring of lifter plunger when engine is first started

Reassembly: Reverse disassembly procedure as noted above.

LOW POINT OF CAMSHAFT LOBE: Remove distributor cap, noting position of rotor for Nos 1 and 6 cylinders Set timing mark "DC" located on crankshaft pulley to pointer With rotor at No 1 firing position, the following lifters will be on the low side of the cam lobe No 2 intake and exhaust, No 4 exhaust, No 7 intake, No 8 intake and exhaust ***(NOTE***—To remove No 1 intake and exhaust lifter, rotate crankshaft ¼ turn clockwise from above position after removing lifters listed) With rotor at No 6 position, following lifters will be on low side of cam lobe No 3 intake and exhaust, No 4 intake, No 5 intake and exhaust, No 7 exhaust ***(NOTE***—To remove No 6 intake and exhaust lifter, rotate crankshaft ¼ turn clockwise from above position after removing lifters listed)

ROCKER ARM ASSEMBLY (DOUBLE ROCKER ARM SHAFT)

V8 OIL PUMP

OILING SYSTEM

OIL PUMP

ROTOR TYPE OIL PUMP· R m val - Drain engine oil remove oil pan Remove pump mounting bolts and lower pump straight down

Disassembly & Inspection: Remove pump cover and oil seal ring pump rotor and shaft oil pressure relief valve plug lift out spring and plunger

Cover - Place straightedge across cover Replace cover when clearance between straightedge and cover is 0015" or greater

Outer Rotor - Measure diameter and thickness of rotor with micrometer If diameter less than 2 244" or thickness less than 998" replace outer rotor

Inner Rotor & Shaft - Measure thickness of rotor with micrometer If thickness is less than 998", replace inner rotor and shaft

Rotor Depth - Slide outer rotor and rotor with shaft into pump body Place straightedge across pump body (between bolt holes) If clearance between straightedge and top of rotors is 004" or greater replace pump body

Outer Rotor to Pump Body Cl arance - Place outer rotor in pump body and hold to one side If clearance at opposite side is 012" or greater replace pump body

Clearance between Rotors - With inner rotor bottomed in outer rotor, clearance between opposite lobes of rotors should not exceed 010" When clearance excessive, replace both inner and outer rotors

Reassembly: Replace relief plunger if scored or not free in bore Relief plunger spring must meet specification for that color spring Change color of original spring only when changing oil pressure up or down Use new oil seal ring between cover and body Tighten cover bolts to 10 lbs

Distributor-Oil Pump Drive Shaft Bushing: *See "Ignition Notes" below.*

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

IGNITION NOTES

ALL ENGINES

DISTRIBUTOR-OIL PUMP DRIVE SHAFT BUSHING: Removal—Insert Tool C-3052 and thread it into bushing. Holding puller head with wrench, tighten puller bolt and pull bushing out of bore in block

Installation: Slide new bushing over burnishing end of Tool C-3053 Insert tool and bushing into bore of block. Drive bushing and tool down into position, using a soft hammer As the burnisher is pulled through the bushing by pressure applied to puller nut, tool will wedge bushing tight in its bore and will burnish bore to correct size. ***DO NOT REAM THE BUSHING.***

DISTRIBUTOR BASIC TIMING: Before installing distributor-oil pump drive shaft it will be necessary to time engine as follows: Rotate crankshaft until No 1 cylinder is at TDC (or firing position). When cylinder is in this position, the pointer on chain case cover should be over "DC" on vibration dampener Using Tool C-3027, position oil pump shaft so that it lines up with slot in drive gear. Coat shaft of drive gear with engine oil. Install it so that, after the gear spirals into place, it will index with oil pump shaft (slot in top of drive gear will be parallel with centerline of crankcase)

PROPELLER SHAFT

PROPELLER SHAFT CENTER BEARING: Removal - Disconnect front and rear universal joints at companion flanges to free propeller shaft assembly, take out center bearing housing-to-frame crossmember mounting bolts remove propeller shaft and center bearing assembly as a unit.

1956-57 IMPERIAL MODELS

►*DRIVE LINE SHUDDER OR VIBRATION AT 15-20 MPH: May occur under certain passenger load conditions and can be corrected by the following procedure:*

1) Engine Tune-Up - Engine must operate smoothly with no hesitation or stumble on acceleration. A rough engine may cause this shudder or add to it

2) Propell r Shaft Alignment - Shaft alignment and "working angle" of center and rear universals must be adjusted and held within limits. *See "Propeller Shaft Alignment" below. CAUTION* - When installing propeller shaft, make certain that letter "O" on front end of spline shaft is aligned with key slot at rear end of front propeller shaft. This is necessary to place all universal joints in correct relationship.

REAR AXLE CONTROL STRUT: This strut consists of a single spring leaf anchored to bracket on rear axle housing and bracket on frame side rail adjacent to front end of rear spring. Strut is designed to control rear axle carrier movement and prevent nose of carrier rising under passenger loading conditions. *See "Propeller Shaft Alignment" below for strut shimming adjustment.*

PROPELLER SHAFT ALIGNMENT: Working angle of rear universal joint must be maintained at 1-3° with correct corresponding working angle of center universal joint as listed below.

Universal Joint Working Angles

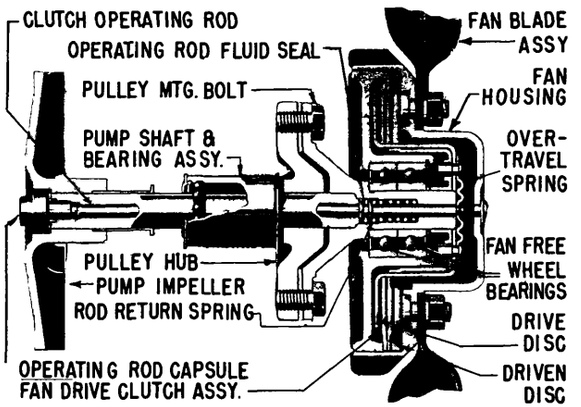
Rear Universal	Center Universal
1°	3°
1½°	2¾°
2°	2½°
2½°	2¼°
3°	2°

►*CHECKING CAUTION:* Place car on platform or wheel aligning machine so that car weight resting **on wheels,** fuel tank should be at least ¾ full and car should be empty (no passenger load). Check and adjust as follows:

Checking Universal Joint Working Angle: *NOTE* - Tool Set J-6845 furnished for this purpose has graduations on bubble tube indicating necessary shim adjustment. If spirit level used to check angles, same procedure is used and working angles are determined as follows: **Rear Universal Joint** - Measure angle of front face of pinion shaft companion flange by placing spirit level vertically on flange face (propeller shaft must be disconnected at rear universal joint to make this measurement). Measure angle of rear propeller shaft by placing spirit level lengthwise on underside of shaft. **Add** these two readings which will be working angle of rear universal joint *(NOTE* - Readings should be **added** if rear propeller shaft slopes down toward rear which is normal position; if shaft sloped up toward rear readings should be subtracted). This working angle should be 2° and must be within limits of 1-3°. *See Adjustment below.* **Center Universal Joint** - Measure angles of front and rear propeller shafts by placing spirit level lengthwise on lower side of each shaft **Add** these two readings which will be working angle of center universal joint *(NOTE* - Readings should be **added** if both shafts slope differently up or down when viewed in same direction which is normal position; if shafts slope in same direction readings should be **subtracted**). See table for desired center universal joint working angle in accordance with rear universal joint angle (between 1-3°) *See Adjustment below*

Adjusting Universal Joint Working Angle: If rear universal joint angle is not 1-3°, or if center universal joint angle is not correct for the particular rear joint angle, adjust as follows:

Rear Universal Joint - Install a 2° taper shim between rear axle housing and rear spring (install thick end of shim toward front of car) After installing shim loosen control strut bracket attaching bolts and install shims between frame bracket and frame so that control struts are free and not loaded. This will allow nose of carrier to assume correct angularity.



Center Universal Joint - Remove or install shims between center bearing support and frame crossmember (add shim to increase center universal working angle, remove shim to decrease angle). Recheck working angle. A 1 8" thick shim will change working angle approximately ½°. *CAUTION* - If a large adjustment is made at center bearing, recheck rear universal joint working angle to make certain it has not changed too much from desired 2° angle

COOLING NOTES

(AIR COND. CARS)

FLUID FAN DRIVE: Consists of a rotor (enclosed in housing to which fan is bolted) and driven by shaft secured to water pump flange. Housing mounted on shaft through two single row (sealed for life) ball bearings. Rotor has clearance with housing and is free to move along shaft axis. Housing filled with special heavy fluid which provides drive for fan. Drive is designed to provide driving force for cooling at low speeds and to limit top speeds of fan at higher engine speeds.

Checking Drive Unit: Water pump to engine speed ratio is 1 1 to 1 *NOTE* - 1 to 1 ratio (crank pulley to fan) should occur at 1400 RPM or above. Check by marking units with chalk and using timing light. Speed of fan and pulley is the same (1 to 1) when both components stopped by timing light. If this stoppage by timing light occurs at speeds less than 1400 RPM, replace unit DO NOT remove filler plug or add fluid to drive unit. *NOTE* - Fan only, may be rotated with light finger pressure and effort will lessen after turning fan several revolutions.

BRAKE NOTES

HAND BRAKE ADJUSTMENT (External Type): Free play between anchor bracket on center of band and sides of hand brake support should not exceed .005". Correct by compressing bracket in vise or by tapping with hammer before attempting brake adjustment. Adjust anchor screw to obtain .015- 020" clearance between band and drum at anchor. Adjust guide bolt to obtain uniform clearance for upper and lower halves of band. Guide bolt controls position of lower end of band, nut controls position of upper end of band.

HAND BRAKE ADJUSTMENT (Internal Type): Disconnect front end of propeller shaft and remove adjusting screw cover plate. Turn adjusting nut to decrease shoe-to-drum clearance until drum drags then back off nut at least one full notch to give 010" clearance (Using Spanner Tool C-3014) Shoulders on nut must be seated in grooves on adjusting sleeve. Adjust hand brake lever cable so there are 3-5 notches on lever visible beyond face plate when brake applied.

► *CHRYSLER "300C": This model has special "Firepower" engine (Hemispherical combustion chamber and double rocker arm shafts). Special specifications and service data for this model are included below.*

MODEL IDENTIFICATION

Model	Model Identification
Chrysler Windsor	C-75-1
Chrysler Saratoga	C-75-2
Chrysler New Yorker	C-76
Chrysler 300C	C-76-300
Imperial	IM-1
Imperial Crown	IM-2
Imperial LeBaron	IM-4

SERIAL NUMBER: Stamped on metal plate attached to left front body hinge post.

Starting Serial Nos.	Detroit	Los Angeles
Windsor	W571001	W57L1001
Saratoga	L571001	L57L1001
New Yorker	N571001	N57L1001
Imperial	C571001	

ENGINE NUMBER: Stamped on a boss on top side of cylinder block just back of water pump.

Car Model	Starting Engine Nos.
Windsor	WE571001
Saratoga	LE571001
New Yorker	NE571001
Imperial	CE571001

► *ENGINE NUMBER LETTERS & MARKS (Following Engine Number): Identified as follows:*
"A" - All Cylinders .020" oversize.
"B" - All Crankshaft Journals .010" undersize.
"AB" - Both above conditions exist.
"MALTESE CROSS" (3/8" high) - ONE OR MORE crankshaft Journals .001" undersize. *See "Connecting Rods" and "Crankshaft" below.*
♦ (3/8" high) - ALL valve lifters .008" oversize.

TUNE-UP

COMPRESSION PRESSURE: (C-75-1, 2) 140-170 lbs., (Others) 150-180 lbs., at idling speed of 150 RPM (plugs removed, throttle wide open). Maximum variation between cylinders 20 lbs.

VALVE TAPPET CLEARANCE: (All exc. 300C). None in service (hydraulic lifters).
C-76-300 (Mechanical Lifters) - .015" Intake, .024" Exhaust, HOT.

MANIFOLD HEAT CONTROL: *NOTE* - Before installing valve on engine, lubricate valve shaft with graphite grease.
(C-75-1 Standard) - Single exhaust on right cylinder block with thermostatically controlled valve. Install valve with counterweight toward front of engine and small anti-rattle spring retaining pin toward rear and adjacent to cylinder block.
(C-75-1 with Power Pack, C-75-2, C-76, C-76-300, IM-1, 2, 4) - Dual exhaust system used. Heat control valve is in right exhaust pipe.
Coil Spring Installation - Position valve shaft in extreme counter-clockwise position. Place coil spring in position over shaft slot, with outer end of tongue of spring in upper left hand position. Press inner end of coil into slot of shaft and seat firmly. Move outer end tongue of spring around and hook under pin (left pin when facing coil end of valve).

► *DUAL EXHAUST NOTE:* When valve is closed most exhaust gases are discharged through left exhaust pipe.

IGNITION

FIRING ORDER: 1-8-4-3-6-5-7-2.
Cylinders - RIGHT BANK 2-4-6-8. LEFT BANK 1-3-5-7.

SPARK PLUG GAP: .035".
Spark Plugs - Auto-Lite AR-42 (C-75-1, 2), AGR-42 (Others). 14 mm. Torque to 30-32 ft. lbs. *NOTE* - Auto-Lite AGR-32 recommended for High Speed operation on C-76-300

COIL: Auto-Lite CAH-4001B.
Ignition Current - 2.5 amps. idling, 3.1 amps. stopped.
Resistor - Auto-Lite PU-4003. .665-.735 ohms (70-80°F).

► *COIL RESISTOR NOTE:* Connected in circuit between "IGN" terminal of horn relay and positive terminal of coil. *Resistor must be in circuit when testing coil output.*

DISTRIBUTOR: Auto-Lite IBP-4002A (C-75-1, 2), IBK-4304 (Others). *NOTE* - "IBK" Distributor is double breaker.
Condenser - Auto-Lite IAT-2015RA (IBP-4002A), IBB-2015R (IBK-4304). **Capacity** - .25-.285 mfd.
Contact Point Set - Auto-Lite IBP-3028AS (IBP-4002A), IGW-3028KS (IBK-4304).
Breaker Gap - .015-.018".
Cam Angle (IBP Distr.) - 27-32°

► *CAUTION* Cam angle should be checked with vacuum line **disconnected.** Angle may decrease as much as 10° when vacuum line reconnected but must not decrease more than 12°

Cam Angle (IBK Distr.) - 29-32° (single set of points), 36-39° (both sets operating together).
Breaker Arm Spring Tension - 17-20 ozs.
Rotation - Clockwise viewed from above.

Automatic Advance - IBP-4002A

Degrees	Distr.	RPM	Degrees	Eng.	RPM
Start		400	0		800
1		425	2		850
6.5		750	13		1500
12		1835	24		3670
13		2050	26		4100

Automatic Advance - IBK-4304

Degrees	Distr.	RPM	Degrees	Eng.	RPM
Start		350	0		700
1		450	2		900
5		875	10		1750
9		2000	18		4000
10		2250	20		4500

Vacuum Spark Control: Auto-Lite. Integral type.

Vacuum Advance - IBP-4002A

Distr. Degrees	Eng. Degrees	Vacuum (" of Hg)
Start	0	10
1	2	10 3/8
5	10	12 1/4
9	18	14 7/8
10.5	21	16

Vacuum Advance - IBK-4304

Distr. Degrees	Eng. Degrees	Vacuum (" of Hg)
Start	0	8 1/8
1	2	8⅜

IGNITION TIMING

Model	Std. Setting
C-75 1, 2, C-76, IM-1,2,4	6° BTDC at 500 RPM
C-76-300	4° BTDC at 500 RPM

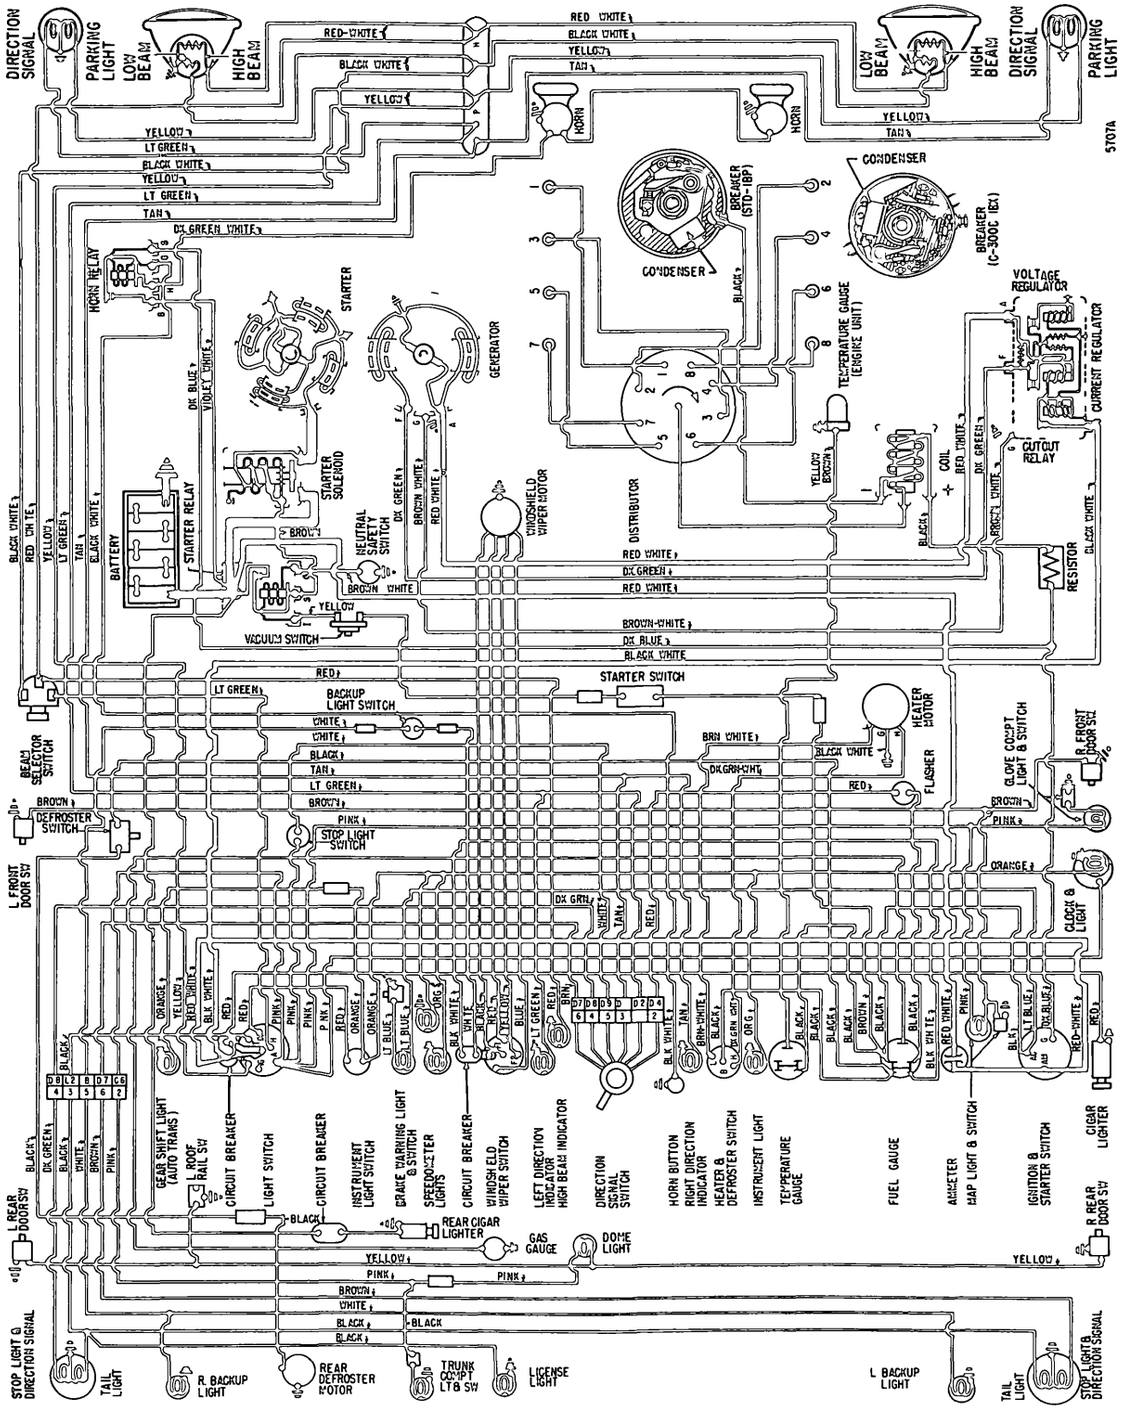
Timing Mark - Vibration dampener marked at TDC point with graduations indicating advance. Align correct mark with pointer on right side of timing chain cover.

CARBURETOR

Model	Carter Carburetor No.
C-75-1	BBD 2527S
C-75-2(Early) Ⓒ	WCFB 2589S
C-75-2 (Later) Ⓒ	AFB 2686S
C-75, IM-1,2 4 (Early)	WCFB 2590S
C-75, IM-1 2,4 (Later)	AFB 2448S
C-76-300	WCFB 2534S(front), 2535S (rear)

Ⓒ Power Pack on C-75-1

► *CARBURETOR AIR CLEANER (DRY TYPE) NOTE: Special cleaning procedure required. See AIR CLEANER below.*



THROTTLE LINKAGE ADJUSTMENT: *NOTE* - Accelerator pedal angle should be 118° to the horizontal in closed throttle position. To adjust, disconnect pedal end of bellcrank-to-pedal rod, adjust rod length by turning swivel end on rod, tighten locknut after adjusting. Then proceed as follows: Make certain engine idle speed correctly set at 475-500 RPM with selector in Neutral and engine at normal operating temperature. On 2-Barrel Carburetor Models, loosen adjusting screw located on accelerator shaft-to-carburetor rod. On 4-Barrel Carburetor models, loosen adjusting screw on accellerator shaft assembly-to-intermediate shaft assembly rod. On all models, move rear portion of rod to rear until it is stopped by idle stop on transmission throttle cam, align rods and tighten adjusting screw to 7-9 ft. lbs. torque. Recheck engine idle speed.

CARTER BBD 2-BARREL

Carter BBD, No. 2527S. Dual downdraft type.

► *CARBURETOR METERING JET CHANGE:* New jet calibration used on later cars as follows. **Main Metering Jet** No. 120-214S (superseding No. 120-213S which is now 1 Size Lean), **Step-up Rod** No. 75-1370 (superseding No. 75-1177).

CHRYSLER C-75-1,2, C-76 MODELS

CONTINUED FROM PRECEDING PAGE

▷ *MANIFOLD FUEL DISTRIBUTION Carburetor RIGHT Barrel feeds Cyl. 2-3-5-8, LEFT Barrel 1-4-6-7.*

Idle Setting - ½-1½ turns open. Adjust both screws alike. Turn screws out for richer mixture.

Idle Speed - 500 RPM (Synchro-mesh), 475-500 RPM (TorqueFlite in Neutral).

Float Level - 9/32" (Gauge T109-239) between top of each float ridge (at center of float) and top surface of body casting. To adjust, bend lip on float arm.

Accelerating Pump - Install connector rod in center hole (medium stroke) of throttle lever and inner hole of pump arm.

Fast Idle - .015" (Gauge T109-44) between lower edge of valve and bore with adjusting screw on high step of cam.

Fast Idle Cam Clearance With choke valve closed and lip on inner choke shaft lever contacting lug on outer lever, index mark on cam should align with fast idle adjusting screw. Adjust by bending lip on inner choke shaft lever.

Automatic Choke Setting - Set 1 point rich.

Throttle Linkage Adjustment - See *CARBURETOR* above.

▷ *OTHER DATA See "Carter BBD Carburetors" in Carburetion Section*

CARTER WCFB 4-BARREL
(Except C-76-300)

Carter WCFB, 2589S (C-75-2), 2590S (Others).

▷ *MANIFOLD FUEL DISTRIBUTION Carburetor RIGHT Barrels feed Cyl. 2-3-5-8, Left Barrels 1-4-6-7.*

Idle Setting - (2589S) ¾-1¾ turns open, (2590S) 1-2 turns open. For richer mixture, turn screws out.

Idle Speed - 475-500 RPM with TorqueFlite in Neutral.

Throttle Linkage Adjustment - See *CARBURETOR* above.

▷ *OTHER DATA See "Carter WCFB Carburetors" in Carburetion Section*

CARTER AFB 4-BARREL

Carter AFB 2686S (C-75-2), 2448S (Others)

▷ *CARBURETOR FLOODING CORRECTION See "Carter AFB Carburetors" in Carburetion Section*

▷ *MANIFOLD FUEL DISTRIBUTION Carburetor RIGHT barrels feed Cyl 2-3-5-8, LEFT barrels 1-4-6-7*

Idle Setting - ¼ 1¾ turns open Turn screw out for richer mixture

Idle Speed - 500 RPM with Neutral button pushed in

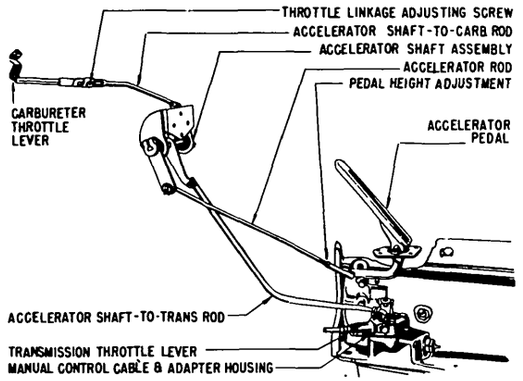
Throttle Linkage Adjustment - See *CARBURETOR* above

▷ *OTHER DATA See "Carter AFB Carburetors" in Carburetion Section*

CARTER WCFB 4-BARREL
(C-76-300)

Carter WCFB 2534S (Front), 2535S (Rear) These carburetors have "Idle Air Bypass Screws" used for idle speed adjustment except on reworked carburetors with recommended changes (following)

▷ *POOR IDLE, STUMBLE ON ACCELERATION, STALLING ON STOPS OR SUDDEN TURNS CORRECTION*



For recommended changes (including New Idle Adjustment Procedure), see "Carter WCFB Carburetors" in Carburetion Section

▷ *MANIFOLD FUEL DISTRIBUTION RIGHT barrels feed right bank cylinders, LEFT barrels feed left bank*

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

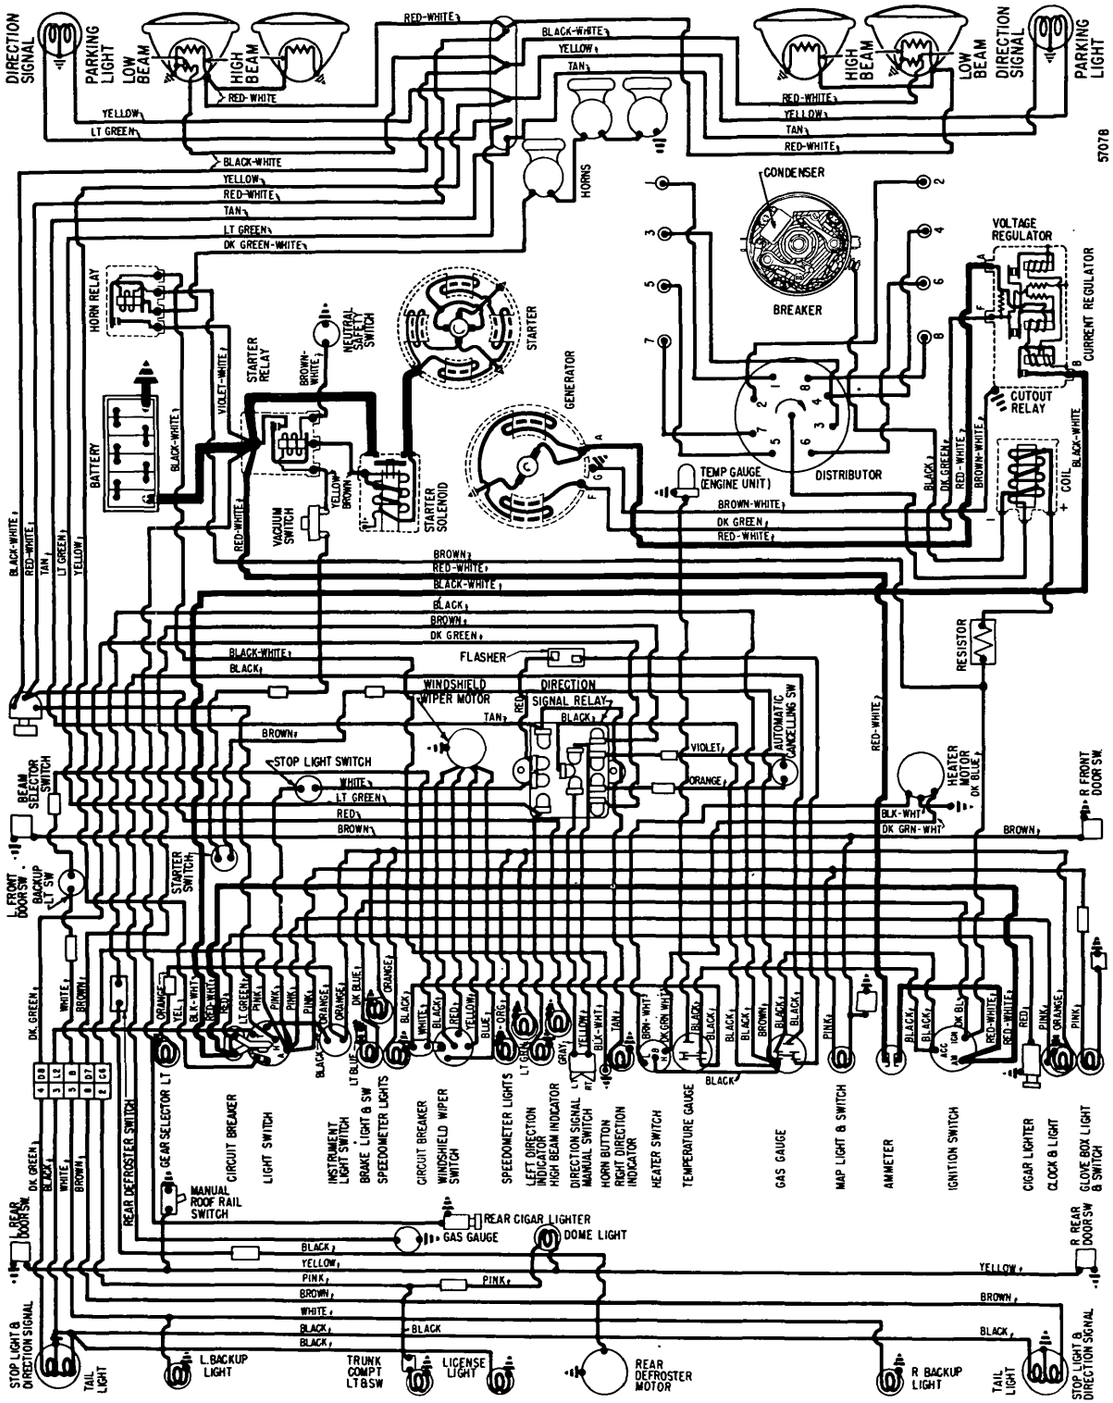
►*CARBURETOR SYNCHRONIZATION NOTE:* Before adjusting idle mixture and idle speed, the carburetor inter-connecting rod must be adjusted as follows: Hold rear carburetor throttle in wide open position (choke off) and adjust rod at slotted end so front carburetor

TORQUEFLITE THROTTLE LINKAGE

throttle valve will be in wide open position. Tighten locknut and check linkage operation. Make sure rod can rotate slightly on pivots and not bind.

Idl Mixture & Speed Adjustment: *CAUTION - DO NOT use this procedure on carburetors reworked to correct Poor Idle, Stumble, etc. See "Carter WCFB Carburetors" in Carburetion Section for recommended procedure on reworked carburetors. On other carburetors, proceed as follows:* **1)** Set all idle mixture screws (2 per carburetor) 1 turn open, set idle air bypass screws (1 per carburetor) 1 turn open. **2)** With engine at normal operating temperature, connect tachometer for accurate determination of engine idle speed. **3)** Adjust idle speed to approximately 600 RPM by adjusting idle air bypass screw on **both** carburetors equally. **4)** Adjust idle mixture screws on **rear** carburetor for maximum RPM. **5)** Adjust idle mixture screws on **front** carburetor for maximum RPM, readjust rear carburetor if necessary. **6)** Reset idle speed to 600-650 RPM by readjusting idle air bypass screw on **both** carburetors.

FUEL PUMP PRESSURE: 6-7 lbs.



CARB. EQUIPMENT

Fuel Pump: Carter M2503S. Mechanical type.
Pressure – 6 – 7 lbs.
See "Fuel Pumps" in Carburetion Section.
Gasoline Gauge: Auto-Lite Electric Type.
Dash Unit – Auto-Lite 14296A (C75, C76). Auto-Lite 14263A (1M–1, 2, 4).
Tank Unit – Auto-Lite 14380A (Sub. & Est. Wgn.). Auto-Lite 14381A (Others).
See "Fuel Gauges" in Carburetion Section.

AIR CLEANER: DRY FILTER ELEMENT type. Clean every 5000 miles, replace element every 15,000 miles.

►*CLEANING CAUTION:* Clean filter element by tapping

CONTINUED ON NEXT PAGE

CHRYSLER IMPERIAL IM-1,2,4 MODELS

CONTINUED FROM PRECEDING PAGE

and shaking to remove dirt particles. *DO NOT wash element in solvent or other liquids and DO NOT oil or lubricat .*

BATTERY

(C–75–1, 2) Auto-Lite 12H–60. 12 volt, 11 plate, 60 ampere hour capacity (20 hr. rate).
(Others) Auto-Lite 12H–70. 12 volt, 13 plate, 70 ampere hour capacity (20 hr. rate).
Grounded T rminal – Negative.
Engine Ground – Engine to body.

STARTER

Aut -Lit MDL–6001. Armature MDL–2006.
NOTE – Auto-Lite MDL–6002 used on first 13000 cars (except C–75–1, 2).
Drive – Overrunning clutch (solenoid pinion shift).
Rotation – Counter-clockwise at commutator end.
Brush Spring Tensi n – 31–47 oz.

Performance Data

Torque	RPM	Volts	Amperes
0 ft. lbs.	3200	10.0	60
6.0 ft. lbs.	Lock	4.0	225

Starting Switch: Auto-Lite Solenoid SAD–4301 with separate Auto-Lite Relay RAJ–4001 (Relay not used on C–75–1 with Synchro-mesh Transmission). Controlled as follows: **Synchro-mesh Cars –** Combination Ignition & Starter Switch. **TorqueFlite Cars –** Neutral pushbutton switch (operated by fully depressing Neutral Button). Vacuum Switch, Auto-Lite 14406A, on Intake Manifold (prevents starter actuation with engine running), and Neutral Switch on transmission case (prevents starter actuation except when transmission in neutral).
S e "Auto-Lite Starter Controls" in Electrical Section.
►*VACUUM SWITCH CORRECTION (Inoperative Starter caused by open circuit in Vacuum Switch):* May be due to pressure build-up in upper cavity of switch. Correct by drilling 1/64" hole on side at top of switch assembly (directly below terminal plate). *CAUTION –* Do not drill beyond thickness of metal or diaphragm may be damaged.
Neutral Safety Switch Adjustment: *See "TorqueFlite Transmission" in Transmission Section.*

GENERATOR

GENERATOR: Auto-Lite. Application as follows:

Mdl	Generator	Armature
All (Exc. 300) Early ..	GJC-7002H	GJC-2030F
C-75-1,2 Later	GJC-7012A	GJC-2030F
C-76, IM1, 2, 4 Later .	GHM-6001E	GHM-2006F
C-76-300 Std.	GHM-6010A	GHM-2006F
C-76-300 Air Cond.	GHM-6011A	GHM-2006F
C-76-300 Special	GGA-6007A	GFY-2101F
C-75-1-2 Special	GHM-6001E	GHM-2006F
All Air Cond. Cars	GHM-6004C	GHM-2059F

Performance Data - GGA (Cold - 70°F)

Amperes	Volts	RPM
4.0	14.6	950 max.
40.0	14.6	1600 max.
40.0	15.0	1600 max.

P rformance Data - GHM (C ld - 70°F)

Amperes	Volts	RPM
5.0	14.0	875 max.
25.0	15.0	1350 max.
30.0	15.0	1500 max.

Performance Data - GJC (Cold - 70°F)

Amperes	Volts	RPM
0.0	12.8	1225-1325
30.0	15.0	2050-2250

Brush Spring Tension - (GGA) 34-41 ozs., (GHM) 35-53 ozs., (GJC) 18-36 ozs., with new brushes.
Field Current - (GGA, GHM) 1.1-1.3 amperes, (GJC) 1.2-1.3 amperes, at 10.0 volts (70°F).
Motoring Current - (GGA) 2.3-2.6 amperes, (GHM) 3.0-3.5 amperes, (GJC) 3.4-3.9 amperes. All at 10.0 volts (70°F).
Rotation - Counter-clockwise at commutator end.
Belt Adjustment: 1/8" deflection midway between generator and water pump pulleys with 5 lbs. pressure (Std.), 3/8" deflection midway between generator and compressor pulleys with 5 lbs. pressure (Air Cond. Cars).

REGULATOR

Auto-Lite - Used with generators as follows:

Auto-Lite Regulator	Generator Type
VRX-6201A	GJC & GHM Gen.
VAT-6201A	GGA Gen.

Cutout Relay

Cuts In - 12.6-13.6 volts (VRX), 13.0-13.75 volts (VAT).
Cuts Out - 8.2-9.3 volts from sealed position (VRX discharge amperage 3-5 amperes).
Contact Gap - .015" minimum.
Air Gap - .031-.034" with contacts open (measure at hinge end of core).

Voltage Regulator

Setting - 14.5 ± .3 volt charging at 10 amperes (80°F) or with .25 ohm resistor in series between regulator and battery.
Air Gap - .048-.052" with contacts just opening (check at brass armature stop pin).
Checking & Adjusting - *See "Auto-Lite 12 Volt Regulators" in Electrical Section.*

Current Regulator

►*SETTING CAUTION: "Temperature Compensated" type. Set to following specifications at 70°F.*

Regulator	Test A - Operating Amperes -	Test B
VRX-6201A	36	30 (28-32)
VAT-6201A	46	40 (38-42)

Test A - After 15 minutes operation charging at 10 amperes.
Test B - After additional 15 minutes operation with current regulator operating (load applied to hold voltage down to 13.6-13.8 volts (VRX), 13.7-13.9 volts (VAT).
Air Gap - .048-.052" with contacts just opening (check at brass armature stop pin).
Checking & Adjusting - *See "Auto-Lite 12 Volt Regulators" in Electrical Section.*

MISC. ELECTRICAL

Headlamps: Sealed Beam. **4–Headlight System** Std. on IM–2, 4 and optional on other models. *See "4–Headlights" in Electrical Section.*
Directional Signal: *See Electrical Section.*
Headlight & Pan l Light Switch Rem val: Remove headlight switch knob recessed hex screw, remove knob. Remove hexnut and threaded sleeve holding switch or switches in instrument panel. Slide panel light switch control off lugs of tab plate.
Stop Light Switch L cati n: On forward end of master cylinder.
CIRCUIT BREAKERS: Used as follows:
20 Ampere – Protects headlights and beam indicator. On back of lighting switch.
6 Ampere – Protects Parking, Tail, License plate, Instrument, Ignition and Clock lights. On back of light switch.
6 Ampere – Protects Stop, Map, Dome, Glove Compartment, Courtesy and Trunk Compartment lights. On back light switch.
6 Ampere – Protects Windshield Wiper and Back-up Lights. On back of wiper switch.
8 Ampere – Protects rear cigar lighter. Behind left front kick panel on side cowl.
20 Ampere – Protects window lift circuits. Located behind left front kick panel.
40 Ampere – Protects 6–way seat circuits. Located behind left front kick panel.
Horn Relay: Auto-Lite RAH–4002.

ENGINE

►*AIR CONDITIONED CAR SERVICE CAUTION: Us extreme care when disconnecting any part of air conditioning equipment or lines. See "Air Conditioning Service Cautions" in Miscellaneous Section.*

ENGINE SPECIFICATIONS: 90° V8 (All Models).
Spitfire (C-75-1, 2) - Single rocker arm shaft.
FirePower (Others) - Hemispherical combustion chamber and Double Rocker Arm Shaft.
►*C-76-300 NOTE:* Special full race camshaft used in connection with mechanical lifters, special pushrods and rocker arms with adjusting screws in pushrod end (for tappet adjustment), and high load inner and outer valve springs.

Model	Bore	Stroke	Displacem nt
C-75-1, 2	3.94"	3.63"	354 cu. ins.
Others	4.00"	3.90"	392 cu. ins.

Model	Compr. Ratio	Rated HP	Developed HP
C-75-1	9.25-1	49.7	285 at 4600 RPM
C-75-1, 2 ①	9.25-1	49.7	295 at 4600 RPM
C-76	9.25-1	51.2	325 at 4600 RPM
C-76-300 (Std.)	9.25-1	51.2	375 at 5200 RPM
C-76-300(Opt.)	10.0-1	51.2	390 at 5400 RPM
IM -1,2,4	9.25-1	51.2	325 at 4600 RPM

① - 4Bbl. Carb. (Power Pkg. on C-75-1).
Compression & Vacuum Reading - *See TUNE-UP.*
OIL PAN REMOVAL: Drain oil, remove starter, and on cars with single exhaust disconnect cross-over and "Y" pipe at manifold and at extension clamp. Move exhaust out of the way and support in place. Loosen front engine mounts and raise engine ¾". Disconnect steering linkage at idler arm support bracket, then rotate crankshaft so front counterweight is up (timing mark on dampener 180° from pointer), then remove oil pan.
ENGINE REMOVAL: *See "Engine" in Chrysler Special Data.*
CYLINDER HEAD: *See "Cylinder H ad & Manifolds" in Chrysler Special Data.*
TIGHTENING TORQUES: *See "Tight ning Specifications" in Chrysler Sp cial Data.*

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

PISTONS

Aluminum Alloy, thermally controlled by steel strut, elliptically turned, tin plated.

►*CYLINDER BORE OVERSIZE CAUTION:* Engines with letter "A" following engine number indicates that cylinder bore is .020" oversize.

Weight – 22.8 ozs. (C75–1, 2; C–76); 24.7 (Others).

Removal – Piston & Rods removed from above.

Clearance – .0005–.0015" measured 1½" from bottom of skirt. Check clearance with .002" ribbon feeler ½" wide. Pull to withdraw feeler should be 8–12 lbs. with feeler. at right angles to piston pin.

Replacement Pistons: Std. and .005", .020", ..040" Oversize. *NOTE* – 060" Oversize also for C–75–1, 2.

Installing Pistons: Install pistons on connecting rods so indent on head of piston is toward front of engine. Indent will be on large chamfer side of connecting rod (1–3–5–7) and opposite side (2–4–6–8). *See Rod Installation.*

PISTON PINS

Floating type with lock ring at each end. *NOTE* – Pin offset in piston toward right side of engine.

Diameter – .9841–.9843". **Length** – 3.140–3.150".

Clearance in Piston – .0005–.0015". Thumb press fit at 70° F.

Clearance in Rod – .0001–.0004". Selective fit.

Replacement Pins: Standard, .003", .008" oversize. *NOTE* – Fitted pins are furnished with new pistons.

PISTON RINGS

C-75-1, 2 Engines

Ring	Width	End Gap	Side Clearance
Compr. (1,2)	.0775-.078"	.010-.020"	.002-.0035"
Oil (3)	.186-.1865"	.010-.020"	.001-.0025"

All Other Engines

Ring	Width	End Gap	Side Clearance
Compr.(1,2)	.0775-.078"	.013-.025"	.002-.0035"
Oil (3)	.186-.1865"	.013-.025"	.001-.0025"

Replacement Rings: Furnished in Sets: Std. and .010", .020", .030", .040" Oversize. *NOTE* – .060" oversize also for C–75–1, 2.

Installing Rings: "Top" mark on each compression ring is to top of piston when ring is installed.

CONNECTING RODS

Length – 6.625" (C–75–1, 2); 6.951" (Others).

Weight – 25.2 oz. (C–75–1, 2); 27.6 oz. (Others).

Crankpin Journal Diameter – 2.2507" (C–75–1, 2). 2.375" (Others).

►*JOURNAL DIAMETER CAUTION: (ONE OR MORE Journals machined (UNDERSIZE). See "Crankshaft" below.*

Bearings (Lower) – Lead Base Babbitt on Steel Exc. C–76–300 which is Tri-Metal (Babbitt on Copper Lead Alloy on Steel Back).

Clearance – .0005–.0015".

End Play – .006–.014" (Two rods).

Replacement Bearings: Std. and .001", .002", .003", .010", .012" undersize.

Installing Rods: Install piston and rod assemblies with indent on piston head toward front of engine (all cylinders) and large chamfer on lower end of rod toward nearest crankshaft journal fillet. Install bearing caps so that "V" groove in cap is in line with similar groove in rod (this is oil spit hole for cylinder wall lubrication).

CRANKSHAFT

Journal Diameter - 2.4995-2.5005" (C-75-1, 2); 2.687-2.688" (Others).

►*CRANKSHAFT JOURNAL UNDERSIZE CAUTION: Engines with undersize journals identified as follows:* **.010" UNDERSIZE (Main & Connecting Rod Journals)** - Letter "B" following engine number indicates that ALL Main & Connecting Rod Journals are .010" undersize.

.001" UNDERSIZE (ONE OR MORE Main & Connecting Rod Journals) - A "Maltese Cross" (3/8" high) stamped on the machined surface following the engine number indicates that ONE OR MORE crankshaft main and connecting rod journals are machined .001" UNDERSIZE. The position of undersize journals are stamped on the machined surface of the center (No. 3) counterweight in following manner: "R" indicates connecting rod journal, "M" indicates main bearing journal. The number following letter indicates main or connecting rod journal number (counting from front of engine).

Bearings – C–75–1, 2; C–76; IM–1,–2,–4. Tin Base Babbitt on Steel (#3), Lead Base Babbitt on Steel (Others). **C–76–300.** Tri-Metal (Babbitt on Lead Alloy on Steel Back).

Clearance – .001–.0025" (C–76–300), .0005–.0015" (Others).

Replacement Bearings: Furnished Standard, .001", .002", .003", .010", .012" undersize. *NOTE* – No. 1, 2, and 4 upper and lower bearings are interchangeable. No. 3 upper and lower are interchangeable. No. 5 upper and lower bearings are **not** interchangeable.

End Thrust – Taken by center (#3) main bearing.

End Play – .002–.007".

Crankshaft Rear Main Bearing Oil Seal: *See "Crankshaft & Main Bearings" in Chrysler Special Data.*

Crankshaft Front Oil Seal: *See "Engine Front Cover" in Chrysler Special Data.*

CAMSHAFT

Journal Diameters – 1.998–1.999" (#1,2,3,4), 1.4355–1.4365" (#5).

Bearings – Removable, steel-backed, Babbitt-lined bushings.

Clearance – .001–.003".

End Thrust: Taken by thrust plate behind camshaft sprocket hub.

End Play – .002–.006".

Timing Chain: **Width** 1 1/8". **Pitch** .375". **Length** 68 links.

Camshaft Setting: Camshaft timing is correct when timing marks on camshaft and crankshaft sprockets are adjacent and in line across shaft centers.

Camshaft Removal: *See "Camshaft & Bearings" in Chrysler Special Data.*

Engine Front Cover (Removal & Installation): *See "Engine Front Cover" in Chrysler Special Data.*

Engine Front Cover Oil Seal (Crankshaft Front Seal): *See "Engin Front Cover" in Chrysler Special Data.*

VALVES

Tappet Clearance : C–76–300 Intake .015", Exhaust .024" Hot. **Others** Zero lash – hydraulic lifters.

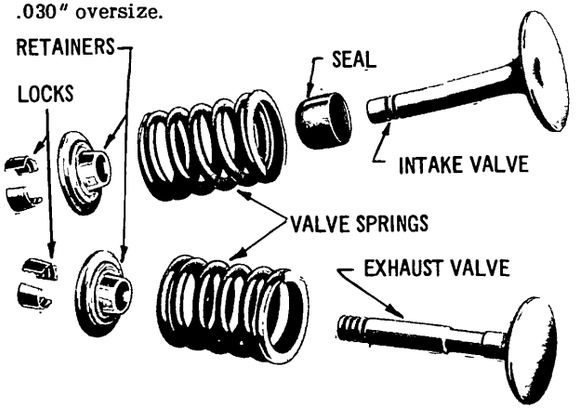
C-75-1, 2 Engines

Valve	Head Diam.	Stem Diam.	Length
Intake	1 15/16"	.372-.373"	4.78"
Exhaust	1½"	.371-.372"	4.74"

Valve	Seat Angle	Lift	Stem Clearance
Intake	45°	.389"	.001-.003"
Exhaust	45°	.389"	.002-.004"

All Other Engines

Valve	Head Diam.	Stem Diam.	Length
Intake	2"	.372-.373"	5.09"
Exhaust	1¾"	.371-.372"	5.05"



Valve	Seat Angle	Lift	Stem Clearance
Intake	45°	①	.001-.003"
Exhaust	45°	②	.002-.004"

① - .389" (Exc. 300), .444" (C-76-300 - Std. Camshaft), .455" (C-76-300 - Optl. Camshaft.).

② - .389" (Exc. 300), .435" (C-76-300 - Std. Camshaft), .455" (C-76-300 - Optl. Camshaft.).

Valve Seat Width - 1/16-3/32" Int., 3/64-1/16" Exh.

►*C–75–1,2 OVERSIZE VALVE STEM NOTE:* Valves with oversize stems are available in .005", .015", .030" oversize.

CHRYSLER V8 VALVE ASSY.

►*C–76–300 EXHAUST VALVE SEAT INSERT: See "Valv System" in Chrysler Special Data.*

Intake Valve Stem Oil Seal - Cup seal installed on intake valve stem with cup extending down over top of valve guide.

►*VALVE GRINDING CAUTION:* Check valve height in head after grinding valves using Tool C-3436 (C-75-1,2), C-3061 (Others). If valve tip exceeds maximum (end of cylindrical gauge), grind tip down to approach, but do not go below minimum height (slotted area on gauge).

VALVE SPRINGS: (Exc. 300) Single springs. Free Length 2". **(C-76-300)** Double springs. Free Length 1 7/8" (Outer), 1 25/32" (Inner).

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Valve Spring Specifications

	Inner Spring Pressure	Length	C-76-300 Engine Outer Spring Pressure	Length
Closed	28 lbs.	1.53"	60 lbs.	1.66"
Open	66 lbs.	1.09"	158 lbs.	1.22"

All Other Engines

Valve	Lbs. Pressure	Length
Closed	78-88 lbs.	1.69"
Open	170-184 lbs.	1.31"

►*CAUTION: Spring ends must be square within 1/16".*

►*VALVE SPRING INSTALLED HEIGHT:* Check installed height of spring after grinding valves (from face of counterbore in head to bottom face of spring retainer). If height greater than 1 11/16", install 1/16" Spacer to bring spring back to normal height of 1 5/8-1 11/16"

Valve Guides: (C–75–1,2) Cast integral with cylinder head. When valve stem clearance excessive, use reamer tool set to ream guides for next oversize valve as follows: C–3433 (.379–.380" – .005" O.S.), C–3430 (.389–.390" – .015" O.S.), C–3427 (.404–.405" – .030" O.S.).

(Others) – Drive old guides out through top of cylinder head with Tool DD–883. With combustion chamber up, drive new guides into cylinder head until distance from upper edge of valve seat to guide is 31/32" (Intake), 1 3/64" (Exhaust). Ream each guide to .374–.375" with Tool C–741.

Hydraulic Valve Lifters: Integral flat-valve type.

►*VALVE LIFTER OVERSIZE CAUTION: .008" OVERSIZE Valve lifters used on some engines.* A "Diamond" 3/8" high stamped on engine number indicates that all lifters are .008" oversize.

Diameter – .9040–.9045". **Clearance in Block –** .0005–.0015".

Lifter Overhaul & Testing – *See "Valve System" in Chrysler Special Data.*

►*VALVE GRINDING CAUTION:* See Valves (above).

Rocker Arm Assembly: *See "Valve System" in Chrysler Special Data.*

VALVE TIMING

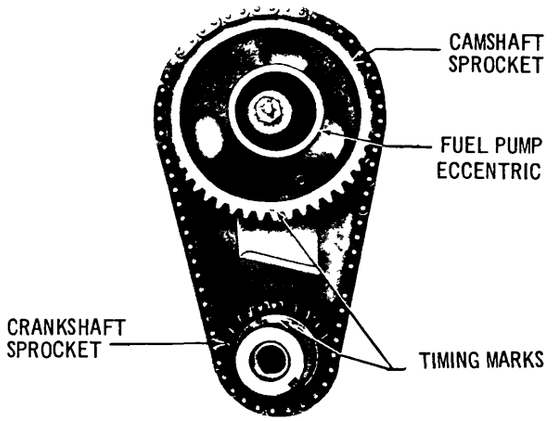
See "Camshaft Setting" under CAMSHAFT above.

C-75-1, 2

Intake Valves - Open 13° BTDC. Close 59° ALDC.
Exhaust Valves - Open 59° BLDC. Close 17° ATDC.

C-76 & IM1-1, 2, 4

Intake Valves - Open 15° BTDC. Close 57° ALDC.
Exhaust Valves - Open 57° BLDC. Close 15° ATDC.



C-76-300 - Std. Camshaft

Intake Valves - Open 35° BTDC. Close 65° ALDC.
Exhaust Valves - Open 65° BLDC. Close 25° ATDC.

C-76-300 - Optional Camshaft

Intake Valves - Open 20° BTDC. Close 55° ALDC.
Exhaust Valves - Open 60° BLDC. Close 20° ATDC.

Valve Timing Check (Exc. C-76-300) - With No. 1 intake valve closed, insert .210" feeler between rocker arm and No. 1 intake valve stem, mount dial indicator directly over this valve with indicator button contacting valve spring retainer. When retainer stops moving (hydraulic lifter plunger bottomed so that lifter is solid), set dial indicator at zero. Turn crankshaft **clockwise** until dial indicator shows valve lifted .020" (C-75-1,2), .024" (Others). Timing mark on vibration dampener should read between 5° BTDC and 7° ATDC. Turn crankshaft **counter-clockwise** until valve back to closed position, remove feeler.

CHRYSLER V8 VALVE TIMING MARKS

►*CAUTION:* Do not turn crankshaft further than indicated above with feeler in place (spring may bottom and damage valve mechanism).

Valve Timing Check (C–76–300): Turn engine to TDC for No. 1 Piston (use dial indicator arm in spark plug hole) with #1 intake valve closed. Check accuracy of TDC mark on vibration dampener. Install dial indicator to read valve spring retainer movement. Adjust rocker arm adjusting screw to zero clearance. Zero indicator, turn crankshaft (clockwise) until dial indicator reads .081" valve lift.

Mark on vibration dampener under pointer should read 5° BTDC to 7° ATDC. If reading incorrect, check gear index marks and timing chain for stretch.

OILING SYSTEM

Crankcase Capacity: 5 qts. (refill). Add one quart when filter changed.

Normal Oil Pressure: 40–65 lbs. at 40–50 MPH.

►*OIL PRESSURE CAUTION:* With full flow filter (Optional on C–75–1, Std. all other models), oil pressure will drop 15–20 lbs. when FILTER ELEMENT CLOGGED. Replace element.

Oil Pressure Relief Valve – Mounted in oil pump. Use correct color spring, *see Spring Specification Table below.*

Relief Valve Spring Specifications

Color	Free Height	Load Pressure & Height
Gray (Lt.)	3½"	16.1–17.1 lbs. at 2 1/16"
Red (Std.)	2 27/32"	19.5–20.5 lbs. at 2 1/16"
Brown (Hvy.)	2 31/32"	22.0–23.9 lbs. at 2 1/16"

Oil Pressure Gauge – Auto-Lite 14297A (C–75–1,2; C–76, C–76–300), 14264A (IM–1, 2, 4). Not electric.

Oil Pump: Rotor type. In crankcase at rear end. Driven by lower distributor drive shaft.

Pump Overhaul – *See "Oiling System" in Chrysler Special Data.*

Oil Filter: Full flow (Std. all models exc. C–75–1, Optl. C–75–1). All oil enters lubrication system of engine through filter at full pump pressure. By-pass valve held in place by rear main bearing cap.

►*OIL FILTER REMOVAL (Firepower Engine):* Remove air cleaner and loosen oil filter, raise car and remove oil filter from below car.

Filter Element – Install new filter element at 5000 mile intervals (or earlier if required). Change oil with filter element replacement.

Crankcase Ventilation: Filter Element in oil filler cap and (Export only) air cleaner in crankcase outlet pipe. Clean oil filler pipe element with kerosene at 5,000 mile intervals.

COOLING

Water Capacity: (C–75–1,2) 21 qts., (Others) 24 qts. Add 1 quart with heater installed.

Pressure Valve: 14 lb. radiator filler cap used on all models.

►*AIR CONDITIONER OPERATING CAUTION: Engine cooling system must be protected to a temperature of 20°F (above zero) for summer operation.*

Thermostat: Pellet type. 158–162°F (Std.), 177–182°F (Air Cond.).

Water Pump: Ball bearing type. No lubrication required. *See "Chrysler" in Water Pump Section.*

Pump Removal – Drain cooling system. Loosen generator and power steering pump or idler pulleys, remove all belts. Remove fan, spacer, and pulley (NOTE – On Air Cond. Cars, remove upper half of fan shroud, then remove fan hub pulley, loosen fan, remove fluid fan drive). Remove water pump body to housing bolts and remove water pump.

Fluid Fan Drive: Standard on Air Conditioned Cars and C–76–300. *See "Cooling System" in Chrysler Special Data.*

Temperature Gauge: Auto-Lite. Electric type.

Dash Unit – Auto-Lite 14298A (C–75–1,2; C–76, C–76–300), 14266A (IM–1,2,4).

Engine Unit – Auto-Lite 14405A (All Models).

See "Temperature Gauges" in Miscellaneous Section.

CLUTCH

Borg & Beck Model 10A8 No. 361417 (C–75–1), 11A8 No. 361447 (C–76–300). Single plate.

See "Borg & Beck" in Clutch Section.

Clutch Disc – Borg & Beck No. 382531 (10A8), 382626 (11A8).

Pedal Adjustment: Turn release fork rod adjusting nut for 5/32" free play at release fork outer end. This will give 1" free pedal movement and 6" pedal travel.

Over-center Spring Adjustment: Release clutch pedal release rod by removing spring washer and back off over-center spring adjusting nut to free "C" link. Depress clutch pedal, turn adjusting nut until nut just contacts "C" link, then tighten nut 7 full turns. Install clutch release rod and retaining washer.

Removal: Remove release fork pull-back spring, fork rod from fork at rear end, dust seal, and clutch release fork. Remove transmission, clutch housing pan, release bearing. *CAUTION* – Do not force bearings and pull-

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

back spring off fork prongs. Mark clutch cover and flywheel for reassembly. Loosen retaining bolts evenly to release spring tension, remove clutch cover assembly.

SYNCHRO-MESH TRANSMISSION

Own (C–75–1 & C–76–300). Three-speed synchro-mesh type with new design gearshift mechanism.
See "Chrysler Synchro-mesh" in Transmission Section

Transmission Controls: *See "Transmission Controls" in Transmission Section*

Removal: Disconnect propeller shaft, speedometer cable, and gearshift control rods. Remove speedometer drive pinion and back-up light switch. If transmission to be overhauled, apply hand brake to hold mainshaft and loosen flange nut, remove flange nut and washer, disconnect hand brake cable, remove brake drum and flange assembly (Puller C–452), remove oil seal (Puller C–748) Pull transmission straight back until drive gear shaft clears clutch disc, lower transmission and remove from beneath car *NOTE* – Use pilot studs when reinstalling transmission and use care not to spring clutch disc

TORQUEFLITE TRANSMISSION

Wide range torque converter and automatically operated planetary gear transmission
See "TorqueFlite" Transmission in Transmission Section

►*PRODUCTION CHANGES AND REPLACEMENT PARTS CAUTION: See "TorqueFlite" Transmission in Transmission Section*

►*TESTING & TROUBLE SHOOTING: See "TorqueFlite" Transmission in Transmission Section.*

Lubrication: Check fluid level every 1,000 miles, drain and refill every 20,000 miles. Use only Automatic Transmission Fluid type "A"

Checking Fluid Level - *CAUTION - Following procedure and fluid level supersede previous recommendations.* Check transmission COLD if possible. Idle engine with brakes applied, press all pushbuttons in turn, then check fluid level on dipstick with engine idling in "N". Maintain level as follows:

Cold Transmission (After standing and before being driven for several miles) - Level should be between "L" mark and ½" below "L" mark. Add oil if below ½" below "L" mark, remove oil if above "L" mark. Do not add oil if level within above range.

Hot Transmission (After being driven several miles) - Level should be between "F" mark and ½" below "F" mark (on cars with first type dipstick with distance of 1 5/8" between "F" and "L" marks, level should be ½" below "F" mark). Add oil if level below "L" mark to bring level up to ½" above "L" mark, remove oil if level above "F" mark. Do not add oil if level within above range.

Throttle Linkage Adjustment: *See CARBURETOR above.*

►*OTHER DATA: See "TorqueFlite" Transmission in Transmission Section.*

UNIVERSALS

Drive Universals. (C–75–1,2, C–76, C–76–300) Ball & Trunnion used at front, Cross type used at rear (IM–1,2,4) Cross type used front, center, and rear.

Propeller Shaft Center Bearing: *See "Propellor Shaft" in Chrysler Special Data.*

Rear Axle Control Strut: *See "Propellor Shaft" in Chrysler Special Data.*

REAR AXLE

Own. Semi-floating, hypoid gear, Hotchkiss Drive.
See "Chrysler Cage Type Hypoid" in Rear Axle Section

►*REAR AXLE LUBRICATION LEVEL CAUTION* Recommended lubrication capacity (3½ pints) will bring fluid level to 1" below filler opening DO NOT add to bring level to opening

Axle Ratios

C-75-1, 2	①②3.18-1 (35-11)
C-76	2.93-1 (41-14)
IM1-1, 2, 4	3.18-1 (35-11)
C-76-300	③3.36-1 (37-11)

① - C-75-1 with Synchro-mesh Trans. 3.73-1 (41-11).
② - C-75-2 Optl. Ratio 2.93-1 (41-14).
③ - Optl. Ratios: 2.92 (38-13), 3.18 (35-11), 3.54 (39-11), 3.73 (41-11), 3.91 (43-11), 4.1 (41-10), 4.3 (43-10), 4.56 (41-9), 4.89 (44-9), 5.38 (43-8), 5.83 (35-6), 6.17 (37-6).

Backlash - 006-.008"

Carrier Removal: Disconnect rear universal, remove axle shafts,(see below), take out carrier capscrews, lift off carrier assembly.

Axle Shaft Removal: Remove wheel, hub, and drum assembly (use screw type hub puller - Tool C-845), block brake pedal, disconnect brake line at wheel cylinder, remove axle shaft key, install sleeve (Tool C-757) in oil seal, remove brake support (oil seal mounted in support), pull shaft and bearing (use C-499 puller)

Wheel Bearing Adjustment: Shims between backing plate and axle housing With wheel and hub removed, check endplay with dial indicator. To adjust, remove backing plate (see above), add or remove shims (furnished 005", 010", 0125", 015" 030" thick) equally at both wheels

Endplay– 003- 008"

SHOCK ABSORBERS

"Oriflow". Direct acting, hydraulic, non-adjustable. Serviced by replacement.

FRONT SUSPENSION

Independent. New "Torsion-Aire"type with ball joints and torsion bar springing
See "Torsion-Aire" in Front Suspension & Wheel Alignment Section

Steering Axis Inclination - 5-7° at 0° camber.

Caster - (Manual Steering) Neg. ¾° ±¾°. **(Power Steering)** Pos. ¾° ±¾°. *NOTE* - Caster should be equal as nearly as possible on both sides of the car.

Camber - (Left Wheel) Pos. 3/8° preferred (limits Pos. ½° to 0°). **(Right Wheel)** 0° preferred (limits Pos. ¼° to Neg. ¼°).

Toe-In - 1/8" preferred (limits 3/32" to 5/32").

Toe-Out on Turns - With outer wheel 20°, inner wheel should be 21°45'.

STEERING

Manual: Gemmer. Worm and three-tooth roller
See "Gemmer Worm & Roller" in Steering Section

Power Steering: "Coaxial"
See "Coaxial" Power Steering in Steering Section

Steering Linkage: *See "Steering Linkage" in Steering Section.*

Steering Gear Removal: *See "Gemmer Worm & Roller" Steering Section.*

BRAKES

Service: Center Plane (Floating Shoe) hydraulic type. *See Chrysler "Center Plane" Brakes in Brake Section.*

Drums–Centrifuse Diameter 12"

Wheel Cylinder Diameter–1 1/8" bore. Single acting (front), double acting (rear wheels)

Lining–Molded asbestos (bonded to shoe) Length– **12.57 per shoe. Width - 2½". Thickness - 13/64".**

Braking Power - 60% front, 40% rear

Clearance - Front Wheels - Turn each adjusting cam in direction of forward wheel rotation until shoe lining is solid against drum and wheel is locked Turn adjusting cams slowly in opposite direction (each cam a little at a time) until no drag is felt.

Rear Wheels - Same as front wheels except that on rear wheels forward shoe adjusting cams are rotated in direction of forward wheel rotation and rear shoe adjusting cams are rotated in direction of revers wheel rotation.

Master Cylinder: On engine side of dash panel opposite base of brake pedal

Checking Fluid–Filler plug at top of master cylinder (on dash panel in engine compartment)

Power Brakes: Bellows Assist type Mounted on firewall and linked to upper end of brake pedal (used with standard master cylinder)
See "Chrysler, Desoto, Dodge, Plymouth Bellows Type Power Unit" in Brake Section

Removal of Power Unit – Use Pedal depressor to depress pedal to prevent trigger arm extending beyond end of bracket (to prevent damage to trigger arm). Disconnect vacuum hose Remove nuts on four mounting studs and withdraw unit from firewall *CAUTION* – Do not lose nylon bushing on pedal linkage cross pin.

Parking Brake: Independent type on propellor shaft at rear of transmission. 6" external contracting type (Synchro-mesh Cars), 7" internal expanding type (Automatic Trans Cars)

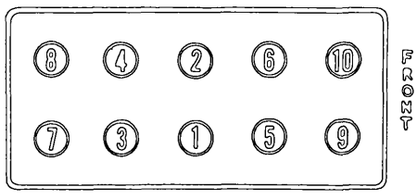
Adjustment – *See "Hand Brake Notes" in Chrysler Special Data.*

Lining – Width – 2" Thickness – 5/32" Length –

MISC. MECHANICAL

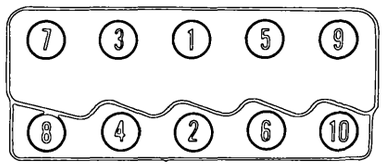
Windshield Wipers: Auto-Lite EPV–4001A (C–75–1,2; C–76, C–76–300), EPV–4001 (IM–1,2,4) Electric type. *See "Auto-Lite Electric Windshield Wipers" in Miscellaneous Section.*

Air Conditioning: Heater-Air Conditioning. *See "Air Conditioning" in Miscellaneous Section.*



Power Window Regulators: Auto-Lite. Electric type Reversible type motor in each window. Controlled by switch and master control switch. *See "Electric Window Regulators" in Miscellaneous Section.*

Power Seat Adjusters: Electric, 6–Way type *See "Power Seat Adjusters" in Miscellaneous Section.*



Convertible Top Control: Auto-Lite. Electric-Hydraulic type *See "Chrysler Top Control" in Miscellaneous Section.*

TIGHTENING SPECIFICATIONS

	Ft. Lbs.
Cylinder Head	85
Intake Manifold	30
Exhaust Manifold	25
Oil Pan	15
Main Bearing Caps (Without Lockwashers)	100
Flywheel	60
Vibration Dampener	135
Crankshaft Pulley	135

Oil Pump Mounting	35
Oil Filter	30
Clutch Housing	35

V8 ENGINES (DOUBLE ROCKER ARM SHAFT)

V8 ENGINES (SINGLE ROCKER ARM SHAFT)

ENGINE

ENGINE ASSEMBLY REMOVAL: Drain cooling system, remove battery. Remove fan shroud, radiator, and hood. (*NOTE* - Before removing hood, scribe outline of hinge brackets to insure proper adjustment when reinstalling.) Disconnect fuel lines and wires attached to engine units. Remove air cleaner and carburetor. Attach engine lifting Tool C-3466 to carburetor flange studs on intake manifold and attach chain hoist to fixture eyebolt. Raise car and disconnect propeller shaft at transmission. Disconnect wires and linkage at transmission. Disconnect wires and linkage at transmission and clutch. Remove exhaust pipe (make sure exhaust system is supported while engine is removed). Drain engine and transmission oil. Remove rear crossmember-to-transmission support attaching bolts. (*NOTE* - Place a roll-away jack under transmission to relieve weight from crossmember. Place a wood block between head of jack and transmission to avoid damaging transmission oil pan. Jack must support weight of rear of engine and must be able to roll with engine as engine is removed). Remove crossmember-to-frame bracket attaching bolts. Remove crossmember and rear engine support. Lower car to convenient working height, then remove engine front support mounting bolts. With chain hoist, raise engine and, at same time, work engine out of chassis toward left front fender.

CYLINDER HEAD & MANIFOLD

CYLINDER HEAD INSTALLATION: Use Torque Indicating Wrench to tighten cylinder head bolt nuts and capscrews, tighten in correct sequence as shown in diagram for each car.

Tightening Torque—See Tightening (Torque Wrench) Specifications above.

CYLINDER HEAD INSTALLATION (Double Rocker Shaft): Use new gaskets when installing head. Insert cylinder head bolts into rocker arm support brackets. Insert pushrods through holes in head (short rods in upper holes - intake, long rods in lower holes - exhaust). Place rocker arm assemblies in position on heads, then position pushrods. Starting at top center, tighten all cylinder head bolts to correct torque (see Tightening Specifications above). Install exhaust manifolds, crankcase breather tube, and intake manifold. *NOTE* - When installing intake manifold, insert short bolts in holes on extreme ends of manifold.

CRANKSHAFT & MAIN BEARINGS

REAR MAIN BEARING SEAL: Rope type seal of braided asbestos. With bearing cap, bearing and seal removed, install a new seal in position in cap so that both ends of seal protrude above cap. Tap seal down in position with Tool C-3511 until tool is seated in bore. Hold tool down and cut off protruding ends flush with cap. Install bearing insert and both cap seals. The long cap seal should be installed so that when cap is in position, seal is on the oil filter side of engine.

ENGINE FRONT COVER

ENGINE FRONT COVER (Double Rocker Shaft Engines): Proceed as follows.

Removal: Remove water pump. Remove vibration dampener retainer bolt and washer. Remove two of the vibration dampener pulley bolts and install puller Tool C-3033. Remove crankshaft pulley and vibration dampener as an assembly. Remove felt dust seal and vibration dampener hub key from crankshaft slot Remove left cylinder bank exhaust pipe Disconnect fuel lines at fuel pump Remove fuel pump. Remove oil level indicator. Remove starter using Tool C-455. Drain engine oil and remove oil pan Remove cover bolts and lockwashers Drive chain case cover off the two dowel pins, using soft hammer.

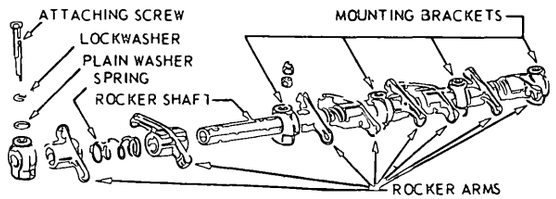
Installation: Be sure mating surfaces of cylinder block and cover are clean Apply moderate coat of sealing compound to block and cover faces, install new gasket. Make sure crankcase oil slinger is in proper position (flange end pointing toward seal). Position cover on two dowel pins and then gently tap cover in place. Install cover bolts and lockwashers and tighten to 30 ft lbs Install other items by reversing removal procedure.

FRONT OIL SEAL: Remove crankshaft pulley and water pump housing. Loosen oil pan bolts sufficiently until pan clears chain case cover. Install Tool C-3506 and remove seal. Discard seal and retainer. Position new seal and retainer assembly in housing and press into place using Tool C-3503. Seal must be tight against seat surface. *CAUTION* - Always have thin shoulder away from front of cover with stamped case cover, thick shoulder away from front of cover with cast iron cover.

CAMSHAFT & BEARINGS

CAMSHAFT REMOVAL: With intake manifold, tappet cover, pushrods, tappets and timing gears removed, remove distributor. Lift out distributor drive gear and stub shaft. Remove camshaft thrust plate attaching bolts and oil trough. Withdraw camshaft and spacer, being careful not to damage cam bearings with cam lobes.

▷ *CAMSHAFT REPLACEMENT CAUTION:* When replacing camshaft to correct cam lobe wear, observe the following precautions:



1) Clean and flush engine thoroughly (use mixture of ½ kerosene and ½ No. 10 engine oil) to remove all metal dust and grindings.
2) Replace all hydraulic lifters (check for fit).
3) Check for sticking valves (guide clearance) and valve spring pressure (must be within limits).
4) Inspect new camshaft for lobe roughness, nicks, or scratches. Lubricate cam lobes when installing shaft and add 1 qt. Mopar Anti-Scuff Oil No. 1643234 to engine oil for break-in.
5) Drain oil after first 500 miles of operation and thereafter at regular drain intervals.

VALVE SYSTEM

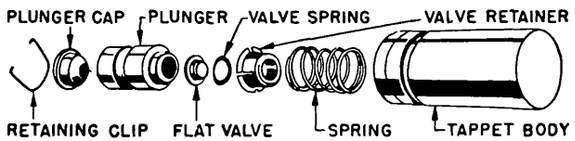
ROCKER ARMS

ROCKER ARM ASSEMBLY: Removal—Remove rocker arm covers. Place cotter pins in holes of first and last rocker arm brackets (if not already there) to prevent springs on rocker from pushing assembly

CONTINUED ON NEXT PAGE

ROCKER ARM ASSEMBLY
(SINGLE ROCKER ARM SHAFT)

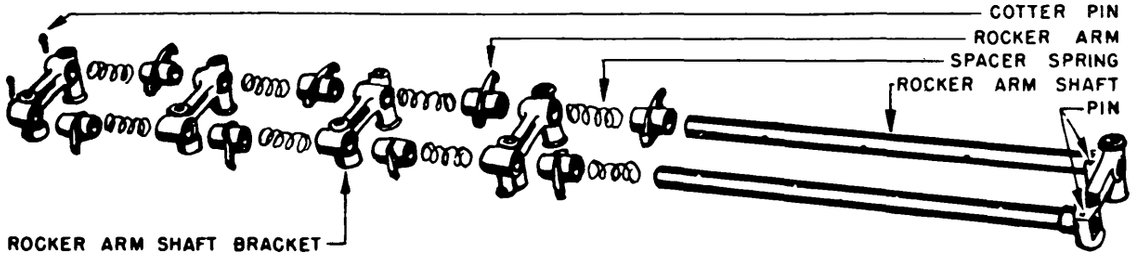
CONTINUED FROM PRECEDING PAGE



apart when cylinder bolts removed. Completely loosen ten bolts on each bank that attach rocker arm support brackets to cylinder head and block. Grasp support bracket at each end of head, pull rocker assemblies and bolts directly away from heads, then remove push rods and place in respective slots in holder C-3068. ***CAUTION—Use care when removing rocker assemblies in order not to jerk cylinder heads off locating dowels which would allow them to drop and become damaged.***

Installation Insert cylinder head bolts in brackets, with **short** bolts in intake side Insert push rods through push rod holes in heads (short rods in upper intake holes, long rods in lower exhaust holes) Place rocker arm assemblies in position on heads, lining up all push rods to their respective rocker arms Starting at top center tighten all cylinder head bolts to torque indicated in Tightening Specifications above ***When tappets are full, extreme care must be taken when tightening head bolts so that tappets have time to bleed down to their operating length.*** Bulged tappet bodies and permanent noisy operation will result if tappets are forced down too rapidly

HYDRAULIC VALVE LIFTER



HYDRAULIC VALVE LIFTERS (One-Piece Integral Type)

Barrel type. Unit consists of plunger and valve assembly operating within a cylinder formed by valve lifter body. Oil is introduced to this unit through hole in side of lifter plunger.

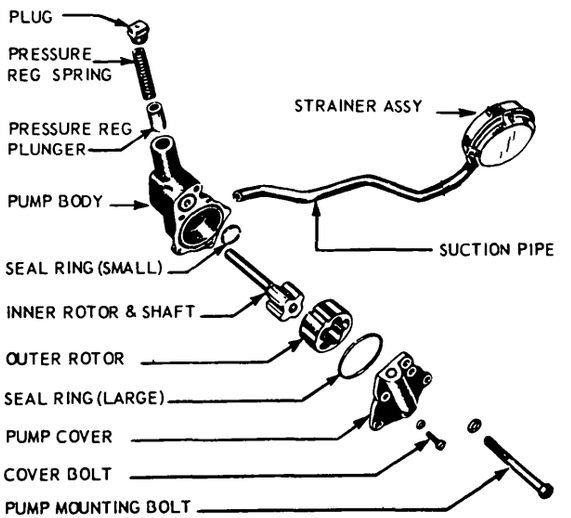
DE SOTO V8 HYDRAULIC VALVE LIFTER

Removal (Double Rocker Arm Shaft Engine): Drain cooling system to a point below level of intake manifold. Install valve spring compression Tool C-3024 over rocker arm so heel of tool rests on valve stem side. Make certain valve is seated and tappet body is resting on low point of camshaft lobe (see below). Using handle of tool for leverage, compress valve springs sufficiently to raise rocker arm above pushrod. While holding rocker arm in this position, slide rocker arm to one side along tube (*CAUTION* - To avoid damage to valves, be sure piston head is well below top of travel before compressing valve springs). Remove carburetor air cleaner, disconnect coil wires and wire from heat indicator sending unit. Disconnect heater hose and carburetor heat tube at integral choke. Remove intake manifold, coil and carburetor as an assembly. Remove tappet chamber cover and gasket. Insert hooked portion of Tool C-3216 into hole in tappet body (this portion of tool can be used to remove tappets without varnish build-up). Lift tappet out of bore. If tappet sticks, slide puller portion of tool C-3316 through cylinder head (pushrod) holes and seat firmly in cap of tappet. Insert puller pin through tappet body and tool shaft in holes provided. Grasp tool handle and pull tappet out of bore with twisting motion.

ROCKER ARM ASSEMBLY (DOUBLE ROCKER ARM SHAFT)

Disassembly: ***(CAUTION—Disassemble one lifter at a time to avoid the possibility of mixing lifter parts. It is very important that lifter parts not be interchanged)*** Depress lifter plunger with a push rod and remove plunger retainer spring clip, plunger cap, plunger ball check (or flat type valve), valve springs, valve retainer, and plunger spring from lifter body Inspect plunger, lifter body, valves and valve seats for signs of scoring, wear or pitting Check to see that valve exerts a slight pressure on valve spring to insure valve seating Clean lifter assembly in clean solvent and remove all traces of varnish and carbon Blow parts dry with air DO NOT USE A CLOTH AS LINT WILL CAUSE LIFTER TO OPERATE UNSATISFACTORILY

Testing: Remove plunger cap and immerse lifter assembly in an upright position in a container of kerosene ***(CAUTION***—Container and kerosene must be absolutely clean) Allow lifter to fill with kerosene, then remove and replace the plunger cap Holding lifter in an upright position and using tool C-3160, compress plunger slightly a few times to fill lifter body Then compress lifter firmly with testing pliers, and if plunger collapses instantly as pressure is applied, disassemble, inspect and clean again If second cleaning fails to prevent lifter from collapsing instantly when compressing, replace lifter When cleaning and testing has been completed, remove kerosene and prime lifter lightly with clean engine oil before installing This will prevent possible scoring of lifter plunger when engine is first started



Reassembly: Reverse disassembly procedure as noted above

LOW POINT OF CAMSHAFT LOBE. Remove distributor cap, noting position of rotor for Nos 1 and 6 cylinders Set timing mark "DC" located on crankshaft pulley to pointer With rotor at No 1 firing position, the following lifters will be on the low side of the cam lobe No 2 intake and exhaust, No 4 exhaust, No 7 intake, No 8 intake and exhaust ***(NOTE***—To remove No 1 intake and exhaust lifter, rotate crankshaft ¼ turn clockwise from above position after removing lifters listed) With rotor at No 6 position, following lifters will be on low side of cam lobe No 3 intake and exhaust, No 4 intake, No 5 intake and exhaust, No 7 exhaust ***(NOTE***—To remove No 6 intake and exhaust lifter, rotate crankshaft ¼ turn clockwise from above position after removing lifters listed)

OILING SYSTEM

OIL PUMP

ROTOR TYPE OIL PUMP Removal—Drain engine oil, remove oil pan Remove oil pump mounting bolts and lower pump straight down

V8 OIL PUMP

Disassembly & Inspection: Remove oil strainer and pump cover, rotor and shaft. Lift out outer rotor. Remove release valve plug, spring and plunger. Wash all parts in suitable solvent, and inspect for damage or excessive wear. Check pump for wear as follows

Outer Rotor - Replace rotor if thickness is less than 988".

Inner Rotor & Shaft - Replace if thickness of rotor is less than 988" and diameter less than 2.244".

Pump Body - Place both inner and outer rotors in pump body. Place straightedge across body between bolt holes. If clearance between rotors and straightedge is 004" or more, replace pump body.

Outer Rotor Clearance - If clearance is more than 012" between outer rotor and pump body, replace pump body.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Outer Rotor to Inner Rotor Clearance - Place both rotors in pump body. With inner rotor bottomed in outer rotor, if clearance between opposite lobe of inner rotor and lobe of outer rotor is more than .010", replace both rotors.

Oil Pump Cover - Place straightedge across pump cover. If clearance between straightedge and cover is .0015" or more, replace cover.

Reassembly: Use new oil seal ring between cover and body Tighten cover bolts to 10-15 ft lbs Prime pump and then install new oil seal ring in pump mounting face

Distributor-Oil Pump Drive Shaft Bushing: *See "Ignition Notes" below.*

IGNITION NOTES

DISTRIBUTOR-OIL PUMP DRIVE SHAFT BUSHING: Removal—Insert Tool C-3052 and thread it into bushing Holding puller head with wrench, tighten puller bolt and pull bushing out of bore in block

Installation: Slide new bushing over burnishing end of Tool C-3053 Insert tool and bushing into bore of block Drive bushing and tool down into position, using a soft hammer As the burnisher is pulled through the bushing by pressure applied to puller nut, tool will wedge bushing tight in its bore and will burnish bore to correct size ***DO NOT REAM THE BUSHING.***

DISTRIBUTOR BASIC TIMING: Before installing distributor-oil pump drive shaft it will be necessary to time engine as follows. Rotate crankshaft until No 1 cylinder is at TDC (or firing position) When cylinder is in this position, the pointer on chain case cover should be over "DC" on vibration dampener Using Tool C-3027, position oil pump shaft so that it lines up with slot in drive gear Coat shaft of drive gear with engine oil Install it so that, after the gear spirals into place, it will index with oil pump shaft (slot in top of drive gear will be parallel with centerline of crankcase)

PROPELLER SHAFT NOTES

REAR UNIVERSAL JOINT OPERATING ANGLE: Rear universal joint operating angle must be within range of 1-3° (2° preferred). Check and adjust this angle as follows

► *CHECKING CAUTION:* Car weight must be on wheels (use drive-on type hoist or platform) and there must be no extra weight in trunk.

Checking Rear Universal Joint Angle: Measure angle of pinion shaft companion flange by placing spirit level vertically on back face of flange. Measure angle of propeller shaft by placing spirit level parallel to shaft on top or underside of shaft. **Add** these two readings. This is the universal joint angle and should be 2° (limits 1-3°)

Adjusting Rear Universal Joint Angle: If angle exceeds 3°, install wedge shim between the rear spring and spring seat on axle housing. Make sure that shim surface is not burred, install shim with flat side toward spring and thick end toward front of car. Recheck universal joint angle.

BRAKE NOTES

HAND BRAKE ADJUSTMENT (External Type): Free play between anchor bracket on center of band and sides of hand brake support should not exceed .005". Correct by compressing bracket in vise or by tapping with a hammer before attempting brake adjustment. Adjust anchor screw to obtain .015-.020" clearance between band and drum at anchor. Adjust guide bolt to obtain uniform clearance for upper and lower halves of band. Guide bolt controls position of lower end of band, nut controls upper end of band.

HAND BRAKE ADJUSTMENT (Internal Type): Disconnect front end of propeller shaft and remove adjusting screw cover plate. Turn adjusting nut to decrease shoe-to-drum clearance until drum drags, then back off nut at least one full notch to give .010" clearance (use Spanner Tool C-3014). Shoulders on nut must be seated in grooves on adjusting sleeve. Adjust hand brake lever cable so there will be 3-5 notches visible on lever beyond face plate when brake applied.

►*ADVENTURER NOTE:* This model has special Fire-Flite Engine (Larger Bore, Racing Camshaft, Dual Breaker Distributor, Double Valve Springs, and special Carburetors). Complete data is included below.

MODEL IDENTIFICATION

Model	Model Designation
Firedome	S-25
Fireflite	S-26
Adventurer	S-26
Firesweep	S-27

SERIAL NUMBER: Stamped on plate attached to left front door body hinge post.

Starting Serial Numbers

Model	Detroit	Los Angeles
S-25 Firedome	55332001	
S-26 Fireflite	50396001	
S-27 Firesweep	58001001	60014001

ENGINE NUMBER: Stamped on machined boss on top of front side cylinder block just behind water pump.

Starting Engine Numbers

Model	Detroit	Los Angeles
S-25 Firedome	S25-1001	
S-26 Fireflite	S26-1001	
S-26 Adventurer	S26A-1001	
S-27 Firesweep	KDS-1001	KDS-1001

►*ENGINE NUMBER LETTERS & MARKS (Following Engine Number): Identified as follows:*
"A" – All cylinders .020" oversize.
"B" – All Main & Connecting Rod Bearings .010" undersize.
"AB" – BOTH above conditions exist.
"MALTESE CROSS" symbol (3/8" high)—ONE OR MORE Crankshaft Journals .001" undersize. *See "Connecting Rods" & "Crankshaft" under ENGINE below.*
"DIAMOND" symbol (3/8" high)—ALL Lifter Bodies are .008" oversize.

TUNE-UP

COMPRESSION PRESSURE: (S-25, S-26) 145-175 lbs., (S-26 Adventurer) 160-190 lbs., (S-27) 90-155 lbs. All at cranking speed of 150 RPM (plugs removed, wide open throttle). Maximum variation between cylinders 20 lbs. (S-26 Adventurer), 15 lbs. (All others).

VALVE TAPPET CLEARANCE: None in service (hydraulic).

MANIFOLD HEAT CONTROL: Automatic thermostatic type located between right hand exhaust manifold and exhaust pipe. *NOTE* – Single exhaust pipe with cross-over Std., Dual Exhaust Optl.
Thermostatic Coil Installation – Outer end of coil should be hooked under right hand stop stud. An anti-rattle spring is hooked between valve shaft and stud on opposite side of valve housing.

►*DUAL EXHAUST NOTE:* When valve is closed, most exhaust gases are discharged through left exhaust pipe.

IGNITION

FIRING ORDER: 1-8-4-3-6-5-7-2.
Cylinders – RIGHT BANK 2-4-6-8, LEFT BANK 1-3-5-7.
SPARK PLUG GAP: .035".
Spark Plugs – Auto-Lite AR-42 (Std.). Resistor type. 14 mm. Torque to 30-32 ft. lbs. *NOTE* – On Adventurer, Auto-Lite AR-32 recommended for sustained high speed.

COIL: Auto-Lite CAH-4001C (S-25, S-26), CAH-4001B (S-27).
Ignition Current – 2.5 amps. idling, 3.1 amps. stopped.
Resistor – Auto-Lite PU-4003, .665-.735 Ohms.

►*COIL RESISTOR NOTE:* Resistor is connected in lead from ignition switch to coil. When testing coil, include resistor with coil.

DISTRIBUTOR: Auto-Lite. Distributors are single breaker type (IBP), double breaker type (IBS).

Car Model	Auto-Lite No.
S-25	IBP-4001
S-26	IBP-4001A
S-26 Adventurer	IBS-4004
S-27 (Std.)	IBP-4002
S-27 (Power Pak)	IBP-4002B

Condenser – Auto-Lite IAT-2015RA. **Capacity** .25-.28 mfd.
Contact Point Set – Auto-Lite IBP-3028AS (IBP Distr.).
Breaker Gap – .015-.018".
Cam Angle - (IBP Distr.) 27-32°, (IBS Distr.) 29-32° for single set of points, 36-39° for both sets of points.

►*CAM ANGLE SETTING CAUTION (IBP DISTR.):* Cam angle should be checked with vacuum line **disconnected.** Cam angle may decrease as much as 10° with maximum vacuum advance, but must not decrease more than 12°

Breaker Arm Spring Tension – 17-20 ozs.
Rotation – Clockwise viewed from above.

Automatic Advance – IBP-4001

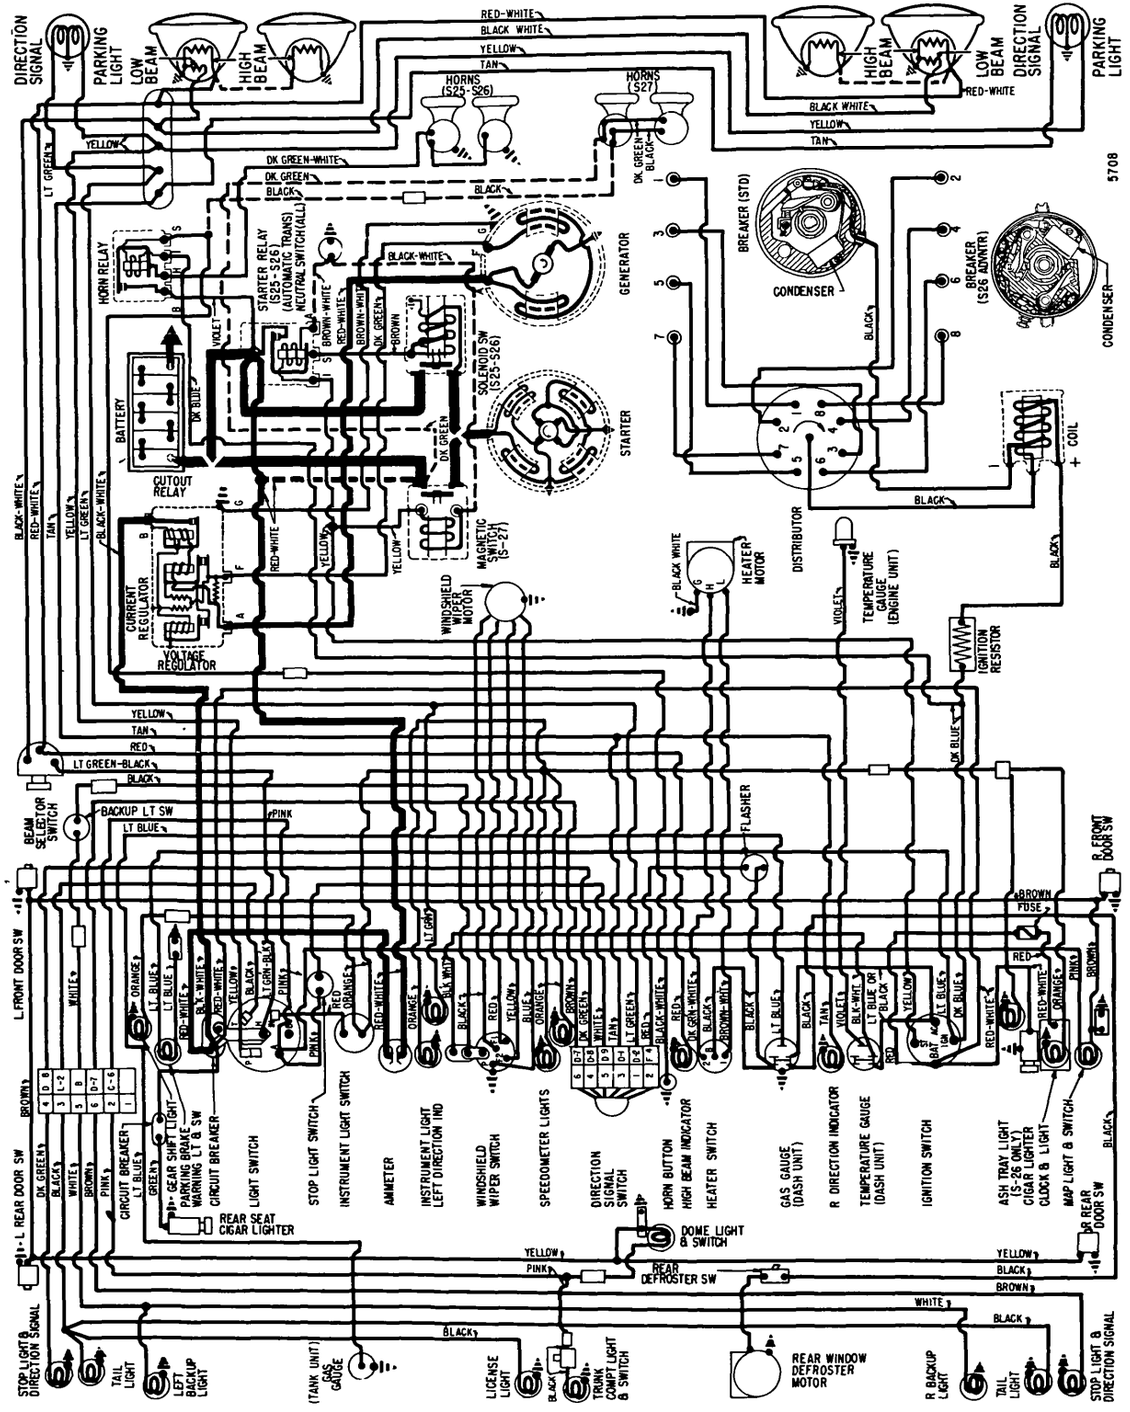
IGNITION TIMING

Setting – 6° BTDC (All Models). NOTE—Setting should not be varied more than 4° before or after the standard setting of 6° BTDC.
Timing Mark – Vibration marked "DC" with 2° graduations before and after this point. Align correct mark with pointer on chain case cover.

CARBURETOR



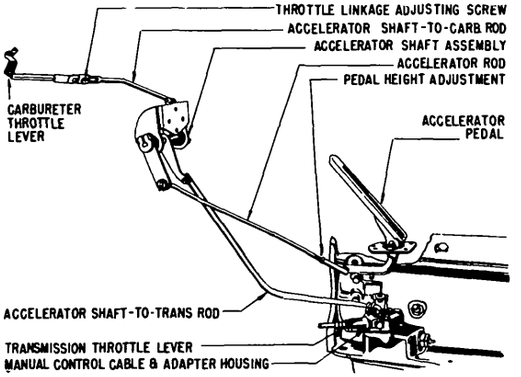
►*CARBURETOR APPLICATION: Carter & Stromberg (2 and 4 barrel types) used as follows:*

Model	Carburetor Type & No.
S-25 (Std.)	Carter BBD 2522S, SA
S-25 (Power Pak)	Carter WCFB 2532S
S-26 (Std.)	Carter WCFB 2588S
S-26 Advntr	Carter WCFB 2635S (Frt), 2636S (Rear)
S-27 (Std.)	Stromberg WW 3-149, 3-150
S-27 (Power Pak)	Carter WCFB 2532S

►*CARBURETOR AIR CLEANER (DRY TYPE) NOTE: Special cleaning procedure required. See AIR CLEANER below.*

►*S-27 POWERFLITE & TORQUEFLITE LINKAGE ADJUSTMENT CAUTION & NO-KICKDOWN CORRECTION:* Different Bellcrank-to-Transmission Throttle Valve Rods used with each transmission. If TorqueFlite throttle linkage cannot be adjusted, or if kick-down does not operate, make certain correct rod installed. Identify rods as follows:
PowerFlite Rod – No. 1735024. Straight portion of rod (from bellcrank end to center of bend) should be 6½" or 1" shorter than corresponding TorqueFlite rod.

CONTINUED ON NEXT PAGE



CONTINUED FROM PRECEDING PAGE

TorqueFlite Rod – No. 1734979. Straight portion of rod (from bellcrank end to center of bend) should be 7½".

THROTTLE LINKAGE ADJUSTMENT: *NOTE* – Accelerator pedal angle should be 118° to horizontal in closed throttle position. To adjust, disconnect pedal end of bellcrank-to-pedal rod, shorten or lengthen rod by turning swivel end on rod, tighten locknut after adjusting. Then proceed as follows:

1) Make certain engine idle speed correctly set at 475-500 RPM with transmission in neutral and engine at normal operating temperature.

2) On 2-Barrel carburetor models, loosen adjusting screw located on accelerator shaft-to-carburetor rod. On 4-Barrel carburetor models, loosen adjusting screw on accelerator shaft assembly-to-intermediate shaft assembly rod. On all models, move rear portion of rod to rear until it is stopped by idle stop on transmission throttle cam. Align rods and tighten adjusting screw to 7-9 ft.lbs. torque. Recheck engine idle speed.

POWERFLITE & TORQUEFLITE THROTTLE LINKAGE

CARTER BBD

Carter BBD, No. 2522S, SA. Std. on Model S25.

► *FLAT SPOT OR HESITATION (2522S Carburetor):* If this not corrected by complete tune-up (including Ingition Timing, Manifold Heat Control operation check, and Carburetor adjustment including Float Level and Pump Stroke check), check pump valves and make changes in carburetor as detailed below. *NOTE* - These new parts installed in 2522SA carburetors in production.

Accelerating Pump Check Valves - Check for leakage by holding discharge check ball at bottom of pump discharge cluster hole while operating pump (Discharge Cluster removed). If leakage noted at discharge ball check or at intake ball check, reseat balls. Use brass rod to tap ball down if new balls not available.

Venturi Cluster Screws (Main Idle Air Bleed) - Install new screws, No. 101-434 (supersedes 101-433).

St p-up Rods - Install new rods, No. 75-1145 (supersedes 75-1177).

► *MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barr l fe ds Cyl. 2-3-5-8, LEFT barr l 1-4-6-7.*

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Idle Setting – 1-1½ turns open. Adjust both screws alike. Turn screws out for richer mixture.

Idl Speed – 450-500 RPM (Synchro-mesh). 475-500 RPM with transmission in Neutral (TorqueFlite).

Float Level - 5/16" (Gauge T109-220) between top ridge of each float and top edge of bowl casting with needle valve closed (float lip held against needle valve). Adjust by bending lip on float arm.

Accelerating Pump – Install connector rod in center hole of throttle lever and inner hole of pump arm. Pump stroke (travel of pump piston rod) should be 1 1/32" plus or minus 1/64". Adjust by bending throttle connector rod.

Fast Idle: .015" (Gauge T109-44) between lower edge of of throttle valve and bore with fast idle adjusting screw on high step of cam.

Fast Idle Cam Clearance – With choke valve closed and lip on inner choke shaft lever contacting lug on outer lever, index mark on cam should align with fast idle adjusting screw Adjust by bending lip on inner choke shaft lever.

Automatic Choke Setting: 1 Point Rich.

Throttle Linkage Adjustment: *See CARBURETOR above.*

►*OTHER DATA: See "Carter BBD" Carburetor in Carburetion Section.*

STROMBERG WW

Stromberg WW, Code 3.149 (Synchro-mesh), 3.150 (PowerFlite & TorqueFlite). Std. on Model S-27.

►*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrel feeds Cyl. 2-3-5-8, LEFT barrel 1-4-6-7.*

Idle Setting – 3/4 - 1-3/4 turns open. Adjust both screws alike. Turn screws out for richer mixture.

Idl Speed – 450-500 RPM (Synchro-mesh), 475-500 RPM with transmission in Neutral (PowerFlite & TorqueFlite).

Float Level – 7/32" (Gauge T-26019) from top of float at center to top edge of bowl casting with needle valve seated (hold float arm lip against needle valve). Adjust by bending lip.

Accelerating Pump – Install connector rod in center hole of throttle lever.

Fast Idle: With throttle stopscrew backed out so that throttle valves completely closed, back out fast idle adjusting screw, close choke valve so that fast idle screw in line with first step of fast idle cam, turn fast idle screw in until initial contact is made with cam, then turn screw in additional 5½ turns. With fast idle screw in position, close choke valve against a #12 drill (3-149 Carb.), #24 drill (3-150 Carb.) placing drill between upper edge of valve and air horn wall. If fast idle screw is not on first step and against shoulder on cam, adjust by bending fast idle rod at upper end.

Aut matic Choke Setting: *NOTE* – Choke is "Crossover" type mounted in well in manifold and linked to choke lever by a rod. Adjustment is not required but can be checked by disconnecting rod and removing choke assembly. Index mark on thermostatic coil plate should be midway between "L" and "R" marks.

Throttle Linkage Adjustm nt: *See CARBURETOR above.*

►*OTHER DATA: See "Stromberg "WW" (Dodge & Plymouth) Carburetor" in Carburetion Section.*

CARTER WCFB 4-BARREL

Carter WCFB No. 2588S (S-26), 2532S (S-25 & S-27 Power Pak).

►*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrels feed Cyl. 2-3-5-8, LEFT barrels 1-4-6-7.*

Idle Setting – ½-1½ turns open (primary only). Turn screws out for richer mixture.

Idle Speed – 450-500 RPM (Synchro-mesh), 475-500 RPM with transmission in Neutral (PowerFlite & TorqueFlite).

Throttle Linkage Adjustment: *See CARBURETOR above.*

►*OTHER DATA: See "Carter WCFB 4-Barrel" Carburetors in Carburetion Section.*

CARTER WCFB 4-BARREL
Two Carburetor Installation
(Adventurer)

Carter WCFB, No. 2635S (Frt), 2636S (Rear).

►*MANIFOLD FUEL DISTRIBUTION: RIGHT barrels feed right bank cylinders, LEFT barrels feed left bank.*

►*CARBURETOR IDLE ADJUSTMENT CHANGE NOTE: The following idle speed & mixture adjustment procedure supersedes previous instructions.*

Linkage Adjustment: Before adjusting idle mixture and idle speed, the carburetor inter-connecting rod must be adjusted as follows: Hold rear carburetor throttle in wide open position (choke off) and adjust rod at slotted end so front carburetor throttle valve will be in wide open position. Make sure rod can rotate slightly on pivots and is not binding. A binding condition can result in a loose throttle lever which may fall off shaft and leave throttle wide open.

►*LOOSE THROTTLE LEVER CORRECTION:* Remove carburetor and place in a vise so that end of throttle shaft away from lever is firmly supported. Place lever on shaft and peen shaft to tighten securely.

Idle Speed & Mixture Adjustment: Screw the "idle by-pass" screw (7/16" slotted hex head screw located on left rear side of each carburetor body flange) against its seat *(NOTE - This "by-pass screw" is no longer used for idle speed adjustment and must remain in the closed position).* Adjust engine idle speed to 650 RPM (transmission in neutral) by screwing in the **idle speed screw** (throttle stop screw at throttle shaft lever) on the front carburetor only. Adjust all four (two on each carburetor) idle mixture screws 1 turn open from a lightly seated position. Obtain the smoothest possible idle speed by further adjusting idle mixture screws on **front** carburetor *(NOTE - It may also be necessary to re-adjust idle mixture screws on rear carburetor if adjustment of front carburetor does not provide proper engine idle speed).*

Throttle Linkage Adjustment (Automatic Transmission Cars): *See CARBURETOR above.*

►*OTHER DATA: Se "Carter WCFB 4-Barrel Carburetor" in Carburetion S ction.*

FUEL PUMP PRESSURE: 6-7 lbs.

CARB. EQUIPMENT

Fuel Pump: **Carter** M2502S (S-27), M2501S (S-25, S-26 Std.), M2504S (S-25, S-26 Air Cond.).
Pressure - 6-7 lbs.
See "Fuel Pumps" in Carburetion Section.

Gasoline Gauge: Auto-Lite Electric Type.
Dash Unit - Auto-Lite 14322A.
Tank Unit - Auto-Lite 14380A (Est. Wgn), 14381A(Others)
See "Fuel Gauges" in Carburetion Section.

AIR CLEANER: DRY FILTER ELEMENT type. Clean every 5000 miles, replace element every 15,000 miles.

►*CLEANING CAUTION:* Clean filter element by tapping and shaking to remove dirt particles. *DO NOT wash element in solvent or other liquids and DO NOT oil or lubricate.*

BATTERY

(S-25, S-26) Auto-Lite 11-HS-60 r Willard HO-11-60. 12 volt, 11 plate, 60 ampere hour (20 hr. rate).
(S-27) Auto-Lite 11-HS-50 or Willard HO-11-50. 12 volt. 9 plate, 50 ampere hour (20 hr. rate).
Battery Ground - Negative.
Engine Ground - Left front of engine.

STARTER

Auto-Lite Used as follows:

Model	Starter N .	Armatur No.
S-25, S-26	MDL-6001	MDL-2006
S-27	MDL-6003	MDL-2088

►*S-27 NOISY OR ERRATIC STARTER DRIVE CORRECTION:* Check for excessive dust or water on drive shaft. Lubricate with No. 10W oil. In extreme cases, remove starter and lubricate Bendix drive unit.

Drive – (MDL-6001) Overrunning clutch & solenoid pinion shift. (MDL-6003) Bendix "Folo-Thru" No. A3596.

Rotation – Counter-clockwise at commutator end.

Brush Spring Tension – 31-47 ozs. with new brushes.

Performanc Data

Torque	RPM	Volts	Amperes
0 ft. lbs.	3200 min.	10.0	60 max.
6.0 ft. lbs.	Lock	4.0	225 max.

Starting Switch: **(S-25, 26)** - Auto-Lite SAD-4301 Solenoid Pinion Shift used with separate relay, Auto-Lite RAJ-4001, and Neutral Safety Switch on transmission (Auto. Trans. Cars). Controlled by Ignition and Starting Switch (key starting).
(S-27) - Auto-Lite SAE-4001 (Synchro-mesh), SAE-4002 (Auto. Trans.) magnetic switch used with Neutral Safety Switch on transmission (Auto. Trans.). Controlled by Ignition & Starter Switch (key starting).
See "Auto-Lite Starter Controls" in Electrical Section.

N utral Safety Switch Adjustment: *See "PowerFlite" or "TorqueFlite" Transmission in Transmission S ction.*

0	12.8	1225-1325
30	15.0	2050-2250

Brush Spring Tension — (GGA) 34-41 ozs., (GHM) 35-53 ozd., (GJC) 18-36 ozs., with new brushes.

Field Current — (GGA, GHM) 1.1-1.3 amperes, (GJC) 1.2-1.3 amperes, at 10 volts (70° F.).

Motoring Current — (GGA) 2.3-2.6 amperes, (GHM) 3.0-3.5 amperes, (GJC) 3.4-3.9 amperes. All at 10.0 volts (70° F.).

Belt Adjustment: (Exc. Air Cond. Cars) - 3/16" deflection midway between generator and water pump pulleys. **(Air Cond. Cars)** - 1/8" deflection midway between generator and Air Compressor pulleys. All with 5 lbs. force.

REGULATOR

Auto-Lite VRX-6201A (GJC & GHM Gen.), VAT-6201A (GGA Gen.).

Cut out Relay

Cuts In — (VRX) 12.6-13.6 volts (VAT) 13.0-13.75 volts.
Cuts Out — 8.2-9.3 volts, from sealed position with point opening amperage discharge 3-5 amps. (VRX).
Contact Gap — .015" minimum.
Air Gap — .031-.034" with contacts open (check at hinge end of core).

Vibrating Regulator

Setting — 14.5±.3 volts charging at 10 amperes (80° F.) or with .25 ohm resistor in series between regulator and battery.
Air Gap — .048-.052" with contacts just opening.
Checking & Adjusting — *See "Auto-Lite 12 Volt Regulators" in Electrical Section.*

Current Regulator

►*SETTING CAUTION: "Temperature Compensated" type. Set to following specifications at 70° F.*

	Test A Operating Amp rag	Test B
VRX-6201A	36	30 (28-32)
VAT-6201A	46	40 (38-42)

Test A — After 15 minutes operation charging at 10 amperes.
Test B — After additional 15 minutes operation with current regulator operating (load applied to hold voltage to 13.6-13.8 volts (VRX), 13.7-13.9 volts (VAT).
Air Gap — .048-.052" with contacts just opening.
Checking & Adjusting — *See "Auto-Lite 12 Volt Regulators" in Electrical Section.*

MISC. ELECTRICAL

Headlamps: Sealed Beam. 2-Headlights standard, 4-Headlights optional. *See "4-Headlights" in Electrical Section.*

Direction Signals: *See Electrical Section.*

Stop Light Switch Location: On forward end of master cylinder.

CIRCUIT BREAKERS: Used as follows:

20 Ampere — Protects headlights and beam indicator. On back of lighting switch.
6 Ampere — Protects parking lights, tail lights, license plate lights, instrument lights, and clock light. On back of light switch.
6 Ampere — Protects stop light, map light, dome light, glove compartment light, courtesy light and trunk compartment light. On back of light switch.
5 Ampere — Windshield wiper & back-up light. On back of wiper switch. *NOTE* — 6 ampere circuit breaker with variable speed wiper.
8 Ampere — Rear cigar lighter. Behind left front kick panel on side cowl.

FUSES: Clock - 2 ampere in clock lead.

HORN RELAY: Auto-Lite RAH-4002 (S-25, 26 only).

ENGINE

►*AIR CONDITIONED CAR SERVICE CAUTION: Use extreme care when disconnecting any part of air conditioning equipment or lines for access to engine. See "Air Conditioning Service Cautions" in Miscellaneous Section.*

ENGINE SPECIFICATIONS: 90° V8, Overhead Valves.

►*ENGINE NOTE:* Three different engines used as follows:

S-25 & S-26 — Overhead lateral valve type with double rocker shaft.
S-26 Adventurer — Larger S-26 engine with increased bore, special racing camshaft, double valve springs, and other special specifications as listed below.
S-27 — Overhead lateral valve type with single rocker shaft.

Engine	Bore	Stroke	Displacement
S-25, S-26	3.78"	3.80"	341 cu. ins.
S-26 Advntr	3.80"	3.80"	345 cu. ins.
S-27	3.69"	3.80"	325 cu. ins.

Engine	Compr. Ratio	Rated HP	Developed HP
S-25	9.25-1	45.7	270 at 4600 RPM
S-26	9.25-1	45.7	295 at 4600 RPM
S-26 Advntr	9.25-1	46.2	345 at 5200 RPM
S-27	8.5-1	42.2	245 at 4400 RPM
S-27 Pwr.Pak	8.5-1	42.2	260 at 4400 RPM

Compression & Vacuum Reading — *See TUNE-UP.*

ENGINE REMOVAL: *See "Engine" in DeSoto Special Data.*

OIL PAN REMOVAL: (S-27) - Remove negative battery terminal, throttle linkage, distributor cap, oil dip stick and starter. Remove flywheel housing dust shield, steering arm at steering gear cross shaft, idler arm at idler arm bracket, engine front mounts and raise engine 1½". Disconnect exhaust pipe at manifold and front of muffler (Single Exhaust) and tie out of way. Drain engine, remove oil pan screws, lower oil pan, rotate crankshaft to bring No. 1 crank to approximately 8 o'clock position and remove oil pan.

(S-25, 26) - Remove dipstick. (Single Exhaust) remove starter, disconnect exhaust pipe at manifolds and at clamp to exhaust extension and move pipe out of way. (Dual Exhaust) remove starter, disconnect tie rod at idler arm and pull downward and out of way. Lower oil pan and turn crankshaft until No. 1 crankpin is at 8 o'clock position and remove oil pan.

►*CYLINDER HEAD GASKET PRODUCTION CHANGE & CAUTION:* On S-27 models a new cylinder head gasket Part No. 1827891 entered production with engine No. KDS-38504. When replacing head gasket, check depth of cylinder bolt thread in block by chalking cylinder head bolt and screwing it in block without a cylinder head. When bolt bottoms before removing 1" of chalk from bolt, increase depth of threads with ½-13 UNC2B tap. *NOTE* - On S-25 & S-26, cylinder head, Gasket No. 1827703 supersedes No. 1827285.

CYLINDER HEAD: *See "Cylinder Head & Manifold" in DeSoto Special Data.*

TIGHTENING TORQUES: *See "Tightening Specifications" in DeSoto Special Data.*

PISTONS

Aluminum alloy, eliptically turned, tin plated, thermally controlled by steel strut (S-27), by steel belt or band (Other models).

►*CYLINDER BORE OVERSIZE CAUTION: Engines with letter "A" following engine number indicates that cylinder bores are .020" oversize.*

Weight - 18.6 ozs. (S-27), 20.7 (Others), piston only.
Removal - Piston & rods removed from above.
Fitting New Pistons: Clearance - .0005-.0015" at top of skirt (.00075-.00125" desired). Use .002" X ½" ribbon feeler to check fit. Pull to withdraw feeler should be 8-12 lbs. (S-25 & S-26), 5-10 lbs. (S-27).
Replacement Pistons: Furnished Std., .005", .020" (S-26 Adventurer only), plus .040", .060" oversize (Other models) with pins and retainers.
Installing Pistons: Install pistons in right bank (2, 4, 6, 8) with indent on piston head opposite larger chamfer on connecting rod, left bank (1, 3, 5, 7), with indent on same side as larger chamfer. The indent will be to front of engine on all pistons. *See Connecting Rods.*

PISTON PINS

Floating type with lock ring at each end.
Diameter - .922". **Length** - 3.060-3.070".
NOTE - Piston pin offset .060" toward right side of engine.

Clearance in Piston - .0000-.0005" or tight thumb press fit at 70°F.
Clearance in Rod - .0001-.0004" or tight thumb press fit.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Replacement Pins: Furnished Std. .003", .008" oversize. *NOTE* - Fitted pins furnished with new pistons.

PISTON RINGS

Ring	Width	End Gap	Side Clearance
Compr. #1	.0780"	.010-.020"	.0015-.003"
Compr. #2	.0780"	.010-.020"	.001-.0025"
Oil #3	.1860-.1865"	.010-.020" ①	.001-.003"

① - .007-.017" on S-27 with Muskegon Rings.

Replacement Rings: Furnished Standard, .010", .020", .030", .060" oversize.

Installing Rings: Install with mark "Top" on compression ring to top of piston.

CONNECTING RODS

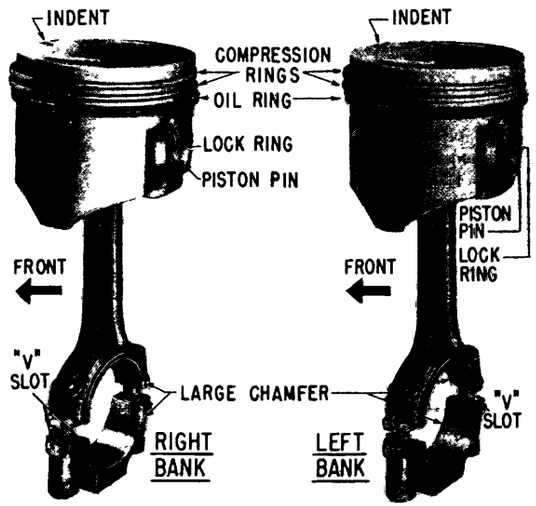
Journal Diameter - 2.249-2.250". Maximum out of round limits .001".

►*JOURNAL DIAMETER CAUTION: (ONE OR MORE Journals Machined UNDERSIZE) - See "CRANKSHAFT" below.*

Length (Center to Center) - 6.621-6.625".

Weight - 22.5 ozs. (S-27), 23.6 ozs. (Others).

Lower Bearings - Removable precision type, bimetallic Copper Lead Grid, Steel backed (S-26 Adventurer), lead based babbit on steel (Others).



Clearance - .0002-.0022" (.0005-.0015" desired).

Side Clearance - .009-.017" (2 rods).

Bearing Adjustment - None, replace bearings.

Replacement Bearings: Furnished Std. .001",.002",.003", .012" undersize.

Installing Rods: Assemble pistons on rods with indentation on piston head opposite to larger chamfer on lower end of rod (Cyl. 2-4-6-8); on same side as larger chamfer (Cyl. 1-3-5-7). Install assemblies in engine with indentation on piston head toward front of engine (all pistons) and larger chamfer side of rod toward nearest crankshaft journal fillet.

DE S TO V8 PIST N & ROD ASSY.

CRANKSHAFT

J urnal Diam t r - 2.4995-2.5005".

►*CRANKSHAFT JOURNAL UNDERSIZE CAUTION: Engines with undersize journals identified as follows:* **.010" UNDERSIZE (Main & Connecting Rod Journals)**—Letter "B" following engine number indicates ALL Main & Connecting Rod Journals .010" Undersize.

.001" UNDERSIZE (ONE OR MORE Main & Connecting Rod Journals)—A "Maltese" Cross (3/8" high) stamped on machined surface following engine number indicates ONE OR MORE crankshaft main and connecting rod journals .001" Undersize. Position of undersize journals stamped on machined surface of No. 3 (center) counterweight as follows: "R" designates connecting rod journal, "M" designates main bearing journal. The number following this letter indicates the particular journal (numbered from front-to-rear of engine).

Bearings - Removable, precision type, Tin Based Babbitt on Steel (S-26 Adventurer), Lead Based Babbitt on Steel (Others).

Clearance - .0002-.0022" (.0005-.0015" desired).

End Thrust - Taken by center (#3) main bearing.

End Play - .002-.007".

Crankshaft Rear Main Bearing Oil Seal: *See "Crankshaft & Main Bearings" in DeSoto Special Data.*

Crankshaft Front Oil Seal: *See "Engine Front Cover" in DeSoto Special Data.*

CAMSHAFT

Journal Diameters - (1) 2.000-2.001", (2) 1.984-1.985", (3) 1.969-1.970", (4) 1.953-1.954", (5) 1.4375-1.4385".

Bearings—Removable, steel-backed, babbitt lined bushings.

Clearance—.001-.003"

End Thrust: Taken by thrust plate behind camshaft sprocket hub.

Endplay—.002-.006".

Timing Chain: Width—1-1/8". **Pitch**—.375". **Length**—68 links.

Camshaft Setting: Timing Check: Marks on gears should be adjacent and in line with straightedge across shaft centers.

Camshaft Removal: *See "Camshaft & Bearings" in DeSoto Special Data.*

Engine Front Cover (Removal & Installation): *See "Engine Front Cover" in DeSoto Special Data.*

Engine Front Cover Oil Seal (Crankshaft Front Seal) *See "Engine Front Cover" in DeSoto Special Data.*

VALVES

Tappet Clearance: None in service (hydraulic).

S-25 & S-26 (Incl. Adventurer)

Valve	Head Diameter	Stem Diameter	Length
Intake	1.94"	.372-.373"	4.90"
Exhaust	1.75"	.371-.372"	4.92"

Valve	Seat Angle	Lift	Stem Clearance
Intake	45°	①	.001-.003"
Exhaust	45°	②	.002-.004"

①—.389" (S-25 & S-26), .431" (S-26 Adventurer).
②—.389" (S-25 & S-26), .413" (S-26 Adventurer).

S-27 (Firesw p)

Valve	Head Diamet r	St m Diamet r	Length
Intake	1.84"	.372-.373"	4.31"
Exhaust	1.47"	.371-.372"	4.31"

Valv	Seat Angl	Lift	Stem Cl arance
Intake	45°	.389"	.001-.003"
Exhaust	45°	.389"	.002-.004"

►*S-27 OVERSIZE VALVE STEM NOTE:* Valves with oversize stems are available in .005", .015", .030" oversize.

Valve Seat Width—1/16-3/32"(Int.), 3/64-1/16" (Exh.).

Intake Valve Stem Oil Seal—Cup seal installed on valve stem after valve installed in head and before installing springs and retainers.

►*VALVE GRINDING CAUTION:* Check valve height in head after grinding valves using Tool C-3061 (S-25 & S-26), C-3436 (S-27). If valve tip exceeds maximum height (end of cylindrical gauge), grind tip down to approach, but do not go below minimum height (slotted area on gauge).

VALVE SPRINGS: Single springs (S-25, S-26, S-27), Double springs on all valves (S-26 Adventurer).

►*SPRING INSTALLATION (ADVENTURER):* Install all springs with closed-coil end toward head.

Spring Specificati ns
S-25 & S-26 (Exc. Adv ntur r)

	Pr ssure	Length
Valve Closed	68-76 lbs.	1-11/16"
Valve Open	160-172 lbs.	1- 5/16"

S-26 (Adventurer)

	Inner Spring		Outer Spring	
	Pressure	Length	Pr ssur	Length
Closed	26-30 lbs.	1-17/32"	58-63 lbs.	1-21/32"
Open	64-69 lbs.	1- 3/32"	156-161 lbs.	1-7/32"

S-27 (Fir swe p)

	Pressure	L ngth
Valve Closed	49-57 lbs.	1-11/16"
Valve Open	134-146 lbs.	1- 5/16"

►*CAUTION:* Spring ends must be square within 1/16"

►*VALVE SPRING HEIGHT CAUTION:* If valves or seats reground, check installed height of spring (from bottom of counterbore to top surface of spring retainer). If height is 1-23/32" or greater (1-41/64" on S-26 Adventurer), install 1/16" spacer in head counterbore to bring spring height back to normal 1-5/8—1-11/16".

►*VALVE SPRING LOAD CAUTION: Hydraulic lift r "Pumpup" will restrict engin speed and caus valv s to burn if spring loads are not maintain d.*

Valve Guides: (S-25, S-26) - Remove old guides by driving them out through the top of head using Tool C-3150. Install new guides by driving them up through valve port opening. To install INTAKE valve guide, place steel scale across combustion chamber and drive guide in until punch mark on Tool C-3150 is flush with face of cylinder head. To install, EXHAUST guide, drive it in until flush with machined surface of hole. Ream guide to .374-.375" with Tool C-741. *NOTE* - If valve guide Tool C-3150 not available drive guides in; measuring from top of valve seat, as follows: **Intak - 1", Exhaust - 1 3/32".**

(S-27) - Valve guides cast integral with cylinder head. Valves with oversize stems available .005", .015", .030" oversize. Use Reamer Tool C-3433 (.379-.380"), C-3430 (.389-.390"), C-3427 (.404-.405") to ream for next larger oversize.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Hydraulic Lifters: Integral, flat valve type.

►*VALVE LIFTER OVERSIZE CAUTION: .008" OVERSIZE Valve Lifters used on some engines.* A "DIAMOND" 3/8" high stamped on engine number pad following engine number indicates that all lifters are .008" oversize.

Lifter Overhauling & Testing: *See "Valve System" in DeSoto Special Data.*

Rocker Arm Assembly: *See "Valve System" in DeSoto Special Data.*

VALVE TIMING

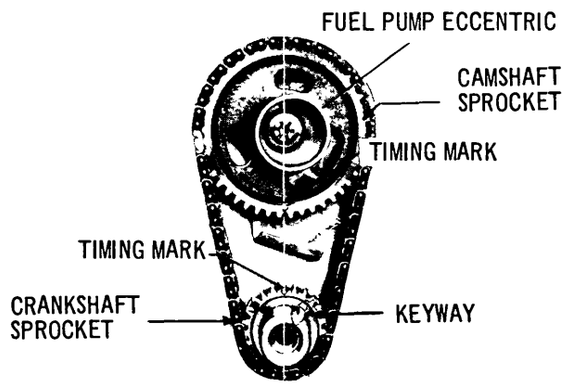
See "Camshaft Setting" under CAMSHAFT above.

Valve Timing

S-25 & S-26 (Exc. Adventurer)

Intake Valves – Open 15° BTDC. Close 57° ALDC.
Exhaust Valves – Open 57° BLDC. Close 15° ATDC.

S-26 (Adventurer)



Intake Valves – Open 35° BTDC. Close 65° ALDC.
Exhaust Valves – Open 65° BLDC. Close 25° ATDC.

S-27 (Firesweep)

Intake Valves – Open 10° BTDC. Close 58° ALDC.
Exhaust Valves – Open 56° BLDC. Close 16° ATDC.

Valve Timing Check – With No. 1 Intake Valve closed, insert .210" spacer between rocker arm and stem of No. 1 intake valve. Mount dial indicator directly over valve with contact button on and at right angles to spring seat. Set dial indicator at Zero after seat stops moving indicating all oil bled out of hydraulic lifter and that valve train solid. Turn crankshaft clockwise (normal direction of rotation) until dial indicator shows valve has lifted .016" (S-25 & S-26 exc. Adventurer), .025" (S-27 Firesweep). Pointer on chain case cover should be between 5° BTDC and 7° ATDC mark on vibration dampener. Turn crankshaft **counter-clockwise** until valve is closed, remove spacer from between rocker arm and valve stem.

►*CAUTION – DO NOT turn crankshaft further in clockwise direction than indicated above (spacer may cause valve spring to bottom and damage valve system).*

DE SOTO V8 VALVE TIMING MARKS

OILING SYSTEM

Crankcase Capacity: 5 quarts (refill). Add 1 quart when filter changed.

Normal Oil Pressure: 50-60 lbs. at 1500 RPM.

Oil Pressure Relief Valve - Mounted in oil pump body. Use correct color spring. *See specifications below.*

Relief Valve Spring Specifications

Color	Free Height	Load Height	Lbs. Pressure
Gray (Lt.)	3½"	2 1/16"	16.1-17.1
Red (Std.)	2 27/32"	2 1/16"	19.5-20.5
Brown (Hvy)	2 31/32"	2 1/16"	22.0-23.9

Oil Pressure Gauge - Auto-Lite 14323A. Not electric.

Oil Pump: Rotor type, mounted on rear bearing cap, with oil strainer parallel with surface of cylinder block.

Overhaul - *See "Oiling System" in DeSoto Special Data.*

Oil Filter: Shunt type, replaceable element.

Filter Element - Install new element and cover gasket every 5,000 miles or earlier as required. Change oil with filter element change.

Crankcase Ventilation: Filter element in oil filler cap (clean with kerosene every 5,000 miles), and breather pipe for crankcase ventilation.

COOLING

Water Capacity - 20 quarts. Add 1 quart for heater.

►*AIR CONDITIONED CAR OPERATING CAUTION: Engine cooling system must be protected to a temperature of 20°F (above zero) for summer operation.*

Pressure Valve: 14 lb. radiator filler cap.

Thermostat: Pellet type. Opens 157-162°.

Water Pump: Centrifugal type. *See Water Pump Section.*

Pump Removal: Drain cooling system, remove radiator inlet hose and upper half of fan shroud. Loosen idler pulley and generator adjusting lock bolts, remove drive belts. Remove fan, spacer, and pulley. Remove pump.

►*WATER LEAK CORRECTION:* Correct water leaks at two upper front cover screws (Power Steering Cars) by replacing present lockwasher with copper washer Part No. 446219. On cars not equipped with Power Steering, coat upper left screw with sealer compound Part No. 1057794 and insert copper washer under upper right screw.

Temperature Gauge: Auto-Lite. Electric type.

Dash Unit - Auto-Lite 14308A.

Engine Unit - Auto-Lite 14405A.

See "Temperature Gauges" in Misc. Section.

CLUTCH

Borg & Beck. 10A8 No. 361417 (Std.), 11A8 No. 361428 (H.D.). Disc No. 382531 (Std.), 381850 (H.D.).

See "Borg & Beck" Clutches in Clutch Section.

Pedal Adjustment: Adjust fork rod to secure 3/16" free movement of clutch fork outer end. This adjustment will provide necessary 1" free play at pedal.

Over-Center Spring Adjustment: (*NOTE* - Over-center spring located above brake pedal and attached to pedal mounting bracket). Release clutch rod at clutch pedal. Back off adjusting nut to release over-center spring. Hold clutch pedal fully released, adjust nut until it just touches "C" link of spring, then turn nut 7 full turns for 10" clutch. Reinstall clutch rod to clutch pedal.

Removal: Remove transmission (See Synchro-mesh Transmission). Remove clutch housing pan. Pull out clutch release bearing and sleeve. Mark clutch cover and flywheel. Remove cap screws, which hold clutch cover to flywheel, loosening each cap screw a few turns (in succession) until cover is free. Remove clutch assembly and clutch disc assembly from clutch housing.

SYNCHRO-MESH TRANSMISSION

Own. *See "DeSoto Synchro-mesh" Transmission in Transmission Section.*

Transmission Controls: *See "Transmission Controls" in Transmission Section.*

Removal: Jack up front end of car, disconnect front universal (loosen companion flange nut if transmission to be disassembled). Disconnect speedometer cable, hand brake cable, gear shift rods. Remove nuts holding transmission to clutch housing. Then remove transmission by pulling it back, down, and out of car.

POWERFLITE TRANSMISSION

Torque converter and hydraulically operated planetary transmission.

See "PowerFlite" Transmission in Transmission Section.

►*PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION: See "PowerFlite" Transmission in Transmission Section.*

►*TESTING & TROUBLE SHOOTING: See "PowerFlite" Transmission in Transmission Section.*

Lubrication: Check fluid level every 1000 miles, drain and refill every 20,000 miles with Automatic Transmission Fluid (Type A).

Checking Fluid Level - *See TORQUEFLITE below.*

Throttle Linkage Adjustment: *See CARBURETOR above.*

►*OTHER "POWERFLITE" SERVICE DATA: See "PowerFlite" Transmission in Transmission Section.*

TORQUEFLITE TRANSMISSION

Torque converter, and **Three Speed** hydraulically operated planetary transmission.

See "TorqueFlite" Transmission in Transmission Section.

►*PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION: See "TorqueFlite" Transmission in Transmission Section.*

►*TESTING & TROUBLE SHOOTING: See "TorqueFlite" Transmission in Transmission Section.*

Throttle Linkage Adjustment: *See CARBURETOR above.*

Lubrication: Check the fluid level every 1000 miles, drain and refill every 20,000 miles. Use Automatic Transmission Fluid, Type A.

►*TRANSMISSION DIPSTICK PRODUCTION CHANGE & FLUID LEVEL CHECKING CAUTION:* At Engine Number S-25-11235, S-26-7821, & S-27-34758, "FULL" mark on dipstick was lowered ½" (Distance from "Full" to "Add" mark is 1-5/8" on first type dipstick, 1-1/8" on later type dipstick). When checking fluid level, maintain level on each type dipstick as listed below.

Checking Fluid Level (Transmission Cold) - Check COLD whenever possible. Idle engine and operate transmission in all ranges (press all buttons in turn), then check level with engine idling and transmission

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

in Neutral. Fluid level should be between "Low" mark and bottom of dipstick (First & Later type dipsticks—See Production Change & Checking Caution above). Add or drain fluid as necessary to maintain this level.

Ch cking Fluid Level (Transmission Hot): If fluid level must be checked after normal highway driving, proceed as for Cold Check (above) but maintain level on each type dipstick as follows (See Dipstick Production Change & Checking Caution above): **First Type Dipstick**—Level should be between "Full" mark and ½" below this point. **Later Type Dipstick**—Level must not be above "Full" mark. Add or drain fluid as necessary to maintain this level.

►*FLUID LEVEL CAUTION:* Overfilling or too high fluid level in transmission may cause foaming under high speed and high operating temperature conditions (if level reaches gear train as fluid expands). This may result in drop in governor pressure and permit transmission to downshift.

Thr ttle Linkage Adjustment: *See CARBURETOR above.*

►*OTHER "TORQUEFLITE" SERVICE DATA: See "TorqueFlite" Transmission in Transmission Section.*

UNIVERSALS

Detroit Universals. Ball & Trunnion type front, Cross type rear.

Rear Universal Operating Angle - *See "Propellor Shaft Notes" in DeSoto Special Data for checking and adjusting.*

REAR AXLE

►*REAR AXLE LUBRICATION LEVEL NOTE:* Recommended lubrication capacity 3½ pints will bring fluid level to ½" below filler opening. DO NOT add to bring level to opening.

Own. Semi-floating Hypoid with Hotchkiss Drive.
S e "DeSoto Hypoid" in Rear Axle Section.

Rear Axle Ratios

Model	Synchro-mesh	Auto. Trans.
S-25	3.91-1 (43-11)	3.36-1 (37-11)
S-26		3.36-1 (37-11)
S-26 Advntr.		① 3.54-1 (39-11)
S-27	3.91-1 (43-11)	3.54-1 (39-11)

① - Optl. ratios available.

Backlash - .006-.008".

Carrier Removal: Drain lubricant. Back off brake adjusting cams (See Brakes) before removing hubs and drums. Remove wheel hub and drum assemblies, using wheel puller C-845. Remove axle shafts (see below). Disconnect rear universal joint and drop propeller shaft. Remove carrier assembly from axle housing.

►*BANJO HOUSING INSTALLATION NOTE:* Check rear universal joint operating angle. *See "Propellor Shaft Notes" in DeSoto Special Data.*

Axle Shaft Removal: Block brake pedal and disconnect brake lines at wheel cylinders. To protect axle bearing outer seal, remove rear axle drive shaft keys and install Tool C-745. Remove axle shaft seals, brake supports and bearing shims. Remove rear axle shaft oil seal from brake support with Tool C-839. *(NOTE* - When removing axle bearing shims from ends of axle housing, keep each set of shims separate to assure proper reassembly). Remove axle drive shaft and bearings with Puller C-499.

Wheel Bearing Adjustment: Shims between backing plate and axle housing. With wheel hub removed, check endplay with dial indicator. To adjust, remove backing plate (see above), add or remove shims (furnished .005", .010", .0125", .015", .030" thick) equally at both wheels. **Endplay** - .003-.008".

SHOCK ABSORBERS

"Oriflow". Direct acting, hydraulic type. Serviced by replacement.

FRONT SUSPENSION

Independent. New "Torsion-Aire" type with ball joints and torsion bar springing.
See "Torsion-Aire Suspension" in Front Suspension & Wheel Alignment Section.
Steering Axis Inclination—5½-7°.
Caster—**(Manual Steering)** Neg. 3/4° ± 3/4°. **(Power Steering)** Pos. 3/4° ± 3/4°. *NOTE*—Caster should be equal as nearly as possible on both sides of car.
Camber—**(Left Wheel)** Pos. 3/8° preferred (0° to Pos. 1/2°). **(Right Wheel)** 0° preferred (0° ± 1/4°).
Toe-In—1/8" preferred (1/8" ± 1/32").
Toe-Out on Turns—With outer wheel at 20°, inner wheel should be 21½° ± 1°.

STEERING

Manual Steering Gear: Gemmer. Worm & three-tooth roller.
See "Gemmer Worm & Roller" in Steering Section.
Power Steering: "Co-Axial". Components encased in tubular housing which is located at bottom of and concentrically around axis of steering column.
See "Co-Axial" Power Steering in Steering Section.
Steering Linkage: *See "Steering Linkage" in Steering Section.*
Steering Wheel & Horn Button Removal: *See "Gemmer Worm & Roller" in Steering Section.*
Steering Gear Removal: *See "Gemmer Worm & Roller" in Steering Section.*

BRAKES

Service: Center Plane (Floating Shoe) hydraulic type.
See "DeSoto Center Plane" Brakes in Brake Section.
Drums - 11" Composite (S-27), 12" Centrifuse (Others).
Wheel Cylinder Diameter - 1 1/8" bore. Single acting (front), double acting (rear wheels).
Replacement Lining & Shoes - Linings or shoes with lining furnished Standard and .030" oversize.
Lining - Molded asbestos (bonded to shoe).
Length - 11.5" (S-27), 12.6" (Other).
Width - 2.5" (All). **Thickness** - .20" (All).
Braking Power - 60% Front, 40% Rear.
Clearance - Front Wheels - Turn each adjusting cam in direction of forward wheel rotation until shoe lining is solid against drum and wheel is locked. Turn adjusting cams slowly in opposite direction until no drag is felt.
R ar Wh ls - Same as front wheels except that on rear wheels forward shoe adjusting cams are rotated in direction of forward wheel rotation and rear shoe adjusting cams are rotated in direction of reverse wheel rotation.
Master Cylinder: On engine side of dash panel opposite base of brake pedal.
Checking Fluid - Filler plug at top of master cylinder (on dash panel in engine compartment).
Removal - Disconnect pushrod. Disconnect brake line tube at master cylinder. Disconnect stop light switch leads, remove four stud nuts from studs, remove master cylinder.
Power Brakes: New "Oval Piston" type (S-25, 26, 27), "Bellows" Assist type (S-26 Adventurer).
See "DeSoto, Dodge, Oval Piston" or "Chrysler, D - Soto, Dodge, Plymouth Bellows" Power Units in Brake Section.
►*POWER BRAKE UNIT HISSING OR POPPING NOISE CORRECTION:* Release pushrod from power lever. Press pedal to floor to extend piston rod and yoke, and apply Silcon type lubricant to shaft. Operate shaft and repeat lubrication several times. *CAUTION* - Do not use Lubriplate or Neatsfoot Oil (not temperature lubricants).
Removal of Power Unit - Place wood wedge between power brake lever and forward edge of triangular hole in pedal bracket, to prevent trigger arm from extending beyond extremities of bracket *(NOTE* - If pedal linkage is allowed to extend through hole in dash panel, trigger arm may be damaged). Disconnect vacuum hose at power unit. Remove complete power unit and bracket assembly by removing four nuts and lockwashers.
Parking Brake: On shaft at rear of transmission. 6" external contracting type used with Synchro-mesh Trans. 7" internal expanding type used with Auto. Trans.
Adjustment - *See "Hand Brake Not s" in D Soto Special Data.*

Lining	Width	Thickness	L ngth
6" Ext. Type	2"	5/32"	15.38"
7" Int. Type	2"	5/32"	13.44"

MISC. MECHANICAL

Windshield Wipers: Auto-Lit EPV-4001A (Std. S-25, S-26. Special Equipment S-27). EPW-5001 (S-27 Std.). Electric type.
See "Auto-Lite" Electric Windshield Wipers in Miscellaneous Section.
Air Conditioning: Heater-Air Conditioner unit.
See "Air Conditioning" in Misc. Section.
Power Window Regulators: Electric type. Reversible type motor in each window. Controlled by door switch and master control switch.
See "Electric Window Regulators" in Misc. Section.
Power Seat Adjusters: Electric 6-Way type. *See "Pow r Seat Adjusters" in Misc. Section.*
Convertible Top Control: Electric-Hydraulic type.
See "Power Top Control" in Misc. S ction.

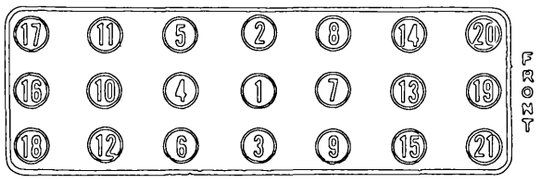
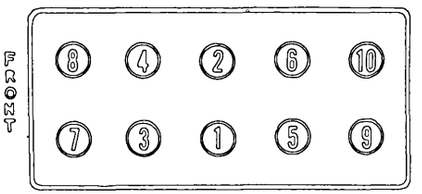
CYLINDER HEAD & MANIFOLD

CYLINDER HEAD INSTALLATION: Use Torque Indicating Wrench to tighten cylinder head bolt nuts and capscrews, tighten in correct sequence as shown in diagram for each car.



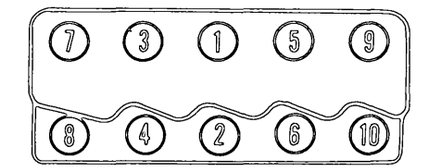
Tightening Torque—See Tightening (Torque Wrench) Specifications above

6 CYL. ENGINES



CYLINDER HEAD INSTALLATION: When installing cylinder head, use new gasket Coat threads of capscrews with sealer except the three screws that lead into intake manifold ports If sealer used on these capscrews, there is a possibility that it will be drawn into carburetor or valves Use torque indicating wrench to tighten cylinder head bolt nuts and capscrews Tighten in sequence shown in diagram

6 CYL. ENGINES



INTAKE & EXHAUST MANIFOLD INSTALLATION: Install the new gasket between intake and exhaust manifold (make sure that heat valve is free and operates freely), and insert the four bolts through exhaust manifold and into intake manifold. Draw bolts down snug but DO NOT TIGHTEN Install thermostatic coil spring and counter-weight. Install manifold-to-engine block gaskets and install

6 CYL. ENGINE CYLINDER HEAD

V8 ENGINES (DOUBLE ROCKER ARM SHAFT)

V8 ENGINES (SINGLE ROCKER ARM SHAFT)

assembled manifolds While holding manifold and gaskets evenly against engine block, install long center bolts and draw down snugly. (If bolts show signs of water leakage, coat threads with suitable sealer) Install remaining washer and nuts *(CAUTION*—Be sure to install the four conical, brass washers and nuts on the extreme ends of exhaust manifold). Tighten manifold nuts and bolts, starting from center and working out towards ends, to 20 ft-lbs. torque Tighten the four bolts holding exhaust manifold to intake manifold.

V8 ENGINES - SINGLE ROCKER SHAFT

CYLINDER HEAD INSTALLATION (Single Rocker Shaft): Before cylinder head removed, remove rocker shaft assembly Slide out push rods and place them in sequence in a suitable rack in order that each push rod can be reinstalled in its original position When installing cylinder head, use new gaskets Make sure all holes are punched out Be certain cylinder head enters both dowel guide pins in cylinder block Tighten cylinder head bolts in sequence shown in diagram Slide push rods in position Lower rocker shaft assembly down on two locating studs Install all washers, nuts and bolts *CAUTION*—Extreme caution must be exercised when tightening rocker shaft bolts and nuts so that hydraulic tappets have time to bleed down to their operating length If tappets are forced down too rapidly, damage to push rods, tappet bodies or rocker arms will result

V8 ENGINES - DOUBLE ROCKER SHAFT

CYLINDER HEAD INSTALLATION (Double Rocker Shaft): Use new gaskets when installing head. Insert cylinder head bolts into rocker arm support brackets. Insert pushrods through holes in head (short rods in upper holes - intake, long rods in lower holes - exhaust). Place rocker arm assemblies in position on heads, then position pushrods. Starting at top center, tighten all cylinder head bolts to correct torque (see Tightening Specifications above). Install exhaust manifolds, crankcase breather tube, and intake manifold. *NOTE* - When installing intake manifold, insert short bolts in holes on extreme ends of manifold.

CRANKSHAFT & MAIN BEARINGS

6 CYL. ENGINES

REAR MAIN BEARING SEAL: Neoprene type seal When replacing seal, both upper and lower halves should be replaced Remove oil pan, clutch housing pan, and rear main bearing cap Remove seal from cap, and then remove upper seal by pushing one corner of seal until opposite end protrudes about ⅜" from block. Pull out with long-nosed pliers Install new seal in lower half by carefully inserting lower half of seal into bearing cap Before installing upper seal, coat seal contacting lip with grease Insert one end of seal into block and push it into place with a rolling motion Install main bearing cap, making certain that tabs of cap gasket fit in cap seal channel

V8 ENGINES

REAR MAIN BEARING SEAL: Rope type seal of braided asbestos With bearing cap, bearing and seal removed, install a new seal in position in cap so that both ends of seal protrude above cap Tap seal down in position with Tool C-3511 until tool is seated in bore Hold tool down and cut off protruding ends flush with cap Install bearing insert and both cap seals The long cap seal should be installed so that when cap is in position, seal is on the oil filter side of engine

ENGINE FRONT COVER

6 CYL. ENGINES

FRONT COVER INSTALLATION: Use new gasket and position cover in place. Install screws but do not tighten. Install Tool C-522 over crankshaft with tapered end against seal housing. Install and tighten crankshaft nut. Tighten cover bolts, while tightening crankshaft nut (to hold tension on seal), to proper specifications.

FRONT OIL SEAL: To replace, drive old seal out with suitable drift When installing seal, make sure seal is driven into place evenly to insure a tight fit Use a new gasket and position cover in place

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

V8 ENGINES

ENGINE FRONT COVER: Removal - Drain cooling system, remove water hoses, fan belt, generator, radiator, crankshaft pulley and key. Remove fan blades and hub, water pump and housing. Remove oil pan, fuel pump, chain case cover bolts and remove cover from dowels.

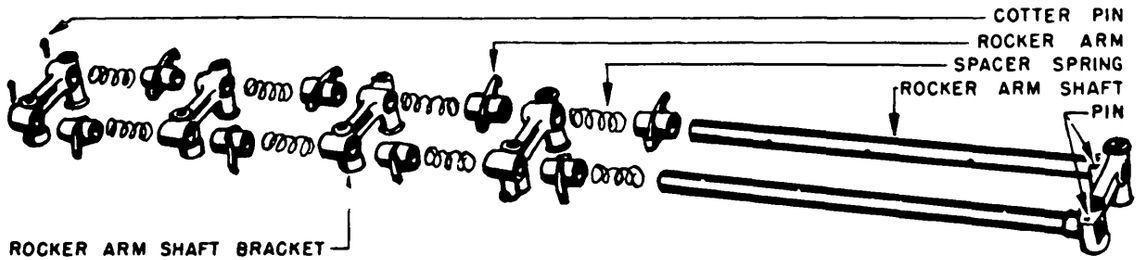
Installation - Clean contact surfaces, use new gasket. Crankshaft oil slinger must have flange end toward seal. Position cover on dowels, coat bolts with sealer and tighten to specifications. Reverse removal procedure, and tighten crankshaft pulley bolt and oil pan bolts to specifications. Adjust fan belt, run engine and check for leaks.

FRONT OIL SEAL: Use Tool C-3056 with puller blocks to distort seal retainer lip, and to pull seal out of cover. To install new seal, insert puller screw through installing plate with thin shoulder up. Place seal in cover opening with neoprene facing down, slide seal installing plate into seal with protective recess toward seal retainer. Tighten screw nut while holding screw to force seal tight against stamping. *NOTE* - Seal is properly installed when a .0015" feeler will not enter between seal and cover.

CAMSHAFT & BEARINGS

6 CYL. ENGINES

CAMSHAFT REMOVAL: Remove radiator grille and core. Remove cylinder head, fuel pump, oil pump, valve lifter cover plates, crankshaft pulley. Jack up engine and remove front engine support. Remove front cover, camshaft sprocket and timing chain. If valves and springs are not to be removed, prop valves up by inserting wedges under opposite sides of valve head. Raise tappets and hold out of camshaft lobe contact, while withdrawing camshaft (rotate camshaft to clear any obstructions).



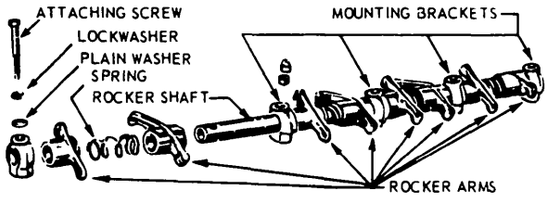
V8 ENGINES

CAMSHAFT REMOVAL: Remove lifter chamber cover, see "Lifter Removal". Remove rocker arms and pushrods, see "Rocker Arms". Remove lifters, ignition distributor, engine oil pan, see "Oil Pan Removal". Remove engine front cover, see "Engine Front Cover". Remove camshaft gear bolt, washer and fuel pump eccentric. Slide crankshaft and camshaft gears with timing chain off shafts. Remove camshaft thrust plate bolts, distributor drive gear and stub shaft (Tool C-484). Remove camshaft.

VALVE SYSTEM

ALL ENGINES

EXHAUST VALVE SEAT INSERT REPLACEMENT: Furnished Std. and .010" oversize. Use Tool C-732 (6 Cyl.), C-3140 (V8) to remove inserts. After inserts have been removed from engine, smooth any roughness of seat with a blunt drift. Valve seat insert should be .002-.004" larger than counterbore to insure correct fit. If inserts are found to be loose, enlarge counterbore with Tool MH-N-1 and install oversize insert. Place inserts in dry ice for approximately 10 minutes. Clean counterbore thoroughly and install a chilled insert with valve seat up, and drive it into place with installing Tool C-768.



V8 ROCKER ARM ASSEMBLY (DOUBLE ROCKER ARM SHAFT)

V8 ENGINES - SINGLE ROCKER SHAFT

ROCKER ARMS: Mounted on shaft supported by brackets secured to cylinder head independent of cylinder head bolts.

Installation - Assemble in sequence shown in illustration, with oil grooves facing down.

V8 ROCKER ARM ASSEMBLY (SINGLE ROCKER ARM SHAFT)

V8 ENGINES - DOUBLE ROCKER SHAFT

ROCKER ARMS: Removal - Remove cover, install cotter pins in holes of first & last rocker arm bracket (if not already there), to hold assembly intact when removed. Loosen all cylinder head bolts, lift off rocker arm assemblies. *CAUTION* - DO NOT lift cylinder head off dowel pins when removing rocker arm assemblies from cylinder head.

Installation - Assemble in sequence shown in illustration, tighten cylinder head bolts to specifications.

HYDRAULIC VALVE LIFTER

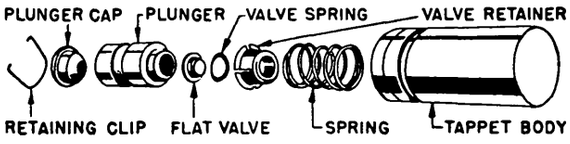
V8 ENGINES

HYDRAULIC VALVE LIFTERS (One-Piece Integral Type) Barrel type. Unit consists of plunger and valve assembly operating within a cylinder formed by valve lifter body. Oil is introduced to this unit through hole in side of lifter plunger.

Removal (Single Rocker Arm Shaft Engin): Remove intake manifold, lifter chamber cover, rocker arm assembly, (see Rocker Arms). Remove pushrods. Remove lifters by hooking Tool C-3158 into hole in lifter body and pulling lifter straight out. *NOTE* - If lifter sticks in bore, use tool as a puller (insert through pushrod hole) and pull lifter out with a twisting motion.

Removal (Double Rocker Arm Shaft Engin): Drain cooling system to below intake manifold level. Remove carburetor air cleaner, disconnect fuel and vacuum lines, accelerator linkage at carburetor, coil wires, heat indicator wire at intake manifold, and heater hose. Remove intake manifold, carburetor, and coil as an assembly (*NOTE* - Cover intake ports with masking tape). Remove crankcase ventilator pipe, lift off cover. Remove rocker arm cover. Turn crankshaft so that lifter is on low side of cam lobe (see Note below), use Tool C-3024 over rocker arm to compress valve spring sufficiently to slide rocker arm sideways off pushrod, remove pushrods. Remove lifters by hooking Tool C-3158 into hole in lifter body and pulling lifter straight out. *NOTE* - If lifter sticks in bore, use tool as a puller (insert through pushrod hole) and pull lifter out with a twisting motion.

Low Side of Cam Lobe Not - To place lifter on low side of cam lobe for pushrod and lifter removal, turn crankshaft to correct position as follows:



1) - With vibration dampener mark "TDC" at indicator and distributor rotor at **No. 1 cyl.** position, remove #2, 7, 8 Intake Lifters, and #2, 4, 8 Exhaust Lifters.

2) - Turn crankshaft ¼ turn clockwise from above position, remove #1 Intake and #1 Exhaust Lifters.

3) - With vibration dampener mark "TDC" at indicator and distributor rotor at **No. 6 Cyl.** position, remove #3; 4, 5 Intake Lifters, and #3, 5, 7 Exhaust Lifters.

4) - Turn crankshaft ¼ turn clockwise from above position, remove #6 Intake and #6 Exhaust Lifters.

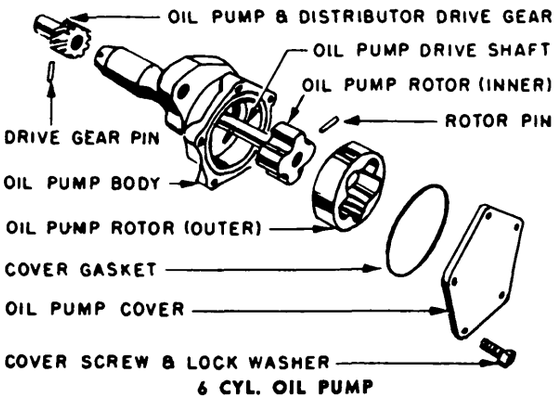
CONTINUED ON NEXT PAGE

D D E V8 HYDRAULIC VALVE LIFTER

CONTINUED FROM PRECEDING PAGE

Disassembly: ***(CAUTION—Disassemble one lifter at a time to avoid the possibility of mixing lifter parts. It is very important that lifter parts not be interchanged.)*** Depress lifter plunger with a push rod and remove plunger retainer spring clip, plunger cap, plunger ball check (or flat type valve), valve springs, valve retainer, and plunger spring from lifter body. Inspect plunger, lifter body, valves and valve seats for signs of scoring, wear or pitting. Check to see that valve exerts a slight pressure on valve spring to insure valve seating Clean lifter assembly in clean solvent and remove all traces of varnish and carbon. Blow parts dry with air. DO NOT USE A CLOTH AS LINT WILL CAUSE LIFTER TO OPERATE UNSATISFACTORILY.

Testing: Remove plunger cap and immerse lifter assembly in an upright position in a container of kerosene ***(CAUTION***—Container and kerosene must be absolutely clean). Allow lifter to fill with kerosene, then remove and replace the plunger cap. Holding lifter in an upright position and using tool C-3160, compress plunger slightly a few times to fill lifter body. Then compress lifter firmly with testing pliers, and if plunger collapses instantly as pressure is applied, disassemble, inspect and clean again. If second cleaning fails to prevent lifter from collapsing instantly when compressing, replace lifter. When cleaning and testing has been completed, remove kerosene and prime lifter lightly with clean engine oil before installing This will prevent possible scoring of lifter plunger when engine is first started



Reassembly: Reverse disassembly procedure as noted above.

OILING SYSTEM

OIL PUMP

6 CYL. ENGINES

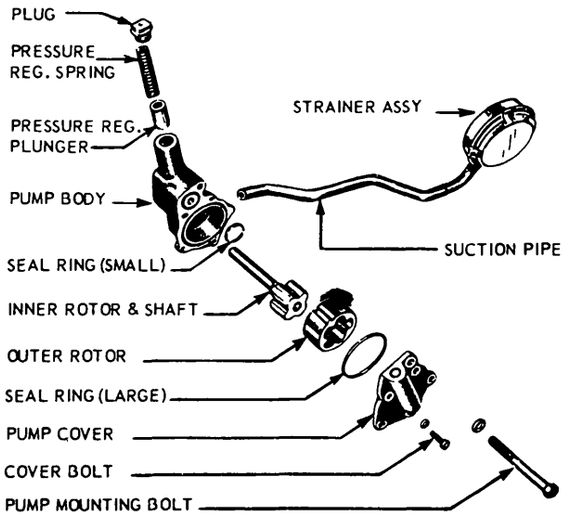
ROTOR TYPE OIL PUMP: Removal - Rotate crankshaft to bring distributor to firing position on #1 cylinder (TDC on vibration dampener or pulley hub). DO NOT rotate engine with oil pump removed. Remove two front motor support "U" bolts, loosen two rear support bolts, remove oil pump mounting bolts, pry engine over sufficient amount to remove oil pump.

6 CYL. OIL PUMP

Disassembly & Inspection: Remove the oil pump cover and gasket Hold hand over cover opening and with pump upside down, turn drive shaft until outer rotor slips out Drive out the straight pin holding pump drive gear to shaft Press the shaft out of drive gear and slide shaft and inner rotor assembly out of pump body Wash all parts and dry with air Inspect all parts and replace as necessary, then measure clearance between opposite lobe of inner rotor and outer rotor Clearance should be .010" or less If clearance is greater, replace both rotors Measure thickness and diameter of outer rotor If thickness is .748" or more and diameter is 2.245" or more, rotor is satisfactory Thickness of inner rotor should be .748" or more If either rotor is less than these dimensions, replace BOTH rotors Insert both rotors into pump body and place a straight edge across pump body between bolt holes Clearance between straight-edge and rotor should be .004" maximum If greater, replace pump body Press outer rotor to one side against pump body and measure clearance between rotor and body on opposite side Maximum clearance should be .008' If greater, replace pump body Cover should be smooth and flat If it is scratched or grooved, replace cover Check flatness by placing a straight-edge across inner surface of cover If it is possible to insert a .001" feeler between cover and straight-edge, replace cover

Reassembly: Slide the drive shaft and rotor assembly into pump body Press drive gear on shaft until end play of shaft is from .003" to .010" Press rotor down in body with hand and measure clearance with feeler gauge Install pin and peen over both ends If pin holes do not line up, drill a new pin hole through gear and shaft, using a 5/32" drill Slide outer rotor into place in pump body Install new cover gasket and install cover and tighten screws evenly.

V8 ENGINES



ROTOR TYPE OIL PUMP: Removal - Drain engine oil, remove oil pan. Remove oil pump mounting bolts and lower pump straight down.

Disassembly & Inspection: Remove oil suction pipe and strainer (turn counterclockwise). Remove pump cover, discard oil seal rings. Remove Inner Rotor and Shaft, Outer Rotor, Relief Valve Plug, Spring, and Plunger. Wash all parts in solvent and inspect for damage or wear.

Outer Rotor—Measure diameter and thickness of rotor with micro-calipers If diameter less than 2.244" or thickness less than .998", replace both inner and outer rotors

Inner Rotor—Measure thickness of inner rotor with micro-calipers If thickness measures less than .998", replace both inner and outer rotors

Rotor Depth—Slide rotors in pump body. Place a straightedge across pump body Use a feeler gauge and measure clearance between top of rotors and straightedge If clearance in excess of .004", replace pump body

V8 OIL PUMP

Cover to Rotor Wear - Place straightedge across cover. If clearance is .0015", replace cover.

Outer Rotor to Body Clearance - Place outer rotor body in pump cavity and hold to one side. If clearance at opposite side is .012", install new pump body.

Inner Rotor to Oute Rotor Clearance - With both inner and outer rotor in pump body, hold inner rotor bottomed against one side of outer rotor and measure clearance between lobes of inner and outer rotor. Replace both inner rotor and outer rotor if clearance exceeds .010"

Reassembly: Use new oil seal ring between cover and body Tighten cover bolts to 10-15 ft lbs Prime pump and then install new oil seal ring in pump mounting face

Distributor-Oil Pump Drive Shaft Bushing: *See "Ignition Notes" below.*

COOLING SYSTEM

6 CYL. ENGINES

WATER DISTRIBUTION TUBE: Replace whenever engine completely overhauled If tube becomes rusted or corroded, overheating of engine may occur due to failure of water to circulate properly through cylinder block To replace tube, remove radiator core and water pump Pull tube out of block with stiff hooked rod. Install tube with slots up and be sure tube is inserted far enough into block so that water pump will seat properly against block

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

IGNITION NOTES
V8 ENGINES

DISTRIBUTOR-OIL PUMP DRIVE SHAFT BUSHING: Removal—Insert Tool C-3052 and thread it into bushing Holding puller head with wrench, tighten puller bolt and pull bushing out of bore in block

Installation. Slide new bushing over burnishing end of Tool C-3053 Insert tool and bushing into bore of block Drive bushing and tool down into position, using a soft hammer As the burnisher is pulled through the bushing by pressure applied to puller nut, tool will wedge bushing tight in its bore and will burnish bore to correct size ***DO NOT REAM THE BUSHING***

DISTRIBUTOR BASIC TIMING: Before installing distributor-oil pump drive shaft it will be necessary to time engine as follows Rotate crankshaft until No 1 cylinder is at TDC (or firing position) When cylinder is in this position, the pointer on chain case cover should be over "DC" on vibration dampener Using Tool C-3027, position oil pump shaft so that it lines up with slot in drive gear Coat shaft of drive gear with engine oil Install it so that, after the gear spirals into place, it will index with oil pump shaft (slot in top of drive gear will be parallel with centerline of crankcase)

PROPELLER SHAFT NOTES

REAR UNIVERSAL JOINT OPERATING ANGLE: Rear universal joint operating angle must be within range of 1-3° (2° preferred). Check and adjust this angle as follows

► *CHECKING CAUTION* Car weight must be on wheels (use drive-on type hoist or platform) and there must be no extra weight in trunk.

Checking Rear Universal Joint Angle: Measure angle of pinion shaft companion flange by placing spirit level vertically on back face of flange. Measure angle of propeller shaft by placing spirit level parallel to shaft on top or underside of shaft. **Add** these two readings. This is the universal joint angle and should be 2° (limits 1-3°)

Adjusting Rear Universal Joint Angle: If angle exceeds 3°, install wedge shim between the rear spring and spring seat on axle housing. Make sure that shim surface is not burred, install shim with flat side toward spring and thick end toward front of car. Recheck universal joint angle.

BRAKE NOTES

HAND BRAKE ADJUSTMENT (Internal Type): Shoe Adjustment - Remove adjusting screw cover, turn adjusting nut until slight drag is felt on drum, then back off screw at least 1 full turn (using Spanner Wrench C-3014) or more until drum is free. *NOTE* - Raised shoulders on adjusting nut must be seated in grooves in adjusting sleeve. Hand brake lever (properly adjusted) will have 1½-2 inches of hand brake lever travel.

Cable Adjustment (After Sho Adjustm nt) - Fully release handle, brake should not drag or chatter. There should be free play (with shoes adjusted properly) in brake lever. Position brake cable guide so brake lever is **centered** in its free play arc. Tighten cable guide clamp securely to lock adjustment, then tighten hand brake cable locknut against adjusting nut (while holding cable adjusting nut in position so cable length adjustment is not disturbed)

HAND BRAKE ADJUSTMENT: (External Type): Band Adjustment - Fully release brake lever. *NOTE* - Clearance between anchor bracket on center of band and sides of brake support, must not exceed 005". Compress in vise or tap with hammer to reduce excessive clearance. Remove lockwire, adjust anchor screw to obtain 015- 020" (feeler gauge) clearance between band and drum at anchor. Replace lockwire. Adjust guide bolt (for lower half of band), and adjusting bolt nut (for upper half of band) to obtain uniform clearance with slight drag on drum. *CAUTION* - DO NOT draw lockwire (on anchor bolt) up tight as uneven lining wear will develop and a poor brake.

Cable Adjustment (For stretch) - Loosen locknut, remove clevis pin from yoke, turn yoke to remove slack, tighten locknut.

MODEL IDENTIFICATION

Model	Model Identification
Coronet	D-72-1
Custom Coronet	D-72-2

SERIAL NUMBER: Stamped on plate attached to left front hinge pillar post.
Starting Serial Numbers (Detroit) - 32,255,001.

ENGINE NUMBER: Stamped on boss on left front section of cylinder block.

► *ENGINE NUMBER LETTERS (Following Engine Number): Identified as follows:*
"A" - ALL cylinder bores .020" oversize.
"B" - ALL Main & Connecting Rod Bearings .010" undersize.
"AB" - BOTH above conditions exist.

TUNE-UP

COMPRESSION PRESSURE: 120-150 lbs. at cranking speed (150 RPM min.). Maximum variation between cylinders 15 lbs.

VACUUM READING: Steady 18-20" at idling speed.

VALVE TAPPET CLEARANCE: .010" Intake and Exhaust (Hot and idling). *NOTE* - Tappet screws are self-locking.

► *CONTINUOUS HIGH SPEED TAPPET CLEARANCE:* An additional .002" clearance for **exhaust** tappets is desirable.

MANIFOLD HEAT CONTROL: Thermostatic coil spring type with counterweight. Valve should operate freely. When installing coil, place coil spring in position over shaft slot, with outer end (tongue) of spring in the upper left hand position (10 o'clock). Press inner end of coil into slot and seat firmly. Move outer end of spring down (counter-clockwise), around and up over stop stud.

IGNITION

FIRING ORDER: 1-5-3-6-2-4.

SPARK PLUG GAP: .035".
Plugs - Auto-Lite Resistor Type AR51. 14 mm. Torque to 30-32 ft. lbs.

COIL: Auto-Lite CAG-4001A.
Ignition Current - 1.8 amps. idling, 2.4 amps. stopped.
Resistor - None used.

DISTRIBUTOR: Auto-Lite IBR-4001.
Condenser - Auto-Lite IAT-2015RA. **Capacity** .250-.285 mfd.
Contact Point Set - Auto-Lite IGW-3028BS.
Breaker Gap - .020". Limits .018-.022".
Cam Angle - 36-42°. DO NOT exceed breaker gap limits to obtain dwell.
Breaker Arm Spring Tension - 17-20 ozs.
Rotation - Clockwise viewed from above.

Automatic Advance

Degrees Distr.	RPM	Degrees Eng.	RPM
Start	350	0	700
1	460	2	920
6.5	1050	13	2100
7.5	1425	15	2850
8.5	1800	17	3600

Vacuum Spark Control: Integral type.

Vacuum Advance

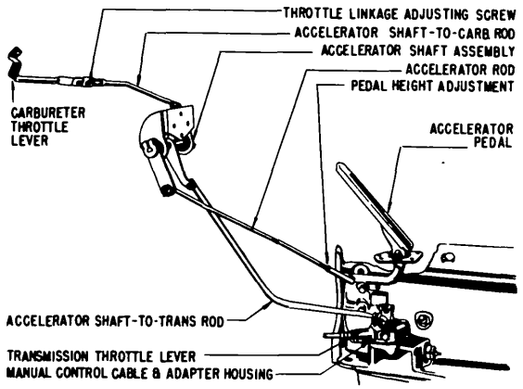
Distr. Degrees	Eng. Degrees	Vacuum (" of Hg)
Start	0	6
1	2	6 7/8
5	10	10½
8	16	13¾
9.5	19	16

IGNITION TIMING

Setting - 2° BTDC.
Timing Mark - 2° BTDC mark on vibration damper under pointer on front cover.

CARBURETOR

Stromberg WW, Code 3-159 (Synchro-mesh), 3-160 (Auto. Trans.). Dual downdraft type.



► *CARBURETOR AIR CLEANER (DRY TYPE) NOTE: Special cleaning procedure required. See AIR CLEANER below.*

► *MANIFOLD FUEL DISTRIBUTION: Each barrel feeds all cylinders.*

Idle Setting - 1 turn open. Adjust both screws alike. Turn screws out for richer mixture.
Idle Speed - 450-500 RPM with transmission in neutral.
Float Level - 3/16" from top of main body (gasket removed) to top of float, with gauge (Tool T-25569) at center of float and float lip held firmly against fuel inlet needle. To adjust, bend float lip (Tool T-24733).
Accelerating Pump - Normal setting, center hole; for less fuel install rod in inner hole; for more fuel install rod in outer hole.
Fast Idle Speed: With choke cover removed, place one cover screw through Spring Tool T-25906 and attach Tool to housing above choke lever. Hook other end of spring to long tang of Thermostat lever. Remove spring from throttle stopscrew and replace screw only. Close throttle valves, turn stopscrew in until it contacts lever, then continue to turn screw in 5 1/8 turns. Hold choke valve closed and bend cam contact ear so that No. 48 drill rod will just go between ear end of contact lever and first step of fast idle cam. *NOTE* - Ear must be parallel to throttle shaft after bending. Replace throttle stopscrew spring.
Fast Idle Cam Setting: Open throttle valve to clear fast idle cam, close choke valve lightly. Force throttle closed against tension of cam positioning spring. Ear on cam contact lever should just clear high step of fast idle cam (Max. .020"). Bend fast idle rod as necessary.
Choke Positioning Spring Setting: With spring tool T-25906 in position, attach weight tool T-25864 on choke lever between rod and end of shaft, hold carburetor vertical, close throttle, making sure cam contact lever ear rests on high step of fast idle cam (If necessary rotate fast idle cam to get this position). Apply light closing pressure on throttle valve which should open choke valve against choke positioning spring tension just enough to insert correct size drill rod between choke valve and wall of air horn. Adjust by bending ear of choke lever as required.
Automatic Choke Setting: Centered (At Index).
Dashpot Adjustment: Push plunger in to end of its stroke. With throttle stopscrew set at normal idle speed, there should be 1/16-3/32" clearance between end of dashpot plunger and ear of throttle lever. Adjust by loosening locknut and turning dashpot in bracket.

Throttle Linkage Adjustment (PowerFlite Cars): Adjust engine idle to 475-500 RPM with transmission in neutral. Loosen throttle linkage adjusting screw (located on throttle control rod from bellcrank to carburetor). While holding throttle control rod against closed throttle stop, move bellcrank arm just enough to start extending accelerator return spring. **(Do not extend spring more than 1/8" in opposite direction).** With control rods in line and preloaded lightly, lock throttle control rod adjusting screw by applying from 10-15 lbs. torque.

► *OTHER DATA: See "Stromberg WW Carburetors" in Carburetion Section.*

POWERFLITE TRANSMISSION LINKAGE

FUEL PUMP PRESSURE: 4-6 lbs.

CARB. EQUIPMENT

Fuel Pump: Carter M2494S. Mechanical type.
Pressure - 4-6 lbs.
See "Fuel Pumps" in Carburetion Section.
Gasoline Gauge: Auto-Lite. Electric type.
Dash Unit - Auto-Lite 14375A.
Tank Unit - Auto-Lite 14380A (Suburban), 14382A (Others).
See "Fuel Gauges" in Carburetion Section.
Air Cleaner: DRY FILTER ELEMENT type. Clean every 5,000 miles, replace element every 15,000 miles.
► *CLEANING CAUTION:* Clean filter element by tapping and shaking to remove dirt particles. *DO NOT* wash *element in solvent or other liquids and DO NOT oil or lubricate.*

BATTERY

Auto-Lite 11-HS-50 or Willard HO-11-50. 12 volt, 9 plate, 50 ampere hour capacity (20 hr. rate).
Battery Ground - Negative.
Engine Ground. Left front of engine.

STARTER

Auto-Lite MDM-6001 (Std.), MDL-6004 (Auto. Trans.).
Armature - Auto-Lite MDL.2088 (All).
Drive - Bendix "Folo-Thru" No. A3596.
Rotation - Counter-clockwise at commutator end.
Brush Spring Tension - 31-47 ozs.

40.0	15.0	1600

Performance Data GHM (Cold - 70°F) -

Amperes	Volts	RPM
5.0	14.0	875
25.0 .	15.0	1350
30.0	15.0	1500

R tation - Counter-clockwise at commutator end.

Brush Spring Tension - 18-36 ozs. (GJC-7000); 34-41 ozs. (GGA); 35-53 ozs. (GHM).

Field Current - 1.2-1.3 Amps. (GJC), 1.1-1.3 Amps. (GGA & GHM), at 10.0 volts (70°F).

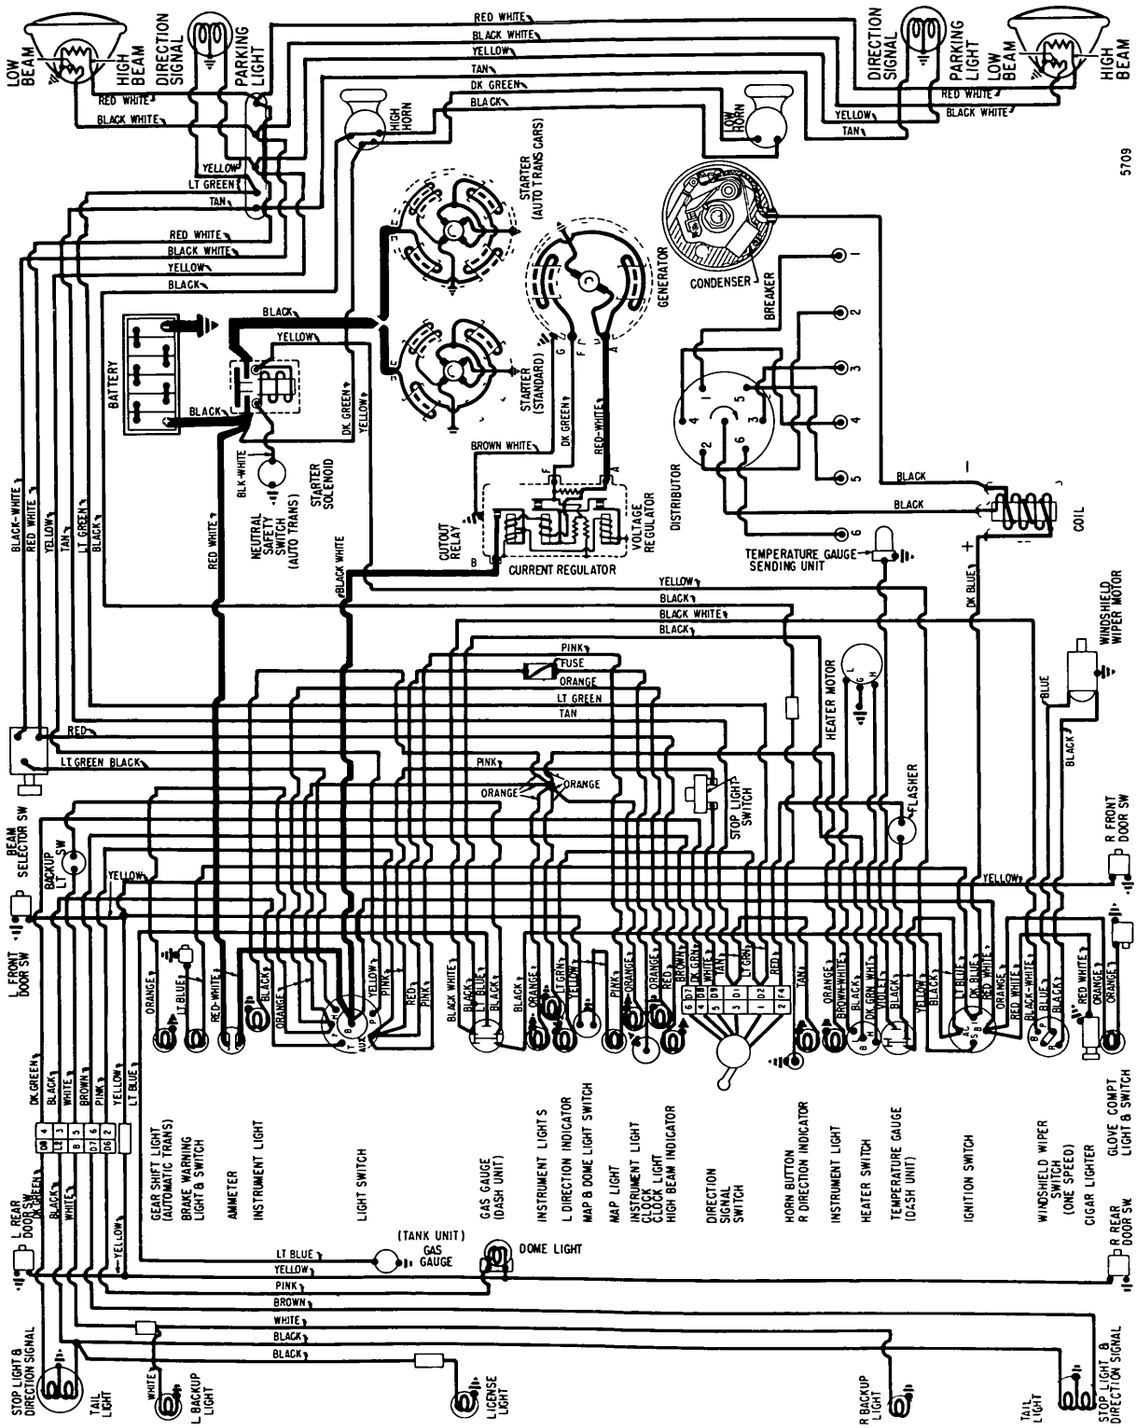
M toring Current - 3.4-3.9 Amps. (GJC), 2.3-2.6 Amps. (GGA), 3.0-3.5 Amps. (GHM) at 10 volts (70°F).

Belt Adjustment: ¼" deflection with 10 lbs. pull applied midway of longest belt span.

REGULATOR

Auto-Lite VRX-6201A (GJC & GHM Gen.), VAT-6201A (GGA Gen.).

Cutout Relay



Cuts In - 12.6-13.6 volts (VRX); 13.0-13.75 volts (VAT).

Cuts Out - 8.2-9.3 volts after charge at 10 amps. (VAT). from sealed position.

Contact Gap - .015" minimum.

Air Gap - .031-.034".

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

V ltag R gulator

Setting - 14.5 volts charging at 10.0 amperes (80°F) or with .25 Ohm resistor in series between regulator and battery.

Air Gap - .048-.052" (check at brass armature stop pin).

Ch cking & Adjusting - *See "Auto-Lite 12 Volt Regulators" in El ctrical S ction.*

Curr nt Regulator

►*SETTING CAUTION: "Temperature Compensated" typ . Set to following sp cifications at 70°F.*

R gulat r	Test A - Operating Amperes -	Test B
VRX-6201A	36	30 (28-32)
VAT-6201A	46	40 (38-42)

T st A - After 15 minutes operation charging at 10 amps.

T st B - After additional 15 minutes operation with current regulator operating (load applied to hold voltage down to 13.6-13.8 volts (VRX), 13.7-13.9 volts (VAT).

Air Gap - .048-.052" (check at brass armature stop pin).

Ch cking & Adjusting - *See "Auto-Lite 12 Volt Regulators" in Electrical S ction.*

MISC. ELECTRICAL

H adlamps: Sealed Beam. *See Electrical Section.*

Directi n Signals: *See Electrical Section.*

Lighting & Pan l Switch Removal: Switches held in instrument panel by a common threaded sleeve and hex nut. Panel lamp knob indexes on its switch shaft by means of lugs in knob and slots in shaft. Headlamp knob is held on its shaft by means of a recessed hex screw.

St p Light Switch Locati n: On forward end of master cylinder.

LIGHTING CIRCUIT BREAKERS: Used as follows:

20 Amp r . Protects Headlights, Parking lights, and Ignition light.

15 Amp re. Protects Tail, Stop, License plate, Instrument, Map, Dome, Clock, Glove Compartment and Courtesy lights.

5 Amp r . Protects Windshield Wiper (Std.).

6 Amper . Protects Windshield Wiper (Variable Speed).

ENGINE

►*AIR CONDITIONED CAR SERVICE CAUTION: Use extrem care when disconnecting any part of air conditioning equipment or lines for access to engine, see "Air Conditioning Service Cautions". in Misc. Section.*

ENGINE SPECIFI CATIONS: Six Cylinder "L" head.

Bor	Str ke	Displacement
3.25"	4.63"	230.2 Cu. ins.

C mpr. Rati	Rat d HP	Developed HP
8.0-1	25.35	138 at 4000 RPM

C mpr ssi n & Vacuum R ading - *See TUNE-UP.*

ENGINE REMOVAL: *See "Engine" in Dodge Special Data.*

►*MANIFOLD INSTALLATION CAUTION:* Two long capscrews extend into cylinder block water passage. Before installing, apply sealer to these capscrews. It is important that conical washers at flange ends of exhaust manifold be installed to permit expansion and contraction without loosening.

OIL PAN REMOVAL: Drain engine oil. As soon as oil is drained, install drain plug and tighten securely. Remove clutch housing pan to prevent damaging oil pan gaskets on clutch housing pan dust seal. Remove oil level indicator and drop pan on tie rod. Lift up oil strainer so it clears baffle inside pan. With strainer lifted, slide pan to rear and remove. NOTE—New end gaskets should protrude 1/4" to 1/8" above oil pan. *Ends must not be cut off.*

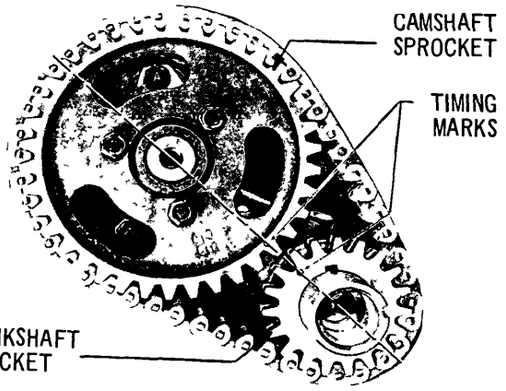
CYLINDER HEAD: *See "Cylinder Head & Manifold" in Dodge Special Data.*

TIGHTENING TORQUES: *See "Tightening Specifications" in Dodge Special Data.*

PISTONS

Aluminum alloy, U-slot, cam ground type.

►*CYLINDER BORE OVERSIZE CAUTION: Engines with letter "A" following engine number indicates that cylinder bore .020" oversize.*



Weight—16 ozs. (stripped).

Removal—Pistons and rods removed from above.

Fitting New Pistons: .0008" clearance, ¼-¾" from bottom of skirt. Pull to withdraw ribbon feeler ½" wide, .002" thick, placed at right angles to piston pin (piston inverted) should be from 6-10 lbs.

Replacement Pistons: Std., .005", .020", .030", .040", .060" oversize.

Installing Pistons: "U" slot away from valves.

DODGE 6 CYL. VALVE TIMING MARKS

PISTON PINS

Full floating type.

Diameter—55/64". **Length**—2-3/4".

Pin Fit in Piston—.0000-.0005". DOUBLE THUMB push fit at room temperature (70° F.)

Pin Fit in Rod Bushing—.0001-.0002". Tight thumb push fit at room temperature (70° F.)

Replacement Pins: Std., .003", .008" oversize.

NOTE—Fitted pins furnished with new pistons.

PISTON RINGS

Ring	Width	End Gap	Sid Cl aranc
Compr. (#1)	3/32"	.010-.020"	.0025-.004"
Compr. (#2)	3/32"	.010-.020"	.002-.0035"
Oil (#3)	5/32"	.010-.020"	.001-.0025"
Oil (#4)	5/32"	.010-.020"	.001-.003"

R plac m nt Rings: Std., .010", .020", .030", .040", .050", .060" oversize.

Installing Rings: #1 Compression, with step on inner edge up. #2 Compression with step on inner edge up (step down, if step on outer edge).

CONNECTING RODS

Length (Center to Center)—7-13/16". **Weight**—27.9 ozs.

Crankpin Journal Diameter—2.0625".

Maximum out-of-round and taper limits—.001"

Lower Bearings—Removable, precision type, thin babbitt on steel. No shims.

►*JOURNAL DIAMETER CAUTION: (ONE OR MORE Journals Machined UNDERSIZE)—See "CRANKSHAFT" below.*

Clearance—.0005-.0015".

Endplay—.006-.011".

Bearing Adjustment: None. Replace bearings.

Replacement Bearings: Std. and .001", .002", .003", .010", .012", .020", .030", .040" undersize.

Installing Rods: Oil metering hole toward valve side of engine.

CRANKSHAFT

Journal Diameter—2.4995-2.5005". Four bearing.

Bearing Type—Removable, precision type, thin babbitt on steel. No shims.

►*CRANKSHAFT JOURNAL UNDERSIZE CAUTION:* Engines with undersize journals identified as follows: **.010" UNDERSIZE (All Main & Connecting Rod J urnals)**—Letter "B" stamped with engine serial number indicates that ALL Main & Connecting Rod Journals are .010" undersize.

Clearance—.0005-.0015" desired.

Replacement Bearings: Std. and .001", .002", .003", .010", .012", .030", .040" undersize.

End Thrust: Taken by flanged faces on rear (#4) main bearing. **Endplay**—.003-.007".

Crankshaft Rear Main Bearing Oil Seal: *See "Crankshaft & Main Bearings" in Dodge Special Data.*

Crankshaft Front Oil Seal: *See "Engine Front Cover" in Dodge Special Data.*

CAMSHAFT

Journal Diameters—(1) 2", (2) 1-31/32", (3) 1-15/16", (4) 1-1'4".

Bearings—Removable, steel-backed babbitt lined bushings (exc. #4—machined in crankcase).

Clearance—.001-.003". NOTE—If clearance exceeds .005" (measure with dial indicator placed against cam lobe and pry toward indicator), install new camshaft for test and if clearance is greater than .0035", replace bearings.

End Thrust: Taken by thrust plate behind camshaft sprocket hub. **Endplay**—.002-.006".

Timing Chain: Width—1". **Pitch**—.500". **Length**—24" or 48 links.

Camshaft R moval: *Se "Camshaft & Bearings". in Dodg Special Data.*

Camshaft S tting: Sprockets marked. Mesh chain with sprockets so that "O" marks on sprockets are adjacent

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

and in line with a straightedge across shaft centers.

Engine Front Cover Installation: *See "Engine Front Cover" in Dodge Special Data.*

Engine Front Cover Oil Seal (Crankshaft Front Seal): *See "Engine Front Cover" in Dodge Special Data.*

VALVES

Tappet Clearance: .010" Intake. .010" Exhaust (engine hot and idling). NOTE—.002" additional clearance on exhaust tappets if car driven at continuous high speed.

Valves	Head Diam.	Stem Diam.	Length
Intake	1-17/32"	.340-.341"	4-27/32"
Exhaust	1-13/32"	.340-.341"	4-25/32"

Valves	Seat Angle	Lift	Stem Clearance
Intake	45°	23/64"	.001-.003"
Exhaust	45°	23/64"	.003-.005"

Valve Seat Width—1/16-3/32". Runout .0015" maximum.

►*VALVE SEAT INSERT CAUTION: See "Valve System" in Dodge Special Data.*

Valve Guides: Remove from above. Press new guides in with upper end 7/8" below top of block, finish ream to give correct valve stem clearance (See Valve Stem Clearance above). *CAUTION—Guides must be installed with counterbore end UP on exhaust valves and counterbore end DOWN on intake valves.*

Valve Springs: Install with closely coiled end up.

Free Length - 2".

Valve Spring Specifications

	Spring Pressure	Length
Valve Closed	40-45 lbs.	1 3/4"
Valve Open	110-120 lbs.	1 3/8"

Valve Lifters: Mushroom type (remove from below).

Stem Diameter - 5/8". Ream holes from above (pilot in guide). Furnished .001", .008", .030" Oversize.

Lifter Clearance - .0002-.001".

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above.

►*VALVE TIMING NOTE: The following valve opening and closing points are with .014" lifter clearance*

Intake Valves - Open 12° BTDC. Close 44° ALDC.

Exhaust Valves - Open 50° BLDC. Close 6° ATDC.

OILING SYSTEM

Crankcase Capacity: 5 quarts. Add 1 quart when changing filter element.

Normal Oil Pressure: 40-45 lbs. at 1500 RPM.

Oil Pressure Relief Valve - Located on left side of block below starting motor.

►*RELIEF VALVE SPRING NOTE:* Three types of spring available. Replace with correct color spring as follows:

Relief Valve Spring Specifications

Spring Color	Lbs. Pressure	Length
Red	12.4-13.8	1 1/4"
Std. (No color)	14.4-15.8	1 1/4"
Green	16.2-17.8	1 1/4"

Free Length - 1 13/16".

Oil Pressure Gauge: Mechanical.

Oil Pump: Rotor type on right side of crankcase.

Overhaul—*See "Oiling System" in Dodge Special Data.*

Oil Filter: By-pass type. On left side of engine above starter.

Servicing—Install new filter element and cover gasket at 8000 mile intervals (more often in dusty areas). Change oil at same time filter is changed.

Crankcase Ventilation: Filter in oil filler tube and air cleaner in crankcase ventilation outlet pipe.

COOLING

Water Capacity: 13 qts. Add 1 qt. for heater.

►*AIR CONDITIONER OPERATING CAUTION: Engine cooling system must be protected to a temperature of 20°F (above zero) for summer operation.*

Pressure Valve: 14 lb. radiator filler cap (All models).

Thermostat: Pellet type. In water outlet connection on cylinder head. Starts to open at 157-162°F.

Water Pump: Packless type. Ball bearing type. No lubrication required. *See Water Pump Section.*

Pump Removal - Drain cooling system, remove fan belt, disconnect hoses at pump, remove pump mounting studs, remove pump.

Water Distributing Tube: *See "Cooling System" in Dodge Special Data.*

Temperature Gauge: Auto-Lite. Electric type.

Dash Unit - Auto-Lite 14377A.

Engine Unit - Auto-Lite 14405A.

See "Temperature Gauges" in Misc. Section.

CLUTCH

Borg & Beck: 9A7 No. 361384 (Std.), 10A7 No. 361376 (H.D.), Auburn 10031-1 (Optl.).

Clutch Disc - Borg & Beck 362649 (Std.), 381758 (H.D.). *See "Borg & Beck" & "Auburn" Clutches in Clutch Sect.*

Pedal Adjustment: Adjust the fork rod to secure 3/16" free movement of clutch fork outer end. This adjustment will provide necessary 1" free play at pedal.

Over-Center Spring Adjustment: *NOTE* - Over-center spring located above brake pedal and attached to pedal mounting bracket. Release clutch rod at clutch pedal. Back off adjusting nut to release over-center spring. Hold clutch pedal fully depressed, adjust nut until it just touches "C" link of spring, then turn nut 7 full turns for 10" clutch, 5 full turns for 9 1/4" clutch. Reinstall clutch rod to clutch pedal.

Removal: Remove transmission, clutch housing pan, pull out clutch release bearing and sleeve. Mark clutch cover and flywheel. Remove clutch cover to flywheel bolts (release each bolt a few turns at a time in succession) to release spring tension until cover is free. Remove clutch disc and pressure plate assembly from clutch housing.

SYNCHRO-MESH TRANSMISSION

Own. *See "Dodge Synchro-mesh" Transmission in Transmission Section.*

Transmission Controls: *See "Transmission Controls" in Transmission Section.*

Removal: Drain lubricant, disconnect propellor shaft, speedometer cable, gear shift control rods. Remove back-up light switch (if so equipped) and speedometer drive pinion. For transmission overhaul or rear seal replacement, apply hand brake, remove flange nut (flange holding Tool C-3281). Disconnect hand brake cable, remove brake drum and flange assembly (puller Tool C-452) and oil seal (puller Tool C-748). Pull transmission straight back until pinion shaft clears clutch disc, then lower transmission.

POWERFLITE TRANSMISSION

Torque Converter and hydraulically operated planetary transmission.

See "PowerFlite" Transmission in Transmission Section.

►*PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION: See "PowerFlite" Transmission in Transmission Section.*

►*TESTING & TROUBLE SHOOTING: See "PowerFlit" Transmission in Transmission Section.*

Lubrication: Check fluid level every 1000 miles, drain and refill every 20,000 miles with Automatic Transmission Fluid (Type A).

Checking Fluid Level - *CAUTION - Following procedur and fluid level supersede previous recomm ndations.* Check transmission COLD if possible. Idle engine with brakes applied, press all pushbuttons in turn, then check fluid level on dipstick with engine idling in "N". Maintain level as follows:

Cold Transmission (After standing and bef r being driven for several miles) - Level should be between "L" mark and ½" below "L" mark. Add oil if below ½" below "L" mark, remove oil if above "L" mark. Do not add oil if level within above range.

Hot Transmission (After being driv n s v ral mil s) - Level should be between "F" mark and ½" below "F" mark (on cars with first type dipstick with distance of 1 5/8" between "F" and "L" marks, level should be ½" below "F" mark). Add oil if level below "L" mark to bring level up to ½" above "L" mark, remove oil if level above "F" mark. Do not add oil if level within above range.

Throttle Linkage Adjustment: *See CARBURETOR above.*

►*OTHER "POWERFLITE" SERVICE DATA: See "PowerFlite" Transmission in Transmission Section.*

UNIVERSALS

Detroit Universals. Ball & Trunnion front, Cross rear.

Rear Universal Joint Operating Angl - *See "Propellor Shaft Notes" in Dodge Special Data.*

REAR AXLE

Own. Semi-floating, hypoid gear type with Hotchkiss drive.

See "Dodge Hypoid" in Rear Axle Section.

Ratios - 3.9-1 (Synchro-mesh), 3.73-1 (PowerFlite).

Backlash - .006-.010".

►*REAR AXLE LUBRICANT LEVEL CAUTION:* Recommended lubricant capacity of 3½ pints will bring level to ½" below bottom of filler plug opening. DO NOT ADD lubricant to bring level up to filler plug opening.

►*BANJO HOUSING INSTALLATION NOTE: Check rear universal joint operating angle. See "Propellor Shaft Notes" in Dodge Special Data.*

Carrier Removal: Remove axle shafts (see below), disconnect rear universal joint, remove differential carrier cap screws, lift out carrier assembly.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Axl Shaft Rem val: Jack up car, remove wheels, hub and drum assembly (Tool C-845) Block brake pedal, disconnect brake line at wheel cylinders, remove axle key, brake and dust shield Note number and remove shims from each axle housing, use puller Tool C-499 to remove axle shaft and bearing, remove inner oil seal (Tool C-637)

Wh l Bearing Adjustm nt: Shims between backing plate and axle housing. With wheel hub removed, check end play with dial indicator. To adjust, remove backing plate (see above), add or remove shims (furnished .005", .010", .0125", .015", .030" thick) equally at both wheels. **Endplay**—.003-.008".

SH CK ABSORBERS

"Orifl w". Direct acting, hydraulic type. Serviced by replacement.

FRONT SUSPENSION

Indep nd nt. New "Torsion-Aire" suspension, with ball joint mounted steering knuckles and torsion bar front springs

See "Torsion-Aire" in Front Suspension & Wheel Alignment S ction

St ering Axis Inclination - 6½° at 0° Camber

Cast r - (Manual Steering) Neg. ¾° ±¾°, (Power Steering) Pos. ¾° ±¾°. *NOTE* - Both sides should be set at same dimension.

Camb r (Right Wh l) - 0° ±¼°, 0° preferred.

Camber (L ft Wh l) - Pos. ¼° ±¼°, Pos. 3/8° preferred.

T -In - 3/32-5/32". 1/8" preferred.

Toe-Out on Turns - With outer wheel at 20°, Inner wheel should be 21°37'.

STEERING

Manual: G mmer. Worm and three-tooth roller

See "Gemmer Worm & Roller" in Steering Section

P wer Steering: Coaxial. Components encased in tubular housing which is located at bottom of, and concentrically around axis of steering column

See "Coaxial" Power Steering in Steering Section

►*JERKY OPERATION OF POWER STEERING GEAR CORRECTION:* Adjust generator drive belt (See Generator), then adjust fan drive belt so that a maximum of ¼" deflection is obtained when applying a 10 lb. pull with spring scale at middle of widest belt span

Steering Linkage: *See "Steering Linkage" in Steering Section.*

Steering Wheel & Horn Button Removal: *See "Gemmer Worm & Roller" in Steering Section.*

Steering Gear Removal: *See "Gemmer Worm & Roller" in Steering Section.*

BRAKES

Service: Dodge Total-Contact (Floating Shoe) type

See "Chrysler, De Soto, Dodge, Plymouth Center-Plane & Total Contact" Brakes in Brake Section

Drum Diameter - 11" (All models)

Wheel Cylinder Diameter - 1 1/8" Single acting (front), double acting (rear)

Replacement Linings & Shoes - Linings or shoes with linings are furnished Standard and .030" Oversize

Lining - Molded asbestos (bonded to shoe)

Width - 2½' Front, 2" Rear (2 ½" rear on 4-door Hardtop, Suburban and Convertible)

Length - 11 5" (All) **Thickness** - .200" (All)

Braking Power - 65% front, 35% rear

Clearance - Front Wheels - .006" Turn each adjusting cam in direction of forward wheel rotation until shoe is solid against drum and wheel is locked Turn cams in opposite direction until no drag is felt

Rear Wheels - .006" Same as for front wheels except that forward shoe adjusting cams are rotated in direction of forward wheel rotation and rear shoe cams are rotated in direction of reverse wheel rotation.

Master Cylinder: On engine side of dash panel opposite base of brake pedal

Checking Fluid - Filler plug at top of master cylinder (on dash panel in engine compartment)

Removal - Disconnect pedal return spring, push rod, brake tube, and stop light switch leads Remove master cylinder to dash bolts, slide master cylinder straight out from dash

Power Brakes: New "Oval Piston Assist" type Mounted on firewall and linked to upper end of brake pedal (used with standard master cylinder)

See "De Soto, Dodge Oval Piston Type Power Unit" in Brake Section

Removal - Place block or wedge between power lever and bracket (to prevent damage to ramp of trigger arm) Mark across power unit adjacent to vacuum test port and mounting bracket, and beween mounting bracket and firewall Disconnect vacuum hose, remove bolts securing bracket to firewall, slide unit and bracket straight forward

Parking Brake: On shaft at rear of transmission 6" external contracting type used with Synchro-mesh Trans 7" internal expanding type used with Automatic Trans

Adjustment - *See "Brake Notes" in Dodge Special Data*

Lining	Width	Thickness	Length
6" Ext type	2"	5/32"	15 38"
7" Int type	2"	5/32"	13 44"

MISC. MECHANICAL

Windshield Wipers: Auto-Lite electric EPW-4001A (Single speed), EPV-4001B (Variable speed)

See "Auto-Lite" Electric Windshield Wipers in Miscellaneous Section

Air Conditioning: Heater-Air Conditioning *See "Air Conditioning" in Miscellaneous Section*

Power Window Regulators: Electric type Reversible type motor in each window Controlled by door switch and master control switch *See "Electric Window Regulators" in Miscellaneous Section*

Power Seat Adjusters: Electric 6-Way Type

See "Power Seat Adjusters in Misc Section

Convertible Top Control: Electrical-hydraulic type

See "Power Top Controls" in Misc Section

►*DODGE ENGINE & EQUIPMENT NOTE:* "Red Ram" and "Super Red Ram" engines are Std. on all models. Specifications for these engines are alike and listed as "Std. V8" unless otherwise indicated.

►*OPTIONAL "500" & "500-1" ENGINES:* "500" Engine is Optl. on all models, "500-1" Engine is Optl. on Coronet only. Specifications and service data for these engines which differ from standard engines are indicated below.

MODEL IDENTIFICATION

Model	Std. Model	"500" Eng. Model
Coronet	D-66-1,2	D-500
Coronet "501"		D-500-1
Royal	D-67-1	D-500
Custom Royal	D-67-2	D-500
Suburban & Sierra	D-70	D-500
Custom Sierra	D-71	D-500

SERIAL NUMBER: Stamped on plate attached to left front hinge pillar post.

Starting Serial Number - As follows:

Car Model	Detroit	Los Angeles
Coronet & Custom Coronet	35,172,001	42,620,001
Royal & Custom Royal	37,240,001	45,540,001
Sierra 6 Pass.	38,001,001	
Custom Sierra	38,535,001	

ENGINE NUMBER: Stamped on boss at center of cylinder block directly behind water pump and next to oil filler pipe.

►*ENGINE NUMBER LETTERS & MARKS (Following Engine Number): Identified as follows:*

"A" - All cylinders .020" Oversize.

"B" - All Main & Connecting Rod Bearings .010" Undersize.

"AB" - BOTH above conditions exist.

"♦" symbol (3/8" high) - All tappet bodies are .008" Oversize.

TUNE-UP

COMPRESSION PRESSURE: 90-155 lbs. at cranking speed of 150 RPM (plugs removed, throttle wide open). Maximum variation between cylinders 15 lbs.

VALVE TAPPET CLEARANCE: **(Std. V8 & D-500)** None in service (hydraulic lifters).

(D-500-1) - .015" Intake, .024" Exhaust, HOT.

MANIFOLD HEAT CONTROL: Thermostatically controlled valve located between right exhaust manifold and "Y" exhaust pipe on right side of engine. Valve must operate freely. To install coil spring, position shaft in extreme counter-clockwise position. Place coil spring in position over shaft slot, with outer end (tongue) of spring in upper left-hand position. Press inner end of coil into slot of shaft and seat firmly. Move outer end (tongue) of spring down around and up and over stop stud.

►*DUAL EXHAUST NOTE:* When valve is closed, most exhaust gases are discharged through left exhaust pipe.

IGNITION

FIRING ORDER: 1-8-4-3-6-5-7-2.

Cylinders - RIGHT BANK 2-4-6-8, LEFT BANK 1-3-5-7.

SPARK PLUG GAP: .035".

Spark Plugs - Auto-Lite AR-42 (V8 Std.); AR-32 (D-500); AGR-32 (D-500-1). Resistor type. Torque to 30-32 ft. lbs.

COIL: Auto-Lite CAH-4001B.

Ignition Current - 2.5 amps. idling, 3.1 amps. stopped.

Resistor - Auto-Lite PU-4003. .665-.735 Ohms.

►*COIL RESISTOR NOTE:* Resistor is connected in lead between ignition switch and coil. When testing coil include resistor with coil. Test without resistor will show coil to be defective.

DISTRIBUTOR: Auto-Lite.

	Auto-Lite Distr. No.
V8 Std. (Exc. D-67-2)	IBP-4002
V8 Power Pkg. (Std. D-67-2)	IBP-4002B
D-500 Early	IBK-4301A
D-500 Later	IBP-4002D
D-500 Power Pkg.	IBS-4005
D-500-1	IBS-4005

NOTE - IBS-4005 & IBK-4301A are "Double Breaker" type.

Condenser - Auto-Lite IAT-2015RA (IBP Distr.), IBB-2015R (IBK Distr.). **Capacity** - .25-.285 mfd.

Contact Point Set - Auto-Lite IBP-3028AS (IBP Distr.), IGW-3028KS (IBK Distr.) - two used.

Breaker Gap - .015-.018".

Cam Angle - 27-32°. (IBP Single Breaker), 36-39° (IBK & IBS Double breaker with both sets operating together). Do not set gap outside limits to obtain specified cam dwell.

►*CAM ANGLE SETTING CAUTION (IBP DISTR.):* Cam angle should be checked with vacuum line **disconnected**. Cam angle may decrease as much as 10° with maximum vacuum advance, but must not decrease more than 12°.

Breaker Arm Spring Tension - 17-20 ozs.

Rotation - Clockwise viewed from above.

Automatic Advance - IBP-4002

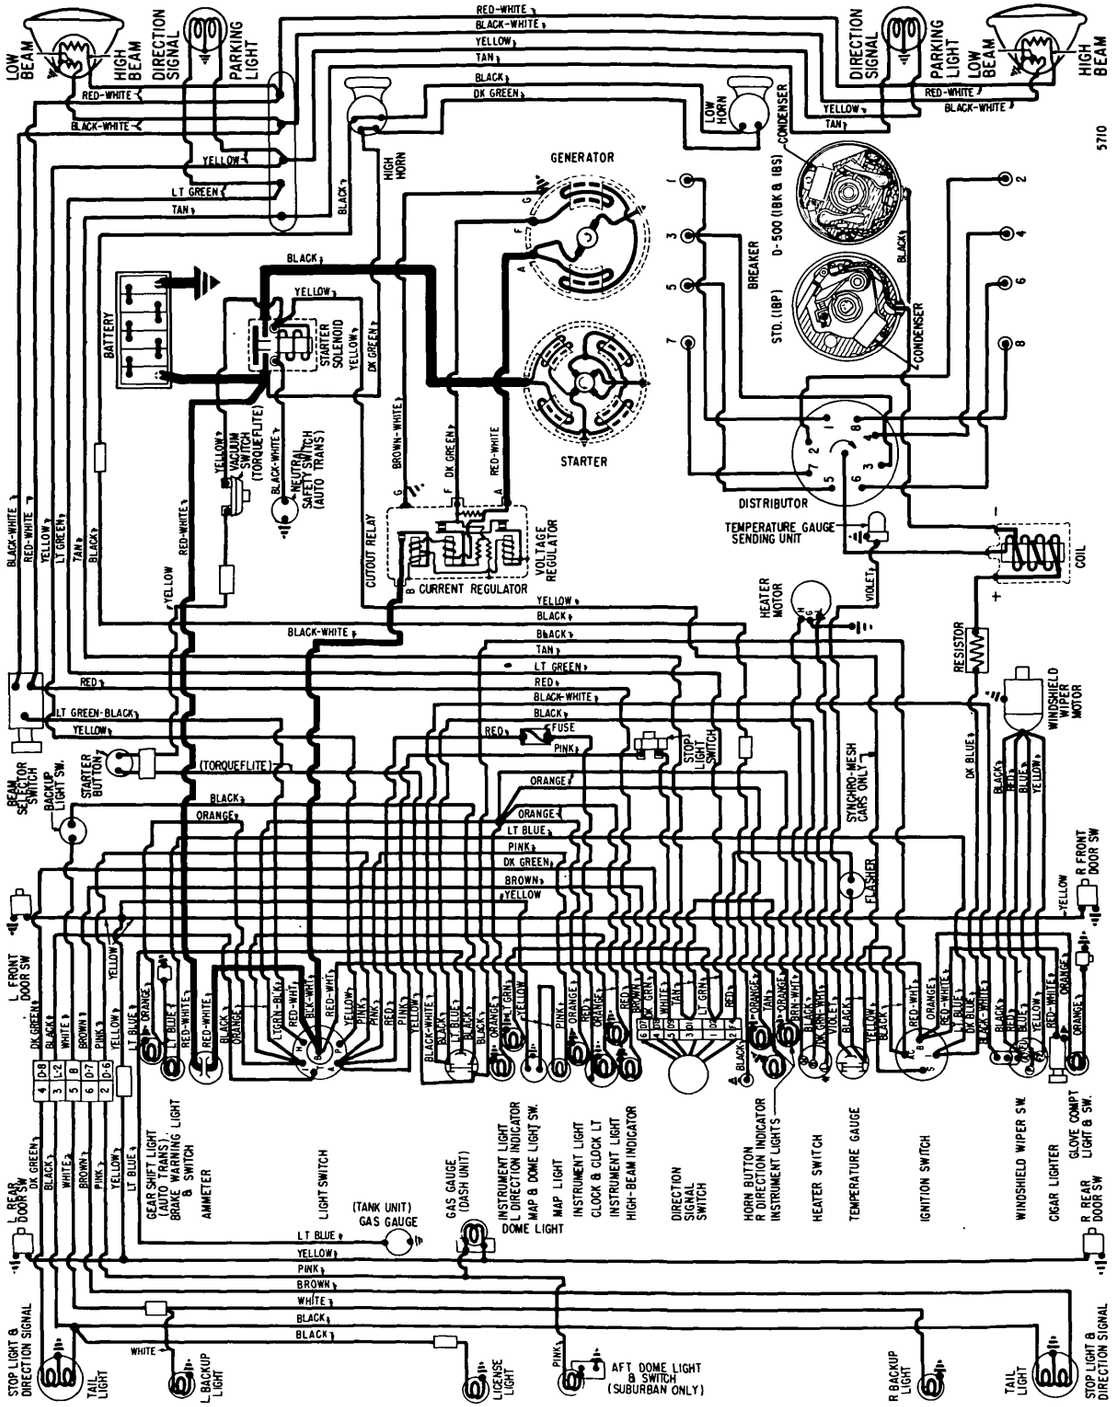
IGNITION TIMING

Model	Std. Ignition Setting
Std. V8 (Exc. D-67-2)	4° BTDC
V8 Power Pkg. (Std. D-67-2)	6° BTDC
D-500 & D-500-1	6° BTDC

Timing Mark - Crankshaft pulley or vibration dampener marked "DC" at TDC point with 2° graduations before and after this mark. Align correct graduation with pointer on chain case cover.



CARBURETOR

►*CARBURETOR APPLICATION: Stromberg WW 2-Barrel Carburetor used as standard equipment on Standard V8 engine, except D-67-2. Carter 4-Barrel Carburetor standard on D-67-2, D-500 and as Power Package on standard V8 engine. Two Carter 4-Barrel Carburetors used on D-500-1 and as Power Package on D-500.*

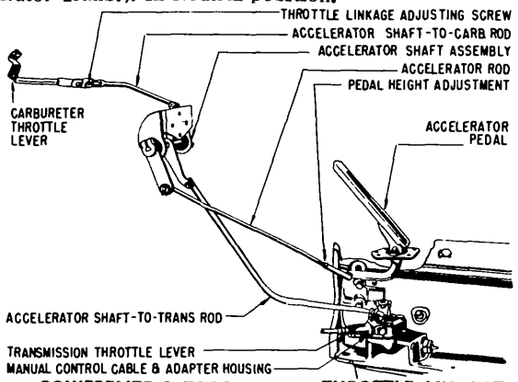
►*CARBURETOR AIR CLEANER (DRY TYPE) NOTE: Special cleaning procedure required. See AIR CLEANER below.*

THROTTLE LINKAGE ADJUSTMENT (PowerFlite & TorqueFlite Cars): Bring engine to operating temperature and adjust idle speed (in Neutral) to 475-500 RPM. Loosen throttle linkage adjusting screw located on ac-

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

celerator shaft-to-carburetor rod (PowerFlite), adjusting nut located on bellcrank to intermediate throttle control (TorqueFlite). Hold rod lightly to rear against transmission stop and tighten screw (7-9 ft. lbs.) or nut. On PowerFlite 4-Barrel Carburetors, remove pedal to accelerator shaft rod at pedal arm, loosen locknut, turn ball and socket end of rod to obtain wide open throttle with pedal just against floor mat. On 2-Barrel Carburetors, adjust bellcrank to carburetor rod in same manner.



STROMBERG WW 2-BARREL

Model	Stromberg Code No.
Std. V8 (Synchro-mesh)	WW 3-149
Std. V8 (Auto. Trans.)	WW 3-150

► *MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrel feeds Cyl. 2-3-5-8, LEFT barrel 1-4-6-7.*

Idle Setting - 1 turn open. Adjust both screws alike. Turn screws out for richer mixture.

Idle Speed - 450-500 RPM (Std. Trans.), 475-500 RPM (Auto. Trans.). In Neutral position.

POWERFLITE & TORQUEFLITE THROTTLE LINKAGE

Float Level - 7/32" from top of main body (gasket removed) and center of float, with inlet needle seated. Use Gauge T-26019 to check float and T-24733 to bend float lip for correction.

Accelerating Pump - Normal setting, center hole; inner hole for less fuel, outer hole for more fuel.

Fast Idle: Turn throttle stopscrew out so that throttle valves completely closed. Hold throttle valves closed, back out fast idle screw until fast idle cam can be positioned with **first** step in line with fast idle screw, turn screw in until it just contacts cam, then turn screw in additional 5½ turns. Close choke valve as far as possible (fast idle screw against shoulder on cam), measure valve opening by inserting No. 12 drill (3-149), No. 24 drill (3-150) between upper edge of valve and air horn. Adjust by bending fast idle rod.

Automatic Choke Setting: *NOTE* - Choke is "Cross-over" type mounted in manifold and linked to choke valve. Should not require adjustment (must be removed from manifold well for checking). Index mark on disc should be centered on scale on thermostat cover plate.

Throttle Linkage Adjustment: *See CARBURETOR above.*

► *OTHER DATA: See "Stromberg WW (Dodge & Plymouth)" Carburetors in Carburetion Section.*

CONTINUED FROM PRECEDING PAGE

CARTER WCFB 4-BARREL

Model	Single Carburetor	Carter Carb. No.
Std. V8 Power Pkg. & D-67-2 (Std.)		2532S
D-500 Early (Std.)		2622S, SA
D-500 Later (Std.)		2532S
D-500 (Police)		2698S

► *STUMBLE & LEANNESS CORRECTION (2532S & 2622S) See "Carter WCFB Carburetor" in Carburetion Section.*

► *MANIFOLD FUEL DISTRIBUTION· Carburetor RIGHT barrels feed Cyl. 2-3-5-8, LEFT barrels 1-4-6-7.*

Idle Setting - 1 turn open. Turn screws out for richer mixture.

Idle Speed - 450-500 RPM (Synchro-mesh), 475-500 RPM (Auto. Trans.). In Neutral position.

Throttle Linkage Adjustment (TorqueFlite & PowerFlite Cars)· *See CARBURETOR above.*

► *OTHER DATA See "Carter WCFB Carburetors' in Carburetion Section*

CARTER WCFB 4-BARREL

Model	Dual (Two Carburetor)	Carter Carb. No.
D-500 (Power Pkg.)	(Front)	2633S, (Rear) 2634S
D-500-1	(Front)	2534S, (Rear) 2535S

► *CARBURETOR IDLE ADJUSTMENT CHANGE NOTE· The following idle speed & mixture adjustment procedure supersedes previous instructions.*

► *MANIFOLD FUEL DISTRIBUTION RIGHT barrels feed right bank cylinders, LEFT barrels feed left bank*

► *CARBURETOR SYNCHRONIZATION NOTE* Before adjusting idle mixture and idle speed, the carburetor inter-connecting rod must be adjusted as follows Hold rear carburetor throttle in wide open position (choke off) and adjust rod at slotted end so front carburetor throttle valve will be in wide open position. Make sure rod can rotate slightly on pivots and not bind.

Idle Speed & Mixture Adjustment· Screw the "idle by-pass" screw (7/16" slotted hex head screw located on left rear side of each carburetor body flange) against its seat *(NOTE - This "by-pass screw" is no longe used for idle speed adjustment and must remain in the closed position).* Adjust engine idle speed to 650 RPM (transmission in neutral)·by screwing in the **idle speed screw** (throttle stop screw at throttle shaft lever) on the front carburetor only. Adjust all four (two on each carburetor) idle mixture screws 1 turn open from a lightly seated position. Obtain the smoothest possible idle speed by further adjusting idle mixture screws on **front** carburetor *(NOTE - It may also be necessary to re-adjust idle mixture screws on rear carburetor if adjustment of front carburetor does not provide proper idle speed).*

Throttle Linkage Adjustment (Automatic Transmission Cars)· *See CARBURETOR above.*

► *OTHER DATA See "Carter WCFB 4-Barrel Carburetor" in Carburetion Section.*

FUEL PUMP PRESSURE: 6-7 lbs.

Air Cleaner· DRY FILTER ELEMENT type Clean every 5 000 miles replace element every 15 000 miles

► *CLEANING CAUTION* Clean filter element by tapping and shaking to remove dirt particles *DO NOT wash element in solvent or other liquids and DO NOT oil or lubricate*

BATTERY

Gould 11-OE-53. 12 volt, 9 plate, 53 ampere hour capacity (at 20 hr rate)
Grounded Terminal - Negative
Engine Ground - Left front of engine

STARTER

Auto-Lite MDL-6001 (D-500-1), MDL-6003 (Others)
Armature - Auto-Lite MDL-2088 (D-500-1), MDL-2006 (Others).
Drive - Solenoid Pinion Shift (D-500-1), Bendix "Folo-Thru" type, No. A3596 (Others).
Rotation - Counter-clockwise at commutator end.
Brush Spring Tension - 42-53 ozs.

Performance Data - MDL-6001 & 6003

Torque	RPM	Volts	Amperes
0	3200	10 0	60
6.0 ft. lbs.	Lock	4.0	225

Starting Switch· Auto Lite SAE 4001 (Std) SAE-4002 (Auto Trans) **Synchro-mesh & PowerFlite** - Magnetic switch controlled by Ignition & Starter Switch, plus Neutral Safety Switch on transmission (PowerFlite) **TorqueFlite** - Magnetic Switch controlled by pushing In Neutral Button plus Vacuum Switch on Intake Manifold and Neutral Safety switch on outside of transmission
See "Starter Controls' in Electrical Section

Neutral Safety Switch Adjustment· *See 'PowerFlite & TorqueFlite" in Transmission Section*

GENERATOR

Auto-Lite Used as follows

Application	Generator No.	Armature No.
Standard Early	GJC-7001D	GJC-2030F
Standard Later	GJC-7012A	GJC-2030F
Spec. Equip.	GGA-6001AC	GFY-2101F
Taxi	GHM-6004A	GHM-2059F
Air Cond.	GHM-6004C	GHM-2059F

► *SPECIAL GENERATOR NOTE* GJC, GGA, & GHM types generators used. Performance specifications apply equally to all generators within the three groups specified.

Performance Data - GJC (Cold - 70°F)

Amperes	Volts	RPM
0.0	12.8	1225-1325
30.0	15.0	2050-2250

Performance Data - GGA (Cold - 70°F)

Amperes	Volts	RPM
4.0	14.6	950
40.0	14.6	1600
40.0	15.0	1600

Performance Data GHM (Cold - 70°F) -

Amperes	Volts	RPM
5.0	14.0	875
25.0	15.0	1350
30.0	15.0	1500

Rotation - Counter-clockwise at commutator end
Brush Spring Tension - 18-36 ozs. (GJC-7000), 34-41 ozs. (GGA), 35-53 ozs. (GHM).
Field Current - 1.2-1.3 Amps. (GJC), 1.1-1 3 Amps. (GGA & GHM), at 10.0 volts (70°F).
Motoring Current - 3.4-3.9 Amps. (GJC), 2 3-2.6 Amps. (GGA) 3.0-3.5 Amps. (GHM) at 10 volts (70°F).
Belt Adjustment: (Std.) - 1/4" deflection with 10 lb pull applied midway of longest span
(Air Cond) Loosen generator mounting bolts and use Tool C-3379 & Tool C 3005 to apply 15 lbs tension to belt Tighten generator mounting bolts while holding this tension

REGULATOR

Auto-Lite VRX-6201A (GJC & GHM Gen), VAT-6201A (GGA Gen.)

Cutout Relay

Cuts In - 12.6-13.6 volts (VRX), 13.0-13.75 volts (VAT)
Cuts Out - 8.2-9 3 volts after charge at 10 amps. (VAT) from sealed position.
Contact Gap - .015" minimum.
Air Gap - .031-.034'.

Voltage Regulator

Setting - 14.5 volts charging at 10.0 amperes (80°F) or with .25 Ohm resistor in series between regulator and battery.
Air Gap - .048-.052" (check at brass armature stop pin).
Checking & Adjusting - *See "Auto-Lite 12 Volt Regulators" in Electrical Section.*

Current Regulator

► *SETTING CAUTION "Temperature Compensated" type. Set to following specifications at 70°F*

Regulator	Test A - Operating Amperes -	Test B
VRX-6201A	36	30 (28-32)
VAT-6201A	46	40 (38-42)

Test A - After 15 minutes operation charging at 10 amps.
Test B - After additional 15 minutes operation with current regulator operating (load applied to hold voltage down to 13.6-13.8 volts (VRX), 13.7-13.9 volts (VAT).
Air Gap - .048-.052" (check at brass armature stop pin).
Checking & Adjusting - *See "Auto-Lite 12 Volt Regulators" in Electrical Section.*

MISC. ELECTRICAL

Headlamps Sealed Beam *See Electrical Section*
Directional Signals *See Electrical Section*
Lighting & Panel Switch Removal: Switches held in instrument panel by a common threaded sleeve and hex nut Panel lamp knob indexes on its switch shaft by means of lugs in knob and slots in shaft Headlamp knob is held on its shaft by means of a recessed hex screw
Stop Light Switch Location On forward end of master cylinder
LIGHTING CIRCUIT BREAKERS· Used as follows
20 Amp r Protects Headlights, Parking lights and

Ignition light.
15 Amp r . Protects Tail, Stop, License plate, Instrument, Map, Dome, Clock, Glove Compartment and Courtesy lights.
5 Amp r . Protects Windshield Wiper (Std.).
6 Amp r . Protects Windshield Wiper (Variable Speed).

ENGINE

► *AIR CONDITIONED CAR SERVICE CAUTION: Use extr me car wh n disconnecting any part of air conditioning quipment or lin s for access to engine, see "Air Conditi ning S rvice Cautions" in Misc. Sect.*

ENGINE SPECIFICATIONS: 90° V8, Overhead Valves. Different engines used as follows:
"R d Ram" & "Sup r R d Ram" Engines - Std. on all models. These engines have polyspherical combustion chamber and single rocker arm shaft.
"D-500" & "D-500-1" Engines - "D-500" Optl. on all models. "D-500-1" Optl. on Coronet only. These engines have hemispherical combustion chamber and double rocker arm shafts, heavier pistons and connecting rods, different valve timing, and larger brakes.

Mod l	B r	Stroke	Displacement
V8 Std.	3.69"	3.80"	325 cu. ins.
D-500	3.69"	3.80"	325 cu. ins.
D-500-1	3.94"	3.63"	354 cu. ins.

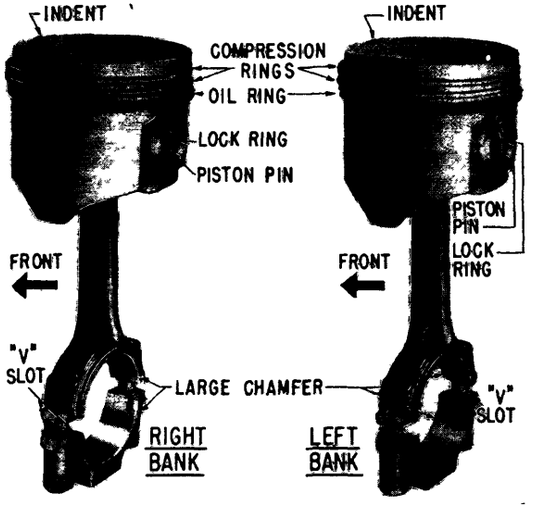
M d l	Compr. Rati	Rated HP	Developed HP
Std. V8 ①	8.5-1	43.6	245 at 4400 RPM
Std. V8 ②	8.5-1	43.6	260 at 4400 RPM
D-500 Std.	9.25-1	43.6	285 at 4800 RPM
D-500 Pwr.Pkg.	9.25-1	43.6	310 at 4800 RPM
D-500-1	10.0-1	49.7	340 at 5200 RPM

① - Except D-67-2.
② - With Power Pkg. (Std. on D-67-2).
C mpr ssion & Vacuum Reading - *See TUNE-UP*

OIL PAN REMOVAL: 1) Disconnect steering linkage at idler arm support bracket. Remove starter, rotate crankshaft to bring timing marks to 5 o'clock position (to place counterweights out of way).
Single Exhaust - Disconnect "Y" pipe at right and left exhaust manifolds and remove heat valve. Loosen tail pipe and rear muffler support clamps and remove clamp from exhaust to "Y" pipe. Break "Y" pipe connection, move "Y" out of way. *NOTE* - To replace "Y" pipe, remove right hand torsion bar. Remove engine front supports at frame, raise front end of engine ½".
2) Remove pan bolts, drop rear of pan and work out over top of crossmember.

ENGINE REMOVAL: *See "Engine" in Dodge Special Data.*

CYLINDER HEAD: *See "Cylinder Head & Manifold" in Dodge Special Data.*



TIGHTENING TORQUES: *See "Tightening Specifications" in Dodge Special Data.*

PISTONS

Aluminum alloy, slipper type, elliptically turned, steel strut, tin plated.

► *CYLINDER BORE OVERSIZE CAUTION: Engin s with letter "A" following engine number indicates that cylinder bores are .020" oversize.*

W ight-19.5 ozs. (D-500), 22.8 ozs. (D-500-1), 18.6 ozs. (All others).
R moval -Pistons and rods removed from above.
Cl aranc - Top of skirt - .00075-.00125".

DODGE V8 PISTON & ROD ASSY.

Fitting New Pistons: Invert piston in cylinder bore with .0015" X ½" feeler stock between thrust face of piston and cylinder wall. Pull required to withdraw feeler should be 5-10 lbs. at 70°F.
Replacement Pistons: Furnished in Std. and .005", .020", .030", .040" and .060" oversize.
Installing Pistons: Notch on piston must be toward front of engine, *See Rod Installation below.*

PISTON PINS

Floating type with lock ring at each end.
Diameter - .984" (D-500-1), .922" (All others).
Length - 3.145" (D-500-1), 3.07" (All others).
Pin Fit in Piston - .0000-.0005". Tight thumb press fit at 70°F.
Pin Fit in Rod Bushing - .0001-.0004". Tight thumb press fit at 70°F. Selective fit.
Replacement Pins: Std. .003", .008" oversize.
NOTE - Fitted pins furnished with new pistons.

PISTON RINGS

Ring	Width	End Gap	Side Clearance
Compr.(1)	.0775-.0780"	.010-.020"	.0015-.0030"
Compr.(2)	.0775-.0780"	.010-.020"	.0010-.0025"
Oil (3)	.1860-.1865"	① 010-.020"	.001-.003"

① - .007-.017" Muskegon rings.

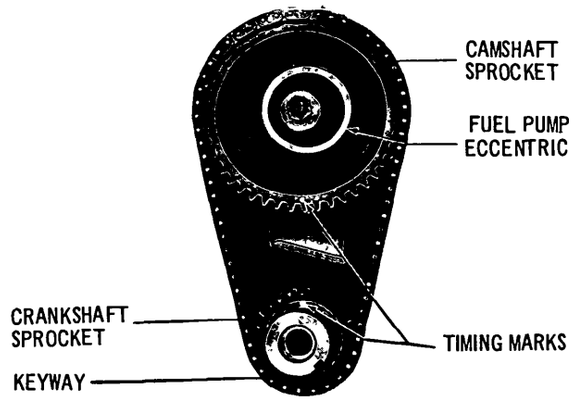
Replacement Rings: Furnished Std. .005", .020", .030", .040", .060" oversize.
Installing Rings: "Top" mark on compression ring is to top of piston when ring is installed.

CONNECTING RODS

Length (Center to Center) - 6.95" (D-500-1), 6.62" (All others).
Weight - 25.2 ozs (D-500-1), 22.5 ozs. (All others).
Crankpin J urnal Diam t r - 2.2495-2.2505". Maximum out-of-round and taper limits .001".
L w r B arings - Tri-Metal Copper lead on Steel Back (D-500-1), Lead base babbitt on Steel (Others). Removable precision type. No shims.

► *JOURNAL DIAMETER CAUTION: ONE OR MORE Journals Machined UNDERSIZE* - *See "CRANKSHAFT" b - low.*
Clearance - .0005-.0015".
End Play - .006-.014" (D-500-1), .009-.017" (All others).
Bearing Adjustment - None, replace bearings.
Replacement Bearings: Std. and .001", .002", .003", .010" .012" undersize.
Installing Rods: Install piston and rod assemblies with indentation in piston head toward front of engine and larger chamfer on lower end of rod toward nearest crankshaft fillet. Oil groove in rod and bearing cap must be be together (for cylinder wall lubrication).
► *CAUTION:* Rods are **interchangeable.** However, when rods are assembled to piston, the assemblies of one engine bank are **not interchangeable** with the other bank.

CRANKSHAFT



Journal Diameter: 2.2495-2.2505".
► *CRANKSHAFT JOURNAL UNDERSIZE CAUTION:* Engines with undersize journals identified as follows: **.010" UNDERSIZE (All Main & Connecting Rod Journals)** - Letter "B" following engine number indicates that ALL Main & Connecting Rod Journals are .010" undersize. **.001" UNDERSIZE (ONE OR MORE Main & Connecting Rod Journals)** - Position of undersize journals are stamped on the machined surface of the center (NO.3) counterweight in the following manner: "R" indicates connecting rod journal, "M" indicates main bearing journal. The number following the letter indicates main or connecting rod journal number (counting from front of engine).
Bearing Type - Replaceable, precision type, as follows: **(Exc. D-500-1)** - No. 3 is tin base babbitt on steel, all others are lead base babbitt on steel.
(D-500-1) - Has Tri-metal (Copper Lead on Steel Back).
Clearance - (Exc. D-500-1 Rear Main) - .0005-.0015". (D-500-1 Rear Main) - .0015-.0025".
Replacement Bearings: Std. .001", .002", .003", .010" .012" undersize. Halves of Nos. 1, 2 and 4 bearings are interchangeable with one another (caps are not interchangeable); upper and lower halves of No. 3 bearing interchangeable; No. 5 halves are NOT INTERCHANGEABLE.
End Thrust; Taken by No. 3 main bearing.
End Play - .002-.007".
Crankshaft Rear Main Bearing Oil Seal: *See "Crankshaft & Main Bearings" in Dodge Special Data.*
Crankshaft Front Oil Seal: *See "Engine Front Cover" in Dodge Special Data.*

CAMSHAFT

► *CAUTION:* Three camshafts used. One for D-500, one for D-500-1 and one for all other V8 models.
Journal Diameter - (1) 2", (2) 1.984", (3) 1.96875", (4) 1.053125", (5) 1.4375".
Bearings - Removable, lead base babbitt on steel.
Clearance - .001-.003". Maximum .005".
End Thrust: Taken by thrust plate behind camshaft sprocket hub.
End Play - .002-.006". Maximum .010".
Timing Chain - 1 1/8". **Pitch** - .375". **L ngth** - 68 links.
Camshaft Setting: Mark on gears should be adjacent and in line across shaft centers.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

DODGE V8 VALVE TIMING MARKS

Camshaft Removal: *See "Camshaft & Bearings" in Dodge Special Data.*

Engine Front Cover (Removal & Installation): *See "En- Front Cover" in Dodge Special Data.*

Engine Front Cover Oil Seal (Crankshaft Front Seal): *See "Engine Front Cover" in Dodge Special Data.*

VALVES

Tappet Clearance: (D-500-1) - Intake .015", exhaust .024" Hot.

(All Others) - Zero lash, hudraulic lifters.

VALVES: Std. V8 Engines

Valve	Head Diam.	Stem Diam.	Length
Intake	1.84"	.372-.373"	4.31"
Exhaust	1.47"	.371-.372"	4.31"
Valve	**Seat Angle**	**Lift**	**Stem Clearance**
Intake	45°	.389"	.001-.003"
Exhaust	45°	.389"	.002-.004"

D-500 Engine

Valve	Head Diam.	Stem Diam.	Length
Intake	1.87"	.372-.373"	4.83"
Exhaust	1.53"	.371-.372"	4.85"
Valve	**Seat Angle**	**Lift**	**Stem Clearance**
Intake	45°	.388"	.001-.003"
Exhaust	45°	.388"	.002-.004"

D-500-1 Engine

Valve	Head Diam.	Stem Diam.	Length
Intake	1.94"	.371-.372"	5.03"
Exhaust	1.75"	.372-.373"	4.99"
Valve	**Seat Angle**	**Lift**	**Stem Clearance**
Intake	45°	① .444"	.001-.003"
Exhaust	45°	② .435"	.002-.004"

① - .394" (Optl. Camshaft). ② - .400" (Optl. Camshaft).

► *VALVE SEAT INSERT REPLACEMENT: See "Valve System" in Dodge Special Data.*

► *VALVE STEM OVERSIZE NOTE:* Oversize valve stems are indicated by letter "I" Intake, or "E" Exhaust stamped on rocker arm cover gasket boss. Ream integral guides when installing valves with oversize stems, furnished .005", .015", .030" oversize.

Intake Valv Stem Oil Seal - Cup type seals used on all intake valve stems.

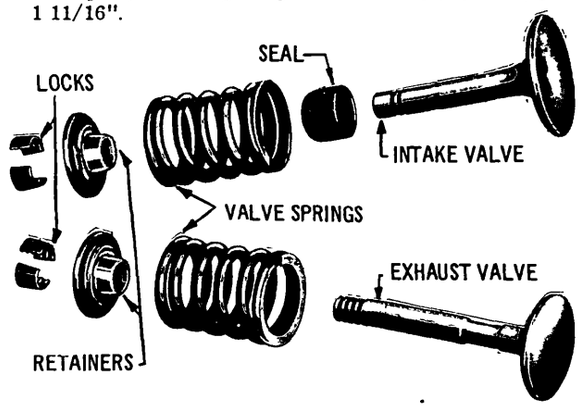
► *VALVE GRINDING CAUTION:* Check valve height in head after grinding valves using Tool C-3436. If valve tip exceeds maximum (end of cylindrical gauge), grind tip down to approach, but do not go below minimum height (slotted area in gauge).

Valve Springs: Double springs used on D-500-1, Single springs used on all other models.

Valve Spring Specifications

(V8 Standard)

Valve	Lbs. Pressure	Length
Closed	72	1.69"
Open	166	1.31"



(D-500)

Valve	Lbs. Pressure	Length
Closed	78-88	1.69"
Open	170-184	1.31"

(D-500-1)

	Inner Spring		Outer Spring	
Valve	Lbs. Press.	Length	Lbs. Press.	Length
Closed	28	1.53"	60	1.66"
Open	66	1.09"	158	1.22"

► *VALVE SPRING HEIGHT CAUTION:* If valves or seats are ground, check installed height of spring (from counterbore in head to lower surface of spring retainer). If height exceeds 1 11/16", install 1/16" spacer under spring to bring height within limits of 1 5/8" - 1 11/16".

DODGE V8 VALVE ASSEMBLIES

► *VALVE SPRING LOAD CAUTION!* Hydraulic lifter "pump-up" will restrict engine speed and cause valves to burn if spring loads are not maintained.

Valve Guides; (Std. V8) Valve guides cast integral with cylinder head. When valve stem clearance excessive, use reamer tool set to ream guides for next oversize valve as follows: C-3433 (.379-.380"-.005" O.S.), C-3430 (.389-.390"-.015" O.S.), C-3427 (.404-.405"-.030" O.S.).

(D-500, D-500-1) Drive out old guides with Tool C-3159 through top of cylinder head. Place steel gauge across combustion chamber and drive Intake guide down until punch mark on side of driving tool is flush with face of cylinder head. Drive exhaust guide down until flat end of valve guide is flush with top of valve guide boss. Use Tool C-741 to ream guide to .374-.375". Intake valve guide will measure 15/16" from top of guide to top of valve seat, while Exhaust valve guide will measure 1 3/32".

► *OVERSIZE VALVE STEM IDENTIFICATION NOTE:* Engines with oversize valve stems marked as follows: Letter "E" (Exhaust), "I" (Intake) on rocker arm cover gasket boss indicates that all stems of valves are oversize (depending on the letter).

Hydraulic Valve Lifters: Used on all models except D-500-1.

► *OVERSIZE LIFTER NOTE:* A "DIAMOND" mark on engine serial number pad indicates .008" oversize lifter bores.

Diameter - .9040-.9045". **Clearanc** - .0005-.0015".

Replacement Lifters - Furnished Standard and .001", .008", .030" oversize.

Lifter Overhauling & Testing - *See "Valve Syst m" in Dodge Special Data.*

Rocker Arm Assembly: *See "Valve System" in Dodg Spe- Data.*

VALVE TIMING

See "Camshaft Setting" under Camshaft abov .

℄ V8 Std. & D-500 (Early) Valv Timing

Intake - Open 10° BTDC. Close 58° ALDC.
Exhaust - Open 56° BLDC. Close 16° ATDC.

① D-500 (Later) Valv Timing

Intake - Open 18° BTDC. Close 58° ALDC.
Exhaust - Open 56° BLDC. Close 20° ATDC.

℄ D-500-1 (Std.) Valv Timing

Intake - Open 35° BTDC. Close 65° ALDC.
Exhaust - Open 65° BLDC. Close 25° ATDC.

① D-500-1 (Optl.) Valv Timing

Intake - Op en 33° BTDC. Close 71° ALDC.
Exhaust - Open 68° BLDC. Close 36° ATDC.

① - With valve train solid.

Valve Timing Check: (V8 Std. & D-500 Early) - Rotate engine to close No. 1 intake valve. Insert .210" spacer between rocker arm and valve stem and wait for hydraulic lifter to bleed down so valve train will be solid. Mount dial indicator to register valve spring retainer movement, as valve is opened. Zero indicator, then turn crankshaft until dial indicator reads .024" (valve lift). Pointer on timing case cover should indicate between 5° BTDC and 7° ATFC when timing is correct. Reverse crankshaft rotation until indicator returns to zero and remove spacer. *See "Camshaft Setting" under CAMSHAFT above.*

► *CAUTION:* Do not turn crankshaft further than indicated above. Further movement might bottom spring and damage mechanism.

OILING SYSTEM

Crankcase Capacity: 5 quarts (refill), add 1 quart when filter changed.

Normal Oil Pressure: 50-65 lbs. at 1500 RPM.

Oil Pressure Relief Valve - Mounted in oil pump.

► *RELIEF VALVE SPRING NOTE:* Three types of springs available. Replace with correct color spring. *See "Relief Valve Spring Specifications" below.*

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

R lief Valve Spring Specifications

Spring Color	Lbs. Pressure	Length
Gray (Light)	16.1-17 1..	3 1/32"
Red (Standard)	19.5-20.5	.2 27/32"
Brown (Heavy)	.22.9-23.9	2 31/32"

Free Length - 2 1/16".

Oil Pressure Gauge: Mechanical.

Oil Pump: Mounted on rear main bearing cap. Rotor type with strainer mounted on oil pump body. Strainer must be mounted parallel with bottom of cylinder block.

Overhaul - *See "Oiling System" in Dodge Special Data.*

► *OIL PUMP INSTALLATION NOTE:* Prime oil pump before installing on rear main bearing cap.

Oil Filter: Full flow (D-500-1), Shunt type all other models. Shunt type filters only a portion of pump output, balance of output goes directly into engine lubrication system.

Filter Element - Install new filter element and cover gasket at 5,000 miles intervals (or earlier if required) Change oil at same time filter element is changed.

Crankcase V ntilation: Filter element in crankcase filler Cap and breather tube at rear of crankcase. NOTE - Remove air cleaner in ventilator pipe (when so equipped) wash in kerosene and reoil.

COOLING

Water Capacity: 21 quarts (D-500-1), 20 quarts (all other models). Add 1 quart for heater.

► *AIR CONDITIONER OPERATING CAUTION:* Engine cooling system must be protected to a temperature of 20°F (above zero) for summer operation.

Pressure Valve: 14 lb.. radiator filler cap (All models)

Thermostat: Pellet type. In water pump to radiator connector. Starts to open at 157-162°F

Water Pump: Packless type. Sealed ball bearing type. No lubrication required.

Pump Removal - Drain cooling system, remove fan shroud (air conditioned cars), loosen fan belt, loosen idler pulley (air conditioned cars). Remove fan spacer and pulley, remove mounting bolts and water pump.

Ov rhaul - *See Water Fump Section.*

Fan B lt Adjustment (Air Conditioned Cars); 1/8" deflection with 10 lbs. pressure midway between idler and water pump pulleys.

NOTE - For Generator belt adjustment see Generator above.

Temperature Gauge: Auto-Lite. Electric type.

Dash Unit - Auto-Lite 14377A.

Engin Unit - Auto-Lite 14405A.

See "Temperature Gauges" in Misc. Section.

CLUTCH

B rg & Beck. Used as follows:

Model	Borg & Beck No.	Disc No.
D66 70,10A8(Std.)	361417	.382531
D67,71,500-1,11A8	361447	382626
D66,70,11A8(H D)	361428	381850

See "Borg & Beck" Clutches in Clutch Section.

Pedal Adjustment: Adjust the fork rod to secure 3/16" free movement of clutch fork outer end. This adjustment will provide necessary 1" free play at pedal.

Ov r-Center Spring Adjustment: (NOTE - Over-center spring located above clutch pedal and attached to pedal mounting bracket) Release clutch rod at clutch pedal. Back off adjusting nut to release over-center spring. Hold clutch pedal fully depressed, adjust nut until it just touches "C" link of spring, then turn nut 7 full turns for 10" clutch. Reinstall clutch rod to clutch pedal.

Removal: Remove transmission and clutch housing pan, pull out clutch release bearing and sleeve. Mark clutch cover and flywheel. Remove clutch cover to flywheel bolts (release each bolt a few turns at a time in succession to release spring tension until cover is free). Remove clutch disc and pressure plate assembly from clutch housing.

SYNCHRO-MESH TRANSMISSION

Own. *See "Dodge Synchro-mesh" Transmission in Transmission Section.*

Transmission Controls: *See "Transmission Controls" in Transmission Section.*

Removal: Drain lubricant, disconnect propellor shaft, speedometer cable, gear shift control rods. Remove back-up light switch (if so equipped), and speedometer drive pinion. For transmission overhaul, or rear seal replacement, apply hand brake, remove flange nut (flange holding Tool C-3281). Disconnect hand brake cable, remove brake drum and flange assembly (puller Tool C-452) and oil seal (puller Tool C-748). Pull transmission straight back until pinion shaft clears clutch disc, then lower transmission.

POWERFLITE TRANSMISSION

Torque Converter and hydraulically operated two speed transmission.

► *PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION: See "PowerFlite" Transmission in Transmission Section.*

► *TESTING & TROUBLE SHOOTING: See "PowerFlite" Transmission in Transmission Section.*

Lubrication: Check fluid every 1,000 miles, drain and refill every 20,000 miles with Automatic Transmission Fluid type "A".

Checking Fluid Level - *See "TorqueFlite" below.*

Throttle Linkage Adjustment: *See CARBURETOR above.*

► *OTHER POWERFLITE SERVICE DATA: See "PowerFlite" Transmission in Transmission Section.*

TORQUEFLITE TRANSMISSION

Torque Converter and hydraulically operated three speed transmission.

► *PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION: See "TorqueFlite" Transmission in Transmission Section.*

► *TESTING & TROUBLE SHOOTING: See "TorqueFlite" transmission in Transmission Section.*

Lubrication: Check fluid every 1,000 miles, drain and refill every 20,000 miles with Automatic Transmission Fluid type "A".

Checking Fluid L v l - *CAUTION - Following procedure and fluid level supersede previous recommendations.* Check transmission COL D if possible. Idle engine with brakes applied, press all pushbuttons in turn, then check fluid level on dipstick with engine idling in "N". Maintain level as follows:

Cold Transmission (After standing and before being driven for several miles) - Level should be between "L" mark and ½" below "L" mark. Add oil if below ½" below "L" mark, remove oil if above "L" mark. Do not add oil if level within above range.

Hot Transmission (After being driven several mil s) - Level should be between "F" mark and ½" below "F" mark (on cars with first type dipstick with distance of 1 5/8" between "F" and "L" marks, level should be ½" below "F" mark). Add oil if level below "L" mark to bring level up to ½" above "L" mark, remove oil if level above "F" mark. Do not add oil if level within above range.

Throttle Linkage Adjustment: *See CARBURETOR above.*

► *OTHER TORQUEFLITE SERVICE DATA: See "TorqueFlite" Transmission in Transmission Section.*

UNIVERSALS

Detroit Universals. Ball & Trunnion front, Cross rear.

Rear Universal Joint Operating Angle - *See "Propellor Shaft Notes" in Dodge Special Data.*

REAR AXLE

Own. Semi-floating, hypoid gear type with Hotchkiss drive. *NOTE* 'Two pinion gear type differential used in all models.

See "Dodge Hypoid" in Rear Axle Section.

► *REAR AXLE LUBRICANT LEVEL CAUTION:* Recommended lubricant capacity of 3½ pints will bring lubricant level to ½" below bottom of filler plug opening. DO NOT ADD lubricant to bring level up to bottom of filler plug opening.

Ratios:	Std. Trans.	PowerFlite	TorqueFlit
D-66	3.73 (41-11)	3.36(37-11)	3 18(35-11)
D-67	3 73 (41-11)		3 18(35-11)
D-70,D-71	3 91 (43-11)		3 36(37-11)
D-500	①3 73 (41-11)		②3.18(35-11)
D-500-1	③3.73 (41-11)		②3.18(35-11)

①- 3.54(39-11), 3.91(43-11) Optl.

②- 3 36(37-11), 3 54(39-11) Optl.

③ - 2 92(38-13), 3.18(35-11), 3 36(37-11), 3.54(39-11), 3.73(41-11), 3.91(43-11), 4 1(41-10), 4 3(43-10), 4.56 (41-9), 4.89(44-9), 5 12(41-8), 5.38(43-8), 5 83(35-6), 6.17(37-6).

Backlash - .006- 010".

Carrier Removal: Remove axle shafts (see below), disconnect rear universal joint, remove differential carrier capscrews, lift out carrier assembly.

► *RANJO HOUSING INSTALLATION NOTE:* Check rear universal joint angle. *See "Propellor Shaft Notes" in Dodge Special Data.*

Axle Shaft Removal: Jack up car, remove wheels, hub and drum assembly (Tool C-845). Block brake pedal, disconnect brake line at wheel cylinder, remove axle key, brake and dust shield. Note number of shims removed from axle housing, use puller Tool C-499 to remove axle shaft and bearing, remove inner seal (Tool C-637)

Wheel Bearing Adjustment: Shims between backing plate

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

and axle housing. With wheel hub removed, check end play with dial indicator. To adjust, remove backing plate (see above), add or remove shims (furnished .005", .010", .0125", .015", .030" thick) equally at both wheels. **Endplay** - .003-.008"

SHOCK ABSORBERS

"Oriflow". Direct acting, hydraulic type. Serviced by replacement.

FRONT SUSPENSION

Independent. New "Torsion-Aire" type with ball joints and torsion bar springing.

See "Torsion-Aire" in Front Suspension & Wheel Alignment Section.

Steering Axis Inclination - 6 1/2° at 0° Camber.

Caster - (Manual Steering) Neg. ¾° ± ¾°, (Power Steering) Pos. ¾° ± ¾°. *NOTE* - Both sides should be set at same dimension.

Camber (Right Wheel) - 0° ± ¼°, 0° preferred.

Camber (Left Wheel) - Pos. ¼° ± ¼°, Pos. 3/8° preferred.

► *CASTER & CAMBER ADJUSTMENT NOTE: Adjusting shims located between upper control arm support bracket and frame side rail.*

To -In - 3/32-5/32". 1/8" preferred.

To -Out on Turns - With outer wheel at 20°, Inner wheel should be 21°37'.

STEERING

Manual: Gemmer. Worm and three-tooth roller.

See "Gemmer Worm & Roller" in Steering Section.

Power Steering: Co-Axial. Components encased in tubular housing which is located at bottom of, and concentrically around axis of steering wheel.

See "Co-Axial" Power Steering in Steering Section.

Steering Linkage: *See "Steering Linkage" in Steering Section.*

Steering Wheel & Horn Button Removal: *See "Gemmer Worm & Roller" in Steering Section.*

Steering Gear Removal: *See "Gemmer Worm & Roller" in Steering Section.*

BRAKES

Service: "Total-Contact" (Floating Shoe) type.

See "Chrysler, De Soto, Dodge, Plymouth Center-Plane" Brakes in Brake Section.

Drum Diameter - 12" (D-500-1), 11" (All Others).

Wheel Cylinder Diameters - 1 1/8". Single acting (front), double acting (rear).

Replacement Lining & Shoes - Linings or shoes with linings furnished Standard and .030" oversize.

Lining - Molded asbestos (bonded to shoe).

Lining Width - (D-500-1) 2.5" All. **(All Others)** 2.5" (Front), 2.0" (Rear with 2.5" used on 4-Door Hardtops and Convertibles).

Length - 16.6" (D-500-1), 11.5" (All others).

Thickness - .20" All models.

Clearance - Front Wheels - .006". Turn each adjusting cam in direction of forward wheel rotation until shoe is solid against drum and wheel is locked. Turn cams in opposite direction until no drag is felt.

Rear Wheels - .006". Same as for front wheels except that forward shoe adjusting cams are rotated in direction of forward wheel rotation and rear shoe cams are rotated in direction of reverse wheel rotation.

Braking Power - D-66, D-67 65% Front, 35% Rear (except 4-Door Hardtops & Convertibles which are 60% Front, and 40% Rear).

All Others - 60% Front, 40% Rear.

Master Cylinder: On engine side of dash panel opposite base of brake pedal.

Checking Fluid - Filler plug at top of master cylinder (on dash panel in engine compartment).

Removal - Disconnect pedal return spring, pushrod, brake tube and stop light switch leads. Remove master cylinder to dash bolts, slide master cylinder straight out from dash.

Power Brakes: New "Oval Piston Assist" type. Mounted on firewall and linked to upper end of brake pedal (used with standard master cylinder).

See "De Soto, Dodge Oval Type Piston Power Unit" in Brake Section.

Removal - Place block or wedge between power lever and bracket (to prevent damage to ramp of trigger arm). Mark across power unit adjacent to vacuum test port and mounting bracket; and between mounting bracket and firewall. Disconnect vacuum hose, remove bolts securing bracket to firewall, slide unit and bracket straight forward.

Parking Brake: On shaft at rear of transmission. 6" external contracting type used with Synchro-mesh Trans., internal expanding type used with Automatic Trans.

Adjustment - *See "Brake Notes" in Dodge Special Data.*

Lining	Width	Thickness	Length
6" Ext. type	2"	5/32"	15.38"
7" Int. type	2"	5/32"	13.44"

MISC. MECHANICAL

Windshield Wipers: Auto-Lite electric. EPW-4001A (Single Speed), EPV-4001B (Variable Speed).

Air Conditioning: Heater-Air Conditioning.

See "Air Conditioning" in Miscellaneous Section.

Power Window Regulators: Electric type. Reversible type motor in each window. Controlled by door switch and master control switch.

See "Electric Window Regulators" in Misc. Section.

Power Seat Adjusters: Electric, 6-Way type.

See "Power Seat Adjusters" in Misc. Section.

Convertible Top Control: Electrical-hydraulic type.

See "Power Top Controls" in Misc. Section.

℄ — See Cylinder Head Installation (below) for head tightening procedure. Three different torque applications must be made.

ENGINE

6 CYL. CARS

ENGINE REMOVAL: (Conv. & Overdrive Trans.): *NOTE* DO NOT remove transmission Drain cooling system and crankcase Remove radiator, air cleaner starter battery and engine grounds and all electric wires Disconnect choke cable rod and bushing at carburetor, accelerator linkage clutch bracket spring, release rod and remove clutch bracket Disconnect wiper hose and flex line at fuel pump Remove flywheel housing upper and lower bolts and remove flywheel housing cover Remove engine insulator bracket bolts Attach lifting hook, raise engine and withdraw it from transmission

Fordomatic: Same as Conventional and Overdrive except as follows Remove converter housing lower access cover plate lower bolts and turn flywheel until one flex plate is in position to remove three flywheel-to-converter bolts then turn flywheel 180° and remove other three bolts Secure converter assembly in housing *CAUTION* - After removing flex plate bolts turn flywheel 90° so flex plates will not catch on converter housing as engine is removed Remove lower housing to engine bolts and rear splash shield and oil cooler lines retaining clip from right engine support bracket Remove filler tube bracket Support transmission on jack raise engine slightly and pull it forward out of converter housing

V8 PASSENGER CARS

ENGINE REMOVAL (Exc. Thunderbird): *NOTE* - DO NOT remove transmission Drain cooling system and crankcase and remove radiator and air cleaner Disconnect accelerator or throttle control rod wiper and fuel lines, engine and battery grounds heater hoses, and electric wires Disconnect Power Steering Pump bracket and secure pump to fender Remove coil screws, secure coil to one side and remove distributor Remove flywheel converter housing bolts, starter and dust shield (Fordomatic filler tube bracket) On Synchro-mesh Cars remove flywheel inspection cover, clutch pedal spring bracket flywheel housing to engine lower bolts and splash shield and oil filter On Fordomatic remove converter housing lower access cover cover assembly and flywheel to converter bolts Secure assembly in housing Remove converter housing to engine lower bolts, engine left splash shield and oil cooler lines retaining clip, from engine right insulator support bracket Disconnect exhaust pipe and left engine insulator at frame and remove right insulator Pull engine from transmission

Thunderbird: Same as for V8 Passenger Cars except as follows: Raise car remove both steady rest brackets from engine

6 CYLINDER TRUCKS

ENGINE REMOVAL: (Courier & Ranchero) - *See Passenger Cars* (Coventional Truck & School Bus) - Remove hood drain cooling system and crankcase Remove radiator and shroud as an assembly Remove air cleaner Disconnect choke cable accelerator or throttle control rod Remove accelerator spring Disconnect exhaust manifold and fuel line Remove all electric wires and ground strap Remove flywheel or converter housing to engine block and engine rear plate retaining bolts Remove belts fan, spacer and pulley Disconnect heater hoses On Conventional & Overdrive trucks remove flywheel housing inspection cover and support transmission on jack On Fordomatic trucks remove converter housing inspection cover and flywheel to converter bolts Secure converter assembly in housing Disconnect transmission oil cooler inlet and outlet tubes at engine attach lifting hooks Remove engine front support to frame bracket bolts and remove engine

Parcel Delivery: Drain cooling system and crankcase and remove drivers seat assembly master cylinder cover and steering column cover plates Disconnect accelerator pedal battery ground cable and electric wires Disconnect flexible fuel lines and remove starter Remove left wheelhouse panel and center floor plate Remove rear engine cover *NOTE* - Wedge right and left frame gussets open so rear flange of cover plate will clear the slots Remove crossmember Remove accelerator bracket assembly spring and carburetor Disconnect exhaust manifold and remove muffler inlet pipe to engine bracket bolt Remove fan and bracket as an assembly and remove radiator Remove engine front support bolts flywheel or converter housing cover Remove flywheel housing or converter housing to engine block and engine rear plate retaining bolts Remove engine rear support cap screws and engine breather tube Support transmission on Jack On Fordomatic Trucks disconnect transmission oil cooler inlet and outlet hoses at engine Drain transmission and remove filler tube Install drain plugs in torque converter Remove engine

V8 TRUCKS

ENGINE REMOVAL: (Courier & Ranchero) - *See Pass Cars* (Conventional Truck & School Bus) - Remove hood drain cooling system and crankcase Remove air cleaner fan spacer belt radiator and shroud assembly Open air reservoir drain cock (if so equipped) Disconnect air line at front of engine place to one side Disconnect heater hoses and electric wires and engine ground strap Remove starter and dust seal Disconnect exhaust manifold and choke control cable Remove engine front support bolts accelerator return spring and disconnect fuel line vacuum brake booster hose On Conventional & Overdrive trucks disconnect accelerator rod assembly throttle control cable and cable clamp at governor (4-barrel carburetor) Remove clutch release lever retracting spring (272 ECR) flywheel housing inspection cover flywheel housing retaining bolts On Fordomatic trucks remove transmission cover plate with accelerator assembly Disconnect oil cooler water hoses Support transmission attach lifting hooks raise engine slightly and pull engine from transmission

Parcel Delivery: Drain cooling system and crankcase Remove drivers seat master cylinder inspection cover steering column cover plates Disconnect accelerator pedal, electric wires and battery ground cable Remove left wheelhouse panel and center floor plate Remove engine cover panel *NOTE* - Wedge right and left hand frame gusset open so that rear flange of engine rear cover plate will clear slots Remove crossmember Disconnect radiator hoses Remove engine front insulator bolts. Disconnect speedometer cable and drive gear and vacuum brake hose Disconnect choke control cable and remove right exhaust manifold to exhaust pipe retaining nuts carburetor air cleaner stud and engine rear support capscrews hand brake cable bracket and cable Disconnect universal joint to transmission output shaft flange, manual control rods at transmission lever (Fordomatic), clutch hydraulic slave cylinder hose (Conventional & Overdrive) attach lifting hooks remove engine and transmission as an assembly

ENGINE MOUNTINGS

THUNDERBIRD

ENGINE FRONT SUPPORT: Removal - Remove insulator nut and bolt, and insulator Remove insulator to bracket bolts and nuts Jack up engine remove insulator assembly and spacer

Installation - Position spacer and insulator assembly and lower engine Install insulator bolt, lower insulator and nut Tighten nut to 85-95 ft lbs Install insulator assembly to bracket bolts flat washer lockwasher and tighten nuts to 45-50 ft lbs

(THUNDERBIRD)

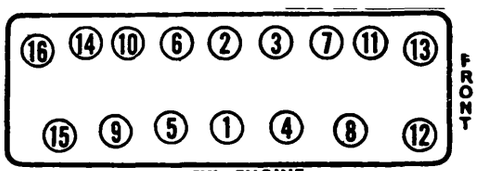
ENGINE STEADY REST: Removal - Remove nut washer and bushing from lower end of steady rest rod Remove upper bracket bolts remove assembly from engine Disassembly - Remove lower bushing and washer, nut, washer and insulator and bracket from top of rod Remove remaining insulator washer and nut from top of

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

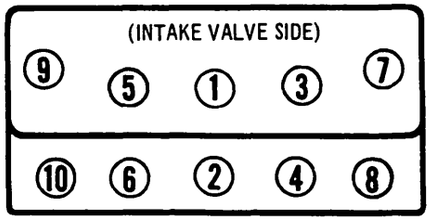
rod.

Assembly - Install bottom nut, washer, insulator and bracket on upper end of rod. Install top insulator, washer, and nut on upper end of rod. Install top bushing and washer on lower end of rod.



Installation - Install assembly in car, tighten engine bracket bolts to 30-35 ft. lbs. Install bottom washers, bushing and nut on lower end of rod.

Adjustment - With both engine and frame brackets in place and tightened, loosen lower and upper nuts on both steady rests. Let engine seek its own level position, then turn lower nut, washer, and insulator (each side of engine) up against lower (chassis) support bracket, tighten lower nut until distance from washer to washer (at lower end) is 1.29-1.33". Turn lower nut, washer, and insulator (at upper end) up against engine support until distance from lower washer to bracket is 1.08" then turn upper nut, washer and insulator down against bracket until distance from upper washer to bracket is .77". Total distance, washer to washer, (at upper bracket) should be 1.97-2.02".



CYLINDER HEAD & MANIFOLD

6 CYL. ENGINE

Installation - Apply coating of cylinder head gasket sealer to both sides of gasket, position gasket over guide studs, place cylinder head over guides and lower carefully. Coat threads of each bolt with small amount of water resistant sealer, install two bolts at opposite ends of head to hold gasket in place and remove guide studs. Install balance of bolts, tighten bolts in sequence as shown in diagram, as follows: Tighten to 50 ft. lbs. (Cold) in proper sequence, then 65 ft. lbs. (Cold) in proper sequence. Install pushrods in proper locations, position rocker arm assembly on head and install oil drain line, clip and retaining screw on No. 1 bracket. Make sure line enters shaft locating hole. Position oil feed line on No. 6 bracket, with lower end of line, "O" ring seal in oil supply counterbore, then install bolt. Tighten all retaining bolts to 45-55 ft. lbs. torque. Make preliminary (Cold) valve lash adjustment. Install manifolds, lines, and wires. Connect wiper hose,

6 CYL. ENGINE

V8 ENGINE

battery cable and fill cooling system. Remove tape from air horn, connect choke wire, start and run engine at 1200 RPM for approximately 30 minutes. Tighten cylinder head bolts in proper sequence to 75 ft. lbs. (Hot), recheck valve lash and engine idle as necessary.

V8 ENGINES

CYLINDER HEAD: Installation - Clean head and block gasket surfaces, coat both sides of gasket with sealer, use water sealer on threads of all head bolts. Install oil drain tube in same end bracket from which it was removed. Tube must enter locating hole in rocker shaft to position shaft. Position tube in right assembly to drain in front (No. 1 Exhaust) pushrod opening, and tube in left assembly to drain in end (No. 8 Exhaust) pushrod opening. Tighten rocker arm bracket retaining nuts to specifications. Tighten cylinder head bolts in three steps as follows: Tighten all head bolts to sequence shown in diagram to 55 ft. lbs. cold, then repeat tightening in sequence to 65 ft. lbs. After completing installation, run engine for 30 minutes at 1200 RPM to normalize block and head and again tighten all cylinder head bolts in proper sequence to 75 ft. lbs.

CRANKSHAFT & MAIN BEARINGS

(ALL ENGINES)

CRANKSHAFT THRUST BEARING ALIGNMENT: Install No. 1, 2 & 4 main bearing caps and torque to specifications. Install No. 3 main bearing cap with bolts finger tight. Pry crankshaft forward against upper half of No. 3 main bearing, pry No. 3 main bearing cap to rear to align thrust surfaces of both halves, and tighten bolts, while holding shaft forward and cap to rear, to torque specifications. Check crankshaft end play.

(ALL ENGINES)

REAR MAIN BEARING OIL SEALS: *NOTE* - Crankshaft seal is installed in groove in block and in bearing cap (6 Cyl.) or in seal retainer directly behind rear main bearing (V8). Bearing cap or retainer is sealed in block by special sealing strips inserted in vertical grooves in sides of bearing cap or retainer after they are installed in block.

Seal Installation: Install new seal in groove in cylinder block using Tool T52L-6701-AGD to drive it in place. Install seal in Bearing cap groove (6 Cyl.), in retainer groove (V8), using Tool as above. Cut surplus seal flush with block, bearing cap or retainer. Coat Bearing cap (6 Cyl.) or retainer (V8) mating surfaces with sealer, install bearing cap (6 Cyl.) or retainer (V8), and tighten bolts to correct torque. Dip side seals in engine oil and quickly install them in vertical grooves. *NOTE*- It may be necessary to drive seals in place the last ½" of travel. DO NOT use sealer on side seals. They will expand when dipped in engine oil.

Testing Seal Installation – To check vertical seal installation for leaks, squirt a few drops of oil into parting lines between cap or retainer and cylinder block from the outside. Blow compressed air against seals from the inside of the block. If air bubbles appear in the oil, it is an indication of oil leakage.

ENGINE FRONT COVER

6 CYL. ENGINES

ENGINE FRONT COVER: Removal – Remove radiator, crankshaft damper, oil pan, and cover retaining screws, cover and gasket. **Installation** – Coat gasket surface of block and cover with sealer. Install cover and tighten screws to specifications. Install oil pan, crankshaft damper and belt. On Power Steering cars, install power steering pump pulley and belt. Install radiator.

V8 ENGINES

ENGINE FRONT COVER: Removal - Remove radiator, fan blades and hub, crankshaft dampener and fuel pump. On Power Steering Cars, disconnect power steering pump bracket from water pump, secure power steering pump to fender apron. On Thunderbird, remove engine front support. On conventional cars with Air Conditioning, remove condenser brackets, and move out of way. Remove generator mounting bracket bolts, move bracket out of way. Disconnect heater hose at water pump, remove remaining bolts (including oil pan to front cover bolts) then remove water pump (and spacer on Thunderbird), with front cover as an assembly.

Installation - Install oil pan with retaining bolts loose. Clean front cover and block gasket surfaces, coat gasket surface of cover, block and bolt threads with sealer. Place gasket and cover in place using pilot assembly over crankshaft to align cover with bolts finger tight. Install generator support and adjusting arm brackets. On Air Conditioned Cars, connect condenser brackets to cylinder front cover. Tighten cover bolts to specifications. Install oil pan to cylinder front cover bolts and tighten oil pan bolts to specifications. Install dampener, fuel pump, power steering pump bracket to water pump. Install fan blades and hub. Adjust belts, connect heater hoses, install radiator, fill cooling system and crankcase and check for leaks.

FRONT COVER OIL SEAL: Drive out old seal with a pin punch, then clean out recess in cover. Coat new seal with grease, then install seal with Tool T52L-6700-BEE. Drive seal in until it is fully seated in recess. Check seal to be sure spring did not come out during installation.

CAMSHAFT & BEARINGS

(6 CYL. ENGINE)

CAMSHAFT REMOVAL: Remove air cleaner, tape air horn closed, remove distributor cap. Disconnect high tension wire from coil and spark plug wires, remove fuel pump. Disconnect primary coil wire from engine clip and remove pushrod cover. Remove rocker arm assemblies, pushrods (in sequence), radiator support bar, radiator, and grille assembly. Remove fan belt, vibration dampener, oil pan to cylinder block two front bolts, engine front cover. Turn crankshaft until timing marks on sprockets are 12 link pins apart on drive side, and remove camshaft sprocket bolt. Mark distributor housing and cylinder block for position of rotor and housing reinstallation, and remove distributor. Remove sprockets and timing chain woodruff key camshaft thrust washer. Turn camshaft and raise lifters off lobes and secure with clips. Draw camshaft out carefully so as not to damage bearings.

(V8 ENGINE)

CAMSHAFT REMOVAL: Drain cooling system and crank-

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

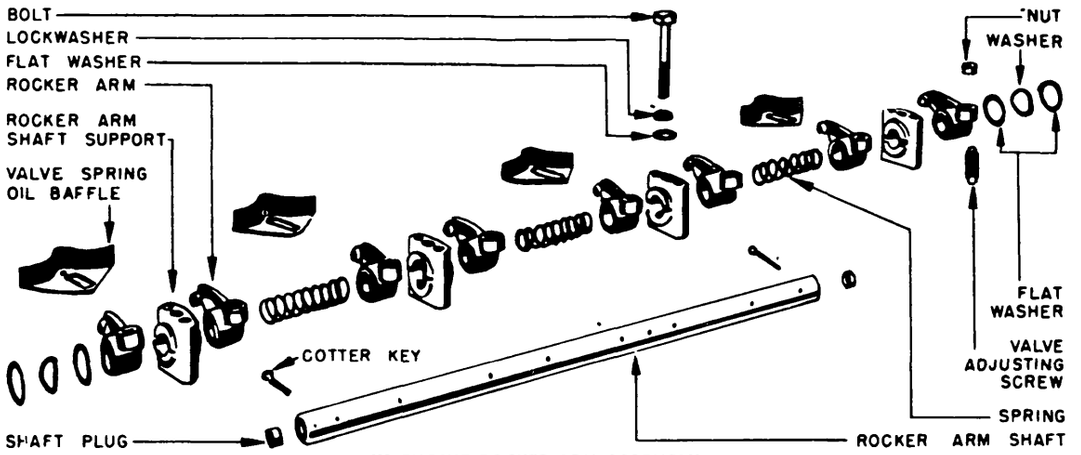
case, remove radiator, cylinder front cover oil pan. Remove intake manifold, carburetor and coil as an assembly. Remove rocker arm covers, rocker arm assemblies and valve pushrods in sequence. Remove pushrod chamber cover. Crank engine until timing marks on sprockets and chain are both on drive side of chain and 12 pins between marks. Remove distributor cap, scribe line on distributor housing and cylinder block to mark position of rotor and distributor housing for installation, then remove distributor. Remove camshaft sprocket bolt, fuel pump eccentric and counterweight. Remove sprockets and timing chain as an assembly. Remove camshaft thrust plate, woodruff key and spacer. Turn camshaft until lifters can be raised up, with a magnet or fingers, until clear of cam lobes, and secure them in this position. Carefully remove camshaft.

VALVE SYSTEM

ALL ENGINES

ROTATABLE VALVES: "Rotatable" type valves operate directly in valve guide holes in cylinder head and are removed and installed as follows:

Valve Removal: Use Tool 6513-EE to compress valve springs, remove vaove spring locks, retainer sleeve, retainer, spring, and "umbrella" type oil seal. Discard oil seal.



Valve Assembly Installation: Install valve in port from which it was removed. Install valve stem oil seal with cupped side toward valve guide boss. Install valve spring, spring retainer, retainer sleeve, and valve locks.

VALVE SEAT INSERTS

V8 "272" ECR ENGINE

"272 ECR" ENGINE VALVE SEAT INSERT: Removal - Invert head and insert drift through exhaust valve port, drive seat out.

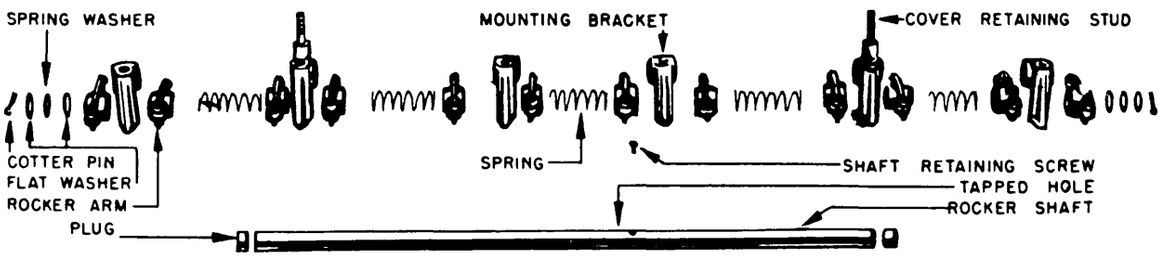
Installati n: Counterbore insert recess to engine specifications. Cut slightly (.001-.002") below old counterbore depth to clean up this face. Clean out chips and all oil from recess. Chill oversize insert and installation tool in dry ice for ½ hour. Position insert on tool with small radius on outer edge facing outward. Pilot the driving tool in valve guide, then drive the insert into counterbore until it is fully seated. Do not peen area around insert. Reface new valve seat insert. *CAUTION*-Installation of insert must be performed immediately on removal of tool and insert from dry ice. Protect hands with gloves when handling chilled insert and tool.

V8 ENGINE ROCKER ARM ASSEMBLY

VALVE GUIDES

ALL ENGINES

VALVE GUIDES (Oversize Valve Stem Installation): Use Tool T52L-6085-AEE Piloted Reamer to ream cylinder head valve guides for oversize stems. Reamers are furnished in .003", .015", .030" oversizes. Pilots are furnished Standard, .003", .015". Use reamers with correct pilots in sequence when reaming from standard to oversize holes. Regrind valve seats AFTER reaming guides.



ROCKER ARMS

(6 CYL. ENGINES)

ROCKER ARMS: Removal – Remove rocker arm cover, cap screw and clip from No. 6 rocker arm support bracket, pull oil feed line out of bracket, then pull it out of block with pliers, being careful not to damage line. Loosen rocker arm adjusting screws to remove valve spring load from rocker arms, then remove rocker shaft assembly.

Disassembly – Pull oil drain line and clip out of No. 1 support bracket, remove cotter pins at each end of rocker arm shaft, and remove flat washers and spring washers, and plugs from each end of shaft. *NOTE* - Plugs are interference fit. To remove, drill or pierce plug at one end, then force other end out with steel rod, and repeat on first plug. Slide rocker arms, springs, and brackets off of shaft, being sure to identify parts.

Reassembly – Oil all parts with engine oil. Drive new plugs in each end of shaft with cup side out using a blunt tool, install a flat washer, spring washer, another flat washer, and a cotter pin on end of shaft. Install rocker arms, support brackets, and springs in order shown in diagram, and complete assembly by installing remaining flat washers with spring washer between them and install cotter key.

6 CYL. ENGINE R CKER ARM ASSEMBLY

(V8 ENGINES)

ROCKER ARMS: Removal – Remove rocker arm cover, loosen adjusting screws to release valve spring tension on rocker arms, then remove rocker arm assembly, and baffle plates. Note position of oil tube and bracket for oil drain into No. 1 exhaust (right rocker arm assembly), No. 8 exhaust (left rocker arm assembly). Remove and identify pushrods for correct reassembly.

Disassembly – Remove cotter pin from each end of rocker shaft, remove flat washers and spring washers, slide rocker arms, springs and brackets off shaft. *NOTE* - Oil tubes must go in same bracket from which they were removed. Identify parts for correct reassembly. Remove plugs from each end of shaft. *NOTE* - Plugs are interference fit. To remove, drill or pierce plug at one end, then force out other plug with steel rod, then force out first plug.

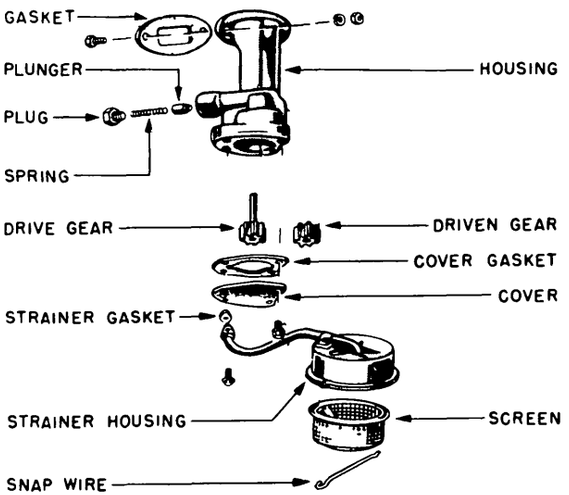
Reassembly – Oil all parts with engine oil. Drive new plugs in each end of shaft with cup side out, using a blunt tool. Install a flat washer, spring washer, another flat washer, and a cotter pin on end of shaft. Install rocker arms, support brackets, and springs in order shown in diagram, and complete assembly by installing remaining washers with spring washer between them and install cotter key.

OILING SYSTEM

OIL PUMP

6 CYL. ENGINE

OIL PUMP: Gear type oil pump mounted in crankcase in line with distributor. Pump driven by means of a hex drive shaft. Shaft is pinned in end of distributor drive shaft by a roll pin, and other end seats in end of oil pump drive shaft. Pressure relief valve is incorporated



CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

in oil pump housing.

Removal – Remove distributor, oil level indicator, and oil pan. Remove two nuts and lockwashers retaining pump to cylinder block. Remove pump and gasket.

Disassembly: Remove screen assembly retaining screws, screen assembly, and gaskets Remove cover retaining screws, cover, and gasket. Push pump drive shaft and drive gear assembly from pump housing Remove driven gear Remove oil pressure relief valve plug, spring, and and plunger Remove snap wire retaining pump screen, and remove screen from housing

6 CYL. OIL PUMP

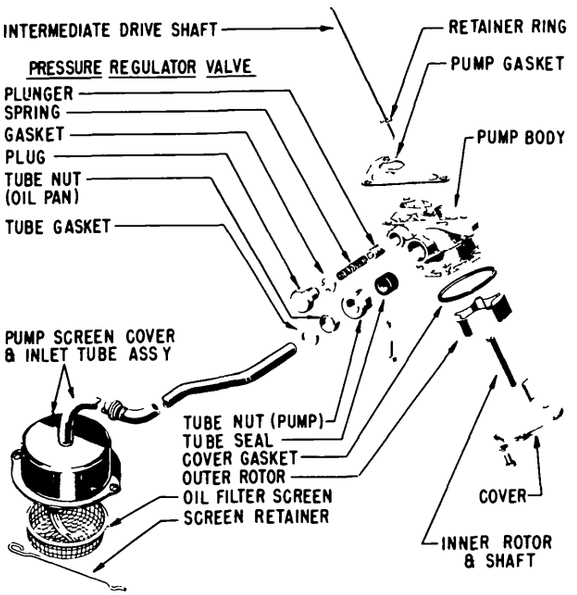
Inspection: Wash all parts in solvent clean inside of pump housing and pressure valve chamber with a brush Check inside of pump housing outer race and rotor and shaft for wear If pump cover mating surface is worn scored or damage it should be replaced

Outer Race Clearance - 006- 009" Check with feeler gauge between race and housing

Outer Race & Rotor Clearance - Place straightedge across housing between bolt holes Clearance between straightedge and rotor and race should be 001 0035" *NOTE* - Outer race shaft and rotor are replaceable as assemblies only

Drive Shaft to Bearing Clearance - 0015- 0029"

Pressure Valve Piston Clearance - 0015- 0029"



Relief Valve Spring Pressure - 9 2 10 4 lbs at 80"

Reassembly: Apply engine oil to all moving parts Install relief valve plunger spring and plug and tighten to 33 38 ft lbs Slide drive gear and shaft assembly into housing Install drive gear Apply sealer to both sides of gasket Install gasket and cover with screws loose Secure screen in place with retainer and install inlet tube gasket and inlet tube assembly on pump cover Now tighten cover retaining screws to 12 15 ft lbs and check pump for free rotation

Installation: Install new "O" ring seal on pump end of tube, install tube and seal in pump Insert intermediate shaft into oil pump drive shaft position gasket on pump housing and install pump and shaft as an assembly *CAUTION* - Rotate intermediate shaft to permit pump to be seated without pressure Tighten pump retaining screws to 12-15 ft lbs Tighten the jam nut at oil pump 10-12 ft lbs and nut at oil pump 28-32 ft lbs Do Not overtighten inlet tube nuts

V8 ENGINES

OIL PUMP: Rotor type mounted externally on left rear side of engine and driven by distributor through intermediate drive shaft Oil pressure relief valve installed in pump body

V8 ENGINE OIL PUMP

Removal: Disconnect oil inlet tube at pump and remove "O" ring seal Loosen tube at pan Remove pump to block retaining screws remove pump intermediate shaft and gasket

Disassembly: Remove cover screws cover and "O" ring seal Remove inner rotor and shaft then outer race Remove oil pressure relief valve chamber plug gasket spring and plunger

Inspection: Wash all parts in a solvent and dry them thoroughly Use a brush to clean inside of pump housing and pressure relief valve bore Be sure all dirt and chips are removed Remove all old gasket material from pump body and cover Check pump housing for damage or excessive wear Check pump gear teeth for damage or wear Check compression of relief valve spring (9 76-9 84 lbs at 1 56") Check relief valve clearance in relief valve bore Check drive gear to shaft clearance (001- 002" maximum) Pump shaft to housing bearing clearance should be 0015- 0029" Check gear end clearance with Dial Indicator or Plastigage Install drive gear and shaft assembly in housing Install gasket then lay piece of Plastigage on gear and install cover Remove cover and check thickness of Plastigage (0015- 0055" 0015- 003" preferred) with Dial Indicator Place gasket on body and straight edge across gasket Attach Dial Indicator to body with contact button on end of gear to read gear play Subtract 005" from reading for gasket compression

Reassembly: Lubricate all parts install pressure relief valve plunger spring and plug torque plug to 33 38 ft lbs Slide drive gear and shaft assembly into housing install driven gear apply sealer to gasket and install cover Assemble screen cover inlet tube gasket and tube on pump cover tighten cover screws to 12-15 ft lbs Check rotation of pump shaft for freedom of operation

Installation: Place new gasket on retaining bolts slide pump mounting flange over retaining bolts install lock washers and nuts Install oil pan fill crankcase Run engine and check pressure

OIL FILTER

(TRUCK ENGINES)

OIL FILTER: Filter is full-flow type and should be replaced at 4000 mile intervals (or more often if required by operating conditions)

►*REPLACEMENT CAUTION Use Replacement Kit, Part No. B2A-6731-A, which includes correct filter element and NEW GASKETS WHICH MUST BE USED. CAUTION–Use of by-pass filter element would restrict oil flow and might cause failure of engine.*

Filter Installation: Wash all parts in a solvent and dry them thoroughly Make sure all openings in center bolt are clean Install new fibre gasket on center bolt, then place bolt through filter housing Install spring and spring assembly on bolt, making sure seat tangs are engaged in spring Install a new neoprene gasket and new filter element over center bolt *(NOTE–Be sure* two elongated holes in oil filter diaphragm are at top when positioned on block) Install new neoprene gasket in filter housing recess Place filter assembly in position, and thread center bolt into adapter, finger tight Rotate filter assembly slightly, in each direction, to make sure gasket is seated evenly Tighten center bolt ¾-1 complete turn (20-25 ft lbs) With engine at normal operating temperature and operating at fast idle, check for oil leaks past housing gasket or around center bolt gasket If oil leaks past housing gasket, check housing for proper seating If oil leaks past center bolt gasket, check center bolt for proper torque or replace gasket *NOTE*–Pressed paper type element does not use neoprene gasket

MODEL IDENTIFICATION

VEHICLE NUMBER: Stamped on patent plate on left front body pillar.
First Number:- 100001.

►*VEHICLE NUMBER NOTE:* Vehicle number (example *A7FV100501*) includes following identification data in sequence.

Eng. Type ①	Year ②	Assy. Plant	Body Style ③	Serial No.
A	7	See below	See below	100501

① - **A** - 6 Cyl. 223 cu. in. engine.
② - Last digit of model year.
③ - **C** - Conv. (Fairlane "500"). **F** - Ranchero. **G** - Tudor & Fordor (Custom & Custom "300"). **H** - Thunderbird. **R** - Ranch Wagon (Custom "300"). **S** - Sedan Delivery (Courier). **T** - Tudor & Fordor - Concealed Pillar (Fairlane & Fairlane "500"). **V** - Victoria Tudor & Fordor (Fairlane & Fairlane "500"). **W** - Retractable Hardtop (Fairlane "500"). **X** - Country Sedan. **Y** - Country Squire.

Assembly Plant Designation

A - Atlanta	**F** - Dearborn	**N** - Norfolk
B - Buffalo	**G** - Chicago	**P** - St. Paul
C - Chester	**K** - Kansas City	**R** - San Jose
D - Dallas	**L** - Long Beach	**S** - Somerville
E - Mahwah	**M** - Memphis	**U** - Louisville

TUNE-UP

►*POWER POUND CORRECTION:* This condition may be caused by the cylinder head if normal external corrections, such as tune-up, engine alignment, exhaust system grounding, have not eliminated the trouble. Check engine compression and if compression pressure is found to be 170 lbs. or greater, it is recommended that the cylinder head be replaced by a 1956 head, Part No. B6A-6049-D Temperature Indicator Bulb, Part No B7A-10884, must be used with the 1956 head.

►*ENGINE PINGING (AT LOW SPEED UNDER LOAD) CORRECTION: Requires modification of Carburetor (B7A-9510-N), and Distributor (B7A-12127-C) See DISTRIBUTOR and CARBURETOR below*

COMPRESSION PRESSURE: 150 lbs. at cranking speed. Maximum variation between cylinders 10 lbs.

VACUUM READING: Steady 18-20" idling at 475-500 RPM in Neutral.

VALVE TAPPET CLEARANCE: .019" Intake & Exhaust (Hot & Cold). Adjust all tappets to .019" clearance while engine is cold, then again check all tappets for .019" clearance after running engine for 30 minutes to normalize temperature.

►*SELF LOCKING VALVE TAPPET ADJUSTING SCREW NOTE:* Special threads on adjusting screw provide interference fit. 3 ft. lbs. (36 in. lbs.) interference when center section of screw threads are fully engaged with rocker arm threads. Replace screw and/or rocker arm as necessary when interference is below this specification

MANIFOLD HEAT CONTROL· Automatic thermostatic type with counterweight. Valve is closed when engine is at normal temperature and running at slow idle, and opens when operating at high RPM Spring is installed with ¾ turn windup and hooked over stop pin.

IGNITION

FIRING ORDER: 1–5–3–6–2–4.

SPARK PLUG GAP: .032-.036".
Spark Plugs - Champion 870. 18 mm. Torque to 15-20 ft. lbs.

►*SPARK PLUG CAUTION:* Spark plug has tapered seat and does not require a sealing gasket. It is important that plugs be torque tightened within range of 15-20 ft.lbs.

COIL: Ford No. B6A-12029-B.
Ignition Current - 2.5 amps. idling, 4 5 amps. stopped.
Resistor - Ford B6A-12250-D. 1.3-1.4 Ohms.

►*COIL RESISTOR NOTE:* Resistor is connected in lead from ignition switch to coil. Resistor is by-passed during cranking by a lead from starter solenoid to battery terminal of coil.

DISTRIBUTOR: Ford No. B7A-12127-C. "Loadomatic" type of same design used on previous models.

►*DISTRIBUTOR MODIFICATION TO ELIMINATE ENGINE PING:* Replace distributor primary advance spring with Part No. 7RA-12192 and secondary advance spring with Part No. FDE-12225-A. Calibrate distributor to modified advance table below. *See also CARBURETOR below*
Condenser - Ford No. 7RA-12300-C. **Capacity** .21-.25 mfd.
Contact Point Set - Ford No. FAA-12171-A.
Breaker Gap - .024-.026".
Cam Angle - 35-38°.
Breaker Arm Spring Tension - 17-20 ozs.
Rotation - Clockwise viewed from above.

Advance Performance (Unmodified Distributor) ►With Distributor on Test Stand

Distr. Degrees	Vacuum (" of Hg)	Distr. RPM
0±½	0	300
0 ±½	2¼	500
3-4	5	800
7¼-8½	6	1200
9¼-10½	5¾	1500
12-13¼	4¼	2000

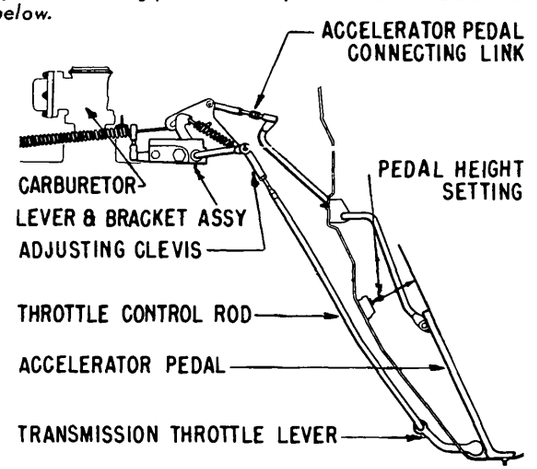
Advance Performance (Modified Distributor) ►With Distributor on Test Stand

Distr Degrees	Vacuum (" of Hg)	Distr. RPM
0	29	600
1-2	55	800
6¼-7¼	1 36	1200
10½-11½	2 66	1700
11-12¼	3 38	2000

►*DISTRIBUTOR INSTALLATION CAUTION:* Be sure oil pump intermediate shaft engages the seat in the oil pump. It may be necessary to turn over the engine with starter after distributor drive gear is partially engaged, in order to engage intermediate shaft fully in oil pump.

Initial Distributor Timing: Set engine crankshaft so that No.1 cylinder is at TDC after compression stroke (with timing mark in line with pointer). Install distributor so that rotor points to the No.1 spark plug wire terminal in distributor cap.

IGNITION TIMING



S tting - 4° BTDC (Std.), 6° BTDC (Fordomatic) with engine idling at 475 RPM and vacuum line disconnected *See Initial Distributor Timing above. NOTE* - Maximum initial timing recommended is 6° BTDC (Std.) and 8° BTDC (Fordomatic).
Timing Mark - Vibration damper marked "TDC", and "3", "5", "7", "9" degrees BTDC. Align correct mark with pointer on cylinder front cover.

CARBURETOR

Ford No. B7A-9510-C (Std. Trans.), B7A-9510-D (F rdomatic), B7A-9510-N (Std. & Fordomatic), B7A-9510-Y (Std. & Fordomatic), B7A-9510-M (Special Economy). "Visi-flo" single barrel

►*CARBURETOR MODIFICATION TO ELIMINATE ENGINE PING: See "Ford Visi-flo Carburetors" in Carburetion Section*

►*CARBURETOR AIR CLEANER (DRY TYPE) NOTE Special cleaning procedure required. See AIR CLEANER below.*

FORDOMATIC TRANSMISSION THROTTLE LINKAGE

Throttle Linkage Adjustment (Fordomatic Cars): Adjust engine idle speed to 475-500 RPM with selector lever in "N" position and engine at normal operating temperature. Adjust anti-stall dashpot (see below). Set hand brake and check idle speed in Dr (Drive) range and adjust if necessary to 425-450 RPM. Pull throttle rod assembly upward firmly so transmission lever is against its internal stop, align hole in throttle rod clevis with hole in accelerator assembly by rotating clevis on throttle rod. Then lengthen throttle control rod 2½ turns counterclockwise. Assemble throttle control rod to accelerator assembly and adjust pedal height to 3.10" by changing length of accelerator assembly connecting link Road test car. If band or clutch slippage is evident, increase rod length to 3 turns but not more than 3½ turns of the clevis

Anti-Stall Dashpot (Fordomatic Cars): After engine idle speed adjusted to 475-500 RPM, turn off engine Loosen dashpot adjusting screw locknut Hold throttle in closed position and depress dashpot plunger with a screwdriver blade Turn dashpot or adjusting nut until 045-064" clearance obtained between dashpot plunger and throttle shaft lever Tighten locknut

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

FORD "VISI-FLO"

Idle Setting - Initial setting 1 turn open. Turn adjusting screw in until engine begins to run roughly from lean mixture, then turn screw out until engine begins to roll from rich mixture Turn screw in until engine runs smoothly. Favor a slightly rich mixture, rather than a lean setting

Idle Speed - 475-500 RPM (Std. & O D) 475-500 RPM (Fordomatic) with selector in Neutral and check for 425-450 RPM in Dr (Drive) range Adjust as necessary to get drive range RPM

Fuel Level - 11/16" ± 1/32" below power valve mounting surface (Tool T52L-9550-AEE).

Accelerating Pump: Inner hole for average or hot weather operation, outer hole for cold weather operation.

Fast Idle· Integral type operated by choke valve No adjustment required

Throttle Linkage Adjustment: *See CARBURETOR above*

► *OTHER DATA See "Ford Visi-flo Carburetors" in Carburetion Section*

AIR CLEANER: DRY FILTER ELEMENT type Clean every 5,000 miles, replace element every 20,000 miles

► *CLEANING CAUTION·* Clean filter element by tapping and shaking to remove dirt particles. DO NOT wash element in solvent or other liquids and DO NOT oil or lubricate

FUEL PUMP PRESSURE: 3 5-5.5 lbs. at 500 RPM.

CARB. EQUIPMENT

Fu l Pump: Ford B5A-9350-A Fuel only (Exc Fordomatic & Overdrive Cars), B5A-9350-B Fuel & Vacuum (Fordomatic & Overdrive)

Fuel Pump Pressure - 4-5 lbs at 500 RPM

See "Fuel Fumps" in Carburetion Section

Gasoline Gauge: New King-Seeley Electric "CV" (Constant Voltage) with gauge voltage regulator Ford No B7A-10804-B

Dash Unit - Ford No B7A 9280-A

Tank Unit - Ford No B6A-9278-B

See "Fuel Gauges" in Carburetion Section

Air Cleaner: DRY FILTER ELEMENT Type Clean every 5,000 miles, replace element every 20,000 miles

► *CLEANING CAUTION* Clean filter element by tapping and shaking to remove dirt particles *DO NOT wash element in solvent or other liquids and DO NOT oil or lubricate*

BATTERY

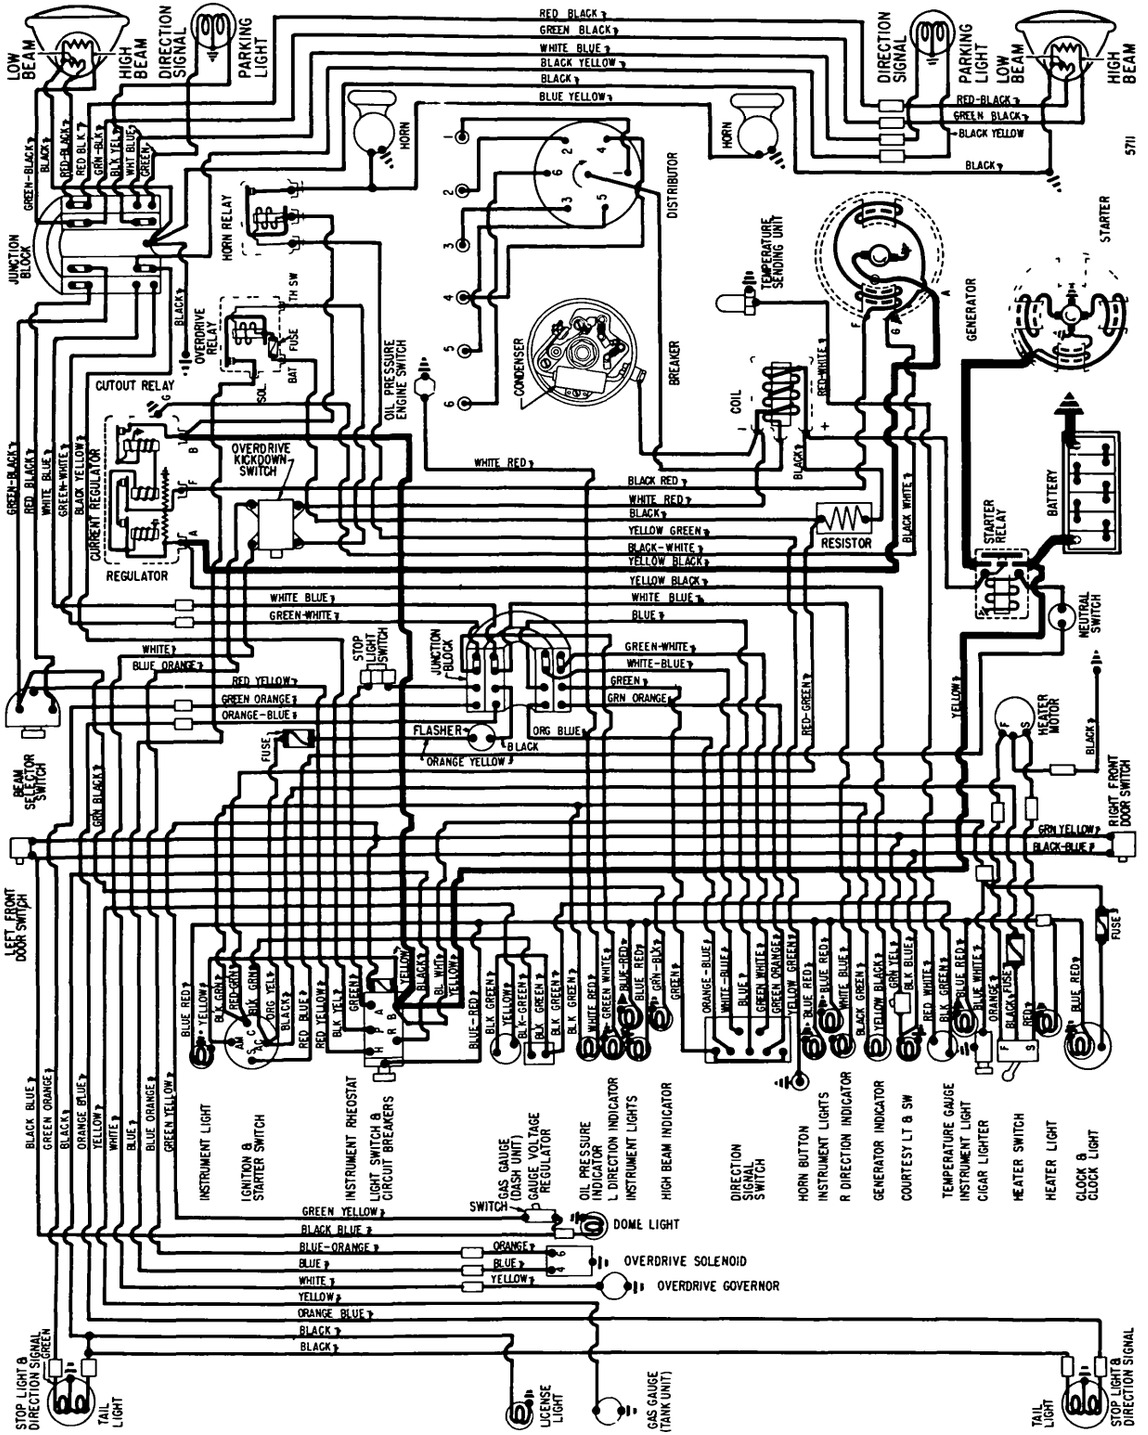
Ford B6A-10655-C. 12 volt, 11 plate, 55 ampere hour capacity or **Ford B7A-10665-A,** 12 volt, 11 plate 70 ampere hour capacity (20 hour rate)

Battery Ground - Negative, to engine block

Engine Ground - Cylinder head to dash

STARTER

Ford B6A-11002-A. Armature - B6A-11005-B



Drive - Ford ICM-11350-C Bendix "Folo-Thru"

Rotation - Counterclockwise at commutator end

Brush Spring Tensi n - 48-56 ozs

Cranking Spe d - 150-180 RPM, 190 amperes max

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Performance Data

Torque	RPM	Volts	Amperes
0 ft. lbs.	①	12.0	120
15.5 ft. lbs.		5.0	550

①- With starter on engine and engine idling.

Starting Switch: Magnetic type, Ford No. B6A-11450-A. Starter Switch is controlled by ignition switch. *NOTE* - Neutral Safety switch used on Fordomatic Transmissions.

Ford matic Neutral Safety Switch: Ford B7A-15812-A. **Adjustment** - *See "Fordomatic & Mercomatic" in Transmission Section.*

GENERATOR

F rd. Used as follows:

Generat r	Armature	Application
B6A-10002-C	B6C-10005-B	①Std.
B6A-10002-H	B6A-10005-A	②Std.
B6A-10002-F	B6C-10005-C	Special

①- With B6C-10505-B Regulator.
②- With B6A-10505-A Regulator.

►*40 AMPERE GENERATOR INSTALLATION CAUTION:* Install 2 Spacers, Ford No. 10148, to secure proper alignment of generator-to-water pump and fan pulleys. *NOTE* - Shorter or thinner spacer at front end of generator longer spacer at rear end.

Performance Data

Generator	Amperes	Eng. RPM
B6A-10002-C,H	30	1500
B6A-10002-F	40	1500

Brush Spring T nsi n - 26-34 ozs.
Fi ld Current - 1.5-1.6 amperes at 12 volts.
R tati n - Counterclockwise at commutator end.

Belt Adjustment: ¼" deflection midway between generator and water pump pulleys with light thumb pressure.

REGULATOR

Ford B6A-10505-A (B6A-10002-H Gen.), B6C-10505-B (B6A-10002-C Gen.), B6A-10505-B (B6A-10002-F Gen.).

►*SETTING CAUTION: "Temperature Compensated" type. Set to following specifications at 75°F, ambient (engine compartment) temperature, after ½ hour operation in vehicle, or after regulator heated and stabilized.*

Cutout Relay

Cuts In - 12.0-12.8 volts.

Voltage Regulator

S tting - 14.6-15.4 volts at 75°F (Ambient).
Checking & Adjusting - *See Electrical Section.*

Current Regulator

S tting - 28-32 amperes (B6A-10505-A & B6C-10505-B), 38-42 amperes (B6A-10505-B).
Checking & Adjusting - *See Electrical Section.*

MISC. ELECTRICAL

Headlamps: Sealed Beam. *See Electrical Section.*
Directional Signals: *See Electrical Section.*
Lighting Switch Removal: With control knob in "OFF" position, press spring release button on switch housing, turn shaft slightly and pull it out of switch. Unscrew mounting nut with Tool 17470-N. Remove Switch and disconnect all wires.

St p Light Switch Location: On forward end of brake master cylinder (Conventional Brakes), on top of booster assembly (Power Brakes). Master cylinder located on firewall in engine compartment.

CIRCUIT BREAKERS: On headlight switch. Combination headlight switch, circuit breaker, and fuse assembly used. One circuit breaker protects headlight circuit and second circuit breaker protects instrument, parking, stop and tail light circuits.

FUSES: Size & location as follows:
Back Up Light - SFE 7.5 ampere, in feed wire behind instrument panel.
Cigar Lighter - Sulphur disc in base or reset circuit breaker located on back of lighter socket.
Clock - 1 AG, in feed wire.
Heaters - SFE 14 ampere, in feed wire.
Interior Lamps - SFE 7.5 ampere, on lighting switch.
Overdrive - 15 AGC, on overdrive relay.
Spot Light - SFE 7.5 ampere in feed wire.
Turn Signal - SFE 7.5 ampere, in feed wire.

Horn Relay: Ford No. B7A-13853-H.

►*HORN RELAY REPLACEMENT NOTE:* When replacing a horn relay that has been shorted by water, be sure to spray new relay with a plastic ignition spray (around crimped areas in particular but not on terminals) and install three ¼" flat washers between mounting bracket and fender apron.

ENGINE

ENGINE SPECIFICATIONS: 6 Cyl. Valve-in-head.

Bore	Stroke	Displacement
3.62"	3.60"	223 Cu. Ins.

Compr. Ratio	Rated HP	Developed HP
8.6-1	31.54	.144 at 4200 RPM

Compression & Vacuum Reading - *See TUNE-UP.*

CYLINDER HEAD: *See "Cylinder Head & Manifolds" in Ford Special Data.*

TIGHTENING TORQUES: *See "Tightening Specifications" in Ford Special Data.*

ENGINE REMOVAL: *See "Engine" in Ford Special Data.*

OIL PAN REMOVAL: Drain crankcase, Remove oil level indicator, engine left and right front splash aprons. Remove stabilizer bar, flywheel housing inspection cover, oil pan retaining screws, and pan.

PISTONS

Autothermic type. Solid skirt with three rings above pin.
Removal - Pistons and rods removed from above.

Fitting New Pistons: Clearance - .0009-.0015" at bottom of skirt. Use ½" ribbon feeler inserted between piston and cylinder wall at right angle to pin on thrust side, with piston inverted and end of piston 1½" below top of block. Pull required to remove feeler should be 5-10 lbs. when using feeler gauge thicknesses as follows:
New Piston in New Bore - .0015".
New Piston in Used Bore - .0020".
Used Piston in Used B re - .0025".

Replacem nt Pistons: Furnished with fitted pins in Std. and .020", .030", .040", .060" oversize.

Installing Pistons: Install piston with indentation in head of piston toward front of engine.

PISTON PINS

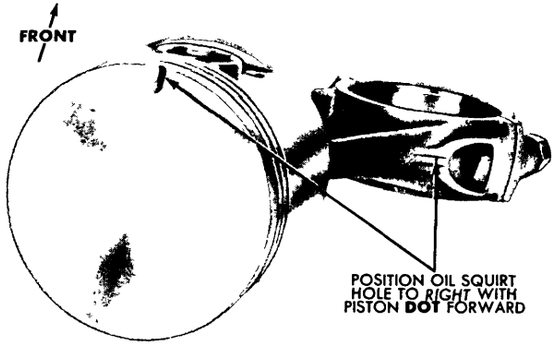
Floating type with lock ring at each end.
Diameter - .9120-.9123". **Length** - 3.016-3.030".
Pin Fit in Piston - .0001-.0003", wear limit .0008".
Pin Fit in Rod Bushing - .0001-.0003", wear limit .0008".

Replacement Pins: Standard, and .001", .002" oversize.

PISTON RINGS

Ring	Width	End Gap	Side Clearance
Compr. #1,2	3/32"	.010-.027"	.002-.0035"
Oil #3	3/16"	.015-.062"	①

①- Side sealing type ring.



Replacement Rings: Standard, .020", .030", .040", .060" oversize (Expander type).

CONNECTING RODS

Journal Diameter - 2.2980-2.2988".
Clearance - .0004-.0023", wear limit .0033".
Side Clearance - .003-.009", wear limit .012".

Replacement Bearings: Standard size (4 sizes marked **Red** & **Blue** for selective fitting) and .010", .020", .030" Undersize.

Installing Rods: Install rod with squirt hole to right and piston indentation toward front of engine.

FORD 6 CYL. PISTON & ROD ASSY.

CRANKSHAFT

Journal Diameter - 2.4980-2.4988". Four Bearings.
Bearings - Steel backed, copper lead alloy, or lead babbitt.
Clearance - **Copper Lead** - .0005-.0025", wear limit .0035". **Lead Babbitt** - .0005-.0021", wear limit .0031".

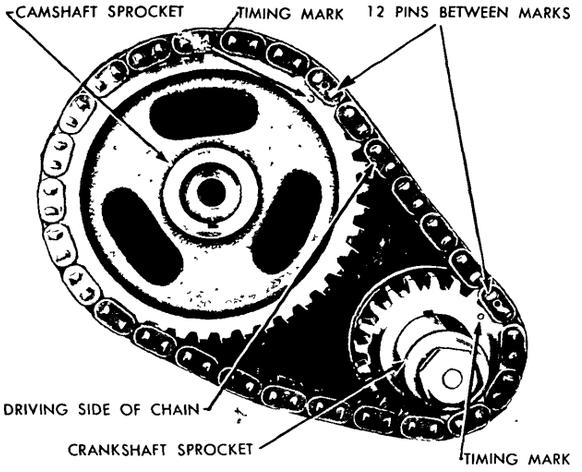
Replacement Bearings: Standard size, (4 sizes marked **Red** & **Blue** for selective fitting) and .010", .020", .030" Undersize.

End Thrust: Taken on rear intermediate #3 bearing.
Thrust Bearing Alignment - *See "Crankshaft & Main Bearings" in Ford Special Data.*
End Play - .004-.008", wear limit .012".

Crankshaft Rear Oil Seal Installation: *See "Crankshaft & Main Bearings" in Ford Special Data.*

Crankshaft Front Oil Seal Installation: *See "Engine Front Cover" in Ford Special Data.*

►*OIL SLINGER NOTE:* A crankshaft front oil slinger is incorporated on all cars and truck engines to reduce oil leakage at front oil seal. Slinger is held in



CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

place by crankshaft pulley and cylinder front cover. To remove slinger, remove cylinder front cover and slide slinger off crankshaft.

CAMSHAFT

Journal Diameter - 1.9255-1.9265".
Clearance - .001-.003", wear limit .006".
End Thrust: Taken by thrust plate and spacer behind camshaft sprocket. *NOTE* - Chamfer on inside of spacer must be toward camshaft journal.
R placement Bearings: Finished bearings furnished Standard, and .015" undersize. *CAUTION* - Rear intermediate (#3) bearing not interchangeable with other bearings.
Camshaft Removal & Installation: *See "Camshaft & Bearings" in Ford Special Data.*
Timing Chain: Side-guide type. 56 links.
► *REPLACEMENT NOTE:* Replace chain and sprockets when deflection on slack side exceeds ½" (take up all slack on driving side and measure on opposite side). Remove and install chain as a unit with both sprockets.
Camshaft Setting: Sprockets marked by "O" at one tooth. Mesh chain so that there are 12 pins between "O" marks on driving side of chain.

FORD 6 CYL. VALVE TIMING MARKS

Engine Front Cover Oil Seal (Crankshaft Front Seal): *See "Engine Front Cover" in Ford Special Data.*
Engine Front Cover Removal: *See "Engine Front Cover" in Ford Special Data*

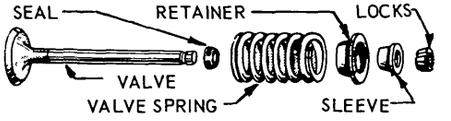
VALVES

Tappet Clearance: .019" Intake & Exhaust (Hot or Cold).

Valve	Head Diameter	① Stem Diameter
Intake	1.775-1.785"	.3416-.3423"
Exhaust	1.505-1.515"	.3403-.3410"

Valves	Seat Angle	② Lift	③ Stem Clearanc
Intake	45°	.273"	.001-.0024"
Exhaust	45°	.273"	.0023-.0037"

①- Furnished with .003", .015", .030" oversize stems.
②- Cam lobe lift. Wear limit, .268".
③- Wear limit .0045" (Intake), .0065" (Exhaust).



► *ROTATABLE VALVE NOTE: All valves are rotatable type. See "Valve System" in Ford Special Data.*
Valve Stem Seals - Umbrella type seals used on both intake and exhaust valve stems, cupped side down.
Valve Seat Width - .060-.080" (Intake), .070-.090" (Exhaust).
Valve Springs: Free Length - 2.09" approximately.

Valve Spring Specifications

Valve	Spring Pressure	Length
Intake	①71-79 lbs.	1.780"
Exhaust	②161-177 lbs.	1.390"

①- Wear limit 64 lbs. at 1.780".
②- Wear limit 145 lbs. at 1.390".

► *VALVE SPRING INSTALLATION NOTE:* Measure valve spring assembled height from machined surface of cylinder head spring pad to spring retainer contact surface. If assembled height is 1 13/16" or greater, install necessary .030" spacer or spacers between cylinder head valve spring pad and valve spring to bring assembled height to recommended dimension of 1 25/32-1 13/16".
Valve Guides: Integral with cylinder head. When stem-to-guide clearance exceeds maximum (see table above), ream guides and install oversize valves. *See "Valve System" in Ford Special Data.*
Valve Lifters: Mushroom type. Removed from below with camshaft out.
Rocker Arm Assembly: *See "Valve System" in Ford Special Data.*

FORD 6 CYL. VALVE ASSEMBLY

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above.
► *VALVE TIMING NOTE:* The following valve opening and closing points are with camlift as indicated.
Intake Valves - Open 17° ① BTDC. Close 53° ② ALDC.
Exhaust Valves - Open 61° ① BLDC. Close 9° ② ATDC.
①- Camlift .016". ②- Camlift .019".
Valve Timing Check - Release No. 1 Intake valve adjusting screw, push rocker arm to one side, install dial indicator in pushrod socket. Zero indicator with cam on heel of lobe. Install quadrant on crankshaft pulley, rotate engine to amount of lobe lift shown in table above, then check quadrant and compare reading with degrees shown in table above for that valve.

OILING SYSTEM

Crankcase Capacity: 4 quarts (refill), 5 quarts (when filter element changed).
Normal Oil Pressure: 45-50 lbs. at 2000 RPM.
Pressure Regulator Valve - In pump body, not adjustable.
Oil Pressure Indicator - Indicator light on instrument panel, operated by engine unit, Ford No. B6A-9278-B
Oil Pump: Gear type pump located in crankcase,
Pump Overhaul - *See "Oil Pump" in Ford Special Data.*
Oil Filter: New "Disposable" type. Replace at 4000 mile intervals.
Disposable Filter Replacement - Coat gasket face of filter with oil, thread filter on insert by hand until gasket contacts adapter surface, then tighten filter an additional one-half turn.
Crankcase Ventilation: Filter in oil filler cap (inlet), an outlet pipe in rear of crankcase at left side

COOLING

Water Capacity: 15 quarts, add 1 quart for heater.
Pressure Valve: Ford LA-8100-A Radiator filler cap. Opens 12-15 lbs. *CAUTION* - Use only 12-15 lb. cap. for replacement.
Thermostat: Ford No. EAA-8575-A (157-162°F) standard, Ford No. EAA-8575-B (177-182°F) for use with permanent anti-freeze.
Water Pump: Packless, sealed ball bearing type.
See "Ford 6 Cyl." in Water Pump Section.
Temperature Gauge: New King-Seeley Electric Constant-voltage ("CV") type, with gauge voltage regulator Ford No. B7A-10804-B.
Dash Unit - Ford No. B7A-10883-A.
Engine Unit - Ford No. B7A-10884-A.
► *TEMPERATURE UNIT (CYL. HEAD) CAUTION:* 1957 Unit Ford No. B6A-10884-A will not transmit proper temperature when used with a 1956 Cyl. Head No. B6A-6049-D. Use Unit No. B7A-10884-B
See "Temperature Gauges" in Miscellaneous Section.

CLUTCH

Long Model 9½ CF. No. 268594, 11 CF 266978. Semi-Centrifugal type.
See "Long Clutches" in Clutch Section.
Clutch Disc - Long No. 288824, (9½ CF) 285419 (11CF).
Pedal Adjustment: If total pedal travel is less than 6 3/8" or more than 6 5/8", reposition pedal bumper and bracket until travel is within limits. Adjust assist spring link to give assist spring length of 6 5/8" when clutch is fully released.
Pedal Free Travel - 1 1/8-1 3/8". Loosen locknut on clutch pedal release rod, turn adjusting nut until correct travel is obtained. *NOTE* - Check free travel by operating engine at 3000 RPM with transmission in neutral position. There should be a minimum of ½" free travel under these conditions.
Removal: Remove flywheel housing cover, release lever, and retracting spring. Slide release bearing and hub off release lever. Mark clutch cover and flywheel for reinstallation, loosen six cover bolts uniformly to release spring tension, remove cover and pressure plate through opening of flywheel housing.

SYNCHRO-MESH TRANSMISSION

Own. Helical gear, constant mesh, synchro-mesh (second & high), sliding gear (low & reverse).
See "Ford Synchro-mesh" in Transmission Section.
Transmission Control: *See "Transmission Controls" in Transmission Section.*
Removal: With car raised up, disconnect drive shaft at rear universal joint, slide drive shaft off transmission output shaft. Remove speedometer cable and gear. Disconnect shift rods at transmission. Remove rear engine support to extension housing bolts. Disconnect parking brake adjusting rod from equalizer bracket. Support rear of engine and remove rear en-

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

gine support, then lower engine for clearance, and remove transmission to flywheel housing bolts. Use guide pins in two lower bolt holes and slide transmission back until input shaft clears flywheel housing, and lower transmission.

OVERDRIVE

Warner R10. Solenoid operated type, with governor control and throttle operated kick-down.
See "Warner R10 Overdrive" in Transmission Section.
Overdrive Control: *See "Overdrive Control" in Transmission Section.*
Removal: Same as for Synchro-mesh Transmission (above) after disconnecting control cable and wiring.

FORDOMATIC TRANSMISSION

Torque Converter and three speed automatic transmission with hydraulic control.
See "Fordomatic, Merc-O-Matic & Turbo-Drive" in Transmission Section.
▷ *PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION: See "Fordomatic, Merc-O-Matic & Turbo-Drive" in Transmission Section.*
▷ *TESTING & TROUBLE SHOOTING: See "Fordomatic, Merc-O-Matic & Turbo-Drive" in Transmission Section.*
Lubrication - Check transmission fluid at 1,000 mile intervals and maintain level at "F" mark on indicator. Drain and refill every 25,000 miles. Use only Automatic Transmission Fluid Type "A".
Checking Fluid Level - Bring transmission to operating temperature by running engine with selector lever in Neutral position. Move selector lever through all ranges to assure fluid distribution, then place lever in "P" (Park) position for checking fluid level. Add Automatic Transmission Fluid Type "A" to bring level to "Full" mark on indicator.
Throttle Linkage Adjustment: *See CARBURETOR above.*
▷ *OTHER FORDOMATIC SERVICE DATA: See "Fordomatic, Merc-O-Matic & Turbo-Drive" in Transmission Section.*

UNIVERSALS

Mechanics. Needle bearing type.
▷ *CAUTION:* Rear universal joint companion flange nut controls pinion bearing preload (must be adjusted whenever nut is loosened). *See "1957 Ford & Mercury" in Rear Axle Section.*

REAR AXLE

Own. New Separate Carrier type, semi-floating, hypoid with Hotchkiss Drive. *NOTE - Same type used on all models.*
See "1957 Ford & Mercury" in Rear Axle Section.

Model	Axle Ratios Sta. Wgn.	Others
Conventional	3.89-1①	3.70-1 ②3.89-1)
Overdrive	4.11-1	3.89-1 ②3.70-1)
Fordomatic	3.56-1	3.10-1 ②3.56-1)

①- 4.11-1 Optl. ②- Optional.
Backlash - .004-.009".
Axle Shaft Removal: Remove wheel, take off drum. Remove four axle retainer locking type nuts (work through opening in axle shaft flange). Use Puller No. 4235-N and pull axle shaft (do not disturb brake backing plate or damage wheel bearing oil seal). Replace one nut to secure brake backing plate.
Carrier Assembly Removal: *NOTE* - Pinion carrier assembly can be removed separately without disturbing differential carrier by disconnecting rear universal joint at companion flange, and removing five bolts that attach pinion carrier assembly to differential carrier housing. With rear universal joint disconnected, axle shafts removed (see above), remove differential carrier housing to rear axle housing bolts and lift out carrier assembly.
Wheel Bearing Adjustment: None required.

SHOCK ABSORBERS

Direct acting, non-adjustable. Service by replacement.

Model	①Front	①Rear
Pass. Cars (Std.)	B7A-18124-A	B7A-18125-A
Pass. Cars (H.D.)	B7A-18124-B	B7A-18125-B
Sta. Wgn. & Sed. Del.	B7A-18125-C	
Tudor Sedan (Hard Top) Std.	B7A-18125-D	
Tudor Sedan (Hard Top) H.D.	B7A-18125-E	

① - Furnished in kits which include shock absorber mounting bushing.
▷ *FRONT SHOCK ABSORBER UPPER BUSHING NOTE:* Install bushing with groove seated in frame hole flange, and do not dislodge when installing shock absorber.

FRONT SUSPENSION

Independent. "Ball Joint" suspension with direct acting shock absorbers mounted within front coil springs.
See "Lincoln, Mercury, Ford (Ball Joint)" in Suspensions & Wheel Alignment Section.
Caster - Pos. ½° to Pos. 1½°. Maximum variation between wheels ½°.
Camber - Pos. ½° to Pos. 1½°. ¼° preferred. Maximum variation between wheels ½°.
Toe-In - 1/16" to 1 8". *NOTE* - When checking toe-in on cars with power steering, engine should be running so that power steering control valve will be properly centered.
Toe-Out on Turns - With Outer wheel at 20°, inner wheel should be 24¼°.

STEERING

Manual: Own (Gemmer 305 Design). Worm & Roller type.
See "Gemmer Worm & Roller" in Steering Section.
Power Steering: Ford-Mercury Linkage type. Used in conjuction with standard type steering gear.
See "Ford & Mercury Bendix Linkage Type" in Steering Section.
Steering Linkage: *See "Steering Linkage" in Steering Section.*
Steering Wheel & Horn Button Removal: *See "Gemmer Worm & Roller (3-tooth)" in Steering Section.*
Steering Gear Removal: *See "Gemmer Worm & Roller (3-tooth)" in Steering Section.*

BRAKES

Ford-Bendix Hydraulic. Hand lever applies rear wheel service brakes.
▷ *BRAKE DESIGN NOTE:* Front brake anchor pin (fixed anchor type) is mounted on wheel spindle independently of backing plate (wheel cylinder mounted on anchor pin).
See "Ford, Lincoln, Mercury Bendix" in Brake Section.
▷ *BRAKE PULLING CORRECTION:* To correct, loosen anchor pin attaching bolt (See Brake Design Note above) and retighten to 80-100 ft. lbs.
Drum Diameter - 11" front and rear.
Wheel Cylinder Diameter - 1 1/8" (Front-All), 7/8" (Rear-Pass. Cars), 15/16" (Rear - Sta. Wgn.)

Model	(Width & Length) Primary	Secondary
Pass. Car(Front)	2 1/4"x10.62"	2 1/4"x 11.93"
(Rear)	1 3/4"x10.62"	1 3/4"x 11.93"
Sta. Wgn.(Front)	2 1/4"x10.62"	2"x 10.62"
(Rear)	2 1/4"x11.93"	2"x 11.93"

Clearance - Adjusting screw backed off 10-12 notches from point where shoes are tight against drum.
Brake Pedal Free Play Adjustment: 5/16" to 7/16". If play not correct after brake adjustment, loosen locknut on the eccentric bolt that attaches brake pedal assembly to master cylinder pushrod, rotate eccentric bolt for desired clearance, tighten locknut.
Standard Master Cylinder: Located on engine side of firewall.
Checking Fluid - Maintain fluid level to within ½" of top of reservoir.
Removal - Disconnect rubber boot from rear end of master cylinder, brake line at master cylinder fitting, stop light switch from front of cylinder and disconnect wires from switch. Push down brake pedal several times to force as much fluid as possible (into clean container), remove bolts that secure master cylinder to dash panel. Do not disconnect pushrod from brake pedal unless it is to be serviced.
Power Brakes: New "Bellows Type." Pedal assist power unit with vacuum bellows and control valves mounted on drivers side of dash panel and attached direct to brake power lever.
See "Ford Bellows Type" in Brake Section.
Checking Fluid Level - Maintain fluid to within ½" of top of reservoir.
Removal - Remove vacuum hose from top of unit, valve adjusting eccentric with flat washer, spring, and bushing, nylon bushing from power unit valve housing. Remove two mounting screws (bracket-to-dash panel) and remove power unit from car.

MISC. MECHANICAL

Windshield Wipers: New Cable operated type with tension assemblies.
See "Windshield Wipers" in Miscellaneous Section.
Power Window Regulators: Reversible motor in each window. *See "Electric Window Regulators" in Misc. Section.*
Power Top Control: Electric-Hydraulic with reversible pump motor. *See "Power Top Controls" in Misc. Sect.*
Power Seat Adjusters: "4-way" Electric Screw and Jack type with single electric motor driving a screw jack.
See "Power Seat Adjusters" in Miscellaneous Sect.

►*SPECIAL 270 HP (DUAL 4-BARREL CARBURETOR) & 300 HP (SUPERCHARGED) HIGH PERFORMANCE ENGINES:* Special 312" Engines. Specifications and service data on the equipment used on these engines are given below.

MODEL IDENTIFICATION

VEHICLE NUMBER: Stamped on patent plate on left front body pillar (Exc. Thunderbird). On dash panel in engine compartment (Thunderbird).
First Number - 100001 and up.

►*VEHICLE NUMBER NOTE:* Vehicle number (Example *C7FV100501*) includes following identification data in sequence

Eng. Type ①	Year ②	Assy. Plant	Body Style ③	Serial No.
C	7	See below	See below	100501

① Engine Type
B - V8 272 cu. in. Engine (Dual Carb.).
C - V8 292 cu. in. Engine (Dual Carb.).
D - V8 312 cu. in. Engine (4-Barrel Carb.).
E - V8 312 cu. in. Engine (Dual 4-Barrel Carb.).
② - Last digit of model year (1957).
③ Body Styles
C - Conv. (Fairlane 500), **F** - Ranchero.
G - Tudor & Fordor (Custom & Custom 300).
H - Thunderbird, Ranch Wagon (Custom 300).
S - Sedan Delivery (Courier).
T - Tudor & Fordor - Hardtop (Fairlane & 500).
V - Victoria Tudor & Fordor (Fairlane & 500).
W - Retractable Hardtop (Fairlane & 500).
X - Country Sedan. **Y** - Country Squire.

Assembly Plant Designation

A - Atlanta	**F** - Dearborn	**N** - Norfolk
B - Buffalo	**G** - Chicago	**P** - St. Paul
C - Chester	**K** - Kansas City	**R** - San Jose
D - Dallas	**L** - Long Beach	**S** - Somerville
E - Mahwah	**M** - Memphis	**U** - Louisville

TUNE-UP

COMPRESSION PRESSURE: 160-165 lbs. (All Engines except Schgd. 300 HP), 120-130 lbs. (Schgd. 300 HP) at cranking speed.

VACUUM READING: Steady 19-20" idling at 475-500 RPM in Neutral.

VALVE TAPPET CLEARANCE: (All Engines except Schgd. 300 HP with B7A-6250-C Camshaft) - .020" (Intake & Exhaust COLD), .019" (Intake & Exhaust HOT). If tappet clearance set with engine Cold, recheck tappet clearance after engine operated for 30 minutes to normalize temperature and set to HOT figure.
(300 HP Engine with B7A-6250-C Camshaft) - .020" Intake, .025" Exhaust, HOT.

►*SELF LOCKING TAPPET ADJUSTING SCREW NOTE:* Self locking adjustment screws used which have interference thread fit at center portion of threads. Replace adjusting screw or adjusting screw and rocker arm assembly

MANIFOLD HEAT CONTROL: Automatic thermostatic type with counterweight. Valve is closed when engine is at normal temperature and running at idle speed, and is open when operating at high RPM. Spring is installed with ¾ turn wind-up and hooked over stop pin.

IGNITION

FIRING ORDER: 1-5-4-8-6-3-7-2.
Cylinders - RIGHT BANK 1-2-3-4, LEFT BANK 5-6-7-8.

SPARK PLUG GAP: .032-.036".
Spark Plugs - Champion No 870 (272 Eng), No 860 (292 & 312 Eng.) - Early F-14Y later production, all engines *NOTE* - Use F-14Y for replacement 18 mm

►*SPARK PLUG CAUTION:* Spark plug has tapered seat and does not require a sealing gasket. It is important that plugs be torque tightened within range of 15-20 ft.lbs.

COIL: Ford No. B6A-12029-B.
Ignition Current - 2 5 amps. idling, 4.5 amps stopped.
Resistor - Ford No B6A-12250-D. 1.3-1.4 Ohms.

►*COIL RESISTOR NOTE:* Resistor is connected in lead from ignition switch to coil. Resistor is by-passed during cranking by a lead from starter solenoid to battery terminal of coil.

►*312" ENGINE COIL RESISTOR INTERFERENCE CORRECTION.* Resistor may ground on intake manifold To correct loosen mounting bracket bolt and rotate resistor assembly 45° counterclockwise Tighten bolt

DISTRIBUTOR: New type with separate mechanical and vacuum spark advance systems Tachometer Drive attachment on Thunderbird Used as follows

Engine	Distributor No.
272" & 292"	B7A-12127-A
312" (Std)	B7A-12127-D
312" (2 Carbs)	B7A-12127-E
312" (Supercharged)	B7A-12127-G
Thunderbird (292" & 312" Std)	B7S-12127-A
Thunderbird (312" 2-Carb)	B7S-12127-B
Thunderbird (312" Schgd)	B7S-12127-C

See "Ford, Lincoln, Mercury Distributors" in Electrical Section

►*SCHGD 300 HP ENGINE DISTRIBUTOR NOTE* This distributor is "Double Breaker" type Set both sets of points to the same gap
Condenser - Ford B7A-12300-B (B7A-12127-G & B7S-12127-C Distr), B7A-12300-A (Others) **Capacity** - 21 25 mfd
Contact Point Set - Ford B7A-12171-B (B7A-12127-G & B7S-12127-C Distr), B7A-12171 A (Others)
Breaker Gap - 014- 016" (All Models) On double breaker distributor set both sets of points alike
Cam Angle - 26-28½° (Single Breaker Distr), 33-36° (Double Breaker Distr)
Breaker Arm Spring Tension - 17-20 ozs (All Models)
Rotation - Counterclockwise viewed from above

Automatic Advance - B7A-12127-A

Degrees	Distr.	RPM	Degrees	Eng.	RPM

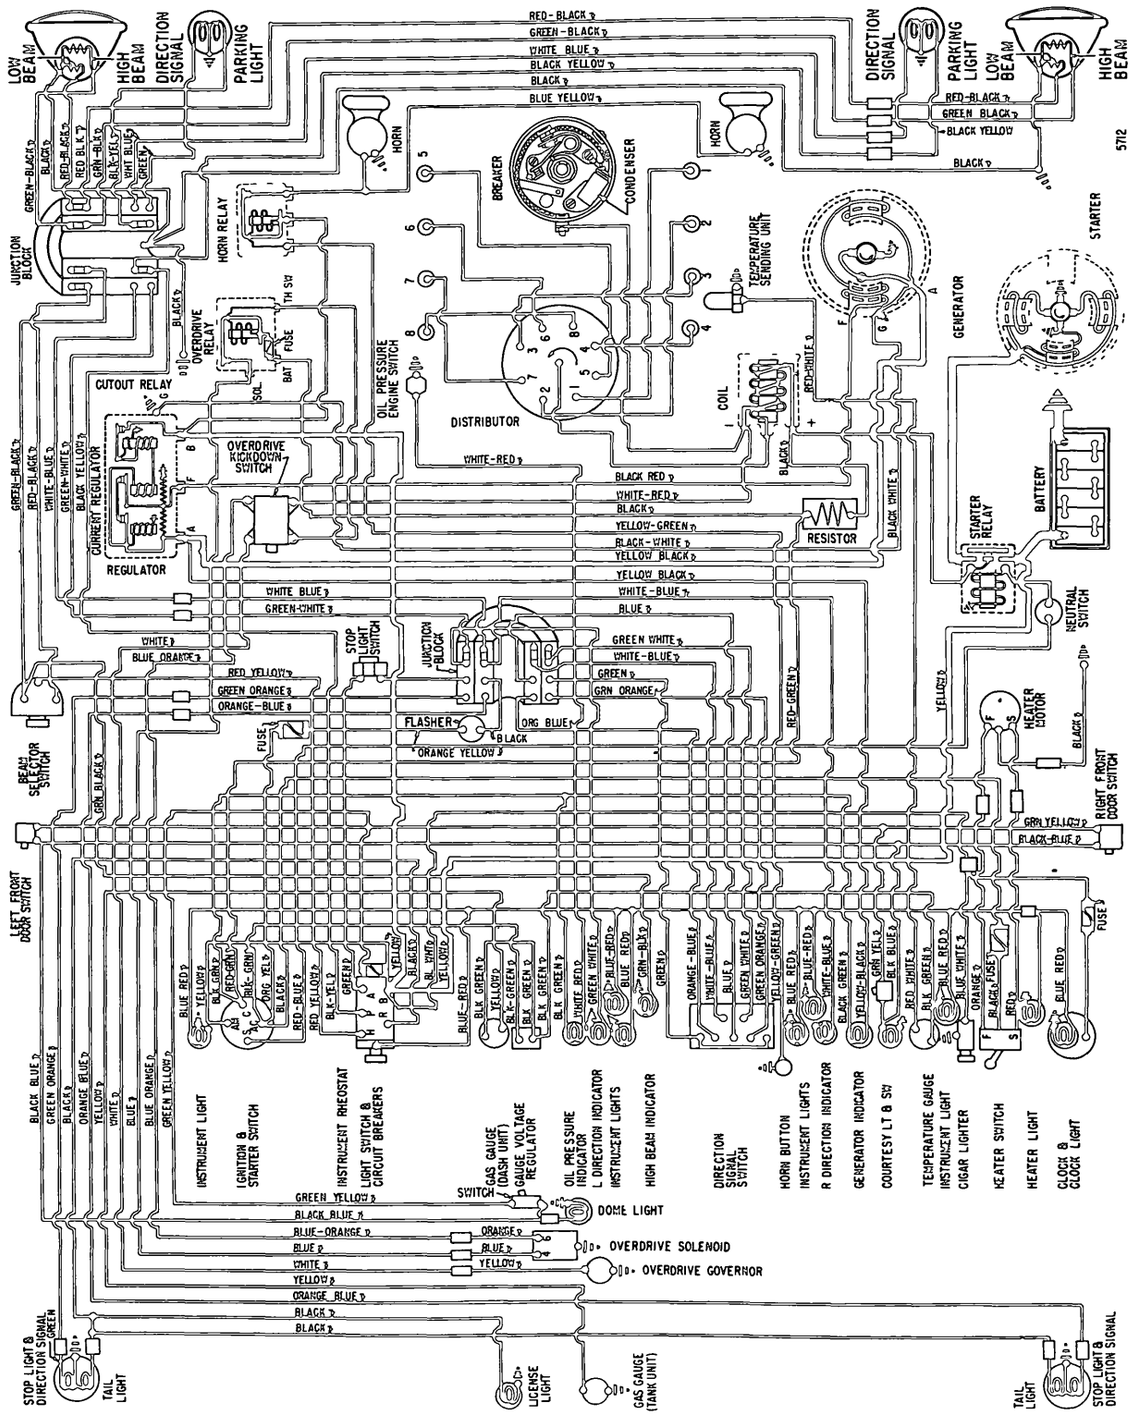
IGNITION TIMING

Engine	Std. Ign. Setting
All exc.300HP (Std. & OD)	3° BTDC (Max. 6° BTDC)
All exc. 300 HP (Fordomatic)	6° BTDC (Max. 8° BTDC)
300 HP Schgd. (All Trans.)	6° BTDC (Max.10°BTDC)

Timing Mark - Vibration damper marked "TDC" and "2 ", "4", "6", "8", "10" degrees BTDC. Align correct mark with pointer (bolted to water pump)



CARBURETOR

►*CARBURETOR APPLICATION Two-barrel carburetors used on 272 & 292 cu. in. engines, 4-barrel carburetors used on 312 cu in. engine. All new typ s*

►*CARBURETOR AIR CLEANER (DRY TYPE) NOTE: Special cleaning procedure required See AIR CLEANER below.*

Throttle Linkage Adjustment (Fordomatic Cars)· With engine at normal operating temperature and idle speed

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

correctly set at 425-450 RPM with selector lever in "Dr" range, disconnect throttle control rod, lock accelerator shaft assembly by inserting pin (¼" drill rod) in lever and bracket, adjust carburetor connecting link so that throttle valves closed. *NOTE* - Holes should remain aligned with pin removed. Adjust clevis on throttle rod while holding throttle control upward against transmission inner stop so pin will enter freely, then turn clevis counter-clockwise 3 turns. Connect assembly. Adjust pedal height to 3.10" (Thunderbird 4.88") by changing length of accelerator assembly connecting link. Road test car. If band or clutch slippage is evident, increase rod length to 3½ turns, but do not exceed 4 turns of clevis.

Dashpot Adjustment (Holley & Ford Carburetors): With engine idle speed set to specifications and throttle closed, there should be .045-.064" clearance between end of dashpot plunger and throttle lever with dashpot plunger fully depressed. To adjust, loosen dashpot locknut, turn adjustment nut to increase or decrease clearance. Tighten locknut.

Dashpot Adjustment (Carter Carburetors): Hold throttle valves wide open. Distance between top surface of bowl cover and bottom of lever should be 7/16". To adjust, bend dashpot inner arm tang (Tool T109-22).

▷ *CARBURETOR LEAKAGE CORRECTION (2 & 4-barrel Carbs.): Overtightening accelerator pump cover plate may distort cover causing leak. Tighten cover evenly and only enough to stop leaking. Replace cover if distorted.*

FORD 2 & 4-BARREL

Ford 2 & 4-barrel carburetors used as follows:

Model 2-BARREL CARBURETORS	Carburetor No.
Pass. Cars 272" Eng. ① ② (Early)	B7A-9510-A

Favor a slightly rich mixture. Turn screws out for richer mixture.

Idle Speed - 475-500 RPM with selector lever in Neutral and check for 425-450 RPM in "DR" (Drive) range. Adjust as necessary to get drive range RPM.

Throttle Linkage Adjustment (Fordomatic Cars): *See CARBURETOR above.*

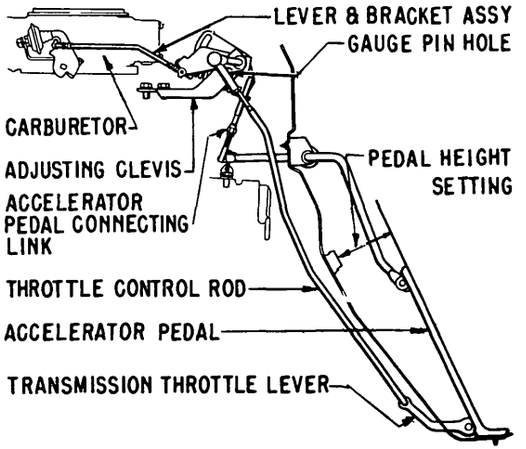
►*OTHER DATA: See "Carter AFB Carburetors" in Carburetion Section*

270 HP ENGINE CARBURETORS
(Dual 4-Barrel)

Two Holley 4-barrel carburetors, **Part No. B7A-9510-P,** used. Similar in design to previous models.



►*CARBURETOR IDENTIFICATION NOTE:* Carburetors stamped ECJ-9510-AA or ECJ-9510-AB on mounting flange

►*ADJUSTMENT NOTE:* Front and rear carburetors linked together by synchronizer rod which must be adjusted for correct synchronized operation of the carburetors (make this adjustment first).

Throttle Linkage Adjustment - 1) Disconnect rear end of throttle synchronizer rod from rear carburetor. 2) Back off throttle stopscrews so that throttle valves of both front and rear carburetors completely closed. 3) Adjust throttle synchronizer rod length so that rod end enters rear carburetor throttle lever freely, connect rod. 4) Set idle speed by adjusting throttle stopscrews. 5) Adjust idle mixture by adjusting both screws on rear carburetor first, and screws on front carburetor last.

Idl Sp d Setting - 500-600 RPM (All Transmissions) with selector lever in Neutral on Fordomatic Cars.

Idle Mixture Setting - Both screws (primary side only) 5/8 turn open. Adjust both screws alike. Turn screws out for richer mixture.

FORDOMATIC TRANSMISSI N THROTTLE LINKAGE

►*OTHER DATA. See "Holley (Ford, Lincoln, Mercury) 4-Barrel Carburetors" in Carburetion Section*

300 HP SCHGD. ENGINE
(Supercharger & Carburetor)

Holley 4-barrel carburetor used as follows:

Model	Carburet r N .
Pass. Car	B7A-9510-AC
Thunderbird (Early)	B7A-9510-V
Thunderbird (Later)	B7A-9510-AC

►*CARBURETOR IDENTIFICATION NOTE:* Model B7A-9510-V stamped EDB-9510-AA on edge of carburetor mounting flange.

SUPERCHARGER

►*SUPERCHARGER CAUTION: Two different McCulloch Superchargers may be found on th se engines:*

1) Conventional Type - This supercharger has variable speed pulley (High & Low Blower) operated by manifold vacuum.

2) Special Type - This supercharger does not have variable speed pulley and is controlled by carburetor linkage and engine oil pressure (special connection to engine oil pressure system). The following operating precautions must be observed with this type supercharger.

►*OPERATING CAUTION (SPECIAL TYPE SUPERCHARGER):* The engine MUST NOT BE OPERATED with the flexible air hose (between supercharger and carburetor) disconnected, or with Flapper Valve in carburetor elbow not properly seated, or with any restriction in air intake (would result in internal oil leak which would drain engine oil system and damage supercharger). If necessary to operate engine under above conditions, remove drive belts, disconnect supercharger oil line at cylinder block, and plug this fitting in block.

Sup rcharg rC ntrol Linkage (Special Type Sup rcharger): 1) Loosen setscrew in swivel clamp on control arm.

CONTINUED ON NEXT PAGE

F rm 4-A—5/r

CONTINUED FROM PRECEDING PAGE

2) Open carburetor throttle valves to approximately 7/8 open position so that 1/8" drill rod can be inserted between throttle stop pin and throttle lever.
3) Place supercharger control lever in full "on" position (control lever foot should be against housing.
4) With throttle lever and supercharger control lever positioned as above, and control wire ball end against throttle lever swivel, tighten setscrew in control arm swivel securely against control wire cable.
5) Check adjustment to make certain that carburetor throttle valves move from full-closed to full-open positions and that supercharger control lever moves through full arc of travel when carburetor throttle lever moved from half-open to 7/8 open position.

Supercharger Output Check (Special Type Supercharger): Remove 1 8" pipe plug in side of carburetor elbow and connect gauge at this point Supercharger pressure should be 2 4-2 7 P S I (Std Trans), 3 4-3 7 P S I (Fordomatic) at 2500 RPM

Engine Idl Speed: 500-525 RPM (all transmissions) with selector lever in Neutral on Fordomatic Cars

►*OTHER DATA· See "McCulloch Supercharger" and "Holley (Ford, Lincoln, Mercury) 4-Barrel Carburetors" in Carburetion Section*

AIR CLEANER: DRY FILTER ELEMENT type. Clean every 5,000 miles, replace element every 20,000 miles.

►*CLEANING CAUTION:* Clean filter element by tapping and shaking to remove dirt particles. *DO NOT wash lement in solvent or other liquids and DO NOT oil or lubricate.*

FUEL PUMP PRESSURE: 3.5-5.5 lbs. at 500 RPM.

CARB. EQUIPMENT

Fuel Pump: AC Fuel only or Fuel & Vacuum

Mod l	Ford Pump No.
V8 exc Thunderbird (Std)	B5A-9350-C
Overdrive & Fordomatic	B5A-9350-D
Thunderbird (Std)	B5S-9350-A
Overdrive & Fordomatic	B5S-9350-B

Pressur - 3 5-5 5 lbs at 500 RPM
See "Fuel Pumps" in Carburetion Section

Gasolin Gauge: New King-Seeley Electric Constant-voltage ("CV") type with gauge voltage regulator, Ford B7S-10804-A Thunderbird, B7A-10804-B Others
Dash Unit-Ford No B7S-9280-A (Thbrd), B7A-9280-A (Others)
Tank Unit - Ford No B7A-9276-A (All)
See "Fuel Gauges" in Carburetion Section

Air Clean r: DRY FILTER ELEMENT type Clean every 5000 miles, replace element every 20,000 miles

►*CLEANING CAUTION* Clean filter element by tapping and shaking to remove dirt particles *DO NOT wash element in solvent or other liquids and DO NOT oil or lubricate*

BATTERY

Ford B6A-10655-C (All). 12 volt, 11 plate, 55 ampere hour capacity **Ford B7A-10655-A (Exc. Thbrd).** 12 volt, 11 plate, 70 ampere hour capacity (20 hr rate)
Battery Ground - Negative to engine block
Engine Gr und - Cylinder head to dash

STARTER

F rd B6A-11002-A. Armature - B6A-11005-B.
Drive - Ford ICM-11350-C Bendix "Folo-Thru"
Rotation - Counterclockwise at commutator end
Brush Spring Tension - 48-56 ozs
Cranking Speed - 150-180 RPM, 190 amperes max

Performance Data

Torque	RPM	Volts	Amperes
0 ft lbs	①	12 0	120
15 5 ft lbs		5 0	550

①- With starter on engine and engine idling
Starting Switch: Magnetic type, Ford No B6A-11450-A Starter Switch is controlled by ignition switch *NOTE* - Neutral safety switch used on Fordomatic Transmission
Fordomatic Neutral Safety Switch: Ford B6S-15812-A (Thbrd), B7A-15812-A (Others)
Adjustment - *See "Fordomatic & Mercomatic" in Transmission Section*

GENERATOR

Ford. Used as follows

Generator	Armature	Application
B6A-10002-C	B6C-10005-B	①Std
B6A-10002-H	B6A-10005-B	②Std
B6A-10002-E	B6C-10005-C	Special

①- Use with B6C-10505-B Regulator
②- Use with B6A-10505-A Regulator

►*40 AMPERE GENERATOR INSTALLATION CAUTION* Install 2 Spacers, Ford No 10148, to secure proper alignment of generator-to-water pump and fan pulleys *NOTE* - Shorter or thinner spacer at front end of generator longer spacer at rear end

Perrormance Data

Generator	Amperes	Eng RPM
B6A-10002-C,H	30	1500
B6A-10002-E	40	1500

Brush Spring Tension - 26-34 ozs
Field Current - 1 5-1 6 amperes at 12 0 volts
Rotation - Counterclockwise at commutator end
Belt Adjustment: Approximately ½" deflection on belts midway between generator and pump pulleys with normal thumb pressure

REGULATOR

Ford No. B6A-10505-A (B6A-10002-H Gen.), B6C-10505-B (B6A-10002-C Gen.), B6A-10505-B (B6A-10002-E Gen.).

►*SETTING CAUTION: "Temperature Compensated" type Set to following specifications at 75°F ambient (engine compartment) temperature, after ½ hour operation in vehicle, or after regulator heated and stabilized*

Cutout Relay
Cuts In - 12 0-12 8 volts

Voltage Regulator
Setting - 14 6-15 4 volts at 75°F (ambient)
Ch cking & Adjusting - *See Electrical Section*

Current Regulator
Setting - 28-32 amperes (B6A-10505-A & B6C-10505-B), 38-42 amperes (B6A-10505-B)
Checking & Adjusting - *See Electrical Section*

MISC. ELECTRICAL

Headlamps: Sealed Beam *See Electrical Section*
Directional Signals: *See Electrical Section*
Lighting Switch Removal: With control knob in the "OFF" position, press spring release button on switch housing, turn shaft slightly and pull it out of switch Unscrew mounting nut with Tool 17470-N
Stop Light Switch Location: On forward end of brake master cylinder (Conventional Brakes), and on top of brake booster assembly (Power Brakes). Master cylinder located on firewall in engine compartment
CIRCUIT BREAKERS: On headlight switch Combination headlight switch circuit breaker, and fuse assembly used One circuit breaker protects headlight circuit and second circuit breaker protects instrument parking, stop and tail light circuits
FUSES: Size and location as follows
Back Up Light - SFE 7 5 ampere in feed wire
Cigar Lighter - Sulphur disc in base or reset circuit breaker, at back of assembly
Clock - 1 AG, in feed wire
Heaters - SFE 14 ampere in feed wire
Interior Lamps - SFE 7 5 ampere, on lighting switch
Overdrive - 15 AGC on overdrive relay
Spot Light - SFE 7 5 ampere in feed wire
Turn Signal - SFE 7 5 ampere in feed wire
Horn Relay: Ford No B7A-13853-H

►*HORN RELAY REPLACEMENT NOTE* When replacing a horn relay that has been shorted by water, be sure to spray new relay with a plastic ignition spray (around crimped areas in particular but not on terminals) and install three ¼" flat washers between mounting bracket and fender apron

ENGINE

►*AIR CONDITIONED CAR SERVICE CAUTION. Use extreme care when disconnecting any part of air conditioning equipment or lines for access to engine See "Air Conditioning Service Cautions" in Misc Sect*

ENGINE SPECIFICATIONS: 90° V8

Engine	Bore	Stroke	Displacement
272	3 62"	3 30"	272 cu ins.
292	3 75"	3 30"	292 cu ins
312	3 80"	3 44"	312 cu ins

Engine	Rated HP	Compr. Ratio	Developed HP
272	42 05	8 6-1	190 at 4500 RPM
292	45 0	9 1-1	①206 at 4500 RPM
312	46 21	9 7-1	245 at 4500 RPM
312" 270 HP②		9 7-1	270 at 4800 RPM
312" 300 HP③		8 3-1	300

① 212 HP at 4500 RPM with Fordomatic
②- High Performance Engine (Two 4-Barrel Carbs)
③- High Performance Engine with Supercharger
Compression & Vacuum Reading - *See TUNE-UP*

CYLINDER HEAD: *See "Cylinder Head & Manifold" in Ford Special Data*

►*ENGINE OIL LEAK CORRECTION:* Engine oil leakage may occur at point where crankcase vent tube is brazed to adapter Hold assembly up to light to check for leak If defective at brazing position, replace assembly.

CONTINUED ON NEXT PAGE

F rm 4-8—5/57

CONTINUED FROM PRECEDING PAGE

►*EXHAUST MANIFOLD BREAKAGE CORRECTION:* Breakage at manifold flange caused by exhaust crossover pipe contacting uneven road surface Fabricate and install a guard (1½" diameter pipe flattened at each end to contact frame) and weld to two 2" strap irons bolted (one bolt each) to frame side rail at existing frame holes Brackets will be back against #1 body bolt outrigger

TIGHTENING TORQUES: *See "Tightening Specifications" in Ford Special Data*

ENGINE REMOVAL: *See "Engine" in Ford Special Data*

ENGINE MOUNTINGS: *See "Engine Mounting" in Ford Special Data*

OIL PAN REMOVAL: On conventional car, remove stabilizer bar, disconnect oil pump inlet tube at oil pump and remove "O" ring seal retainer screws and oil pan

PISTONS

Autothermic type Solid skirt with three rings above pin

Removal - Pistons and rods removed from above

Fitting New Pistons: Use ½" wide feeler gauge inserted between piston and cylinder wall at right angles to pin on thrust side Pull should be 5-10 lbs when using feeler gauge thicknesses as follows New piston in new bore 0015", New piston in used bore 002", Used piston in used bore 0025"

Replacement Pistons: Standard, 020", 030", 040" (312 Eng), plus 060" (272 & 292 Eng) Oversize Pistons furnished only with fitted pins

Installing Pistons: Install with small indentation in head of piston toward front of engine *See Rod Installation*

PISTON RINGS

Two compression, one oil ring per piston Oil ring is "Side Sealing" type (two steel rails with spring spacer between them)

272 & 292 Engines

Ring	Width	End Gap	Side Clearance
Compr #1 2	①	010- 027"	② 002- 0035"
Oil #3		015- 062"	③

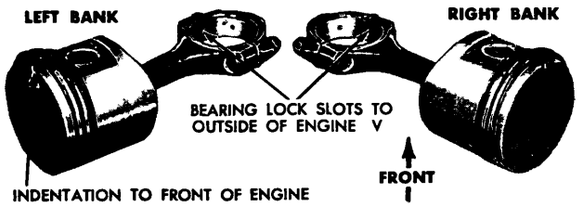
312 Engine

Ring	Width	End Gap	Side Clearance
Compr #1	0775- 0780"	012- 029"	② 002- 0035"
Compr #2	0930- 0940"	012- 029"	② 001- 003"
Oil #3		015- 062"	③

①- (272 Eng) 0930- 0935" (292) 0775- 0780"
② - Wear Limit 006" ③ - Side sealing type rings

PISTON PINS

Floating type with lock ring at each end
Diameter - 9120- 9123" **Length** - 3 016-3 030"
Pin Fit in Piston - 0001- 0003" Wear limit 0008"
Pin Fit in Rod Bushing - 0001- 0003" Wear limit 0008"



Replacement Pins: Furnished 0001- 0003" oversize Fitted pins furnished with new pistons

Replacement Rings: Furnished in Expander and Steel Section Types in Std 020", 030", 040" (312 Eng), plus 060" (272 & 292 Eng)

CONNECTING RODS

Crankpin Journal Diameter - 2 1880-2 1888"
Lower Bearing - Steel backed, copper lead alloy lined type Upper and lower halves interchangeable
Clearance - 0008- 0027" Wear limit 0037 (272 & 292 Eng), 0007- 0026" Wear limit 0036 (312 Eng)
Side Clearance - 006- 016" Wear limit 019" (2 rods)

Replacement Bearings: Standard (2 sizes marked **Red** and **Blue** for selective fitting) and 010", 020", 030" undersize

FORD V8 PISTON & ROD ASSY.

Installing Rods: Install rod in piston so that rod bearing lock slots in connecting rod are toward outside of engine when indentation on head of piston is toward front of engine Cylinder numbers on bearing caps and rods must be on same side and installed in same numbered cylinder

CRANKSHAFT

Journal Diameter - 2 4980-2 4988" (272, 292 Eng), 2 6235-2 6243" (312 Eng)
Bearings - Copper lead (All Eng), or Lead babbitt (272 Eng), Steel backed

Clearance	Copper Lead	Lead Babbitt
272	① 0006- 0032"	② 0005- 0021"
292	① 0006- 0032"	
312	③ 0008- 0026"	

①- 0042" wear limit ②- 0031" wear limit
③- 0036" wear limit

Replacement Bearings: Standard (2 sizes marked **Red** and **Blue** for selective fitting) and 010", 020" 030" (272 & 292 Eng) plus 040" (312 Eng) Undersize

End Thrust: Taken by No 3 main bearing Replace bearing if endplay excessive

Thrust Bearing Alignment - *See "Crankshaft & Main Bearings" in Ford Special Data*

End Play - 002 006", wear limit 010"

Crankshaft Rear Oil Seal Installation: *See "Crankshaft and Main Bearings" in Ford Special Data*

Crankshaft Front Oil Seal Installation: *See "Engine Front Cover" in Ford Special Data*

CAMSHAFT

Journal Diameters - 1 9255-1 9265"
Clearance - 001- 003", wear limit 006"

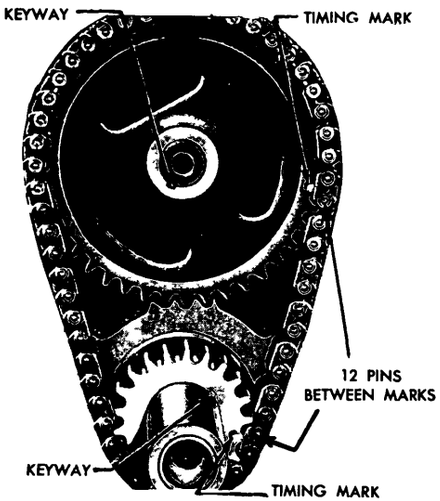
End Thrust: Taken by thrust plate and spacer located between camshaft sprocket and shoulder on camshaft

►*CAMSHAFT THRUST SPACER NOTE* Chamfer on the inside of spacer must be to the rear or face camshaft journal

End Play - 006" max

Replacement Camshaft Bearings: Finished bearings furnished Standard and 015" undersize

Camshaft Removal & Installation: *See "Camshaft & Bearings" in Ford Special Data*



Timing Chain: Side guide type 56 links

►*TIMING CHAIN REPLACEMENT NOTE* Replace chain and sprockets when deflection on slack side exceeds ½" (take up all slack on driving side, measure slack on opposite side) Remove and install chain "endless" as a unit with both sprockets

Camshaft Setting: Sprockets marked by round depression at one tooth Mesh chain so that there are 12 chain link pins between timing marks on sprockets when marks are both on drive side of chain

Engine Front Cover Oil Seal (Crankshaft Front Seal) Installation: *See "Engine Front Cover" in Ford Special Data.*

Engine Front Cover Removal: *See "Engine Front Cover" in Ford Special Data*

FORD V8 VALVE TIMING MARKS

VALVES

Tappet Clearance: 020" (Intake & Exhaust) Cold 019" (Intake & Exhaust) Hot *NOTE* - Valve tappet clearance on truck engines different

Valve	Head Diam.	Stem Diam.①	Length
Intake	1 920-1 930"	3416- 3423"	5 02"
Exhaust	1 505-1 515"	3400- 3410"	5 02"

Valve	Seat Angle	②Lift	Stem Clearance
Intake	45°	272"	③- 0045" wear limit
Exhaust	45°	285"	④- 0065" wear limit

①-Furnished with 003", 015", 030" oversize stems
②- Cam lobe lift 005" wear limit

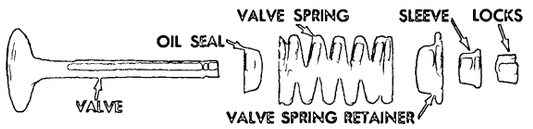
Valve Seat Width - 060- 080" (Intake) 070- 090" (Exhaust)

►*ROTATABLE VALVE NOTE* All valves are rotatable type *See "Valve System" in Ford Special Data*

Valve Stem Oil Seals: "Umbrella" type seals on intake and exhaust valve stems Install seals with cupped side down to cover guide boss on head Install new seals whenever valves removed or when seals become loose on valve stems

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE



Valve Springs: Install with closed end of coil toward cylinder head.

Spring Specifications

	Spring Pressure	Length
Valve Closed	71-79 lbs.①	1 780"
Valve Open	161-177 lbs.②	1 390"

①- 64 lbs. wear limit at 1 780"
②- 145 lbs. wear limit at 1 390"
Free Length - 2.09".

▷*VALVE SPRING INSTALLATION NOTE:* Measure valve spring assembled height from machined surface of cylinder head spring pad to under side of spring retainer. If assembled height is 1 13 16" or greater, install necessary 030" spacers between cylinder head valve spring pad and valve spring to bring assembled height to recommended 1 25 32-1 13 16" *CAUTION* - Do not install spacers unless necessary.

FORD V8 VALVE ASSEMBLY

Valve Guides: Integral with cylinder head When stem-to-guide clearance exceeds maximum (See table above), ream guides and install oversize valves *See "Valve System" in Ford Special Data.*

Valve Lifters: Mushroom type. Remove from below after camshaft removed from engine.
Clearance - 0026"

Rocker Arm Assembly: *See "Valve System" in Ford Special Data*

VALVE TIMING

See "Camshaft Setting" under CAMSHAFT above

▷*VALVE TIMING NOTE:* The following valve opening and closing points are with camlift as indicated

Valve Timing
(All Engines with B7A-6250-B Camshaft)

Intake Valves - Open 18° ⓒ BTDC Close 58° ① ALDC
Exhaust Valves - Open 66° ② BLDC Close 10° ③ ATDC.
① - Camlift 015" ② - Camlift 013" ③ Camlift 016"

Valve Timing
(312" Eng. Schgd. with B7A-6250-C Camshaft)

Intake Valves - Open 32° ℂ BTDC. Close 78° ℭ ALDC.
Exhaust Valves - Open 72° ℂ BTDC. Close 38° ℭ ALDC.
ℂ - Camlift .016". ℭ - Camlift .019".

Valve Timing Check: Release No. 1 Intake Valve adjusting screw, push rocker arm to one side, install dial indicator in pushrod socket. Zero indicator with cam on heel of lobe. Install quadrant on crankshaft pulley, rotate engine to amount of lobe lift shown in table above, then check quadrant and compare reading with degrees shown in table above for that valve. If reading not correct, check for bent pointer, worn timing chain or sprocket before replacing camshaft.

OILING SYSTEM

Crankcase Capacity - 5 qts (refill) 6 qts. when filter changed

Normal Oil Pressure: 45-50 lbs. at 2000 RPM.
Pressure Regulator Valve - In oil pump body, not adjustable.
Oil Pressure Indicator - Indicator light on instrument panel operated by Engine Unit, Ford No. B6A-9278-B (stamped No. 7 on Hex) Lights when ignition switch turned on, goes out when engine starts and pump pressure reaches (7 lbs.)

Oil Pump: Rotor type, located on left side of engine crankcase, driven by distributor shaft.
Pump Overhaul - *See "Oiling System" in Ford Special Data.*

Oil Filter: New "Disposable" type.
Disposable Filter Replacement - Coat gasket face of filter with oil, thread filter on insert by hand until gasket contacts adapter surface, then tighten filter an additional one-half turn. *CAUTION* - Do not overtighten Run engine and check for leaks.

Crankcase Ventilation: Filter in oil filler cap (inlet) all models. Road draft outlet pipe for crankcase ventilation all models. *NOTE* - 272 and 292 Engines have filter screen in road draft outlet pipe. Service filler cap by cleaning with solvent and resaturating with engine oil at 4000 mile intervals.

COOLING

Water Capacity: 19 qts (Pass. Cars & Station Wagons), 20 qts. (Thunderbird). Add 1 qt. for heater.

Pressure Valve: Radiator filler cap. Ford No. LA-8100-A, 12-15 lbs. (marked "13" or "14") *CAUTION:* If replacement required, use 12-15 lb. type.

Thermostat: 157-162°F. (Std.), 177-182°F. (High Temp.) for use with permanent type anti-freeze.

Water Pump: Packless, sealed ball bearing type.
See "Ford V8" in Water Pump Section
Pump Removal - (On Thunderbird remove engine left hand splash shield) Drain cooling system, disconnect lower radiator hose and heater hose. Remove fan belt fan fan spacer, and pulley. (On Thunderbird, remove generator support bracket bolt at the water pump housing and bolt at generator, then move bracket out of way, remove remaining bolts, retaining water pump assembly and timing pointer) On other cars, remove four bolts retaining water pump to cover. Remove pump and timing pointer.

Temperature Gauge: New King-Seeley Electric Constant-voltage ("CV") type with gauge voltage regulator, Ford B7S-10804-A (Thunderbird), B7A-10804-B (Others)
Dash Unit - Ford B7S-10883-A (Thunderbird), B6A-10883-A (Others)
Engine Unit - Ford No B7A-10884-A.
See "Temperature Gauges" in Miscellaneous Section.

CLUTCH

Long Model 10CF. Std. (272, 292 Eng.) 11CF Std. (Thbrd. & 312 Eng) 11CF Heavy Duty. (272, 292 Eng.) Single plate semi-centrifugal type.

Cover Assembly	Long No.	Ford No.
10CF	267346	B7A-7563-A
11CF①	266978	B6A-7563-A
11CF②	267350	B7A-7563-B

①- Black & Yellow paint on cover.
②- Green & Lt. Blue paint on cover.

Clutch Disc	Long No.	Ford No.
272,292 Std, & O D	286116 or 287222	B7A-7550-A
272,292 H D; 312	287226	B7A-7550-B
Thbrd (292)	281982	B5S-7550-A
272 H D	284961	B6A-7550-B

See "Long Clutches" in Clutch Section.

▷*THUNDERBIRD DRIVE LINE VIBRATION OR TRANSMISSION GEAR RATLLE CORRECTION:* When above condition exists on conventional or overdrive cars, install Heavy Duty Dlutch Disc Assembly Ford No. B7A-7550-B.

Pedal Adjustment: If total pedal travel is less than 6 3/8" or more than 6 5/8", reposition pedal bumper and bracket until travel is within limits. Adjust assist spring link to give assist spring length of 9 7 8" (eye centers) with clutch fully released.

Pedal Free Travel - 1 1 8-1 3 8". Loosen locknut on clutch pedal release rod, turn adjusting nut until correct travel is reached. *NOTE* - Check free travel by operating engine at 3000 RPM with transmission in Neutral position. There should be a minimum of ½" free travel under these conditions.

Removal: Remove transmission, flywheel housing cover, release lever retracting spring, slide release bearing and hub off release lever. Mark clutch cover and flywheel for reinstallation, loosen six cover bolts uniformely to release spring tension remove cover and pressure plate through opening in flywheel housing. Remove clutch release lever.

SYNCHRO-MESH TRANSMISSION

Own. Helical gear, constant mesh, synchro-mesh (Second & High), sliding gear (Low & Reverse)
See "Ford Synchro-mesh" in Transmission Section.

Transmission Controls: *See "Transmission Controls" in Transmission Section.*

Removal (Exc. Thunderbird): With car raised up, disconnect drive shaft at rear universal joint, slide drive shaft off transmission output shaft. Remove speedometer cable and gear. Disconnect shift rods at transmission. Remove rear engine support to extension housing bolts. Disconnect parking brake adjusting rod from equalizer bracket. Support rear of engine and remove rear engine support, then lower engine for clearance, and remove transmission to flywheel housing bolts. Use guide pins in two lower bolt holes and slide transmission back until input shaft clears flywheel housing, and lower transmission.
Thunderbird - With car raised up, disconnect drive shaft at rear universal joint, slide drive shaft off transmission output shaft. Remove speedometer cable and gear. Disconnect shift rods at transmission. Remove rear engine support to extension housing bolts. Raise engine and remove engine rear support. Lower engine, remove transmission to flywheel housing bolts, move transmission back for clearance. Remove flywheel housing bottom cover and remove starter. Disconnect clutch linkage at release lever, remove release bearing and hub, clutch assembly and disc. Remove flywheel housing to engine bolts. Turn housing upside down and remove from car. Then remove transmission.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

OVERDRIVE

Warner R10. Solenoid operated type, with governor control and throttle operated kickdown No Lock out Switch used

See "Warner R10 Overdrive" in Transmission Section

Overdrive Control: *See "Overdrive Controls" in Transmission Section*

R moval: Same as for synchro-mesh transmission (above) after disconnecting control cable and wiring

FORDOMATIC TRANSMISSION

Torque converter and three speed automatic transmission with hydraulic control and mechanical parking lock

See "Fordomatic, Merc-O-Matic & Turbo-Drive" in Transmission Section

► *PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION See "Fordomatic, Merc-O-Matic & Turbo-Drive" in Transmission Section*

► *TESTING & TROUBLE SHOOTING· See "Fordomatic, Merc-O-Matic & Turbo-Drive" in Transmission Section*

Lubrication - Check transmission fluid at 1,000 mile intervals and maintain level at "F" mark on indicator Drain and refill every 25,000 miles **Use only Automatic Transmission Fluid Type "A".**

Checking Fluid Level - Bring transmission to operating temperature by running engine with selector lever in Neutral position Move selector lever through all ranges to assure fluid distribution then place lever in "P" (Park) position for checking fluid level Add Automatic Transmission Fluid Type "A" to bring level to "Full" mark on indicator

Thr ttle Linkage Adjustment: *See CARBURETOR above*

► *OTHER FORDOMATIC SERVICE DATA See "Fordomatic, Merc-O-Matic & Turbo-Drive" in Transmission Section*

UNIVERSALS

M chanics. Needle bearing type

► *CAUTION* Rear universal joint companion flange nut controls pinion bearing preload (must be adjusted whenever nut is loosened) *See "1957 Ford & Mercury" in Rear Axle Section*

REAR AXLE

Own. New Separate Carrier type semi-floating hypoid with Hotchkiss drive *NOTE* - Same type used on all models

See "1957 Ford & Mercury" in Rear Axle Section

	Axle Ratios	
M del	**Sta. Wgns.**	**Others**

Overdrive	4 11-1	3 70-1 ②3 56-1)
Fordomatic	3 56-1	3 10-1 ②3 56-1)

① 4 11-1 Optl ② Optional ratio

Backlash - 004 009"

Axl Shaft Removal: Remove wheel take off drum Remove four axle retainer locking type nuts (work through opening in axle shaft flange) Use Puller No 4235-N and pull axle shaft (do not disturb brake backing plate or damage wheel bearing oil seal) Replace one nut to secure brake backing plate

Carrier Assembly Pemoval: *NOTE* - Pinion carrier assembly can be removed separately without disturbing differential carrier by disconnecting rear universal joint at companion flange, and removing five bolts that attach pinion carrier assembly to differential carrier housing With rear universal joint disconnected axle shafts removed (see above) remove differential carrier housing to rear axle housing bolts and lift out carrier assembly

SHOCK ABSORBERS

Direct acting non-adjustable Service by replacement

Model	①Front	①Rear
Pass Cars (Std)	B7A-18124-A	B7A 18125-A
Pass Cars(H D)	B7A 18124 B	B7A-18125-B
Thunderbird(Std)	B7S-18124-A	B7S-18125-A
Thunderbird(H D)	B7S-18124-B	B7S 18125-B
Sta Wgn & Sed Del		B7A-18125-C
Tudor Sedan (Hd Top) Std		B7A-18125-D
Tudor Sedan (Hd Top) H D		B7A-18125-E

① Furnished in kits which include mounting bushing

► *FRONT SHOCK ABSORBER UPPER BUSHING NOTE:* Install bushing with groove seated in frame hole flange and do not dislodge when installing shock absorber

FRONT SUSPENSION

Independent. "Ball Joint" suspension with direct acting shock absorbers.

See "Ford, Lincoln, Mercury, (Ball Joint)" in Suspensions & Wheel Alignment Section

Caster - Pos ½° to Pos 1½° Maximum variation between wheels ½°

Camber - Pos ½° to Pos 1½° ¼° preferred Maximum variation between wheels ½°

Toe-In - 1/16 to 1 8" *NOTE* - When checking toe-in on cars that have power steering, engine should be running so that power steering control valve will be properly centered

Toe-Out on Turns - With outer wheel at 20° inner wheel should be 24¼° (Pass), 25° (Thunderbird)

STEERING

Manual: Own (Gemmer 305 Design). Worm & Roller type

See "Gemmer Worm & Roller" in Steering Section

Power Steering: Ford-Mercury Linkage type Used in conjuction with standard type steering gear

See "Ford & Mercury Bendix Linkage Type" in Steering Section

Pump Belt Adjustment: Install torque wrench on pump pulley bolt Check torque required to slip pulley against belt friction If torque is not 14-16 ft lbs adjustment is required To adjust, position a heavy duty 2½" "C" clamp with bottom against lower side of pump support bracket and top of clamp resting on pump bracket at its center Loosen four pump attaching bolts until pump body may be positioned by tightening "C" clamp Tighten "C" clamp until torque of 14 16 ft lbs is required to slide pump pulley *NOTE*- Hold final torque as close as possible to upper limit

Steering Linkag : *Se "Steering Linkage" in Steering Section*

Steering Wheel & H rn Butt n R m val: *See "Gemmer Worm and Roll r (3 tooth)" in Steering Section*

St ering Gear R m val· *See "Gemmer Worm & Roller (3-tooth)" in Steering Section*

BRAKES

F rd-B ndix Hydraulic. Hand lever applies rear wheel service brakes

► *BRAKE DESIGN NOTE* Front wheel anchor pin (fixed anchor type) is mounted on wheel spindle independently of backing plate (wheel cylinder mounted on anchor pin)

See "Ford, Lincoln, Mercury Bendix" in Brake Section

► *BRAKE PULLING CORRECTION·* To correct, loosen anchor pin attaching bolt (see Brake Design Note above) and retighten bolt to 80-100 ft lbs

Drum Diameter - 11" front and rear

Wheel Cylinder Diameter - 1 1 8" (Front-All) 7 8" (Rear-Pass Cars), 15 16" (Rear-Sta Wgn & Courier)

Lining Specifications (Width & L ngth)

Model	Primary	S condary
Pass Car(Front)	2 1/4"x10 62"	2 1/4"x 11 93"
(Rear)	1 3 4"x10 62"	1 3/4"x 11 93"
Thunderbird(Front)	2"x10 67"	2 1 2"x 12 13"
(Rear)	1 3/4"x10 67"	2"x 12 00"
Sta. Wgn (Front)	2 1/4"x10 62"	2"x 10 62"
(Rear)	2 1/4"x11 93"	2"x 11 93"

Clearance - Adjusting screw backed off 10-12 notches from point where shoes are tight against drum

Brake Pedal Free Play: 5 16 to 7/16" If play not correct after brake adjustment loosen locknut on eccentric bolt that attaches brake pedal assembly to master cylinder pushrod rotate eccentric bolt

Standard Master Cylinder: On engine side of firewall

Checking Fluid Level - Within ½" of top of reservoir.

Removal - Disconnect rubber boot from rear end of master cylinder brake line at master cylinder fitting stop light switch from front of cylinder and disconnect wires from switch Push down brake pedal several times to force as much fluid as possible (into clean container) remove bolts that secure master cylinder to dash panel Do not disconnect pushrod from brake pedal unless it is to be serviced

Power Brakes: New "Bellows Type" Pedal assist power unit with vacuum bellows and control valves mounted on drivers side of dash panel

See "Ford Bellows Type" in Brake Section

Checking Fluid Level - Within ½" of top of reservoir.

Removal - Remove vacuum hose from top of unit valve adjusting eccentric with flat washer spring and bushing nylon bushing from power unit valve housing Remove two mounting screws (Bracket to dash panel) and remove power unit from car

MISC. MECHANICAL

Windshield Wipers: Cable operated type (exc. Thunderbird), Link & Crank Arm (Thunderbird).

See "Windshield Wipers" in Miscellaneous Section.

Power Window Regulators: Electric type.

See "Electric Window Regulators" in Misc. Section.

Power Top Control: Electric-Hydraulic (Convertible), Electric (Retractable Hard-Top). *See "Power Top Controls" in Miscellaneous S ction.*

Power S at Adjust rs: "4-Way" Electric.

See "Power Seat Adjusters" in Miscellaneous Section.

Air C nditi ning: *See "Polar Air " or "Select Aire" in Miscellaneous S ction.*

VEHICLE NUMBER: Stamped in "Serial No." space on Rating Plate attached to left front cab pillar (no separate Engine No.). This number incorporated the following information in sequence shown (Example *F10J7G10001*)

S rial Code ①	Engin Symbol ②	Year ③	Assy. Plant ④	Serial Number
F 10	J	7	G	10001

① — See Model & Serial Code Table (above).
② — See Engine Identification Note (below).
③ — Last digit of model year (1957).
④ — See Assembly Plant Designation(below).

Ass mbly Plant Designation

D — Dallas **K** — Kansas City **P** — Twin City
E — Mahwah **L** — Long Beach (St. Paul)
G — Chicago **M** — Memphis **R** — San Jose
H — Detroit **N** — Norfolk **U** — Louisville

►*ENGINE IDENTIFICATION NOTE.* 6 Cyl. & V8 Engines are used as listed below. For identification in the following Ford Truck data pages, reference is made to these engines by piston displacement, "223 Eng." and "272 Eng.", or as "6 Cyl." and "V8" Engines.

Engine Types

Engin	Mod l	Displ.	Symbol
6 Cyl.		223 cu. in.	J
V8 ⑤	ECW-272	272 cu. in.	K
V8 ⑥	ECY-272	272 cu. in.	L
V8 ⑦	ECR-272	272 cu. in.	U

⑤ — Light Duty Engine with 2-Barrel Carburetor.
⑥ — Heavy Duty Engine with 2-Barrel Carburetor.
⑦ — Heavy Duty Engine with 4-Barrel Carburetor.

First V hicle Numb r: 10 001.

TUNE-UP

COMPRESSION PRESSURE: At cranking speed

Engin	Compr. Ratio	① Compr. Pressure
6 Cyl.	8.3-1	150 lbs.
V8 (ECW & ECY-272)	8.3-1	160 lbs.
V8(ECR-272)	7.6-1	155 lbs.

①—Plus or minus 10 lbs. & uniform within 10 lbs.

VACUUM READING: (6 Cyl.) 18-19", (V8) 19-20", at idling speed.

VALVE TAPPET CLEARANCE: Can be set with engine cold but must be rechecked with engine at operating temperature (30 minutes minimum operation at 1200 RPM) and engine idling.

Tapp t Clearance (Intake & Exhaust)

Engine	Cold	Hot
6 Cyl.	.019"	.019"
V 8 (All)	.020"	.019"

►*TAPPET CLEARANCE ADJUSTING SCREW NOTE:* Screws are "self-locking" and torque required to turn screw (after interference noted) must be 3 ft. lbs., minimum, if less than 3 ft. lbs., replace adjusting screw or adjusting screw and rocker arm assembly.

MANIFOLD HEAT CONTROL (Except ECR-272): Automatic thermostatic type. Located at center of exhaust manifold (6 Cyl.), between cross-over pipe and right exhaust manifold (V8 ECW & ECY-272). Install valve assembly with stop pin at top of valve housing and hook thermostatic spring on stop pin.

►*MANIFOLD VALVE OPERATION CAUTION:* Valve is closed with engine at normal operating temperature and idling (should open with very light finger pressure on counterweight). Valve will open momentarily when engine accelerated, and will be open when engine operated at high RPM.

IGNITION
6 CYL. ENGINE

FIRING ORDER: 1-5-3-6-2-4.

SPARK PLUG GAP: .028-.032"
Plugs – Champion 860. 18 mm.

►*SPARK PLUG CAUTION:* Plugs have tapered seat and no gasket is used. Tighten plugs to 15-20 ft. lbs.

COIL: Ford No. B6A-12029-B.
Ignition Current – 2.5 amps. idling, 4.5 amps. stopped.
Resistor – Ford No. B6A-12250-D. 1 30-1 40 ohms.

►*COIL RESISTOR NOTE:* Resistor is connected in lead from ignition switch to coil and is by-passed during cranking by lead from started switch to battery terminal of coil.

DISTRIBUTOR: Ford No. B7A-12127-C. "Loadomatic" type (same design as previous models).
Condenser – Ford No. 7RA-12300-C. Capacity .21-.25 mfd.
Contact Point Set – Ford No. FAA-12171-A.
Breaker Gap – .024-.026".
Cam Angle – 35-38° at idling speed.
Breaker Arm Spring Tension – 17-20 ozs.
Rotation – Clockwise viewed from above.

Advance Performance
►With Distributor on Test Stand

Distr. Degrees	Vacuum (" of HG)	Distr. RPM
0-½	0.22	500
5½-6½	0 96	1000
9¼-10½	2.09	1500
12-13¼	3.38	2000

►*DISTRIBUTOR REMOVAL & INSTALLATION CAUTION.* Scribe mark on distributor to indicate rotor position and housing position on block before removing distributor, align marks when installing distributor. Make certain that oil pump intermediate shaft engages distributor shaft properly.

IGNITION
V8 ENGINES

FIRING ORDER: 1-5-4-8-6-3-7-2.
Cylinders – RIGHT BANK – 1-2-3-4. LEFT BANK 5-6-7-8-

SPARK PLUG GAP: .028-.032" (All Engines).
Plug – Champion 860 (ECW & ECY-272), F-10 (ECR-272).

►*SPARK PLUG CAUTION:* Plugs have tapered seat and no gasket is used. Tighten plugs to 15-20 ft. lbs.

COIL: Ford No. B6A-12029-B.
Ignition Current – 2.5 amps. idling, 4.5 amps. stopped.
Resistor – Ford No. B6A-12250-D (ECW & ECY-272)B 7A -12250-A (ECR-272), 1 30-1 40 ohms at 75°F

►*COIL RESISTOR NOTE:* Resistor is connected in lead from ignition switch to coil and is by-passed during cranking by lead from starter switch to battery terminal of coil.

DISTRIBUTOR: Ford (ECW-272) B6A-12127-A, (ECY-272) B7A-12127-A, (ECR-272) B7T-12127-B. Loadomatic type same as used on previous models (ECW & ECR Engs.). New type with separate mechanical and vacuum advance mechanism (ECY Eng.). *For ECY Distributor, see "Ford, Lincoln, Mercury Distributors" in Electrical Section*
Condenser – Ford FAB-12300-A (B6A-12127-A & B7T-12127-B Distr.), B7A-12300-A (B7A-12127-A Distr.).
Capacity .21-.25 mfd.
Contact Point Set – Ford FAB-12171B (B6A-12127-A & B7T-12127-B Distr.), B7A-12171-A (B7A-12127-A Distr.).
Breaker Gap – .014-.016" (All models).
Cam Angle – 26-28½° at idling speed (All).
Breaker Arm Spring Tension – 17-20 ozs.
Rotation – Counter-clockwise viewed from above.

Advance Performance – B6A-12127-A
►With Distributor on Test Stand

Distr. Degrees	Vacuum (" of HG)	Distr. RPM
0-½	0.15	300
¼-1¼	0 28	400
6½-7½	0 96	800
11½-12¾	2.21	1200
14½-15½	3.41	1600
16-17¼	4 60	2000

Advance Performance – B7T-12127-B
►With Distributor on Test Stand

Distr. Degrees	Vacuum (" of HG)	Distr. RPM
0	.0	200
1½-2½	0.26	400
6½-7½	1.03	700
9½-10½	1.70	1000
10½-11¾	2.00	1300
12¾-14	2.79	2000

Advance Performance – B7A-12127-A
►Centrifugal (Governor Weight) Advance

Degrees Distr.	RPM	Degrees Eng.	RPM
Start –	250	0	500
5½-6½	625	11-13	1250
11-12¼	1050	22-24½	2100
16¾-18	1600	32½-36	3200

Vacuum Spark Control (B7A-12127-A Distr.): Integral type with vacuum diaphragm unit mounted on distributor housing and linked to breaker plate. Operates in conjunction with centrifugal (governor weight) advance mechanism.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

Vacuum Advance – B7A-12127-A

Distr. Degrees	Eng. Degrees	①Vacuum (" of HG)
0-1¾	0-3½	10"
3-5¼	6-10½	13"
6½-8½	13-17	16"
9½-11½	19-23	19"
11-13	22-26	21"

① – At 1000 RPM distributor speed.

►*DISTRIBUTOR REMOVAL & INSTALLATION CAUTION. See 6 Cyl. Caution (above).*

IGNITION TIMING

Engine	Std. Ignition Setting
6 Cyl. (Std. & O.D.)	4° BTDC
6 Cyl. (Fordomatic)	6° BTDC
V8 ECW-272 (Std.)	8° BTDC
V8-ECW-272 (Fordomatic)	10° BTDC
V8 ECY-272 & ECR-272	10° BTDC

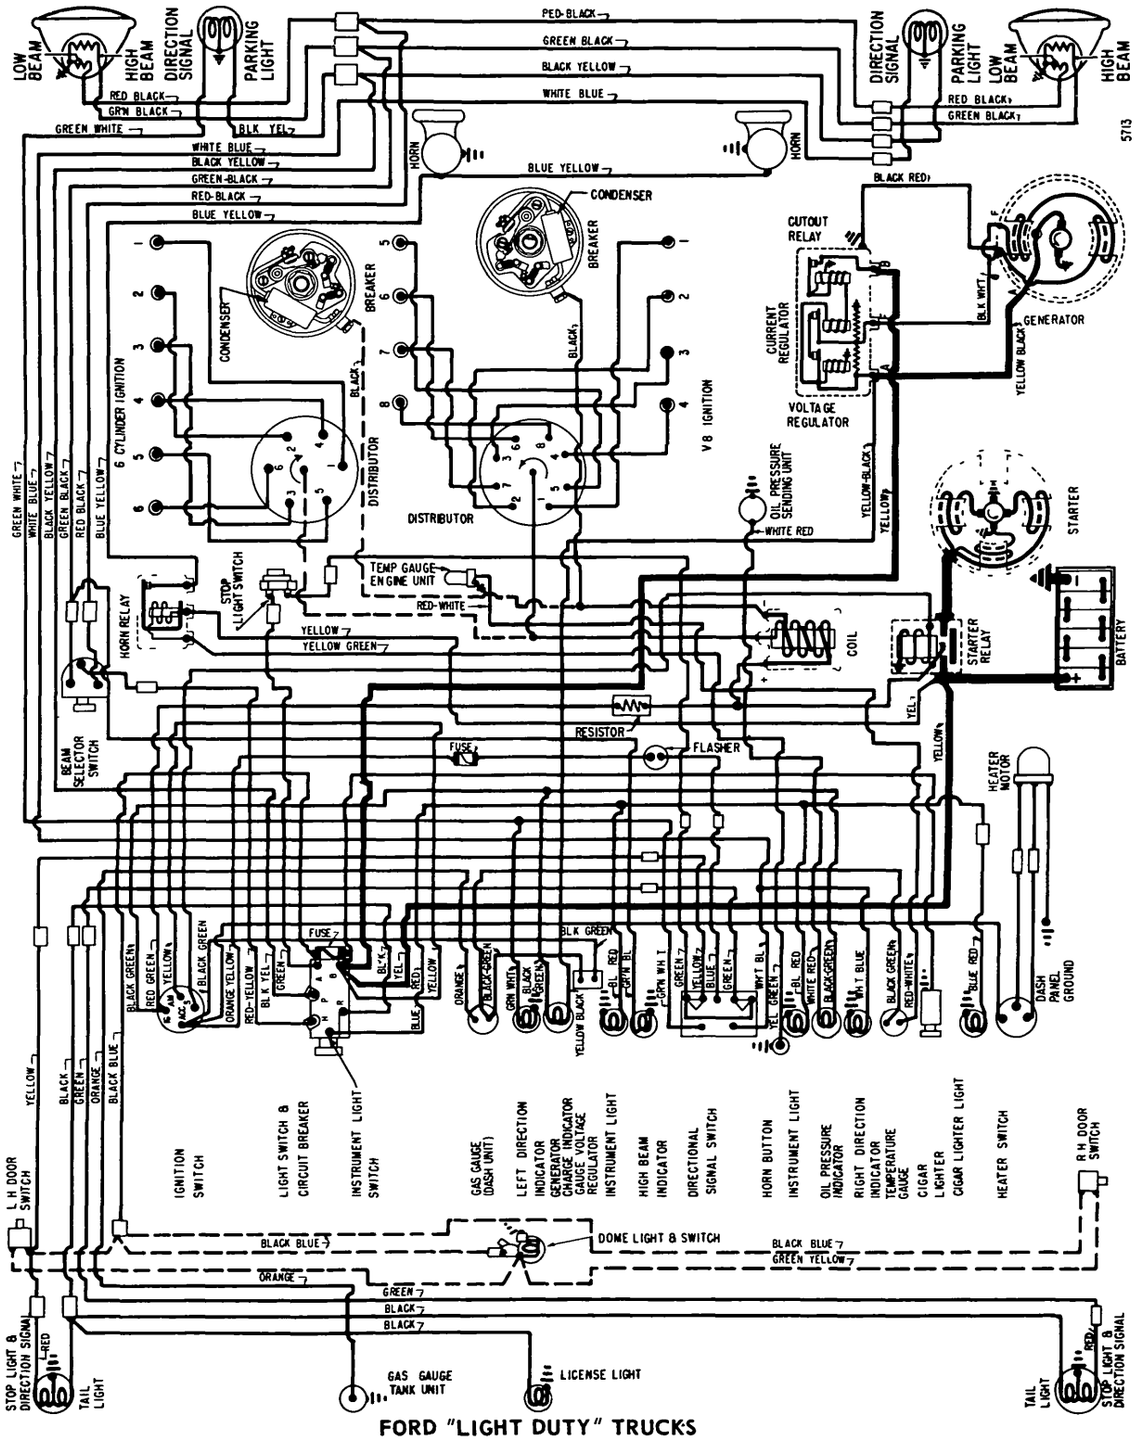
►*TIMING CAUTION* – Set timing with engine idling and with vacuum line disconnected. Check advance operation by running engine at 800 RPM before and after connecting vacuum line (spark should advance when vacuum line connected).

Timing Mark (6 Cyl.) – Vibration dampener marked by lines TDC – 3° – 5° – 7° – 9°. Align space between 3° & 5° lines (4° BTDC setting), or space between 5° & 7° lines (6° BTDC setting) with pointer on chain case cover.

Timing Mark (V8) – Vibration dampener marked by lines TDC – 2° – 4° – 6° – 8° – 10°. Align correct line with pointer on chain case cover.

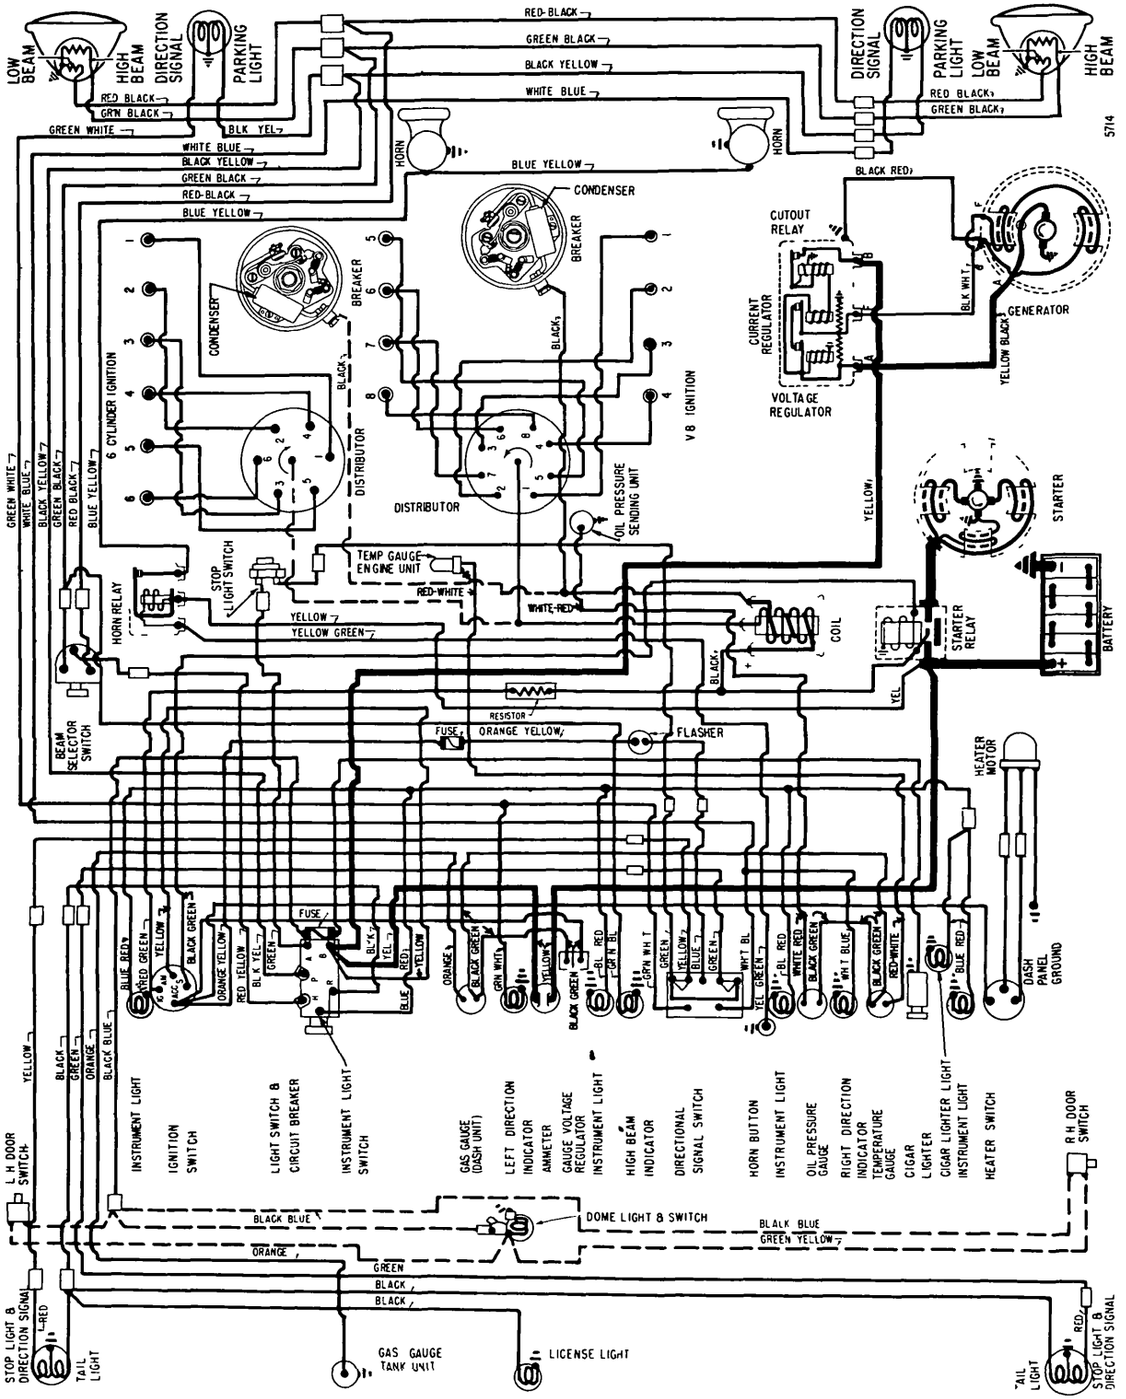
CARBURETOR

CARBURETOR APPLICATION Ford or Holley carburetors used as follows:



Engine	Carburetor Model
6 Cyl. (Std. & OD)	Holley Single B7C-9510-C
6 Cyl. (Fordomatic)	Holley Single B7A-9510-D
V8 ECW-272(Std &OD)	Holley(Ford)Dual B7C-9510-A
V8 ECW-272(Fordomatic)	Holley(Ford)Dual B7C-9510-B
V8 ECY-272 (Par. Del.)	Holley Dual B7J-9510-A
V8 ECY-272 (Others)	Holley Dual B7T-9510-A
V8 ECR-272	Holley 4-Bbl. B7T-9510-C

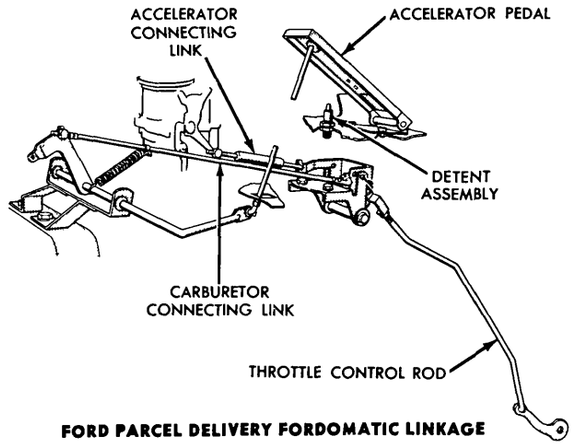
►*CARBURETOR AIR CLEANER (DRY TYPE) NOTE: Special cleaning procedure required. See AIR CLEANER below.*



Thr ttle Linkage Adjustment (Fordomatic Models): *Same as for corresponding 6 Cyl. & V8 Passenger Cars. See Passenger Car data and also note the following:*

Accelerator Pedal Height – With gauging pin installed through holes of accelerator assembly, and carburetor connecting link adjusted so that throttle valves closed with throttle lever stopscrew against stop, accelerator pedal height should be 2-3/4" (6 Cyl. & V8 Trucks except Parcel Delivery). Adjust pedal height by changing length of accelerator pedal connecting link. On all truck models, accelerator pedal should just contact detent (on toeboard under pedal) when carburetor lever strikes wide-open stop (this is the only pedal height specification for Parcel Delivery models).

CONTINUED ON NEXT PAGE



FORD "LIGHT DUTY" TRUCKS

FORD "HEAVY DUTY" TRUCKS

CONTINUED FROM PRECEDING PAGE

Dashpot Adjustment (All Fordomatic Models): After engine idle speed correctly set, turn off engine, loosen dashpot adjusting screw locknut, depress dashpot plunger fully, turn dashpot in or out of bracket until clearance between end of dashpot plunger and lug on throttle lever is .045-.064" (with throttle closed and throttle stopscrew against stop), tighten locknut.

FORD PARCEL DELIVERY FORDOMATIC LINKAGE

HOLLEY SINGLE CARBURETOR (6 Cyl. Trucks)

Ford B7C-9510-C (Std. & OD), B7A-9510-D (Fordomatic).

Idle Setting – Initial setting 1½ turns open. With engine at normal operating temperature, turn screw in until engine runs rough, turn screw out until engine begins to roll, finally turn screw in just enough for smooth running (favor slightly rich mixture).

Idle Speed – 475-500 RPM with transmission in neutral. On Fordomatic models, check idle speed with selector lever in Drive "Dr" position. Idle speed in "Dr" must be 425-450 RPM. If not in this range, readjust as necessary.

Float Level: Fuel level in bowl should be 11/16" plus or minus 1/32" below power valve mounting surface on carburetor. Use Gauge T52L-9550-AGE to check fuel level (remove power valve diaphragm cover and power valve assembly, install gauge in this hole). Fuel should touch tip of "Low" pin on gauge but should not touch "High" gauge pin.

Accelerating Pump: Engage pump link in inner hole of throttle lever for average or hot weather operation, outer hole for cold weather operation.

Fast Idle: No adjustment required.

Throttle Linkage & Dashpot Adjustment (Fordomatic Models): *See CARBURETOR above.*

► *OTHER DATA: See "Ford Visi-flo Carburetors" in Carburetion Section*

HOLLEY (FORD) DUAL CARBURETOR (V8 ECW-272 Engine)

Ford B7C-9510-A (Std. & OD), B7C-9510-B (Fordomatic).

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

►*CARBURETOR CHOKE VALVE REMAINING CLOSED CORRECTION:* On some early trucks carburetor choke valve may remain closed because fast idle cam and shaft assembly may move sideways. To correct, bend end of choke rod lever contacting fast idle pickup arm approximately 10° away from its original position.

►*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrel feeds Cyl. 2-3-5-8, LEFT barrel feeds 1-4-6-7.*
Idle Setting – Initial setting 1 turn open (both screws). With engine at normal operating temperature, turn both idle adjusting needles in until engine runs rough from lean mixture, turn needles out until engine begins to roll, finally turn needles in just enough for smooth running (favor slightly rich mixture).
Idle Speed – 475-500 RPM with transmission in neutral. On Fordomatic models, recheck idle speed with selector lever in Drive "Dr" position. Idle speed in "Dr" must be 425-450 RPM. If not within this range, readjust as necessary.

Fl at Level: 1.437-1.500" from flange surface of air horn to bottom of float (adjacent to soldered seam) and equal for both ends of float with needle valve seated. To check float level, remove air horn and float assembly, invert, place Gauge T56L-9510-A on flange surface of air horn. "Go" leg on gauge (1.500') should slide over bottom of float (not soldered seam), "No Go" leg (1.437") should not clear float.

Accelerating Pump: Three holes provided in throttle lever for pump link engagement: **Inner Hole –** Hot weather or high altitudes, **Center Hole –** Average conditions, **Outer Hole –** Extreme cold weather.

Fast Idle: No adjustment required.

Thr ttle Linkage & Dashpot Adjustment (Fordomatic Models): *See CARBURETOR above.*

►*OTHER DATA: See "Holley (Ford Truck) Dual Carburetor" in Carburetion Section.*

HOLLEY DUAL CARBURETOR
V8 ECY-272 Engines

Ford B7J-9510-A (Par. Del.), B7T-9510-A (Others). New type "Low Silhouette" dual carburetors.

►*MANIFOLD FUEL DISTRIBUTION: Carburetor RIGHT barrel feeds Cyl. 2-3-5-8, LEFT barrel feeds 1-4-6-7.*
Idl Setting – Initial setting 1-1½ turns open (both screws). With engine at normal operating temperature, turn both idle adjusting needles in until engine runs rough from lean mixture, then turn needles out until engine begins to roll, finally turn needles in just enough for smooth running (favor slightly rich mixture).
Idl Speed – 475-500 RPM with transmission in neutral. On Fordomatic models, recheck idle speed with selector lever in Drive "Dr" position. Idle speed in "Dr" must be 425-450 RPM. If not within this range, readjust as necessary.

Throttle Linkage & Dashpot Adjustment (Fordomatic M dels): *See CARBURETOR above.*

►*OTHER DATA: See "Holley 2 & 4-Barrel Carburetors" in Carburetion Section.*

HOLLEY 4-BARREL CARBURETOR
V8 ECR-272 Engin s

Ford B7T-9510-C. New "Low Silhouette" 4-Barrel carburetor with vacuum diaphragm control of the secondary throttle valves.

►*DEPOPPER VALVE OPERATION NOTE:* All trucks equipped with this carburetor have depopper valve made inoperative by plugging air inlet passage between secondary venturis next to air cleaner stud hole boss to improve idle characteristics. Remove plug if depopper needed and a higher idle RPM can be maintained.
Idle Setting – *NOTE - Idle system provided for all four barrels (primary & secondary). Idle mixture adjusting needles used only on SECONDARY side (one on each side of Fuel Metering Block).* Initial setting 1-1½ turns open (both screws). With engine at operating temperature, turn both screws in until engine runs rough from lean mixture, then turn screws out until engine begins to roll, finally turn screws in just enough for smooth running (favor slightly rich mixture).
Idle Speed – 475-500 RPM with transmission in neutral.
NOTE – Idle speed screw located on Throttle Operating Housing adjacent to throttle lever.

►*OTHER DATA: See "Holley 2 & 4-Barrel Carburetors" in Carburetion Section.*

FUEL PUMP PRESSURE: 3.5-5.5 lbs. at 500 RPM.

CARB. EQUIPMENT

Fuel Pump: AC. Fuel only or Fuel & Vacuum types (Std.). *NOTE* - Electric type Optl.

Model	Ford Pump No.
223 Eng. Fuel only	B5A-9350-A
272 Eng. (TH,WH) 4-Bbl. Carb. Fuel & Vac.	B6T-9350-A
272 Eng. (THZ,WHZ) Fuel only	B7T-9350-A
272 Eng. Others 2-Bbl. Carb.	B6C-9350-A

Pressure - 3.5-5.5 lbs. (mechanical diaphragm types), 3.5-7 lbs. (electric type).
See "Fuel Pumps" in Carburetion Section.

Gasoline Gauge: New King-Seeley Electric Constant voltage ("CV") type with gauge voltage regulator, Ford No. B7J-10804-A (J,JH,JL), B7A-10804-B (Others).
Dash Unit - Ford No. B7C-9280-A.
Tank Unit - Ford No. B6A-9276-A.
See "Fuel Gauges" in Carburetion Section.

Air Cleaner: DRY FILTER ELEMENT type. Clean every 12,000 miles, replace element every 36,000 miles.

►*CLEANING CAUTION:* Clean filter element by tapping and shaking to remove dirt particles. *DO NOT wash element in solvent or other liquids and DO NOT oil or lubricate.*

BATTERY

Ford No. B6A-10655-C. 12 volt, 11 plate, 55 Ampere Hour Capacity. **Ford No. B7A-10655-A.** 12 volt, 11 plate, 70 Ampere Hour Capacity. **Ford No. B6A-10655-E.** 12 volt, 13 plate, 70 Ampere Hour Capacity (20 hr. rate).
Grounded Terminal - Negative to engine block.
Engine Ground - At flywheel housing.

STARTER

Ford B6A-11002-A. Armatur - B6A-11005-B.
Drive - Ford LCM-11350-C. Bendix "Folo-Thru".
Rotation - Counterclockwise at commutator end.
Brush Spring T nsi n - 48-56 ozs.
Cranking Sp d - 150-180 RPM, 190 amps. max.

Perf rmance Data

Torque	RPM	Volts	Amperes
0 ft. lbs.	①	12.0	80 max.
15.5 ft. lbs.		5.0	550 max.

① - If starter on engine, engine must be idling.

Starting Switch: Magnetic type, Ford No. B6A-11450-A. Starter switch controlled by ignition switch. *NOTE* - Neutral Safety switch used on Fordomatic transmissions.

Fordomatic Neutral Safety Switch: Ford No. FAC-15812-C. **Adjustment** - *See "Fordomatic & Mercomatic" in Transmission Section.*

GENERATOR

Ford. Used as follows:

Generator No.	Armature No.	Application
B6A-10002-C	B6C-10005-B	6 & 8 (30 Amp)
B6A-10002-F	B6C-10005-C	6 Cyl. (40 Amp)
B6A-10002-E	B6C-10005-C	V8 (40 Amp)

Performance Data

Generator	Amperes	RPM
B6A-10002-C	30	1500
B6A-10002-E, F	40	1500

Brush Spring Tension – 26-34 ozs.
Field Current – 1.4-1.6 amperes at 12.0 volts.
Rotation – Counter-Clockwise at commutator end.

Belt Adjustment: ¼" deflection (6 Cyl.), ½" deflection (V8) midway between generator and water pump pulleys with light thumb pressure.

REGULATOR

Ford B6C-10505-B (B6A-10002-C G n.). B6A-10505-B (B6A-10002-E & F Gen.). *See "Ford, Lincoln, Mercury 12 Volt Regulators" in Electrical Section.*

►*SETTING CAUTION: "Temperature Compensated" type. Set to following specifications at 75°F ambient (engine compartment) temperature, after ½ hour operation or after regulator heated and stabilized.*

Cutout R lay
Cuts In - 12.0-12.8 volts.

Voltage R gulator
Setting - 14.6-15.4 volts at 75°F (ambient).
Checking & Adjusting - *See Electrical Section.*

Current R gulat r
Setting - 28-32 amperes (B6C-10505-B), 38-42 amperes (B6A-10505-B).
Checking & Adjusting - *See Electrical Section.*

MISC. ELECTRICAL

Headlamps - Sealed Beam. *S e Electrical Section.*
Directional Signals: *See Electrical S ction.*

Lighting Switch Removal: With control knob in the "OFF" position, press the spring release button on switch housing, turn shaft slightly and pull it out of switch. Unscrew mounting nut, remove switch.

Stop Light Switch Location: On brake master cylinder, Power Unit Assembly or fitting on frame side rail. Master Cylinder located on firewall (Conventional Trucks), and on bracket attached to left frame member below brake pedal (Other).

LIGHTING CIRCUIT BREAKERS: Two used in lighting switch. One circuit breaker protects headlight circuit, other circuit breaker protects instrument, parking, stop, and tail light circuits.

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

FUSES: **Interior lights** - 7.5 amps. On lighting switch.
Directional Signals - 7.5 amps. in flasher lead.
Overdrive - 15 amps. On Overdrive Relay.
Heater - 7.5 amps. In switch lead.
Clock - 3 amps. In clock lead.
Horn Relay: Ford No. B7A-13853-A.

ENGINE

ENGINE SPECIFICATIONS: 6 Cyl. 223" Eng. (EBR, EBS,EBT), and V8 272" Eng. (ECW,ECY, and ECR Heavy Duty). All engines are overhead valve type.

Engin	Bore	Stroke	Displacement
223	3.62"	3.60"	223 Cu. ins.
272	3.62"	3.30"	272 Cu. ins.

Engine	Compr. Ratio	Rated HP	Developed HP
223	8.3-1	31.5	139 at 4200 RPM
ECW-272 ①	8.3-1	41.9	171 at 4400 RPM
ECY-272 ①	8.3-1	41.9	181 at 4400 RPM
ECR-272 ②	7.6-1	41.9	178 at 3800 RPM

① - 2-Bbl. Carb. ② - 4-Bbl. Carb.

CYLINDER HEAD: *See Ford Special Data.*

TIGHTENING TORQUES: *See Ford Special Data.*

ENGINE REMOVAL: *See Ford Special Data.*

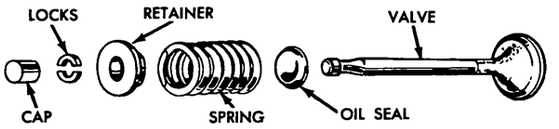
OIL PAN REMOVAL (223" Engine): Drain crankcase, remove oil dipstick. Remove left and right front engine splash aprons. Remove flywheel housing inspection cover. Take out oil pan retaining screws and remove oil pan.

OIL PAN REMOVAL (272" Engine): Drain crankcase. On Fordomatic models, remove converter housing dust cover. Disconnect oil pump inlet tube at oil pump and remove "0" ring seal from pump end of tube. On Tilt Cab Trucks, crank engine until No. 1 piston is on TDC. Remove oil pan retaining screws, remove pan.

223" 6 CYL. ENGINES
(See Engin Sp cifications Above)

See 1957 Ford 6 Cyl. Passenger Car Pages. Engine is similar to those used in 1957 Pass. Cars, and all passenger car engine data applies to truck engines.

272" V8 ENGINES
(See Engin Specifications Above)



See 1957 Ford V8 Passenger Car Pages. Engine is similar to those used in 1957 Pass. Cars, and all passenger car engine data applies to truck engines EXCEPT AS NOTED BELOW.

CRANKSHAFT: Bearings – Copper lead bearings only used in ECR-272 Engine.

VALVES (ECR-272 ENGINE) Exhaust valves are Sodium Cooled "Free Turning" type with special specifications as follows: Stem Diameter–.4343–.4350". Stem Clearance–.0018"-.0032" (Wear limit .0055"), Valve Seat Width–.070-.090" (Intake), .090-.110" (Exhaust).

Valv Cap Clearance (ECR-272 Exhaust Valves) – .0002-.004" between end of valve stem and inner face of cap (necessary to insure cap carrying valve spring pressure and permit rotating of valve). Measure with Micro Gauge, Tool 6513-CE-2. If clearance greater than .004", reduce clearance by lapping open end of cap on flat surface.

► *EXHAUST VALVE CAUTION (ECR-272 H.D. ENGINE):* Exhaust valves are Sodium cooled and require special disposal handling to prevent possibility of fire or explosion due to chemical reaction. DO NOT DISCARD SODIUM COOLED VALVES with other scrap material. Bury in ground not subjected to excavation or in deep water not subjected to dredging.

FORD V8 ECR-272 VALVE ASSY.

EXHAUST VALVE INSERT (ECR-272 ENGINE): *See "Valve System" in Ford Special Data.*

VALVE TIMING: Cam lift specifications for valve timing points differ from Pass. Car engines. Use Pass. Car Valve Timing Check procedures but note special Cam Lift data following:

Valve Timing (All 272" Engines)

Intake Valves - Open 18° ② BTDC. Close 58° ④ ALDC.
Exhaust Valves - Open 66° ① BLDC. Close 10° ③ ATDC.
Cam Lift - ① .014", ② .015", ③ .017", ④ .018".

OILING SYSTEM

Crankcase Capacity: 6 qts. (ECR-272 Eng.) 5 qts. (Others). Add 1 qt. with filter change.

Normal Oil Pressure: 45-50 lbs. at 2000 RPM (Hot).
Pressure Regulator Valve - In oil pump body. Not adjustable.

Oil Pressure Indicator: Warning Light (F-100, 250, 350, 500, 600). King-Seeley Gauge (P-350, 400, 500; B-500, 600).
Dash Unit - Ford No. B7J-9273-A (Parcel Delivery), B7T-9273-A (Others).
Engine Unit - Ford No. B7T-9275-A.
See "King-Seeley Gauges" in Miscellaneous Section.

Oil Pump: Gear type pump mounted inside crankcase in line with distributor shaft (223 Eng.), rotor type located on left side of crankcase and driven by distributor shaft (272 Eng.).
Pump Removal & Overhaul - *See "Oil Pump" in Ford Special Data.*

Oil Filter: Full-flow (Std. Equip.), with pressure relief valve in center bolt. Replace filter element at 4000 mile intervals or when oil becomes dirty or polluted.
Replacement Filter Element - Ford No. B2A-6731-A (Kit includes new gasket).

► *CAUTION:* This special Full-flow filter element must be used for replacement (use of bypass type element would restrict oil flow and result in insufficient engine lubrication).

► *FILTER INSTALLATION CAUTION & OIL LEAK CORRECTION: See "Oiling System" in Ford Special Data.*

Crankcase Ventilation: Filter in oil filler cap (inlet) all models. Road draft outlet pipe for crankcase ventilation all models. *NOTE* - V8 engine has filter screen in road draft outlet tube. Service filler cap by cleaning with solvent and resaturating with engin oil at 4000 mile intervals, clean screen in road draft outlet tube at same mileage.

COOLING

► *LOSS OF COOLANT CORRECTION:* Lower generator mounting bracket bolt holes are tapped into cylinder water jacket. For loss of coolant at this point or when replacing bolts, apply a good coating or waterproof sealer.

Water Capacity: (6 Cyl. exc. Par. Del.) - 18 qts. (6 Cyl. Par. Del.) - 18½ qts.
(V8 F-100, 250, 350) - 18 qts. (V8 F-350 Dual Rear Whls, F & B-500, F & B-600) - 22 qts.
(V8 P-350 Single Rear Whls.) - 22 or 23 qts., (V8 P-350 Dual Rear Whls. , P-400, 500) - 27 qts.
(V8 C-550, 600) - 28 qts. Add 1 qt. for heater.

Pressure Valve: Ford No. OL-8100-A, radiator filler cap (opens at 7 lbs.).

Thermostat: 223 Eng. - Ford No. EAA-8575-A (157-162°), EAA-8575-B (177-182°).
272 Eng. - Ford No. B4C-8575-A (152-157°), B4C-8575-B (167-172°). Spring and cartridge type.

Water Pump: Packless, sealed ball bearing type. *See "Ford 6" or "Ford V8" in Water Pump Section.*

Temperature Gauge: New King-Seeley Electric Constant-voltage ("CV") type with gauge voltage regulator, Ford No. B7J-10804-A (J,JH,JL), B7A-10804-B (Others).
Dash Unit - Ford No. B7J-10883-A (J,JH,JL), B7C-10883-B (Others).
Engine Unit - Ford No. B7A-10884-A.
See "Temperature Gauges" in Miscellaneous Section.

CLUTCH

Long 10, 10½, & 11CF clutches used. For Truck Model (with type Trans.) application of Cover and Disc. See below.

Model	Long No.-Cover Assy.-Ford No.
6 Cyl. 223" Eng. ①	L5222 — B4A-7563-B
6 Cyl. 223" Eng. ②	267371 — B7C-7563-A
V8 272 Eng. ③	L5222 — B4A-7563-B
V8 272 Eng. ④	267371 — B7C-7563-A
6 Cyl. & V8 (Others) ⑤	267147 — B7Y-7563-A

Model	Long No - Disc - Ford No.
6 Cyl. 223" Eng. ①	CD870 — B7C-7550-A
6 Cyl. 223" Eng. ②	287335 — B7C-7550-B
V8 272" Eng. ③	CD870 — B7C-7550-A
V8 272" Eng. ④	287335 — B7C-7550-B
6 Cyl., V8 (Std.) ⑤	CD607 — 81T-7550-A
6 Cyl., V8 (H.D.) ⑤⑥	CD606 — B6D-7550-A

① - F100, 250, 350; P350 (10CF).
② - F100, 250 (EBR); P350 (10½CF).
③ - F100 3-Speed L.D. Trans.; Overdrive (10CF).
④ - F100, 250 (ECW); P350 (10½ CF).
⑤ - 11CF.
⑥ - All 6 Cyl.; 272" Eng. (F100, 250; P350 with Std. Trans.); 272" Eng. (F100, 250 with 4-Speed Trans.); 272" Eng. (F350).

► *HEAVY DUTY CLUTCH DISC:* Heavy Duty Clutch Disc Ford No. B6D-7550-A entered production Jan. 1957 and identified by gray painted damper springs and yellow paint on hub.

Clutch Pedal Clearanc : Adjust pushrod eccentric bolt on clutch pedal (Conv. Trucks) or extension rod (Par. Del.) for ¼" free travel at pedal pad before pushrod contacts master cylinder piston.

Clutch Release Lever Clearance - Adjust clearance be-

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

tween slave cylinder pushrod adjusting nut and release lever to ¼" (six turns of adjusting nut).

Hydraulic Clutch Control: Master cylinder mounted on firewall (Conv. Cab), on bracket on firewall (Tilt Cab), and connected to Slave Cylinder which is attached to flywheel housing and connected to outer end of clutch release lever.

Filling Master Cylinder - Maintain fluid level (H.D. Brake Fluid) to within ½" below top of cylinder reservoir. Change fluid at 15,000 mile intervals.

Removal - Release retracting spring. Remove slave cylinder from flywheel housing, slave cylinder pushrod from release lever. Remove trans. (see Trans. Removal below), dust cover from flywheel housing, release bearing and hub from release lever. Mark pressure plate, cover assembly and flywheel for reassembly. Remove pressure plate and cover assembly to flywheel bolts gradually to reduce spring tension, remove assembly through bottom of clutch housing.

SYNCHRO-MESH TRANSMISSION

3-SPEED (LIGHT DUTY)

Own. 3-speed, all helical gear, constant mesh, synchro-mesh (second and high), sliding gear (low and reverse). Steering column shift standard.

See "Ford Truck 3-Speed (Light Duty)" in Transmission Section.

Removal: Drain lubricant, disconnect speedometer cable and drive shaft and gear shift linkage at transmission. *(NOTE* - On band type parking brake, disconnect brake cable clevis and remove cable support bracket). Remove flywheel housing-to-transmission bolts and nuts, draw transmission to rear to clear flywheel housing and lower transmission.

3-SPEED (MEDIUM DUTY)

Own. 3-speed medium duty with steering column shift standard. *See "Ford Truck 3-Speed (Medium Duty)" in Transmission Section.*

Removal: Same as for 3-Speed (Light Duty) above.

3-SPEED (HEAVY DUTY)

Own. 3-speed, helical gear (second & high), spur gear (low & reverse), constant mesh, synchro-mesh (second & high), sliding gear (low & reverse). Steering column shift standard.

See "Ford Truck 3-Speed (Heavy Duty)" Transmission in Transmission Section.

Removal: Same as for 3-Speed (Light Duty).

4-SPEED

Own. 4-Speed, constant mesh, synchro-mesh (second, third, & high). Helical gears used for second, third, & high. Spur gears used for low & reverse. Floor mounted gear shift standard.

See "Ford Truck 4-Speed (Synchro-mesh) Transmission" in Transmission Section.

Removal: Same as 3-Speed (Light Duty) and note following: If hoist not used, it may be necessary to remove gear shift lever assembly (New Process) and lever housing (Others), before transmission can be removed from truck. *(NOTE* - On Tilt-Cab - release lock and tilt cab forward). Disconnect shift linkage at split pin which attaches universal joint to finger socket shaft in rear cross shaft housing. Drain transmission, disconnect drive shaft at parking brake drum. If truck equipped with coupling shaft support, disconnect support bracket, and remove coupling shaft. Disconnect parking brake and speedometer cables. Remove dust cover from bottom of clutch housing, support transmission on jack, remove two top nuts, two bottom bolts, move transmission to rear until input shaft splines clear clutch housing and lower transmission.

OVERDRIVE

Warner Model R10. Solenoid operated with governor control and throttle operated kickdown.

See "Warner R10 Overdrive" in Transmission Section.

Overdrive Controls: *See "Overdrive Controls" in Transmission Section.*

Removal: Same as 3-Speed Synchro-mesh Transmission (above), after disconnecting control cable and wiring.

FORDOMATIC TRANSMISSION

Torque converter and three speed automatic transmission with hydraulic control and mechanical parking lock. *See "Fordomatic & Merc-O-Matic" in Transmission Section.*

► *PRODUCTION CHANGES & REPLACEMENT PARTS CAUTION: See "Fordomatic & Merc-O-Matic" in Transmission Section.*

► *TESTING & TROUBLE SHOOTING: See "Fordomatic & Merc-O-Matic" in Transmission Section.*

Lubrication - Check transmission fluid level every 1000 mile intervals, maintain level at "F" (full) mark on dipstick. Drain and refill every 15,000 miles. Use only Automatic Transmission Fluid Type "A".

Checking Fluid Level: Bring transmission to operating temperature by idling engine (operate with selector lever in "N" for 4 minutes, in "P" for remainder of time). With transmission warm, move selector lever through all positions, then check fluid level with selector lever in "P" Add Automatic Transmission Fluid Type "A" to bring level to "F" mark on dipstick.

Throttle Linkage Adjustment (Fordomatic Models): *See CARBURETOR above.*

► *OTHER FORDOMATIC SERVICE DATA: See "Fordomatic & Merc-O-Matic" in Transmission Section.*

UNIVERSALS

Spicer. Needle bearing type.

► *UNIVERSAL JOINT INSTALLATION CAUTION:* Make sure that all universal joint yokes in drive line are in same plane to avoid drive line vibration.

Coupling Shaft Center Bearing: Consists or cushion mounted ball bearing bolted to underside of frame intermediate cross member. Bearing is mounted on end of coupling shaft in a sleeve with felt retainer on each end and bearing baffle on front end.

REAR AXLE

SEMI-FLOATING

Own. New Separate Carrier, hypoid gear, with Hotchkiss drive.

See "1957 Ford & Mercury" in Rear Axle Section.

Ratios - 3.70 (37-10), 3.89 (35-9), 4.11 (37-9).
Backlash - .004-.009".

Axle Shaft Removal: Remove wheel, take off drum. Remove four axle retainer locking type nuts (work through opening in axle shaft flange). Use Puller No. 4235-N and pull axle shaft (do not disturb brake backing plate or damage wheel bearing oil seal). Replace one nut to secure brake backing plate.

Carrier Assembly Removal: *NOTE* - Pinion carrier assembly can be removed separately without disturbing differential carrier by disconnecting rear universal joint at companion flange, and removing five bolts that attach pinion carrier assembly to differential carrier housing. With rear universal joint disconnected, axle shafts removed (see above), remove differential carrier housing to rear axle housing bolts and lift out carrier assembly.

Wheel Bearing Adjustment: None required.

FULL FLOATING

Full floating, Hypoid gear, with Hotchkiss drive.

Model	Rear Axle Type
F-250,P-350 (Spicer Model 60)	Integral Housing
350,600 Series	Banjo Housing

See Various types of Ford Rear Axles in Rear Axle Section.

Rear Axle Ratios

Model	Axle Ratios
F-250, P-350	4.56(41-9),4.88(39-8),5.88(47-8) ④
F-350, P-350,400	4.86(34-7),5.14(36-7),5.83(35-6) ⑤
F,P,B-500	6.2(31-5),6.8(34-5) ⑥
F,P,B-500, C-550	5.83(35-6),6.2(31-5),6.8(34-5) ⑥
F,B,C-600	6.2(31-5),6.8(34-5),7.2(36-5) ⑥

Backlash - ④ -.008-.013". ⑤ -.004-.018". ⑥ -.006-.012".

Axle Shaft Replacement: Remove axle shaft stud nuts and lockwashers. Strike center of axle shaft flange with a hammer and drift to loosen tapered dowels, then remove dowels. Pull axle shaft from housing. To reinstall, place gasket in position on housing and install axle shaft. Install tapered dowels, lockwashers and nuts on studs. Tighten nuts to 50-70 ft. lbs.

Axle Assembly Removal (Integral Housing): Loosen wheel and axle shaft stud nuts, disconnect rear shock absorbers, raise rear of frame until weight is off springs. Disconnect flexible hydraulic line at frame, parking cable (if so equipped) at equalizer, remove cables at brackets. Disconnect rear universal joint at flange, remove spring "U" bolts, roll rear axle from under truck and drain lubricant.

Carrier Removal (Banjo Housing): Remove axle shaft stud nuts and lockwashers, strike center of axle shaft flange with hammer and punch to loosen tapered dowels, remove dowels and axle shaft. Disconnect drive shaft at rear universal joint flange, support carrier assembly with roller jack, remove carrier to housing bolts and lockwashers. Tighten puller screws (when provided in carrier) to loosen carrier from housing, roll carrier from truck.

Wheel Bearing Adjustment: Remove axle shafts (see above), use special bearing adjusting wrench and remove bearing locknut (outer nut), and lockwasher Adjust bearings by turning bearing adjusting nut (inner nut) up until tight then backing off 1/8 turn. Install bearing lockwasher. *(NOTE* - If adjusting nut equipped with dowel, make sure lockwasher fits over dowel). Install bearing locknut and draw nut up tight. If flange type lockwasher is used, bend one flange over adjusting nut

CONTINUED ON NEXT PAGE

CONTINUED FROM PRECEDING PAGE

and one flange over locknut. Install axle shaft and lower vehicle.

TWO-SPEED

Own. Electrically operated shift, Two-speed, Full-floating spur gear planetary unit (reduction gearing). Spiral bevel gear final drive.

See "Ford Truck Two-Speed" in Rear Axle Section.

Rati - 5.83-1 (Direct Speed), 8.11-1 (Second Speed); 6.33-1 (Direct Speed), 8.81-1 (Second Speed).

Backlash - .006-.016".

Rem val: Same as for standard axle (above) after removal of wiring harness.

SHOCK ABSORBERS

Direct acting hydraulic. Shock absorbers are sealed units and are not adjustable or refillable.

► *REPLACEMENT SHOCK ABSORBER NOTE:* Shocks are supplied for service replacement in kits consisting of shock absorber and necessary bushings.

Replacement Shock Absorbers

Mdl	Front - Ford Nos. - Rear
F-350	B7C-18124-A B3Y-18125-A
F-100,250	B7C-18124-A B7C-18125-A
P-350,400	B7J-18124-B .①B7C-18125-A
P-500	B7J-18124-A..②B7J-18125-A
F,B-500	B7T-18124-A..①B7J-18125-A
P-350	B7J-18124-B..②B3T-18125-A
F,B-500,600	B7T-18124-A..②B3T-18125-A
C-550-600	B7T-18124-B..②B3T-18125-A

① - Single Speed Axle. ② - Two Speed Axle.

FRONT SUSPENSION

Conventional "I" beam section front axle with Reverse-Elliot ends and semi-elliptical springs.

Kingpin Inclination - 5½° - C-550,600; P-500 (154" W.B.). 4° - Others.

Cast r ①	Specification
F-100,250	3° ± ½°
P-350	4° ± 1°
P-400; P-500(137" W.B.), F-500(130" W.B.)	3° ± 1°
C-550,600	3° ± 1°
F-350	3¾° ± 1°
F-500 (154" W.B.), F-600, B-500, B-600	4½° ± 1°
P-500 (154" W.B.)	3½° ± 1°

① - Maximum variation between wheels ½°.

Camber - 0-1°. Maximum variation between wheels ¼°.

Toe-In - 0-1/16". *NOTE* - On Power Steering models, run engine so hydraulic pressure will center power control valve.

STEERING

Own. Gemmer design. Worm-and-roller types with push-pull adjustment. *NOTE* - Tilt Cab steering column has universal joint.

See "G mm r Worm & Roller Types" in Steering Section.

St ring Linkage: *See "Steering Linkag " in Steering Section.*

Ste ring Wh l & Horn Butt n Removal: *S e "Gemmer Worm & Roll r" in St ring S ction.*

St ring Gear Removal: *See "Gemmer Worm & Roller" in Steering Section.*

BRAKES

Brake types are listed in application table below. Hand lever applies rear wheel service brakes on F-100, F-250, and P-350 trucks. Independent transmission mounted drum and contracting band type brake on other models.

Brake Type Application

Model	Front	Rear
F-100	Duo-Servo	Duo-Servo
F-250;F,P-350,400	Uni-Servo	Duo-Servo
C-550,600	Uni-Servo	Two Cyl.
F,B,P-500; F,B-600	Uni-Servo	Two Cyl.

Uni-Servo - Ford-Bendix. Single anchor. Wheel cylinder actuates primary shoe. Ratchet adjusting screw.

See "Ford-Bendix Uni-Servo Hydraulic" in Brake Section.

Duo-Servo - Ford Bendix. Single anchor, self energizing wheel cylinder actuates both shoes. Ratchet adjusting screw.

See "Ford-Bendix Hydraulic" in Brake Section.

Two-Cylinder Type - Two wheel cylinders in each brake assembly.

See "Ford Truck Two-Cylinder" in Brake Section.

Brake Lining

Model		Drum Diam.	Primary Width-Length	Secondary Width-Length

Hand Brake: **(F-100,250; P-350)** Eliminate slack in cables after adjusting service brakes. *See "Ford-Bendix Hydraulic" in Brake Section.*

(Except F-100,250; P-350) External contracting type, consisting of a brake drum bolted to transmission main shaft companion flange, and an external contracting band mounted on rear of transmission.

Brake Drum Diameter - 8" (F-350), 9½" (THZ, WHZ 4-Speed Trans.), 7 13/16" (All Others).

Adjustm nt - On cable controlled parking brakes, move lever to full released position. On transmission mounted parking brake levers, set lever to first notch. Observe position of cam to make sure flat portion is resting on brake band bracket. If cam not flat with bracket, remove clevis pin from upper part of cam, adjust clevis rod to allow flat portion to rest on brake band bracket. Install clevis and cotter pins. Remove lock wire from anchor adjusting screw, turn adjusting screw clockwise until .010" clearance is established between brake lining and drum at anchor bracket. Loosen locknut on adjusting screw from lower half of brake band. Adjust for .010" clearance between lining and drum at lower half of brake band. Tighten locknut. Turn upper band adjusting rod nut until .010" clearance is established between upper half of band and drum. Reinstall lock-wire in anchor adjusting screw.

Hand Brake Lining

Series	Length	Width	Thickn ss
F-350	24.63"	2.00"	.156"
P-350,400,500;C-550,600	①	2.50"	.250"
F-500,600;B-500,600	24.63"	2.50"	.250"

① - Two 7.89" and one 7.30".

Standard Master Cylinder: Located on engine side of firewall.

Checking Fluid - Maintain fluid level to within ½" of top of reservoir.

Removal - Disconnect rubber boot from rear end of master cylinder, brake line at master cylinder fitting, stop light switch from front of cylinder and disconnect wires from switch. Push down brake pedal several times to force as much fluid as possible (into clean container) remove bolts that secure master cylinder to dash panel. Do not disconnect pushrod from brake pedal unless it is to be serviced.

Power Brakes: Midland (Diaphragm) or Hydrovac (Piston) types used. *See Model Application following:*

Model	Power Brake	Ford N .
C	Midland Diaphragm	AD-2005-A
D,Y	Hydrovac Piston	B7D-2005-A
J,JL	Hydrovac Piston	B4D-2005-A
JH,T,TH,THZ..	Midland Diaphragm	TEAA-2005-B
W,WH,WHZ	Midland Diaphragm	B7T-2005-A

See "Midland" or "Hydrovac" Power Units. in Brake Section.

Checking Fluid - Same as for Manual Brakes above.

Removal of Power Unit - (Hydrovac) - Depress brake pedal several times to remove all vacuum from system. Loosen brake power unit inlet tube clamp and remove tube. Disconnect master cylinder to power unit hydraulic line at power unit. Disconnect vacuum tube at power unit. If stop light switch located on brake power unit, disconnect wires. Remove mounting bracket bolts and power unit.

(Midland) - Depress brake pedal several times to equalize air pressure at both sides of diaphragm in booster unit. Loosen slave cylinder clamp and disconnect the air breather hose from the booster. Disconnect Hydraulic lines at booster and intake manifold to booster vacuum hose at booster. Remove booster. *NOTE* - Do not remove breather in cab or controls mounted in engine compartment unless operating conditions indicate repairs are necessary.

MISC. MECHANICAL

Windshield Wip rs: Vacuum Link and Arm (Exc. H.D. and Tilt Cab models). Electric (H.D. and Tilt Cab models).

See "Windshi ld Wipers" in Miscellaneous Section.

Oil Pump Pick-up Tube Nut	10-12
Oil Pan Pick-up Tube Nut	23-32

ℂ – See Cylinder Head Installation (below) for tightening procedure. Three different torque applications must be made.

ENGINE

LINCOLN

ENGINE REMOVAL (Less Transmission):

1) Disconnect battery, drain radiator and cylinder block, remove hood.

2) Disconnect distributor primary wire at coil, pull secondary coil lead from distributor cap. Disconnect and remove defroster blower motor and duct assembly, loosen two duct clips on firewall and disconnect wires at bullet connectors.

3) Remove capscrew securing transmission oil filler tube bracket to exhaust manifold. Disconnect two right heater hoses at water pump and cylinder block.

4) Disconnect generator wires at generator, remove carburetor air cleaner and air duct as an assembly.

5) Disconnect upper and lower radiator hoses and remove radiator. Remove fan, spacer, water pump pulley, and belts. Disconnect left heater inlet hose at pipe and power brake vacuum line at vacuum pipe.

6) Loosen power steering drive belt and capscrew securing power steering hose bracket to cylinder block. Remove power steering pump. Wire pipe securely to left hood hinge in a position that will prevent oil leakage.

7) Remove accelerator shaft retracting springs. Disconnect carburetor-to-control shaft rod at carburetor. Remove capscrews securing control shaft assembly and accelerator shaft bracket to engine. Wire control shaft assembly and accelerator shaft bracket to dash panel.

8) Disconnect engine ground strap at engine. Disconnect temperature sending unit at sending unit and oil pressure warning light wire at bullet connector. Disconnect wiper at vacuum pipe.

9) Raise vehicle. Remove starter. Disconnect resonator inlet pipes from exhaust manifolds. Remove radiator splash shields. Drain engine oil and remove oil filter.

10) Remove converter housing-to-cylinder block capscrews. Remove converter cover, then bolts securing converter to flex plate. Lower vehicle. Support transmission with floor jack.

11) Disconnect and remove radio speaker. Fold back front center floor carpet and pad. Remove two rubber plugs from access holes in dash panel. Remove two converter housing-to-cylinder block capscrews. Remove two capscrews from each engine front support bracket.
